*Volume* 81 — New York, Saturday, January 6, 1923 — Number 1

# A Year of Records

DURING 1922 the central-station branch of the industry passed three mileposts. First, the total amount of energy sold by the various generating and distributing companies passed the half-hundred billion mark, thereby realizing the prophecy made several years ago by the ELECTRICAL WORLD that this mark could be reached by 1923. Second, the gross income from the sale of energy passed the billion-dollar mark and the industry finds itself indisputably in a class with the other primary industries of the country the value of whose products is in excess of a thousand millions. Third, the capital invested now exceeds five billion dollars, placing the electric light and power business ahead of all the other branches of the electrical industry, with the possible exception of electric railways, the fifth among the primary industries of the country. If the capitalization of all the various branches of the electrical industry is combined, however, that industry stands second, being exceeded only by the steam railroads.

During December the calls for electrical energy, especially in the intensely industrial sections of the country, were so great that the distributing companies found themselves unable to furnish more. This was true despite the addition by the central stations of the country during 1922 of about 1,600,000 kw. in generator rating.

The manufacturing and distribution branch of the industry has broken no particular records. But its total volume of more than $920,000,000 of manufactured products is a wonderful accomplishment following the low level of 1921.

It has been a year of records. And another year of records must follow in 1923 if the installation of generating equipment, the continuing extension of distributing systems and the inevitable development of new utilizations of electric service are to keep pace with the present rate of evolution and progress.

# Giuseppe Faccioli

*An electrical engineer of the first rank, whose influence upon apparatus design and upon the national activities of the profession marks him as both specialist and leader.*

TWENTY years ago a young Italian engineer named Faccioli came to this country with the idea of finding out at first hand what was going on here in electrical development. He had spent the first years of his career designing alternating-current machinery and was keenly interested in American practice. He obtained a position with the New York Edison Company and after acquiring valuable experience in the laboratories of that organization determined to study metropolitan transit work. The Interborough Rapid Transit Company offered the desired opportunity. In 1904 he became a designing engineer for the Crocker-Wheeler Company, intending to return to his native country in a few months. Instead, while working upon the design of a new induction alternator for William Stanley, he attracted the interest of that electrical pioneer by initiating a method of calculating results in advance for new generating equipment. Giuseppe Faccioli became Mr. Stanley's chief assistant, remaining permanently in America, and today, as chief electrical engineer of the Pittsfield works of the General Electric Company and vice-president of the American Institute of Electrical Engineers for District No. 1, he stands among the honored leaders of the profession.

In the year 1906 the Stanley works became a part of the General Electric organization, and in 1908 Mr. Faccioli was transferred to the engineering department of the Pittsfield works. Three years later he became assistant chief engineer of the transformer department and in 1914 was appointed to the post he now holds.

The possibilities of high-tension transmission were early foreseen by Mr. Faccioli. Beginning with pioneer work on the systems of the Central Colorado Power Company and on high-tension switching and line oscillations on the system of the Great Western Power Company, he has for twelve or fifteen years given much time to the more profound problems connected with the development of transmission and related apparatus, including high-tension transformers, lightning arresters and other protective equipment.

Mr. Faccioli has been an indefatigable worker in the A. I. E. E. After having served year after year upon some of its most important committees and four years on the board of directors as manager, he was last year elected a vice-president. He is the author of many papers upon engineering subjects.

Mr. Faccioli was born in Rome on April 7, 1877. He was graduated in 1899 with high honors from the Institute of Technology, Milan, as a mechanical and electrical engineer.

# Editorial Comment

Electrical World, January 6, 1923

Volume 81 Number 1

## Sound Progress During 1922

ANALYSIS of the available facts about the electrical industry indicate that the growth which it has experienced during the past year has been sound and healthy and that despite conditions in other industries it has probably never experienced a more prosperous year, all factors considered, or entered upon the activities of a new year with any greater opportunities or greater assurance of development. It is now seen that the slump of 1921 was nothing more than a slight hesitation in the constant march ahead. The electrical industry is still young, but its aggressive management, sound policies and courageous practice have shown results, and as a consequence it has attained an enviable position in the nation and the future outlook is so auspicious it is impossible to set limits or even lines of growth.

THE central-station branch of the industry, which is of course the real business core, has reason for great pride in its accomplishments during the past twelve months. It has issued nearly six hundred million dollars in securities for refunding, for extensions and for new construction at a cost of less than 6 per cent, and in addition, through customer ownership campaigns, it has placed one hundred and seventy-five millions of dollars' worth of junior securities in the hands of its patrons. Incidentally, the customer ownership plan is now definitely recognized as a great constructive agency for securing and maintaining good public relations—and it might be added for encouraging responsible management.

It has so often been stated that it is almost accepted as a rule that the kilowatt-hour consumption doubles every five years, and if the thought of doubling by 1928 the fifty-two billion kilowatt-hours of 1923 almost staggers the imagination, nevertheless there is nothing to indicate that this will not take place. It is impossible even to predict the effect of the utilization of this great quantity of electricity on every aspect of national welfare.

In order to anticipate, and even in many cases to try to meet, this growing demand for electricity the industry has been exceptionally active in the construction of new generating stations, transmission lines and distributing systems. During the year applications have been made for the development of about eighteen million primary hydraulic horsepower, and there is now under construction more than two and one-half million primary horsepower in hydraulic developments. This new construction involves a direct investment of approximately eight hundred millions of dollars, to which, however, to get a better view of the picture, must be added the cost of transmission lines and distribution systems so that the total investment will exceed two billion dollars. When utilization equipment is added to this the total reaches figures it is almost useless to try to estimate accurately.

The advance of the industry has demanded advances in operating practices and in engineering development quite as significant as its business growth. The use of higher voltages and further interconnection of systems have been outstanding movements. Two hundred and twenty thousand volts will soon become commonplace. Radio and carrier-current equipment has been adapted to intra-system and inter-system communications in the interest of continuity of service. There have been great strides in the development of circuit breakers and use of automatic equipment. Larger and better boilers have been produced; higher steam pressures have been utilized, and powdered fuel has gained a place as a much stronger factor in central-station operation. The engineer has to his credit these and other developments, all of which have made possible better, more economical and more reliable service.

Meanwhile research and invention have been stimulated, and both within and without the industry has the commercial research department—whether pure science or engineering—been accepted and even appreciated as a valuable manufacturing activity. Outstanding among the research accomplishments have been the improvements in the vacuum tube, the development of higher voltage equipment, the discovery of new methods for determining stresses in metals, the production of new and better materials and the development of larger and better illuminating units.

IN THE manufacturing and distribution branches of the industry no marked changes have been consummated, but there has been a general stock-taking as a result of which it is safe to predict that future developments will be along sounder co-operative lines. The increase in the volume of business has been satisfactory. More than nine hundred and twenty million dollars' worth of manufactured products were produced, which afforded to nearly every company at least a normal and a profitable business. Any effect of the industrial slump was largely offset by the increased movement of central-station equipment. The end of the year is reached with many factories running at full load and with prospects ahead for full production in all lines in the near future. The hectic commercial condition of the radio field with its sudden popularity has settled down during the year to a sound business activity with real possibilities for development. The number of types and uses of household and industrial appliances was substantially increased, thus adding to the volume of energy-using devices which make life more livable and increase the use of electricity.

IN ITS political and social aspects the year was distinguished by the defeat of the California amendment for state ownership of water-power projects as well as by similar decisions in Georgia and Wisconsin. There have been activities either to limit or to broaden, depending on local conditions, the jurisdiction of state regulatory commissions. The controversy over the dis-

position of Muscle Shoals was most effective in exciting public interest in the question of how best to develop the nation's power resources. The general result has been, however, that public sentiment was never more favorably disposed toward everything electrical and that the electrical industry stands as a popular leader in national development.

## The Problems of 1923 Call for Creative and Constructive Ability

WHILE the industry should congratulate itself on past accomplishments and may bask somewhat in the sunshine of its apparent future, it is worth while at the beginning of the new year to point out some of the factors which restrict its rapid advancement. Not all that is mentioned here is new, but a gathering together of these elements should prove useful for summing up incentives for constructive thought and activity.

INABILITY to raise all the funds that can be profitably employed in the business is the greatest single deterrent. A solution of the tax-exempt security problem is needed and decisive action must eventually be taken. As has been previously pointed out, the tax-exempt security has introduced a problem on account of the graduated income tax; and while the elimination of the latter would restore former conditions in which the tax-exempt security was little questioned, nevertheless its existence has inspired a study of the situation which may indicate the better solution to be the elimination of this type of security rather than the graduated income tax. And, indeed, if we read social tendencies correctly, there is very little probability of the elimination of the latter. At present, with state and local securities aggregating more than ten billion dollars and increasing at the rate of more than one and one-half billions per year, and with more than twenty-three billions of federal issues of the same character, a serious political and financial condition exists which threatens the economic welfare of the nation. This condition is apparently bringing about a situation whereby earned incomes are taxed at a higher rate than capital incomes, the government is losing tax revenues, and finally there is a certain sidetracking of capital from investment in private enterprises.

ONE feature of the healthy growth of the electrical industry is the adequate, efficient and universal distribution of electrical utilization apparatus to secure maximum output for central stations, better service to the user and the most effective growth of the entire industry. In this task problems of manufacture and distribution are brought directly home to every one in the industry. There is real work to be done, for, as regards simplification of practices, advances in standardization, and the selection of the best channels and methods of distribution and marketing, it is recognized that an unsatisfactory if not chaotic state exists in many places.

WHILE technically the industry is well advanced and realizes most of its service possibilities, nevertheless in connection with cables, circuit breakers, transmission lines, insulators, motors and boilers there are still more problems to be solved in order that the industry may render its best service at greatest economy. The varied types of distribution systems, the uneasiness evidenced in trying to get away from needless expense in underground and station construction and the historic power systems with much uneconomical equipment brought about by the rapidly changing art, all point to engineering and economic questions which must be answered. Still other problems not yet outlined are brought about by the rapid extension of electrical service and the piling up of the consumption of electrical energy in congested districts.

DESPITE the California decision, state ownership of water powers is still an issue. Home rule and regulation has again become a political slogan in many sections. Muscle Shoals is still to be allotted and the effect of a final decision there will be far-reaching. In meeting these problems, which are largely those of public relations, the present advantageous position of the central stations must not be lost but rather capitalized.

THE commercial development task before the industry is, of course, to secure the greater use of electricity and electrical appliances in the home, eliminate the twenty-six million horsepower still privately generated and used in manufacturing establishments, and to secure the electrification of more railroads. Then again, in the marketing of electricity to the public in general the ever-present question of rates is met and there is more and more call for constructive and equitable—and easily interpretable—rate schedules. Another serious problem is that of extension of service into the rural districts, and this confronts every central station no matter what its size. The answer is being called for more and more insistently. This rural extension problem is a vexing combination of finance, public relations, utilization and engineering, and some solution must be found before embarrassing reactions occur.

MERELY listing these major problems indicates that they all affect more or less directly every activity of the electrical industry, and that no branch of the industry can afford to rest on its own laurels. Constructive work is required sufficient to keep every one in the industry busy. The tasks must be taken up with courage and vision and in a co-operative effort to secure results which will give correct and conclusive answers to the problems which are met.

### The Central Station Outstrips the Private Plant

BACK in 1904, less than twenty years ago, more than 72 per cent of the motor load of the manufacturing establishments and the mines of the country was carried by private generating plants. Today the central generating plant carries about 60 per cent of this industrial load. Such is the story of the rise of the central station and the consequent downward trend of private generation of electrical energy. Data collected from thousands of industrial plants scattered throughout the country and presented elsewhere in this issue indicate, however, that there were still (in 1920) seven primary industries in which the major portion of the motor load was carried by private generating plants. The central-station industry has accomplished great tasks, but the industrial power field is still white for the harvest.

Advocates of more intensive standardization campaigns will find additional arguments for their program in the data on motor-operating voltages collected in

this survey. The reports from 6,904 companies indicate that there are at least fifty-seven different voltages in actual use in the operation of the motors in the factories and mines. Doubtless concession to circumstances accounts for most of the variations from the usual figures, but it is questionable whether justifiable cause exists for such wide departures from the voltages accepted by the profession as standard. The iron and steel industry is the most serious offender in this regard, which is undoubtedly due to the fact that this industry has the largest number of private generating plants, many of which have been in service for several years. However, much encouragement may be taken from the fact that as a rule only standard voltages were reported by companies which purchase from central stations.

## Some of the Engineer's Pipe Dreams

NOW and then there comes even to the sanest of investigators a play of the imagination that encroaches on the realm of the magician. Often it is so specious that it bears its not unwilling victim away on the wings of prophecy, only to drop him into the hopeless morass of things that might be but are not. It is not easy to tell at a glance the phantoms of the fancy from the visions of the seer. Many never discover the difference, even if they desire to do so, and still more love the glamour of the improbable for itself and dwell perpetually on the borders of the unreal. Perhaps the best criterion of sound prescience is to subject the phantasm to the rigorous test of quantitative study. A great many things put on a brave front so far as qualitative tests go, only to disappear like a wisp of fog when the ruthless inquirer turns on the light of uncompromising figures.

Just recently a pair of technical sports, born of unbridled imagination, have attracted enough of public attention to demand investigation, and both being based on comprehensible theory, it is not difficult to bring them down to the region where weights and measures hold sway. One of these cheerful eidola is the production of "cold light." For years it has been with us, usually in the guise of the firefly's secret. Undeniably the insect does produce, by a chemical process which is beginning to be understood, a luminous effect at astoundingly high efficiency. But when one inquires how much, and whether the active substances can be obtained in quantity, one has to admit that the supply of light-bearing creatures is really not enough to furnish material for experimentation, and that there has not been the slightest hint of any possible synthesis, as in the case of most of the products of the physiological laboratory.

The latest aspect of the cold-light project is a study of substances sensitized by admixture of radio-active material as in the luminous dial of a wrist watch. An investigator has figured here a luminous efficiency of a very high order, unhappily linked with a brightness which is low even as compared with the firefly. And it therefore turns out not only that the light given is from a source inconveniently large for every-day purposes and obtainable only by the use of rare substances, but also that to replace this world's artificial light to any useful extent one would have to talk in tons instead of milligrams, aggregating more radioactive material than the imagination has yet touched as a possibility. It would be the case of the osmium lamp over again, but a thousand times worse. There is small hope of any illuminant under such a quantitative handicap, however alluring the efficiency. In fact, although numerous illuminants are known which are far more efficient than those ordinarily in use, all so far are attended by cost or inconvenience of a forbidding character.

Another recently revived chase of the will-o'-the-wisp has to do with electric heating for general use. In these days of sixteen-dollar coal and no cars to speak of the theory of heat from a wire at a quarter-million volts looks good until one coldly figures on conditions as they are. To start with, as a matter of sheer thermodynamics a big turbo-generator reckoned in thermal units at its busbars has barely the efficiency of a fireplace. And while we talk glibly sometimes of mouth-of-the-mine plants, there are in fact very few places in which coal can be delivered at the boiler room without as much labor and transportation as would suffice to load the same fuel for distance shipment. Water power looks a better bet, and yet to rely on it for heating in our climate would overrun the supply nature has provided. Any one who seriously figures out at current costs the price of station production, transmission and distribution for heating in a concrete case will quickly find that generalities do not audit bills and that we cannot thus escape the curse of an uncompromising climate.

The ELECTRICAL WORLD is a consolidation of the ELECTRICAL WORLD, the *Electrical Engineer* and the *American Electrician*, which was effected on Jan. 1, 1906.

The ELECTRICAL WORLD traces its history to the year 1874, at which time *The Operator*, entirely devoted to telegraphy, began its career. In 1883 the telegraph journal, which was a monthly, became *The Operator and Electrical World*, and on April 28 the paper was divided and the ELECTRICAL WORLD began its separate career.

In 1888 *The Electrician*, founded in 1882, became the *Electrical Engineer*, which remained a monthly until 1890, when its first weekly issue was witnessed.

In 1894 the ELECTRICAL WORLD adopted its present quarto style. The *Electric Railway Gazette* was absorbed in 1896, and in 1899 the ELECTRICAL WORLD and the *Electrical Engineer* were consolidated, the McGraw Publishing Company acquiring ownership and management. With this change came the adoption of the title ELECTRICAL WORLD AND ENGINEER, which the paper bore until 1906, when the *American Electrician*, a monthly founded in 1896 and owned by the McGraw Publishing Company, was absorbed. The paper has since been known as the ELECTRICAL WORLD.

Each of the editors of the various journals named contributed to the traditions and standing of the publication in the profession. C. O. Mailloux was in reality the first technical editor of the ELECTRICAL WORLD. Others who directed its editorial policy were Franklin I. Pope, Dr. Louis Bell, C. J. H. Woodbury, Joseph Wetzler, J. E. Woodbridge, Ralph W. Pope, N. S. Keith, H. W. Frye, G. H. Stockbridge, C. T. Rittenhouse, C. T. Child, C. P. Poole, T. C. Martin, W. D. Weaver, Frank F. Fowle, Dr. A. S. McAllister and F. M. Feiker.

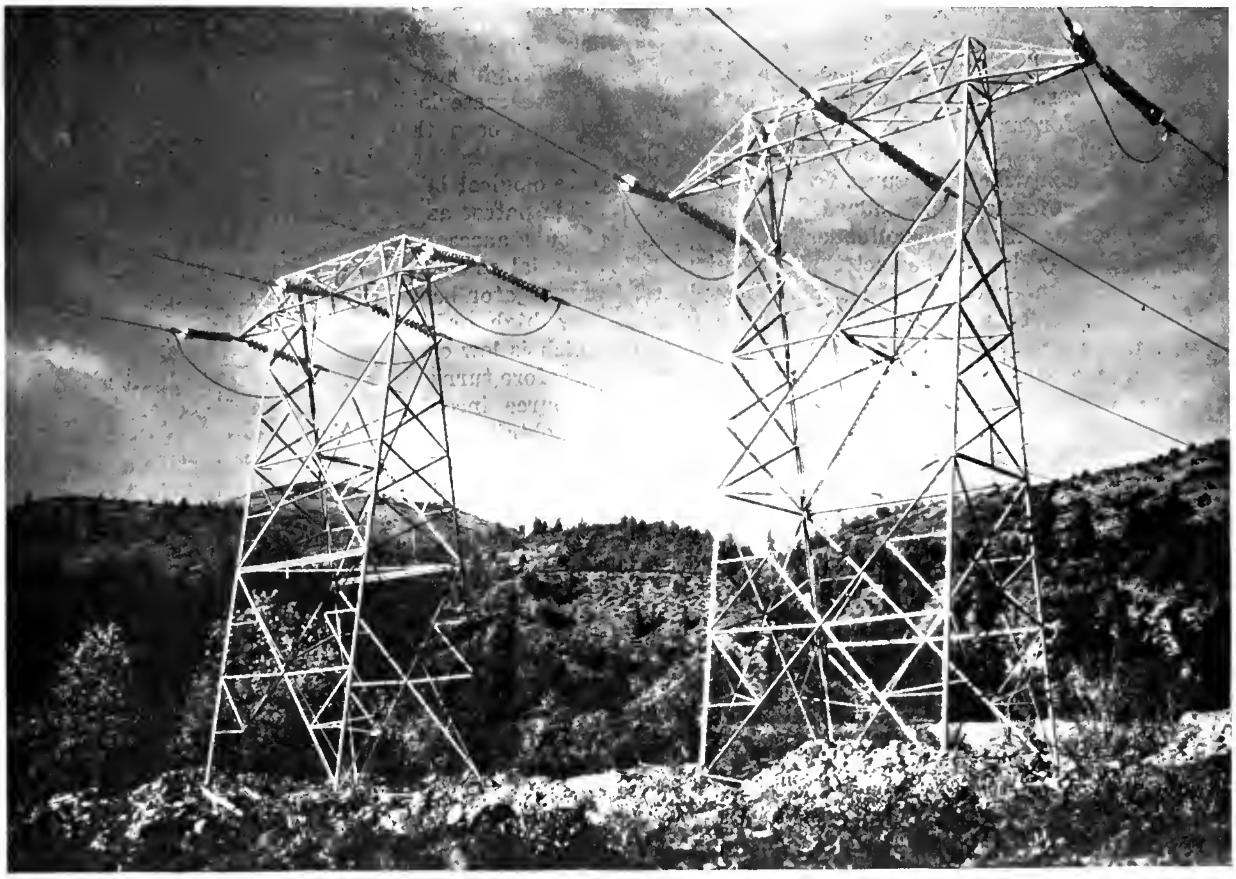
The present staff of the ELECTRICAL WORLD consists of:

*New York:* W. H. Onken, Jr., and H. V. Bozell, co-editors; L. W. W. Morrow, associate editor; Earl E. Whitehorne, commercial editor; Allen M. Perry, engineering editor; R. M. Davis, statistical editor; T. P. Kindig, H. M. Cunnington, R. L. Shepherd, F. C. Wells, assistant editors.

*Chicago:* J. C. Martin, Western editor; H. C. Anderson, assistant editor.

*San Francisco:* W. C. Heston, Pacific Coast editor.

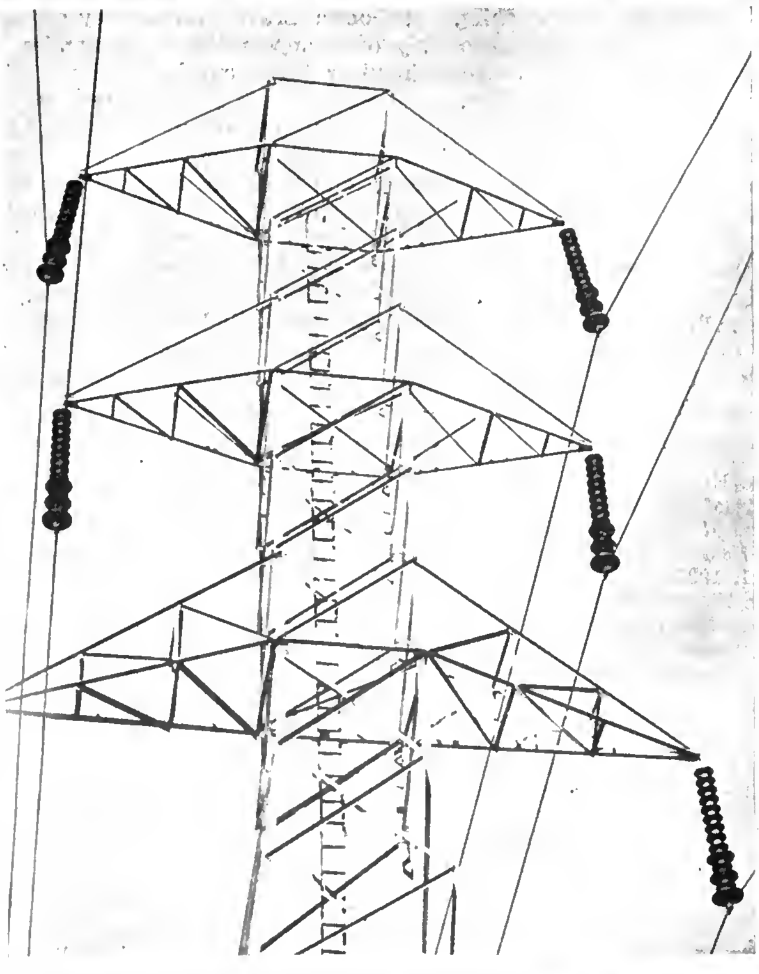
*Boston:* H. S. Knowlton, New England editor.



## The New World's Record Transmission Line

THE new 220-kv. trunk lines of the Pacific Gas & Electric Company constitute a world's record in the transmission voltage employed. Power is being transmitted over the only one of these circuits yet completed from the Pit River Plant No. 1 in northern California to the Vaca substation in the lower Sacramento Valley, a distance of 202 miles. The specially designed conductors used are composed of seven strands of copper cable, each of which is in turn composed of seven strands of single wire. The cable has a cross-sectional area of 500,000 circ.mil and weighs 8,400 lb. per mile. Six of these cables, constituting two complete circuits, are strung on steel towers spaced seven to the mile, embedded in concrete foundations and having a height of from 60 ft. to 97 ft., the 60-ft. towers being a special type utilized in the snowy regions. These two circuits have a capacity of 235,000 hp. at 220 kv. In the construction of this transmission line 10,000,000 lb. of copper cable and 16,000,000 lb. of steel were utilized. The cost of the line, exclusive of substations, will be approximately $33,000 per mile. The copper was purchased in a single order, the largest ever placed. It required 107 cars to ship the cable, which was wound on 1,928 reels, with one-half mile of cable to the reel.

The upper view shows some snow towers with strain construction. The lower view shows the special insulator strings adopted, each consisting of ten standard disks, four special units and a copper-disk corona shield.



# Recent and Prospective Developments of Underground Cable

*By D. W. Roper*
Superintendent of Street Department
Commonwealth Edison Company

Samples of Cable Have Been Made and Tested Successfully at 250 Kv.—Possibilities of Cables for 110-Kv. Operation Are Indicated—Some Points to Consider in Specifications

ABOUT 1900 two 25,000-volt underground cables, one paper-insulated and one rubber-insulated, were installed in St. Paul as part of a transmission line from a power house on the St. Croix River.* For about twenty years thereafter there was no material increase in the maximum operating potential of underground cables installed in this country. Recently some three-conductor, 33,000-volt cable has been placed in operation in Chicago, and the city of Los Angeles has ordered some three-conductor cable for operation at 35,000 volts. Another large company is now installing some single-conductor cable for operation at 44,000 volts between conductors, and still another company is investigating the feasibility of obtaining single-conductor cable for operation at 66,000 volts. These increases in the maximum operating voltage of underground cables have been made possible by the reduction in recent years of the dielectric loss in underground cables with impregnated paper insulation. Such losses have been reduced to so great an extent that they are now but a small fraction of the losses in the cables made five years ago, and it is possible to get cable in which the dielectric loss is so low that it does not seriously affect the carrying capacity of the cable. Several cable manufacturers have on regular commercial orders furnished cable having a dielectric power factor below 2 per cent at 80 deg. C., and the lowest record is below 1 per cent at that temperature. This means that when it is desired to increase the voltage the dielectric loss will not be the limiting feature.

*This installation was described in a paper presented by Henry Floy before the American Institute of Electrical Engineers on Nov. 23, 1900.

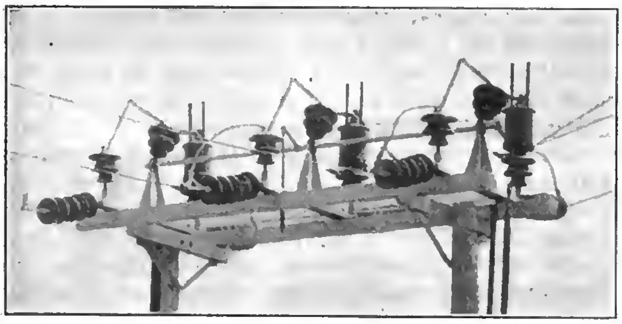
Some engineers have contended that the ionization loss at low temperatures would be a serious factor in the operation of high-voltage cables. One English manufacturer, however, advertises ozone-proof cables, and his published dielectric loss curves indicate that his cables are free from this trouble. If his claim is well founded and if past history can be used as our guide for predicting the future, we may safely assume that this one manufacturer will not long be the only one that can make cables free from ionization.

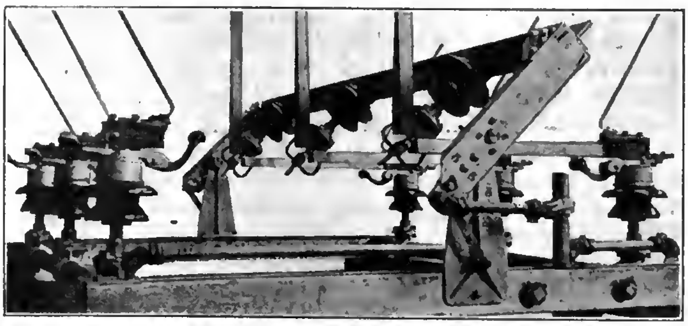
### Possibility of Cable Operation at 110 Kv.

The cable manufacturers and operating engineers who co-operated in preparing the National Electric Light Association cable specifications agreed that the dielectric strength of a short sample of cable should be four times the normal working pressure. One manufacturer has already made a sample of single-conductor cable that withstood a test in excess of 250 kv. between conductor and lead, and the test was discontinued before the sample failed, as the voltage had reached the maximum range of the testing transformer. This would indicate that so far as dielectric strength alone is concerned this sample would have been suitable for operation at 63 kv., which corresponds to 109 kv. between conductors on a three-phase circuit.

The article by J. L. R. Hayden and Dr. Steinmetz in the ELECTRICAL WORLD of Oct. 21, 1922, page 865, describes some experiments from which they conclude that dielectric failures were due to a pyro-electric effect. If this is the case, then with the reduction in the dielectric loss there should be a reduction in the heating which causes the failure, and it seems possible that

## Many Improvements Made in Outdoor Switches





Left—A combined oil circuit breaker and air-break switch with grasshopper action. Right—A unit type of three-pole double-throw air-break switch with roller arcing contacts and sleet hoods

with the very low-loss insulation that the cable manufacturers are now able to furnish we should be able to operate cables at a somewhat higher stress than heretofore without increasing the chances of failure of the insulation. This may mean that a lower ratio than four between the dielectric strength and the operating voltage is entirely feasible.

From the evidence at hand it appears that one sample of cable has been made with sufficiently high dielectric strength for operation as a single-conductor cable on a 110-kv., three-phase circuit. Other samples of cable have been made with a very low dielectric power factor, and still other samples have been made free from ionization. If it were possible to combine in one piece of cable all of the good features in the several samples of cable heretofore manufactured, then it would be entirely possible to secure single-conductor cable for operation at 110-kv., three-phase.

Although it is sometimes possible to locate a substation for reducing the line voltage from 110 kv. to some lower figure and have this substation act as a distributing station as well, it frequently happens that with the rapid growth of the city and the extension of its limits this high-voltage overhead line to the substation becomes seriously objectionable and may have to be removed. This would call for relocating the substation. The use of underground cable would avoid such relocation of a substation, and in some cases it will eliminate the entire cost of a substation which must be built at the city limits for the purpose merely of reducing the voltage and without serving at the same time as a distributing point.

### Points to Be Considered in Specifications

While it would be very rash to attempt at this time to write an exact specification for such a cable, it is suggested that it will probably be found desirable to include in the specifications the following features:

1. Careful and thorough testing and inspection of the raw materials as they are received at the cable factory. This may mean taking a sample of paper from each roll and a sample of oil from each container and carrying a sufficient minimum stock of these materials to make it possible to reject defective lots without interfering with production.

2. Thorough inspection and supervision during the process of applying the paper insulation to insure that the workmanship is 100 per cent perfect.

3. Recording instruments and records in connection with the drying and impregnating of the insulation so as to insure that a careless or inefficient workman has not reduced the time required for these processes in order to cover up unnecessary delays or inefficiency on his part.

4. A requirement that an examination of the insulation, after the standard bending test, shall disclose no torn paper.

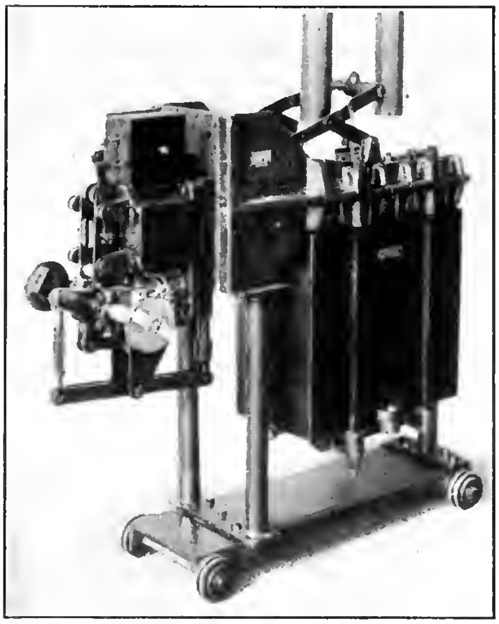
5. A routine test on each reel to insure thoroughness of impregnation.

6. A requirement that there be no ionization at normal working pressure and at the lowest operating temperature, together with a routine test on each reel of cable to insure that the cable meets the requirement.

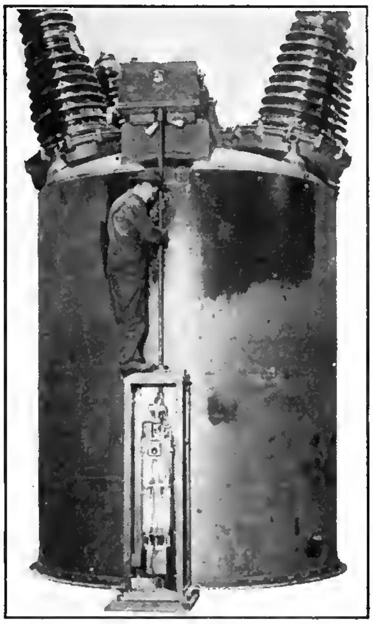
7. A guarantee that the dielectric power factor shall not exceed 2 per cent at 80 deg. C., together with a routine test on each reel.

8. A modification of the rule in the Standards of the American Institute of Electrical Engineers regarding the maximum permissible operating temperature of impregnated paper insulation in lead-covered cables so as to permit the operation of high-voltage cable at temperatures materially above the present limits.

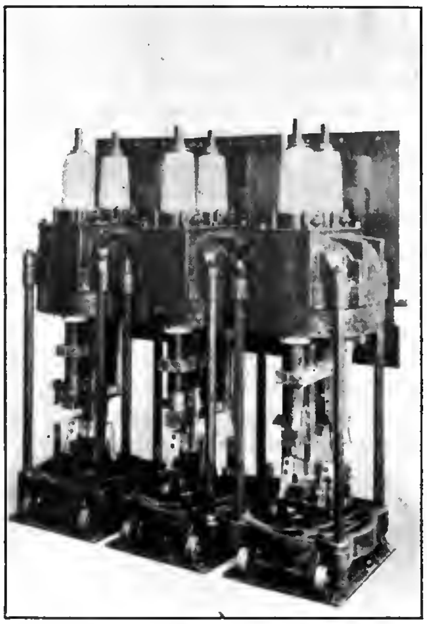
## Circuit Breakers Made More Rugged and for Higher Voltages



Left—Unit type of oil breaker with provisions for connecting adjacent units by a universal coupling.



Center — Solenoid mechanism for operating a 220,000-volt oil breaker. A new type for heavy duty service.

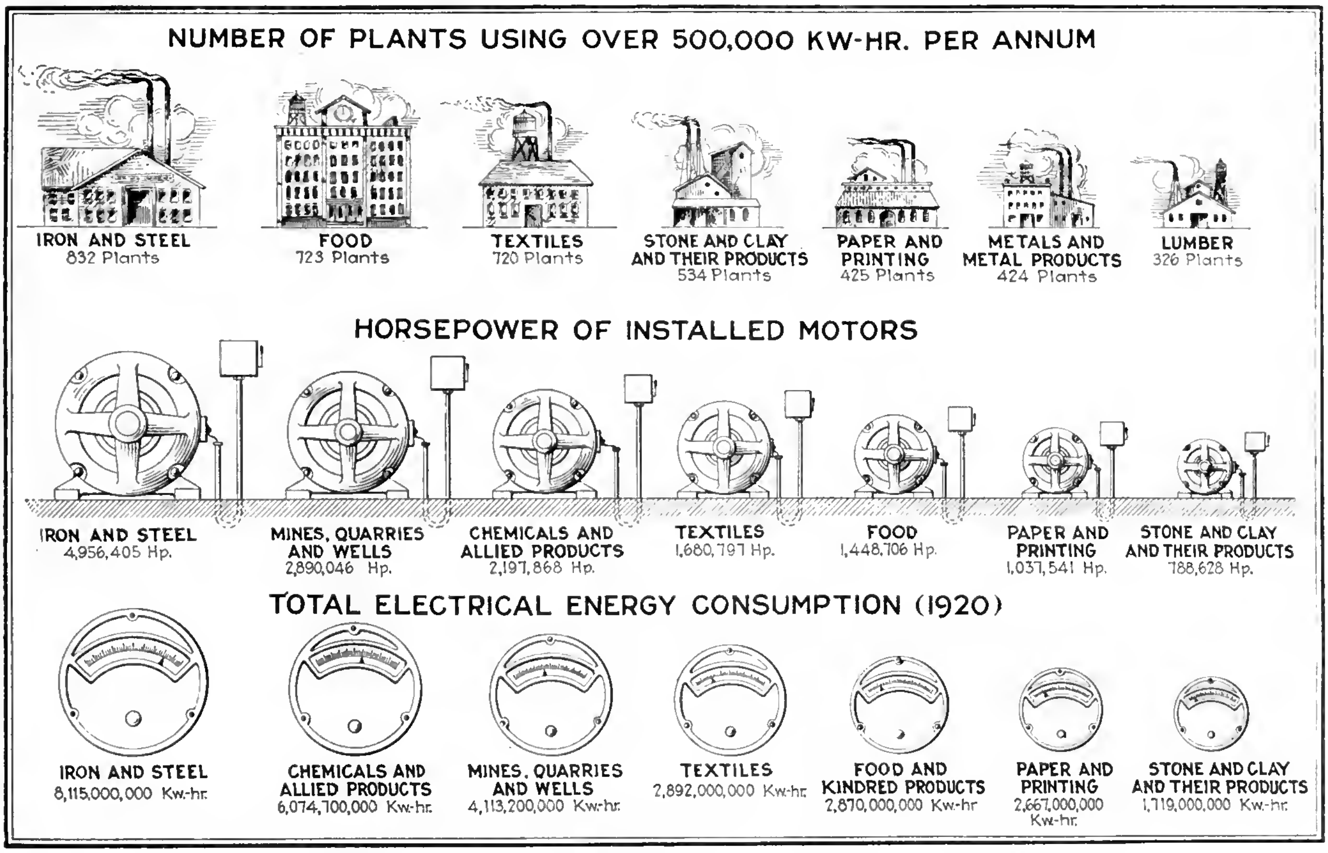


Right—Rugged construction, the use of inverted brushes and four breaks per pole are features of this breaker.

# Industrial Load of the United States

*By Robert M. Davis*
Statistical Editor ELECTRICAL WORLD

Central Stations Generate 57.2 per Cent of the Energy Used in the Industrial Plants and Mines of the Country—More than Fifty Motor-Operating Voltages Are in Use in the Entire Nation



THE IRON AND STEEL INDUSTRY LEADS ALL OTHER INDUSTRIES IN THE USE OF ELECTRICAL ENERGY

THE industrial leadership of the United States of America is made most apparent through the study of a summary of its manufacturing and mining industries. No single country or federation of states can present such an array of economic industrial figures, almost too great for comprehension.

Data gathered by the United States Census Bureau indicate that on Jan. 1, 1920, there were 312,102 manufacturing establishments and mining concerns operating in this country, of which 256,071 reported an installation of prime movers totaling 25,280,699 hp. These industries in the aggregate represent an invested capital of $51,796,717,267, or more than double the present debt of the United States. The value of manufactured and mined products totaled $65,576,542,739 during 1919, or approximately one-half the total net cost of the four years' war in so far as the Allies and associated powers are concerned. These industries support 11,628,295 employees at an annual wage of $13,423,-971,834.

Such is the potential manufacturing and mining power field of the electric light and power industry. It is probable that no other primary industry in this country affords such a vast and lucrative field for future development. The extent to which the central station has entered into the industrial life of the United States is clearly defined from a three-year nation-wide survey which has just been completed by the ELECTRICAL WORLD This survey was undertaken with the idea of ascertaining the extent to which electrical energy was being used by the industrial plants of the country and involved the sending out of about 95,000 questionnaires to the larger establishments.

The returns received from the survey have been divided into twenty-seven general industries, as indicated in the accompanying tables. The data are for the year 1920. Reports were received from approximately 20,-000 companies, of which 15,000 rendered complete or fairly complete data on the use of electrical energy in their respective plants. Reports from only a part of the

## Table I—General Economic Data on the Manufacturing and Mining Industries of the United States

(Taken from U. S. Census of Manufactures for 1919)

| Industry | No. of Establishments in U. S. | Capital | Rent of Power and Cost of Fuel | Value of Products | Employees: Salaried (Number) | Employees: Wage Earners (Number) | Fuel Used: Anthracite Coal (Long Tons) | Fuel Used: Bituminous Coal (Short Tons) |
|---|---|---|---|---|---|---|---|---|
| Agricultural implements | 521 | $366,962,052 | $5,038,512 | $304,961,265 | 12,488 | 54,368 | 13,497 | 549,557 |

industrial plants and mines of the country, such as were received by the ELECTRICAL WORLD, are, however, useless for practical purposes except as they may be made the basis for an estimate of the use of electrical energy by all the plants and mines of the country. The ELECTRICAL WORLD has accordingly made such an estimate for the various items covered in the survey, based upon the information given in the reports received and supplemented by federal census data. These estimates are presented in the accompanying tables.

For the first time in the history of the industrial utilization of electrical energy, the 1919 census data indicated that a major percentage of the energy used was purchased from public utilities as against private generation. The total consumption of electrical energy by the mills, factories, mines and petroleum fields of the United States during 1920 is estimated at 33,282,200,000 kw.-hr., of which 14,242,200,000 kw.-hr., or 42.8 per cent, was generated in private stations of the plants and mines. In 1904, less than twenty years ago, more than 72 per cent of the motor load was carried by private generating plants. In 1909 this percentage had dwindled to about 64 per cent and in 1914 to about 56 per cent, and at the present time it is only about 40 per cent. Such a remarkable growth in the use of central-station energy as against energy generated in private plants is an excellent testimony to the quality of service which the central station has been rendering and is rendering to the manufacturing and mining industries in general.

Based upon the returns received in the survey, it is estimated that there are 5,949 plants using more than 500,000 kw.-hr. of electrical energy per year. Iron and steel mills lead with 832 plants, and textile mills follow with 723 plants.

By far the largest user of electrical energy is the iron and steel industry, which in 1920 consumed 8,115,000,000 kw.-hr., or 24.4 per cent of the total electrical energy consumed for power purposes by the plants and mines of the country. The chemical and allied products industry is second, with a total consumption of 6,074,700,000 kw.-hr. The extent to which operations in all industries were curtailed during the late industrial depression is indicated by the large decrease in the amount of elec-

trical energy consumed in 1921 as compared with 1920 and shown in Table II.

There are 1,557,192 electric motors installed in the factories and mines of the country, with a total rating of 19,207,429 hp. Of these motors 655,611, or 42.1 per cent, are under 5 hp. About 56.6 per cent of the machines are belt-driven, 37.5 per cent are directly connected, and only 5.9 per cent are chain-driven.

Perhaps one of the most noteworthy facts resulting from the data collected through the survey is the large number of voltages in actual use in the operation of motors. It is apparent that there is much remaining to be done toward the standardization of voltages in the country at large. The 6,504 companies reporting motor-operating voltages indicate that there are twenty-three voltages in use for the operation of direct-current motors and fifty-one voltages in use for the operation of alternating-current motors. It appears that about 39 per cent of the direct-current motors are operated at 220 volts, but a large percentage are also operated at 110, 115, 230 and 250 volts. Iron and steel mills particularly reported a high percentage of direct-current motors operated at other than 220 volts. Approximately one-half of the alternating-current motors are operated at 220 volts, and about one-fifth are operated at 440 volts. Three hundred and twenty-eight plants reported the use of primary voltage (i.e., 2,200 volts or 2,300 volts) for operating alternating-current motors.

A careful study of the tabulated returns indicates that a very high percentage of the odd voltages are in use in plants generating their own energy. As a rule only standard voltages are reported by companies purchasing their energy from central stations. This difference is due in large part to the fact that a considerable proportion of the private generating plants have antiquated equipment as compared with the up-to-date central-station equipment. Ohio and Pennsylvania appear to be in most need of voltage standardization.

Out of a total of 7,156 companies reporting on size of motors, about 43 per cent indicated that the largest installed motor was under 25 hp. About 23 per cent of the companies reported that the smallest motor installed ranged between $\frac{1}{8}$ hp. and $\frac{1}{4}$ hp.

It is estimated from the reports of 4,307 companies that there are 667,770 refillable or renewable fuses used monthly by the industries covered in the survey. Standard fuses total 356,330 per month, or a total of 1,024,100 fuses of both general types per month.

### Field for Future Electrification

The electrical industry as a whole is, perhaps, most interested not so much in the past growth and present status of the electrification of industry as in the length and breadth of the field for future electrification. A study of the prime-mover data presented in Table VIII indicates that the industrial field of the central station is only about one-third developed. It is, of course, too much to assume that in course of time all industry will be electrified, or that the private plants will cease to exist, but, notwithstanding these facts, a large field for future industrial power growth is open to the central generating station.

Although the iron and steel industry far outstrips any other in the consumption of electrical energy, there are several other primary industries which are more highly electrified by central-station energy. The data indicate that the so-called "chemicals and allied products industry" is the most highly electrified from central-station energy. This highly diversified industry is 36.4 per cent electrified, not considering that portion using energy generated in private plants. The food industry is also a large patron of the central station, being 33.5 per cent electrified by central-station energy.

# Active Year in Power Transmission

*By Percy H. Thomas*
Consulting Engineer, New York City

Cost of Superpower Lines Not Prohibitive—Excessive Conductor Pulls Should Be Relieved—Tendency to Omit Circuit Breakers, Arresters and Ground Wires—Stabilizing Line Potential—Corona as a Limit

THE year just past has been one of seasoning in the high-tension transmission field rather than a year of new undertakings. After such advances as the Murray superpower report and the 220,000-volt transmission projects in California, a pause for digesting the new ideas and the working out of details was appropriate.

For example, a considerable amount of sober study has been given to the practical aspects of very long transmission systems, such as those proposed in the superpower report between the St. Lawrence and the Niagara power sites and the seaboard. These projects seem surprisingly simple as the plans have worked out, and their cost is by no means prohibitive. Attention may be profitably given to the operating features, starting, interruptions, lightning protection, etc.

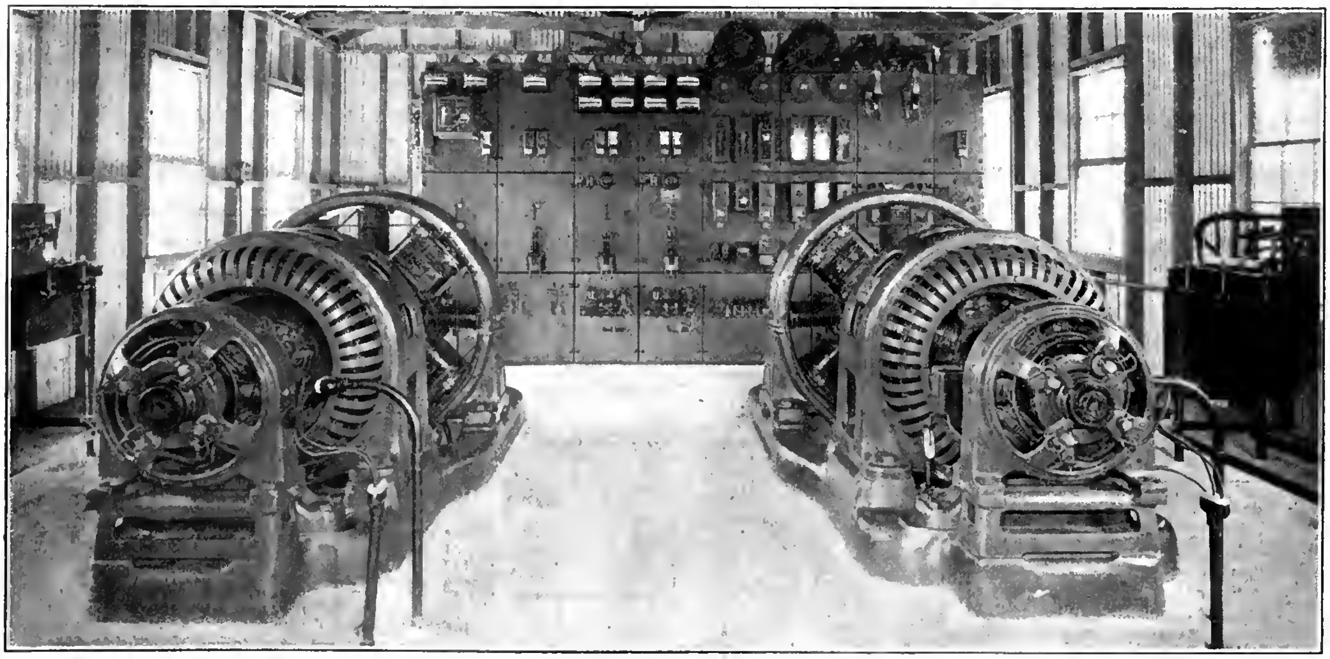
As far as line structures go, there are no new problems of magnitude involved. On the other hand, with the ever-extending systems an opportunity is presented of introducing innovations for lessening costs. The best interests of the industry require a careful consideration of all safe methods of lessening the investment to permit the widest extension of transmission that a proper economy will justify.

One detail of very great importance in the design of super-transmission lines is the so-called suspension clamp. Very strong conductors are used with such lines, and if the towers are to be designed to withstand the full stress on broken conductors, they will be extremely expensive and very heavy. On the other hand, if these clamps are so designed as to allow the conductor to slip when there is an excessive pull, and if the tower be designed to take advantage of this fact, a great deal of weight and cost can be saved.

One question that is receiving consideration is the omission of high-tension oil breakers in super-tension transmission systems, such as those employing 220,000 volts. Where such breakers are used at the ends of very long lines the openings of the breaker on one end of a line, when excited at the other, will cause an excessive rise of potential on the open end. With no chance of the circuits being opened the control of such a condition is much easier; furthermore, the saving of cost is very material.

The question as to the desirability or necessity of stabilizing the potential at the middle of a very long transmission line by synchronous condensers at that point has received some attention, and there is some-

## Automatic Substations Are Popular in Industrial Service



In mining and other industrial service the full automatic substation has made a very favorable impression. This year has also witnessed the development of the full automatic alternating-current substation for distribution service.

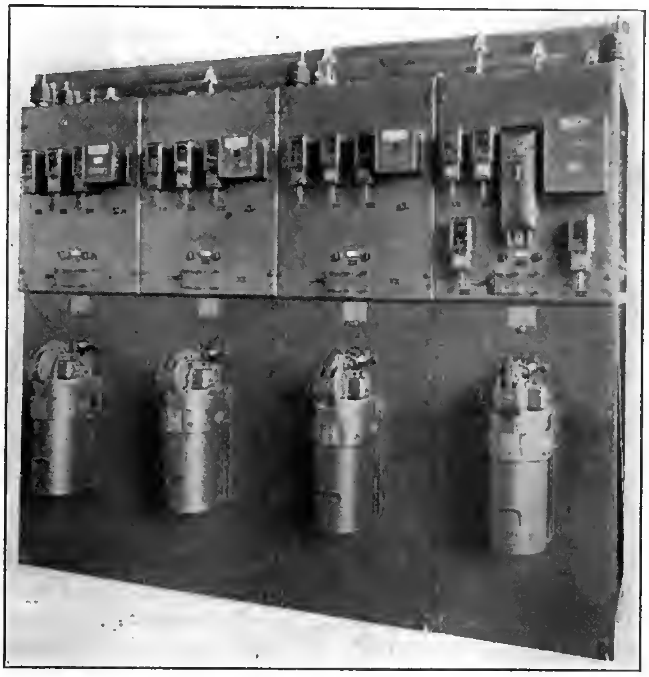
thing to be said both pro and con. The omission of the middle-point station certainly simplifies the operation very much and cheapens the cost. On the other hand the handling of the charging current and the tendency of the potential of a long line to "bow up" in the middle of the line are much helped by the stabilization of the middle point. Furthermore, if the load transmitted is not properly proportioned to the voltage of the line, bad regulation and efficiency result without the middle-point condensers.

The significance of corona as a limitation in transmission is now being fully realized. For 220,000 volts a conductor diameter of approximately 1 in. is required with the usual spacings, but a conductor of this diameter in copper represents a lower resistance, and hence higher cost, than is warranted by any power that can be transmitted with a reasonable drop over the line on account of the reactance of the line. The same statement applies to aluminum conductors, though to a less extent. The use of a steel core in the aluminum restores the balance, however, and presumably the same thing will be done by using a steel core with copper. The use of the copper with a rope strand, which very materially increases the diameter, gives another solution, as is shown by its use in the Pit River transmission system. When we pass to 260,000 volts, corona requires a diameter of approximately 1.15 in. with a resistance of 75 per cent of the resistance of the inch diameter conductor, while the reactance of the cable is not greatly changed. This means a still greater disproportion between resistance and reactance, which requires more radical modifications of conductor design. There has been a great activity in large transmission systems in foreign countries, new machinery having been partly supplied by United States and partly by foreign manufacturers, although the extra-high-tension equipment was furnished largely from this country. Notable installations are the 150,000-volt line in Formosa designed to withstand typhoons with a wind velocity up to 150 miles per hour, the large steam development in southern Australia and the system of the Compañia Chilena de Electricidad, Ltd., of Santiago, Chile. The latter plant, started by Chilean capital and afterward merged with a larger system controlled by English capital, has just completed a 34,000-hp. station and 110,000-volt transmission line to the city of Santiago and is extending this to form a network over central Chile. This plant, which will supply the power for the electrification of the Chilean State Railways, contemplates development in the near future to approximately 100,000 kw. installed capacity. This is a very notable installation for South America.

Foreign plants as well as American plants have been seriously short of power to supply their demands.

Among the contributions of the past year to the technical societies one of the most notable bearing on the subject of transmission was the paper of R. J. C. Wood* before the Pacific Coast convention of the American Institute of Electrical Engineers. This paper gives the results of careful studies that have been made by the Southern California Edison Company for converting its 150,000-volt Big Creek transmission system into a 220,000-volt system and the tests on its 27-mile trial 220,000-volt line. These studies constitute the most practical and constructive contribution to the data on 220,000-volt transmission that has appeared in some time, and a very brief summary may be permitted here. The adaptation of the company's existing 150,000-volt generating station to the converted 220,000-volt line is accomplished by auto-transformers, star-connected, with neutral grounded and a large capacity tertiary winding. Similar auto-transformers are used at the receiving end, but with a ratio of approximately two to one. This is mentioned as a notable though unusual expedient and as solving an awkward condition. The paper summarizes the tests made on insulator strings, and the conclusion arrived at was that by using ring shields around the line unit the same insulator string might be used on 220,000 volts as had been used on 150,000 volts without any greater strain on the unit most stressed than was the case before. Very possibly if new towers had had to be built a somewhat different layout might have been adopted. It will be found of interest to compare these insulator studies with those described by Frank Baum at Salt Lake City in 1921.

## Marked Improvements in Relays and Breakers



The reclosing circuit breaker for feeder service and the development of more rugged and simpler relays have increased the reliability of service.

### CORONA LOSS SHOWS UNIFORMITY

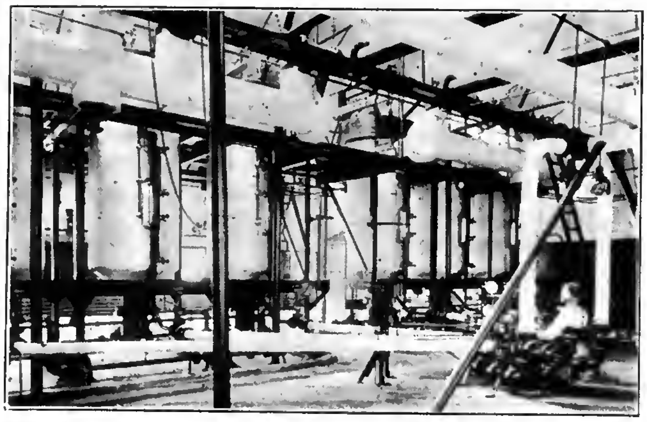
The careful and illuminating measurements of corona loss on this 27 miles of test line check very satisfactorily with the Peek formulas as to form, with some irregularities as to temperature. The constant $M_0$ varies from about 0.7 to over 0.9 between storm conditions and fair-weather conditions. This is about the same range as Peek's values.

It is interesting to note that the charging current of the 27-mile test line equipped with rings is 7½ per cent

*See the ELECTRICAL WORLD for Feb. 11, 1922, page 277.

more than the theoretical charging current of the conductors alone. It was surmised that this was due to the guard rings and the effect of insulator surfaces. There is a growing tendency to eliminate overhead ground wires, and even lightning arresters, especially on lines operating at very high tensions. This change is not based on any concrete evidence from operation, but on the gradual realization of the great cost and complication of the arresters and the limited usefulness that they can have. The trend during the next year will be watched with interest by all operating engineers.

## Electric Heating Used



The use of electricity for heating water is limited to special conditions, but this view shows the attractive appearance of a plant containing two 30,000-kw. boilers.

Among the less important growths in practice may be mentioned the more general use of tertiary windings to suppress the third harmonics in certain cases and to serve for the supply of a synchronous condenser or to insure a positive three-phase short circuit with a single-phase ground. The necessity of having the tertiary winding of sufficient capacity or adequately protected to stand the heating effects of circulating current due to such a single-phase ground is now recognized as some burn-outs have occurred with low-capacity tertiary windings.

High-tension disconnecting switches are now often made for group operation from remote handles and may be interlocked to prevent careless operation. They may also be made for operation by motors.

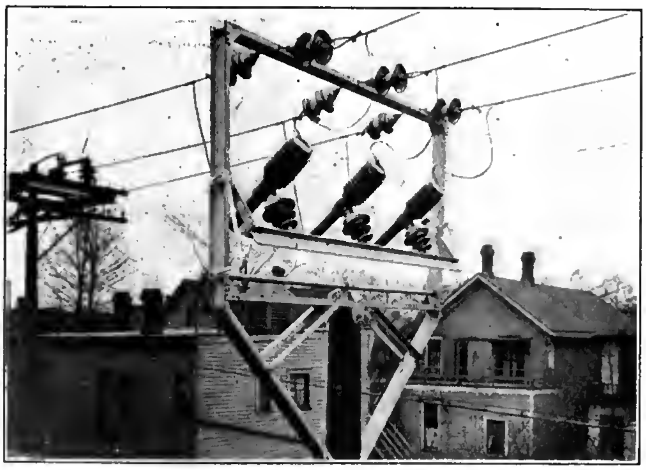
The number of 130,000-volt and 150,000-volt lines steadily increases, with new ones in Brazil and New England.

Steady progress is being made in the study of relays, and their performance has been more reliably and accurately determined. It is possible by co-ordinating the selection and setting of relays with the short-circuit kva. that may be expected at various points in a system, as derived from calculation, to get selective and reliable protection. This has been more difficult in the past. A most important test† of oil breakers was made on the lines of the Consolidated Gas, Electric Light & Power Company's system at Baltimore last year. A full and careful set of tests was made on two makes of breakers of various types, and oscillographs were taken of current and voltage so that their performance was known under definite conditions. The breakers on the whole did well, but as a consequence of the tests a distinct improvement has been made in the way of preventing the throwing of oil, which has been a limiting and troublesome feature. It is a remarkable fact that these tests were made in part on the main system simultaneously with normal operation and without material disturbance of the regular consumers. These tests, while, of course, very technical in their nature, are of very great value to the art. They were described in papers before the A. I. E. E. at the Niagara convention and caused spirited discussion.

During the year there has been some discussion of the theoretical performances of very long lines with lengths up to 3,000 miles, and the periodic character of the typical line has been brought out. That is, the generator voltage, current and power factor of a line delivering a fixed load at a fixed voltage do not increase by regular curves as the lines become longer and longer, but have alternately rising and falling values, according to the relation of the length of the line to its wave length for the frequency used. A 60-cycle line has a wave length of about 3,000 miles, so that a line of that frequency will have a very wide range of regulation with variation of load when of quarter-wave length, or 750 miles, and a very narrow range of regulation with change of load at half-wave length, or 1,500 miles, and again a wide range at three-quarters wave length, or 2,250 miles. These characteristics may have an important bearing on transmissions exceeding five or six hundred miles and may in the more or less distant future determine the frequency of a circuit.

While the record-breaking sleet storm which occurred in New England in the fall of 1921 does not, of course, belong to the year just past, it may be well to turn again to the lessons learned from it. It was proved once for all—though perhaps for the second or third time—that it is not feasible to build transmission lines against any possible sleet; a reasonable compromise must be made. This being the case, is it not incumbent on the industry to make the fullest practicable use of substitute methods, such, for example, as the melting off of sleet? The sleet load is the determining factor in transmission line design and melting methods are needed.

## Outdoor Switches Are Improved



A view of a 37,000-volt, 300-ampere, triple-pole, liquid-break switch with tilting contact for outdoor service.

# Future Policies of Smaller Utilities

*By H. H. Hunt*
Vice-President Stone & Webster, Inc.

Greater Saturation of Investment, More Economical Supply, Better Distribution Engineering and Administrative Skill Essential to Their Safety and Growth

I HAVE been asked to outline the probable trend of development in equipment and administrative policies of small and medium-sized central-station companies during the next few years. The service furnished by such properties is no longer a luxury but one of the essentials of every-day life in all but the smallest isolated communities. Unreliable service from crude and inefficient equipment at high rates and in correspondingly small volume is no longer tolerated. The public today is demanding dependable and closely regulated service in unlimited quantities and at reasonable rates wherever electric transmission or distribution lines are within reach.

### Maximum Use of Investment

The fundamental problem today of public utilities large or small is that of making every dollar of investment yield the greatest and most efficient possible service. Since pre-war days there have been radical changes in the conditions under which central stations operate. We have come to recognize fairly well-defined limits of investment which could be profitably made to yield a dollar of revenue. The unit investment in central stations today is at least 60 per cent greater than in 1914. Much of the new equipment which was demanded during the war period cost considerably more than this. Contrary to the hopes of many people, there appears to be slight prospect of any great downward trend of construction costs for a considerable number of years. During the period of higher prices the average rates charged by central-station companies have increased approximately 20 per cent, and the pressure for reduction of present levels in rates has already begun in spite of the prevailing and anticipated abnormal costs of fuel and the inability of the central stations so far fully to recover the losses sustained early in the period of rising costs before rate increases were authorized.

With such a substantial change in the ratio of investment to revenue as above indicated, central stations are faced with the serious problem of making each unit of equipment assume greater burdens than heretofore or to improve the load factor of the system and thereby secure more revenue per unit. Undoubtedly both these efforts must be made if the former ratios of investment to revenue are to be restored.

With respect to more intensive use of investment, it is evident that central-station experiences during the war period, when rapidly increasing demands for service called for continuous use of practically all available reserve equipment, demonstrated that previous conceptions of required reserve capacity were unnecessarily liberal, and that, with present standards of reliability, an increasing proportion of available equipment may be kept regularly employed. In this way each unit of station capacity may yield greater average output and greater revenue. The same is true of distribution transformers and, to a less extent, of distribution lines. Careful studies of transformer loads, particularly in the case of smaller systems, commonly show underloading and corresponding excessive losses. There is a profitable field of investigation in the methods and standards of distribution construction, with opportunities for simplification and greater reliability, together with reduced investment per unit of product distributed. With growth in their output even the smaller stations may profitably consider the use of larger generating units than have heretofore been available, with their lower cost per kilowatt and higher efficiencies. The extent to which refinements in efficiency through higher steam pressure, superheat, vacuum, better heat balances, etc., are justifiable in smaller stations is a matter for careful engineering study in each case.

### Advantages of Interconnection

In spite of possible improvement in efficiencies of small central stations, there is a wide margin between them and the very large stations which are being built throughout the country. This raises the question as to the future field for the small generating plant as a competitor with so-called superpower plants with their vast transmission networks. Even in localities where power supply from remote steam or hydro-electric sources is not economical, there are still possibilities of economy by interconnection with adjoining systems through which combined reserve capacities may be reduced and maximum advantage taken of the highest generating efficiencies and diversities in the combined systems. The advantages so far demonstrated by interconnections between neighboring systems clearly indicate that the future should see a large expansion of this policy, accompanied by the abandonment or curtailed operation of many small steam plants or their conversion into substations. The perfection of automatic devices and of outdoor types of transforming and switching equipment will doubtless mean that many of these new installations will be of the self-operating type, installed at low cost and lacking many complicated and expensive features which have heretofore been considered necessary.

The more intimate future relationship between smaller central stations suggests the advantage of common administration, and it is to be expected that centralized management will extend its advantages, already enjoyed by more than 75 per cent of the central-station investment in this country, to many now independent

properties. It is to small properties of this character that centralized management offers the greatest opportunities through furnishing to the group of managed properties the administrative skill, purchasing capacity and engineering, construction and financing resources which no one of them alone could command, thereby producing savings which will permit the continued supplying of electric service under conditions as to rates and service which are satisfactory to the public.

### Financial Prospects

With respect to financing policies of the future, it is gratifying to note that central-station companies have emerged from the period of almost prohibitive costs and restricted supply of capital and are now able to procure at fairly satisfactory rates the funds necessary for the reasonable and economic expansion of their properties. Throughout the war period it was necessary for public utilities to do a large part of their financing through the sale of short-term, high-interest-bearing notes, the balance being done through the sale of bonds. This resulted in an unbalancing of the financial structure of these properties, calling for early efforts at readjustment. Fortunately it is now possible for a large proportion of the central-station companies to undertake new financing through the sale of junior securities, at present preferred stocks with a tendency toward common stocks. The customer-ownership movement has made rapid strides and accomplished remarkable results in improving public relations, as was clearly demonstrated by the defeat of the proposed state ownership of water powers at the recent California election. Sale of junior securities, particularly common stock, of small central stations may not now be practicable on a large scale, but it is to be expected that the next few years will see satisfactory development in this direction.

The economies in construction, management and financing above considered will not in themselves be sufficient fully to restore to central stations the credit standards which they need. There must be, in addition, intensive studies of operating methods and economies. A promising and important field is in power-generating costs. A considerable number of central stations have undertaken power-station betterment work with gratifying results. Specific cases show reductions in switchboard costs amounting to from 20 to 40 per cent. Such gains are possible only through immediate supervision of operations by skilled engineers, a systematic maintenance program and continued regular scrutiny of operating results by a supervisory staff.

Under present disturbed coal conditions fuel oil offers attractions to many central stations. Because of the large initial investment necessary for conversion from coal to oil fuel the lower cost of the fuel itself does not offer the same advantages to small, low-load-factor stations as it does to large plants; and so the question of fuel for the smaller plants requires careful engineering analysis as well as forecasts of future fuel conditions. Because of their limited resources, small properties cannot safely undertake as radical changes in operating methods and policies as might be permissible under certain conditions for larger systems. This applies not only to power supply but to all phases of the company's business.

A feature by no means negligible in the administration of public utility properties is good housekeeping. Clean and attractive offices, power plants and premises improve the morale of the organization, produce increased efficiency and promote favorable public relations.

### Helpfulness of Appliance Load

The more intensive use of central-station investments required for their continued profitable operation calls for more careful future attention to commercial policies. Creditable progress has been made in improving system load factors and diversities by increasing the large power loads. Many central stations have also carried on active appliance campaigns and have placed many devices in customers' homes. To a large extent these devices are more helpful to the central station in demonstrating the necessity and convenience of central-station service than as revenue producers. The annual revenue from many of the popular appliances, such as vacuum cleaners, washing machines, etc., is quite small, and, in view of the losses commonly incurred in the selling of these appliances, the question may well be raised whether the sales efforts could not more profitably be directed to service applications involving greater energy requirements. Cooking and refrigera-

## Rehabilitations and Extensions Occur in Street Lighting

The increased use of multiple feed, greater intensities and the use of prismatic and non-dust accumulating reflectors have improved street lighting

tion are two promising fields of this character, and with further improvements in available equipment, the revenue possibilities of the central station from these sources should be substantially increased.

The problem of serving many small scattered customers is one that vitally concerns the smaller central stations, as does also the problem of outlying extensions. Carefully developed standards of rural construction, involving safety but low investment, are problems to be solved. The investment on customers' premises in service, meters, etc., costing more in many cases than the entire balance of the company's investment for the customer's service, is a large factor in high customer cost. With no prospects of substantial reduction in actual customer investment under present standards of metering, the solution of the problem of high customer cost would seem to lie in greater customer consumption.

It is the general practice of large central stations to prepare budgets covering both operation and construction, the latter looking ahead for a considerable term of years. Such budgets should also be prepared for smaller companies. They are just as important in small properties as in large ones because of the narrower margin of resources already referred to. A forecast of capital requirements and the possibilities of meeting the increased fixed charges thereon is particularly important.

Although small central stations have peculiar difficulties and problems which larger systems escape, they have advantages in possibilities of more intimate personal contact between customers and the operating organization which should make for more harmonious public relations. If these companies bring to bear upon their peculiar problems, including greater saturation of investment, more economical power supply and better distribution engineering, the best administrative skill which they can obtain, directly or through association with other similar properties, they will be able to maintain the confidence of both customers and investors upon whom they depend and to meet promptly the recurrent calls for expansion which are incident to the growth of every community, however small it may be.

The narrowing margin of profit brought about by the high cost of construction and operation and the more complete regulation by the public through public utility commissions and other similar agencies calls for thoroughly scientific management of all phases of the public utility business.

# Economies of Interconnection

### Vast Possibilities for Safeguarding Service and for Producing Electricity with Minimum of Fuel, Water, Money, Material and Human Endeavor—Typical Examples Taken from Actual Practice

IT IS chiefly because of the diversity of use of service that electric light and power stations can exist. High station load factor is a goal worth striving for, since it makes for efficiency of production and maximum use of investment, and if high station load factor is coupled with maximum system diversity factor, the goal is doubly attractive.

Now just as one office building may differ from another office building in load characteristics, so may one system differ from another system, and by combining the two certain economies become possible. Thus a block system is better than several isolated plants. A central station is an improvement on the block system. A superpower station is more economical than several small central stations, and an interconnected superpower system represents the highest development of the art. Ignoring all other possible economies, the saving in investment in reserve plant alone often warrants the interconnection of systems even though no power be normally transmitted over the tie lines.

It is essential that greater use be made of present investments in electric public utilities because the time is not far distant when the demands for service will far outrun the ability of the industry to command the necessary funds with which to provide that service. Thus efficiency in the use of money will be exacted of the electric light and power industry just as economy in the use of fuel, oil and water is insisted on in every-day operation, and there is every reason to expect the industry to show the same skill in the use of one as in the other. Up to the present perfection has been sought along engineering and operating lines and financial considerations have not received their just due.

The problem facing the electric public utilities of the country, however, is broader still and embraces the conservation of fuel, water, labor, money, materials and human endeavor. In a measure interconnection encompasses many of these and most of the advantages to be gained through it have fortunately already been demonstrated in practice. Only those, however, who have experienced the benefits of interconnection have any idea of its maximum possibilities.

The Boston-Washington Superpower Survey made by the national government showed the immense savings attainable through interconnection in the restricted area studied. But interconnection is no new expedient so that those contemplating it need not rely on academic studies for proof of its efficacy. Vast interconnected networks have been in existence for some time, notably in California, in Washington and Oregon, in Illinois and Wisconsin, in Michigan, Texas, Tennessee, Alabama, Georgia, South Carolina, North Carolina, Pennsylvania, and throughout the New England States and New York, and the results obtained in every case have more than surpassed expectations. In few of the existing interconnected systems, however, have the maximum attainable advantages been approached.

#### ADVANTAGES OF INTERCONNECTION

The beneficial effects of interconnection may be summarized as follows:

1. Interconnection makes possible the fullest utili-

zation of water powers and watersheds through exclusive hydro-electric systems or in hydro-electric systems operated as auxiliaries to large steam-electric systems. It also enables the interconnected system to take advantage of the diversity existing between watersheds and water storage.

2. Interconnection materially increases the load which may be carried on otherwise separate systems owing to diversity in peaks. This increase ranges from 15 per cent to more than 30 per cent.

3. Interconnection enables a generating system to operate with less equipment in reserve, and in fact in very large interconnected systems no reserve equipment need be provided at all. The reserve is in the system.

4. Interconnection of steam-electric stations or a combination of steam and hydro-electric stations enables a considerable saving to be made in fuel. In the case of exclusive steam plants the most efficient stations may be operated at maximum load factors while the less efficient plants need be called into service only when required.

5. Interconnection makes possible a greater utilization of an investment by providing load for equipment before the local market can absorb it. This condition is subject to change. One year one system may have surplus power for sale because of the installation of new equipment or the acquisition of a new source of power supply, while the next year conditions may be reversed and the neighboring system may have a surplus.

The above are merely abstract enumerations of some of the advantages of interconnection. As practiced at present the interchange of power is practically limited to an interchange between companies owning the interconnected transmission lines. To be most effective interconnections must be made on a larger and grander scale so as to bring about a more flexible arrangement which will permit the interchange of power not only between adjoining companies or systems but between systems that may be interconnected through other systems. But even as they are, limited by the size of the tie lines or the transforming equipment at the junction point, the results amply warrant the practice.

It is obvious that a hydro-electric system with water passing over the dam for a considerable portion of the time should be interconnected with a steam-electric station so as to use all of the water available without wastage and permit a considerable saving in fuel on the part of the steam-electric system. The advantages in such cases are mutual and instances of this kind abound.

### Examples of Interconnection

Typical examples of interconnected systems predicated on actual practice are given herewith. While they do not show every possible combination, they portray different conditions and indicate the greater economies still available to those who will take the trouble to make a thorough investigation of the possibilities. The ultimate goal is a vast interconnected network stretching from border to border and from coast to coast. By means of such a system every water power in the country will be made available for development, huge steam stations become the rule, and the electric public utilities will reach their highest productive efficiency coupled with maximum financial economy.

*Case* 1.—Two hydro-electric companies—A, operating two stations aggregating 11,000 kw., and B, operating three stations aggregating 19,000 kw.—have their power plants on the same stream. The load curves on the two systems differ considerably. They interconnect through a 6,000-kva. tie-in transformer. The load carried by the tie-in transformer since it was put in service four years ago has averaged 3,000 kva., representing water that would otherwise have gone to waste.

*Case* 2.—A 12,000-kw. steam-electric station, using fuel oil, interconnects with a 150,000-hp. hydro-electric system through an 80-mile wooden-pole line costing $150,000. Since the tie-in has been effected more than 25,000,000-kw.-hr. of hydro-electric energy, or from 85 to 90 per cent of the energy requirements of the smaller company, is transmitted annually over the line at an approximate saving of 100,000 barrels of oil.

*Case* 3.—An 8,000-kw. hydro-electric station on a stream possessing a fairly constant flow but with no facilities for pondage is tied in with the steam-reserve station rated at 5,000-kw. During approximately 100 hours of the year the load on the system is 13,000 kw. At night the load drops off to 2,000 kw. and during the day it hovers around 10,000 kw. As normally operated the company uses its steam plant only as needed to supplement the hydro-electric supply. Therefore the wastage of water during the night is considerable. Not far distant is an 80,000-kw. steam station which is fully loaded at the winter peak. An interconnection between the two systems was effected whereby the first system is enabled to shut down its steam station all summer and the second system not only supplies most of the power which the first system was heretofore compelled to generate in its own steam station, but in addition is enabled to shut down its own less efficient turbines during the time when the first system has water power to spare. When load conditions warrant, the second system sells all the surplus energy available. By means of the interconnection the second system is enabled to make a saving of 4 mills on every kilowatt-hour it receives from the first system during the night, and inasmuch as it cost the first system more than 1 cent a kilowatt-hour to generate energy in its steam plant, the energy which it receives from the second system to replace that which it would have to generate itself in this plant enables it to make a saving of approximately 1 cent a kilowatt-hour.

*Case* 4.—A hydro-electric system has a 5,000-kw. steam-reserve station at one end of its line which is called on to produce about 20,000,000 kw.-hr. yearly. In the same district is another hydro-electric system operating at a different frequency but with ample capacity and water storage. Interconnection was effected between the two systems through a 5,000-kw. frequency changer, since which time the steam station has been completely shut down, effecting a saving of more than 92,000 barrels of oil a year.

*Case* 5.—Company A has a 95,000-kw. steam plant and a peak load of 95,000 kw. Company B has waterpower varying with the season. During low-water periods it can generate 500,000 kw.-hr. a day; during high-water periods there is available water for approximately 5,000,000 kw.-hr. a day. Its peak is 50,000 kw. and hydro-electric equipment of that rating is installed. Interconnection between the two systems was effected, and as part of the agreement com-

pany B doubled the capacity of its hydro-electric equipment. Normal operation under the interconnection arrangement is as follows: Company B doubled its business with no increase in its fixed charges except for the waterwheels and generators. During low water it shuts down its entire system at night and stores the water. While its station is shut down it purchases all of its energy from company A. When, however, company A's peak load comes on, company B carries its own peak, the stored water enabling this to be done; but when the peak is passed company B takes energy again from company A and stores water until the peak of the next day. During the high-water periods company B carries its own peak load and also its night load and in addition sells company A energy at night and at any other time except the peak from water which would otherwise pass over the dam.

*Case* 6.—A gas and electric company has an output of 9,000,000 kw.-hr. a year, which is generated in a steam station requiring 4.5 lb. of coal per kilowatt-hour. Interconnection was effected with a large system possessing seven hydro-electric and two steam stations. The gas and electric company was thereby enabled to shut down its steam station and take all its energy from the larger system. The latter supplies most of the energy from hydro-electric sources and about 10 per cent from its steam stations, which, however, generate a kilowatt-hour on less than 2 lb. of coal.

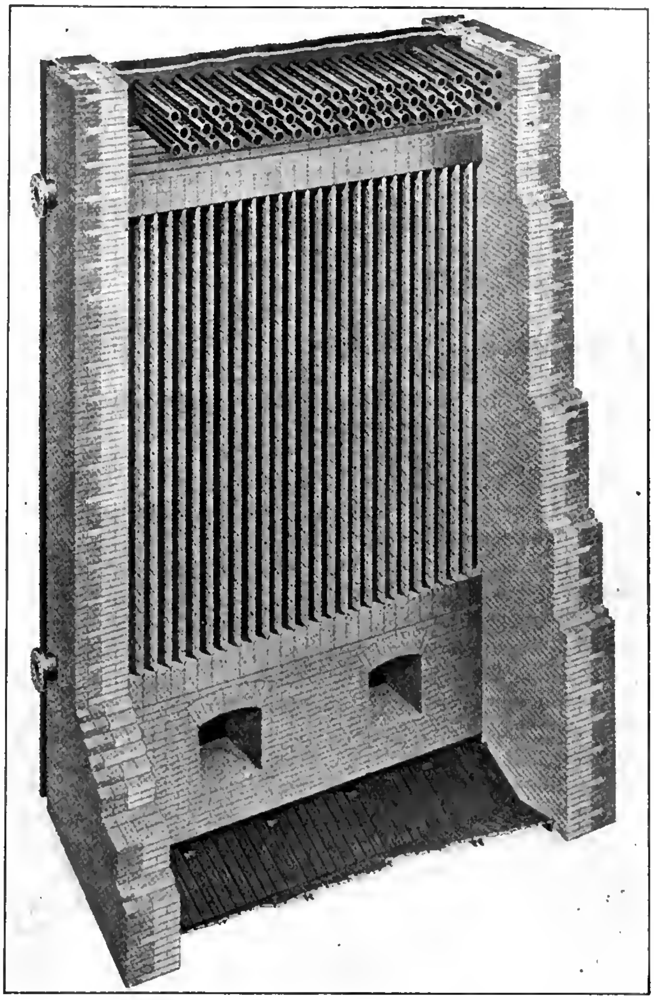
*Case* 7.—Four transmission systems serve as many states and all possess hydro-electric and steam stations which are interconnected. In this system, aggregating 1,000,000 hp., all available waterpower at any point is fully utilized before steam is called upon and the water power itself is operated at an efficiency wholly impossible before the interconnections were effected. Excessive drought caused system A to seek every available source of supply, and system D, 700 miles distant, was the only one having any reserve capacity. The excess in system D was therefore transferred to the lines of system C, which in turn furnished an equivalent amount of energy to system B, and system B transmitted a similar amount to system A, thereby relieving the shortage. In the territory served by system D is a large modern steam turbine station rated at 60,000 kw. This station, which was built as a part of a war industry, was normally idle. Anticipating a shortage in its own supply, system D, assisted by systems B and A, underwrote a lease on the 60,000-kw. plant, which was held in reserve for the entire section. The station can be put into operation on a few hours' notice and has carried loads as high as 30,000 kw. during extended periods of drought.

*Case* 8.—A study of the loads of three independent steam-electric systems in one of the most populous centers of the country indicates a diversity in excess of 12 per cent. The total load on the three systems approximates 1,000,000 kw. Through a diversity which interconnection would make available 100,000 kw. in installed generating capacity could be saved, in addition to 75,000 kw. in emergency reserve requirements. Thus interconnection between these systems would result in an increase of effective generating capacity of 175,000 kw., corresponding to an investment approximating $20,000,000. That sum is more than would be required to build the necessary tie lines, including the step-up and step-down transformer stations.

*Case* 9.—Company A has an installation of 100,000 kw. in modern turbines and its cost for coal and labor approximates 8 mills. Company B has an installation of 50,000 kw. in modern steam turbines and its cost for coal and labor is 9 mills. Company C has a 5,000-kw. reciprocating engine and its cost for coal is 1 cent per kilowatt-hour and labor amounts to $50 per shift. Between stations B and C there is a 3,000-kw. line, and another tie line of similar capacity connects stations A and C. The operations are as follows: During the summer company C shuts down, taking all of its load up to the capacity of the tie line from company B and whatever else is necessary during the summer peak from company A. During the winter company C takes its light load from company B, but starts up once a day and carries the whole of its own peak. Recently company A installed a new turbine capable of taking care of two years' growth. This has enabled company C to run with only a part of its reciprocating equipment during the winter peak, and during part of the winter, owing to spare capacity on the systems of A and B, station C was able to shut down for a month.

*Case* 10.—A hydro-electric system possessing three water-power plants is so situated as to be able to operate at full capacity all the year round with no steam reserve. Having 8,000 kw. to spare, a 35-mile line was built to supply a much larger system possessing both hydro-electric and steam-reserve stations. As much as 51,000,000 kw.-hr. has been transmitted over this interconnection in a year, thereby relieving the auxiliary steam plants of the larger system of that amount of load and saving 230,000 barrels of oil.

## Furnaces and Boilers Improved



A more complete knowledge of combustion and the increased prices of fuel have aided the development of furnaces and boilers. View of a radiant type of superheater exposed to the direct heat of the fuel bed.

### Limitations to Economies Effected

It will, of course, be appreciated that in all of the examples cited the actual savings were not so great as indicated, as maintenance and fixed charges on the transmission and some differences in plant costs other than fuel must be deducted before the net economic result is obtained. Examples may be cited of still more intricate interconnected systems and of the additional savings which have been made possible where the operation of the various systems is centered in one system operator.

Involved in all interconnections of this kind is the question of rates. Obviously the price of interchange energy must never be such as to impose on the purchaser a greater burden than he would have to carry with the use of his own power sources, nor should it be so low as not to yield a profit to the seller. The major profit should go to the company exercising the maximum initiative whereby the economies through interchange have been made possible.

# Equipment Development in 1922

*By Allen M. Perry*
Engineering Editor ELECTRICAL WORLD

### Tendency Toward Concentration of Generation and Transmission of Electrical Energy Has Forced Higher Rating and Reliability in Equipment—Improvements in Industrial Equipment Have Extended Applications

PRODUCTION and development of electrical and allied mechanical equipment have been very encouraging during the past year, according to the reports from a large number of manufacturers. While the design and construction of most equipment have been along established lines, with improvements only in details, there have been a number of major developments in apparatus during the past year which have been influenced by the tendency to concentrate generation, transmission and distribution of electrical energy into units of greater rating, higher voltage and higher efficiency to secure better economy.

Never before has there been such activity in hydro-electric development, and manufacturers have felt its effect in the demand for hydro-electric equipment as well as for the high-tension transmission apparatus necessitated by this development of water power. Unusual demand for heavy-duty oil circuit breakers, unprecedented production of transformers of all classes and record-breaking calls for outdoor electrical equipment have been reported by various manufacturers. Nor has illumination been overlooked. Streets which have remained inadequately lighted for years have been provided with modern equipment, and interest has been quite generally aroused in better school lighting.

It would be repetition to outline detailed changes in operating practice during the past twelve months, since this has been ably done throughout the year in articles prepared by men actively engaged in the industry. Therefore a phase of electrical development which has only incidentally been touched in such articles—namely, equipment development—will be described in this article.

To make the information as nearly complete as possible 250 of the leading manufacturers in electrical and allied mechanical fields were asked the following questions:

1. What new apparatus or equipment has been developed and placed on the market during the past year which will have marked influence on future engineering practice or will make possible greater reliability or economy of operation?
2. What engineering investigations have you made or are you conducting to determine ways of developing or modifying apparatus so that it will meet operating requirements more effectively?

Some of the manufacturers addressed failed to reply, but the information from about fifty companies is presented below under major classification heads. In reporting developments it will be attempted, as far as space permits, to refer to operating conditions which influenced the development, and also to point out the significance of what has been done.

*Stokers and Furnaces.*—While the use of pulverized coal did not originate in the past year, the tendency toward its adoption under central-station boilers increased considerably. Many large stations are now considering it seriously and some new stations will use it. Every one is pretty well convinced of the practicability of burning pulverized fuel and of the efficiencies obtained even with low-grade fuel, but there is still a dearth of actual data showing the fixed charges and the operating and maintenance expenses involved. The advent of pulverized coal has stimulated strong competition on the part of multiple-retort and traveling-grate stokers, which are still the mainstay of all central stations. Efficiencies are being obtained with low-grade Western fuel on forced-draft chain grates which are comparable with the performance of forced-draft stokers burning Eastern fuel. Brush-shifting alternating-current motors have been applied for stoker drive, but there is still opportunity to improve greatly the means of utilizing alternating current for such service.

Considerable attention is being given to boiler furnace construction which will conserve heat and reduce maintenance. Excellent results are reported with high-temperature furnace insulation in firebrick form which will withstand a pressure of 40 lb. per square inch at 1,900 deg. F. without shrinkage. Attention is also being given to the possible use of new materials that will reduce maintenance cost and increase operating efficiency. The value of air or water cooling as well as of high refractory bricks around the fuel and clinker line of furnace side walls is quite generally recognized. The development of low-pressure forced-draft stokers with liberal air space has been undertaken. New boiler and furnace designs have been developed during the past year in which particular consideration was given to fuel characteristics, furnace volume, excess-air requirements for complete combustion ahead of the tubes, etc. Curved or sectional walls have been employed to allow expansion, while brick roofs and side walls have been supported on girders to relieve the furnace walls of excess pressure. To allow greater gas velocities baffles have been rearranged and remarkable improvement has thus been achieved.

One of the most radical departures in furnace arrangement was made in the past year at one of the Detroit plants by placing thirteen retorts which are the equivalent of twenty-six ordinary retorts under type W Stirling boilers having 23,650 sq.ft. of heating surface apiece. The stokers have tuyères, grate bars and side walls that move parallel to the coal feed.

*Boilers and Economizers.*—Several manufacturers report having given serious consideration to the adaptation of boilers to higher steam pressures and temperatures. One company furnished some remarkable boilers designed for 350-lb. operation for the Waukegan plant, the superheaters being placed between two banks of

boiler tubes instead of in the last pass, as has been the practice before. Boilers for one of the Ohio plants of the American Gas & Electric Company will have to operate at 500 lb. pressure. The highest pressures for which boilers have been ordered is 600 lb.

In the design of boilers the radiant heating surface is being increased where possible. Double-deck construction is being used in central stations not employing economizers. Where economizers are used the pressure type are being provided consisting of modified boiler head sections having one pass and operating on the counterflow principle with high-gas velocity. Radiant-type superheaters and steel-tube cast-iron shell economizers have come into more prominence during the last year.

The establishment and maintenance of a heat balance is being given more attention, an automatic method for performing this function having been developed which is applicable to duplex-driven auxiliaries and is actuated by the feed-water temperature. The load is automatically divided between the motor and turbine drive.

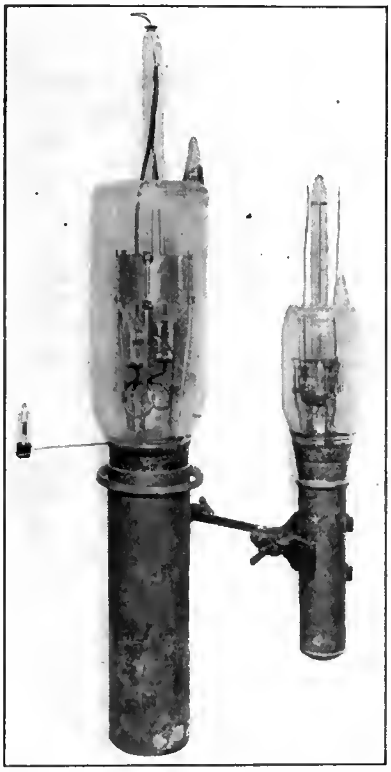
*Turbo-Generators and Auxiliaries.*—Elimination of causes of past turbine trouble, the development of record-breaking sizes, provision for bleeder or mixed pressure operation and acceptance of orders for turbines operable at the high steam pressures previously mentioned are the outstanding features of turbine development during the past year. The difficulties experienced with buckets and wheels due to axial vibration and the approximate coincidence of four-node and six-node critical speeds with the operating speeds have been carefully studied and have been overcome. Among other improvements which have been made are the provision of removable and replaceable low-pressure nozzles, improvement of nozzle partitions, provision of steam-sealed labyrinths with non-corrodible teeth, the use of cast-steel valve casings and turbine heads for temperatures of 450 deg. F. and greater, the elimination of vertical joints in high-pressure casings, and the redesign of emergency governors which permits testing them without disconnecting the generator from the line.

Another large turbine manufacturer reports that it has prevented leakage of steam past the turbine blades by new type of shroud ring and has avoided excessive blade lengths by low-pressure bleeding. Multiple-stage bleeding is coming into greater use for feed-water heating even in the smaller size units, a new line of bleeder or mixed-pressure condensing turbines having been developed for ratings of 500 kw. to 3,500 kw., 3,600 r.p.m.

The most remarkable steam turbines for rating are the single-case units being constructed for the Brooklyn Edison Company, which are rated at 62,500 kva. The 35,000-kw. base-load turbines which are being built for the American Gas & Electric Company to operate at 500 lb. pressure and 725 deg. F. are unapproached by any other turbines on order so far as pressure and temperature are concerned.

As mentioned previously, water-power development has been more active during the past year than ever before, one manufacturer alone having had three-quarters of a million horsepower of water turbines under construction or on contract at one time. One outstanding development of the past year is the turbo-type impulse wheel for heads of 800 ft. to 1,000 ft. Most of the innovations in hydro-electric development, however, like high-head reaction wheels, propeller-type wheels, submerged wheels, new developments in draft tubes, siphon type spillways, etc., were made more than a year ago; but numerous improvements have been made therein during the past year, and the apparatus has found application which proves the value of these developments. For example, practically continuous operation for eighteen months of the 25,000-hp. vertical reaction turbine at Kern River No. 3 under a head of 810 ft. has successfully demonstrated the practicability of this type of turbine. This is further evidenced by the fact that the Portland Railway, Light & Power Company has recently ordered a 35,000-hp. Francis-type turbine which will operate under a head of 850 ft. The Caribou development, involving 32,500-hp. turbines operating under 1,008 ft., has been in operation one year, and at least two projects are under development with heads exceeding 1,200 ft.—both in California, one on the American River, the other on San Gorgonio Creek. The 28,000-hp. water turbines for the Manitoba Power Company are remarkable as the first installation of very large size of the new propeller-type of wheel, while the installation at Mitchell Dam, Alabama, will be unique because of its backwater suppressor.

**Vacuum Tubes for Power Applications**



The year has witnessed the development of a 1,000-kw. power tube. View of a 100-kw. power tube recently produced.

For rating the 65,000-kva., 1,200-volt, 25-cycle water-wheel generators for the Niagara Falls Power Company have the record. These units have an auxiliary generator between the main unit and the exciter supplying auxiliary power and will be guaranteed to operate at 97.8 per cent efficiency at 90 per cent power factor, full load. An unusual application is being made for the Tallassee Power Company, involving a 31,250-kva., 60-cycle, 13,200-volt generator which will be placed on top of an existing 18,000-kva., 30-cycle generator, all to be driven from one waterwheel, to supply separate sources of electric power or serve as frequency changers.

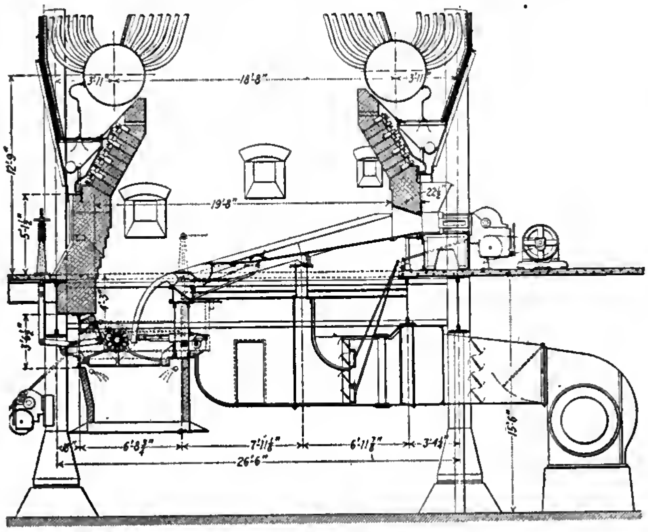
Various applications of automatic control to small hydro-electric plants containing synchronous equipment have been made. This seems to be one means whereby small remote hydro-electric power can be developed economically and interconnected with existing systems.

Improved grades of sheet steel for generator armatures have been developed, one company announcing that a new steel has been developed which reduces iron losses 25 per cent. Improved forms of ventilation at high speeds are also reported by this company and another.

Owing to the large volume of air needed for ventilating large steam turbo-generators and the necessity of reducing fire hazards, closed-circuit ventilation has gained in popularity. For use with this system a modified form of air washer and cooler has been developed during the past year and inert gases have been introduced for smothering fires.

*Switching and Protection.*—According to the reports received from manufacturers, there was an unusual amount of development in oil circuit breakers, relays, instrument transformers, reactors, lightning arresters, disconnecting switches and air and oil-break switches for outdoor use. Greater ruggedness and better design of contact mechanisms made marked changes for the better.

## Bigger Boilers and Furnaces Used



The year has witnessed an increase in the size of boilers and volume of combustion chamber. A section of furnace and stoker for type W Stirling boilers.

Isolation of phases and electrical and mechanical interlocking of disconnecting switches and circuit breakers was extended in the year, at least in stations of the larger size. No definite opinions have been expressed yet regarding the minimum size of station in which phase isolation and interlocking can be economically applied, nor has a definite decision been reached on vertical versus horizontal phase isolation. As mentioned previously, the developments have been influenced chiefly by the tendency to concentrate energy production and transmission and to obtain more reliable service.

*Circuit Breakers.*—Circuit breakers rated at 220,000 volts are in service, and extensive tests have been conducted on electric service systems which afford data to enable intelligent modification of circuit breakers which will adapt them to more severe duty. At present there seems to be some delay in coming to a decision regarding the number of "shots" for which circuit breakers shall be rated, but it is hoped that the differences of opinion will be removed soon. Considerable attention is being given to the rupturing capacity of oil circuit breakers, one manufacturer reporting circuit breakers which have resilient tanks, oil separators, four-break contacts, inverted brushes and vertically laminated bridge arms to facilitate alignment and contact. This company is also investigating the value of eight breaks in series, arcing tips, operation at higher speed and the ejection of gases caused during rupturing. Truck-type switchboards are becoming more popular and a new unit-type switchboard is announced which possesses nearly all the merits of the truck board and some others.

*Relays.*—There is a greater tendency to relieve operators of functions which relays and automatic control equipment can perform better. For example, a thermal relay with two operating points has been developed to reduce the number of shutdowns from overload by automatically changing the load-limit setting. When the first limit is reached the second limit is automatically established; when this is reached the relay operates to shut down the equipment. The same company has developed a field relay and a field-building relay, an overload-discriminating device and an improved mechanism for operating circuit breakers. The field relay is provided with a copper damper to prevent drop-out with momentary reduction in the field current. The field-building relay permits rapid building up of the field by shorting a part of the field resistance until a predetermined voltage is attained. Overload discrimination has been made possible by using an inductive shunt which sends current through a bucking bar that operates to open the circuit breaker when the rise of current is rapid, as during short circuits. The new circuit-breaker, operating mechanism utilizes the stored energy of a rotating mass, thereby reducing the amount of power required. It is particularly applicable to reclosing circuit breakers which must function a number of times in succession.

For automatic station operation another manufacturer has developed a polarity-directional relay, an induction over-current relay with auxiliary current scale and a sectionalizing relay of the impedance or distance type.

*Instrument Transformers and Regulators.*—Several developments in instrument transformers have been made, notably a heavy-current through-type transformer for 300 amp. to 2,500 amp., interchangeable high-side, dry-type current and potential transformers and oil-immersed weatherproof current and potential transformers up to 300 amp. for pole mounting, and a two-stage current transformer with a one-turn primary. The latter is asserted to be indestructible by short circuits, and its accuracy is equal to that of the best multi-turn type.

For close regulation of voltage an induction-type regulator has been developed with a new magnetic type of brake which is noiseless and quick-acting.

*Reactors.*—Causes of reactor trouble have been studied very carefully during the past year with a view to ascertaining the remedies, and the results have been very satisfactory. Thermal and mechanical stresses during short circuit are well under control despite the fact that electromagnetic stresses may reach 700 tons. Some small, rugged, efficient, semi-porcelain-clad reactors have been developed with generous conductor cross-sections and better ventilation which have withstood rain tests at 28,400 volts. Single-phase and three-phase feeder reactors have also been improved and developed. The protecting value of reactors in extensive electric service systems seems to be firmly established, and even smaller companies are using them without materially affecting the regulation, losses or power factor.

*Supervisory Control.*—With a tendency toward automatic generating stations and substations and the necessity for system operators to keep closely in touch with conditions over the entire system has come the development of two types of supervising control. One, the selector type, is for use where few operations per

station are required and the system is extensive. It utilizes three telephone wires between stations. Impulses sent out from the system operator's office operate selectors in the remote station and in turn perform specific operations which are reported by means of red or green signal lamps through the medium of auxiliary switches. The second type, known as the distributor system, is employed within a radius of 20 miles of the central office and where a large number of operations is involved. Distributors in each one of the stations as well as the central office operate in synchronism, giving positive or negative impulses that operate relays and auxiliary switches on the apparatus controlled. Operation is reported by auxiliary switches actuating the distributors. Four wires are essential between stations.

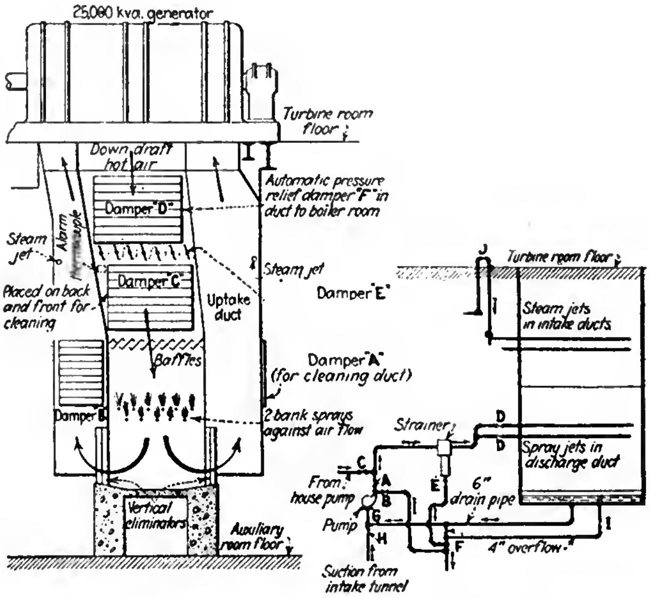
*Outdoor Switches.*—Developments in outdoor switching equipment consisted chiefly of improved air-break and disconnecting-switch construction, with remote operating mechanisms therefor. A combined oil-and-air-break switch has been developed for outdoor use on light loads which is capable of breaking the charging current of long lines. Failure of the oil pot would not ground the circuit, it is claimed. Some of these switches are being used on the Pacific Gas & Electric Company's lines. Another novel liquid-break switch for pole-top mounting has been developed the contactor of which is operated by tilting the container. Some units of this type are in service in the Middle West. The manufacturer has also developed an improved three-phase, vertical-break, double-throw air-break switch with self-aligning contacts, arcing rollers and sleet hoods. The entire switch is a unit instead of being made up of sections. Besides this an outdoor fused disconnecting switch in which the fuse is bridged by a porcelain tube has been developed. Another group-operated outdoor disconnecting switch, the three elements of which can be mounted one above the other in a vertical plane and interlocked with the oil circuit breaker if desired, has been developed for ratings up to 800 amp. and 150 kv. The manufacturer has also developed an outdoor grounding switch which can be operated by remote control if desired. Remote control mechanisms, operable on alternating current or direct current, are available with overload tripping devices if desired. Another motor-operated mechanism for high-tension disconnecting and air-break switches, suitable for remote control, is also available. "Disconnects" with only two insulators per phase instead of three have been marketed. The expulsion-fuse type disconnecting switch is available for ratings up to 7,500 volts and 200 amp. and is capable of rupturing 2,000 amp. The manufacturer claims that these switches have functioned satisfactorily up to 20,000 kva.

Expulsion fuses for 66-kv. circuits and air-break switches for 100 kva. and above are available.

*Lightning Arresters.*—Only one distinctly new type of arrester has been reported this year, namely, the "autovalve," which requires no charging. Where used for protection of distribution transformers it has been so successful that it is being extended to station protection. Operating data should now be available on the oxide-film type of arrester. The compensated-disk gap and flash-rod types of lightning arresters reported last January have been applied during the past year. The demand for the former has extended to the lower-voltage field. Three new designs have been made, one for 600-volt direct-current service, one for 2,300-volt service and one for steam-railway signal circuits.

*Line Supports and Insulators.*—The large amount of high-tension transmission and interconnection undertaken during the past year and the effect of the severe sleet storm in New England a year ago have enlarged the circle of interest in the design of line supports. The question has arisen in various quarters whether tower-design practices will have to be revised in so far as stiffness formulas, safety factors and assumptions of broken wires are involved. In general it is not believed that it is economical to design towers which will stand such severe sleet storms as the one last year unless a weak link is placed somewhere between the line support and the conductor itself to relieve the stress under abnormal conditions. The relative values of painting and galvanizing are again up for reconsideration. A manufacturer of expanded steel poles announces that larger sections are available for heavier loading and that precast foundations and easily attachable arm fixtures can be provided.

## Closed-Circuit Ventilation



The inclosed system of ventilation is extending and the year has witnessed the introduction of air washers and also the use of inert gases for fire-extinguishing purposes.

The most notable high-tension lines undertaken during the last year are those of the Southern California Edison, the Pacific Gas & Electric and Great Western Power Companies. The first two will operate at 220 kv. and the latter at 165 kv. The construction which facilitates these supervoltages is being rapidly completed.

While there was apparently considerable investigation of the insulator problem during the past year, very little is reported by manufacturers. In general standard disks of extra large diameter and strength are being used on a supervoltage line, sometimes with grading shields or high-capacity disks next to the line. No radical innovations have been made in insulators, the chief development being refinement in details of design and manufacture. Drop-forged caps have been adopted for 10,000-lb. and 18,000-lb. standard and heavy-strength units, the 18,000 lb. units being provided with heat-treated vanadium-steel connecting pins. Insulators with this improvement are being used extensively on the largest systems, including 220,000 volts. The manufacturer reports it is using the vacuum process of producing in-

sulator clay to eliminate air content, to secure greater homogeneity and to increase the possibility of making a greater variety of shapes. Gratifying results have been reported with link-type insulators.

In the past there have been a great variety of insulator test methods favored by operating companies. Recently several companies which have used the 60-cycle flashover or high-frequency tests have adopted the overpotential test. Various studies of insulator deterioration are being made including the effect of weathering.

*Transformers.*—Unprecedented production of all classes of transformers took place during the past year, more transformers of 10,000 kva. and higher ratings being ordered and constructed than during all the preceding years combined. The most recent development has been to leave some space over the oil in the top of the tank and provide means for keeping it filled with nitrogen gas. This not only prevents oil fires but reduces oxidation of the oil, serves as a buffer in case sudden pressures occur within the tank, and also saves filling the tank entirely with oil. This feature will be incorporated in a 25,000-kva. bank of transformers to be furnished to the Middle West Utilities Company.

The ratings of transformers have been going up and up. For example, a 36,700-kva, 50-cycle, single-phase auto-transformer rated at 150/220 kv. will be installed by the Southern California Edison Company. The manufacturer of this transformer will furnish the Japanese government with a 21,000-kva., 50-cycle, single-phase transformer rated at 66/150 kv. To make it possible to tie together two 50-kv. systems and adjust the exchange of energy, a 15,000-kva., three-phase 48-64/48-60-kv. transformer has been equipped with a ratio adjuster which can be remotely controlled. For dimensions probably the 20,000-kva., 50 cycle, 220/72-kv., single-phase water-cooled transformer which is being constructed is the largest.

To remove objectionable triple harmonics a 5,550-kva., 50-cycle auto-transformer rated at 220 kv.Y/150 kv.Y has been constructed for the Southern California Edison Company with a tertiary winding. It will be used to interconnect lines on which no lightning arresters are installed. The Southern Power Company will install an 18,750-kva., 60-cycle, 102/66-kv., three-phase transformer which will have a continuous rating of 25,000 kva. A rather unique transformer having three windings for simultaneous operation has been constructed which is rated at 12.000 kva., 60 cycles, 44-13.6/23-40-kv., three phase, with 50 per cent overload for two hours. One of the windings is rated at 12,000 kva. at 44 kv., another at 8,000 kva. at 13.6 kv., and the third at 4,000 kva. at 4 kv. The manufacturer announces that ratio adjusters are being applied to larger-size transformers, these devices having been standardized for currents up to 500 amp. and modified for 1,250 amp. at 13.2 kv. and for 2,200 amp. at 150 kv. One-million-volt testing equipments have been constructed for test purposes. One of the sets, consisting of four 250-kva., 250-kv. transformers, has been built for the California Institute of Technology.

To facilitate the cooling of transformers where water is scarce forced-draft radiators have been developed on which low-pressure air jets can be directed. The manufacturer has also developed an indicating and signaling flow device for water-cooled transformers which is positive, simple and strong in action, utilizing the Venturi-tube principle to actuate a rubber diaphragm. This company is also manufacturing a portable electrically heated centrifugal oil drying and purifying outfit and has extended the use of welded tanks to distribution transformers of 10 kva. to 100 kva. rating.

While pressed-metal tanks are not new, one manufacturer has announced that they are being employed for all distribution transformers.

*Substations.*—In the substation field the major development has been the application of automatic control to alternating-current feeders. Kansas City furnishes a good example of such a station having two or more incoming feeders with two or more banks of transformers and the usual number of outgoing feeders, all automatically controlled. In three-wire motor-generator substations the latest development is the application of automatic control for cutting in a differential field to protect the sets during overload. Automatic control has also been extensively applied in the coal mines, and notably by the Star Coal & Coke Company, where two unit motor-generators are installed with reclosing circuit breakers on the feeders. Among other examples of the application of automatic control is the installation of the Penn Public Service Company, where automatically controlled 5,000-kva. synchronous condensers are in successful operation.

### NEW AUTOMATIC EQUIPMENT PRODUCED

In applying automatic control to substations many automatic features which have been made a part of modern manually operated stations have been incorporated, but new devices have had to be developed also. Among them are direct-current and alternating-current reclosing circuit breakers and slip relays of the balanced type. The latter will perform the switching operation when a synchronous motor pulls out of step. The high-reluctance commutating-pole 60-cycle converter is an accomplishment of the past year. It incorporates flash barriers and a new design of brush holder which covers only a small portion of the commutator periphery, reduces flashing and makes the brushes readily accessible. The adjustable notching relay which functions after a predetermined number of operations is another development which has enabled automatic control.

Among other pieces of apparatus which have been developed for substation use and are particularly interesting are some synchronous condensers with two ratings—namely, 30,000 kva., 7,920 volts, 60 cycles, 600 r.p.m., or 25,000 kva., 6,600 volts, 50 cycles, 500 r.p.m.—for the Department of Public Service of Los Angeles. There are also the 30,000-kva., 6,600-volt, 50-cycle, 600-r.p.m. synchronous condensers for the Southern California Edison Company, the 35,000-kva frequency changers for the Brooklyn Edison Company, the 20,000-kva. synchronous condensers for the Pacific Gas & Electric Company, and synchronous motors for 100 and 80 per cent power factor in sizes of 50 hp. to 2,000 hp. and with speeds of 327 r.p.m. to 1,800 r.p.m. Sturdy static condensers have also been developed in power sizes.

A new automatic series cut-out for street-lighting circuits has been developed which is simple, requires no adjustment and involves carbon gaps and solenoid-operated contacts.

*Meters.*—Considerable attention has been devoted to demand meters during the past year, one for measuring kva. demand comprising two polyphase elements geared so that the energy component actuates the stylus while the reactive component controls the motion of the chart. Another is composed of ordinary watt-hour meter elements, one set of which is operated proportional to

the kilowatt-hours and the other proportional to the kilovolt-ampere-hours. The shafts operate a pantograph. The manufacturer has also perfected a remote indicating and recording instrument operated by impulses and utilizing ordinary telephone or telegraph wire for the connecting link. Distance will have no effect on its accuracy, it is claimed.

Watt-hour meters with bottom terminal chambers adapted to safety cabinets have been developed in 5, 10, 15 and 25-amp. sizes for two-wire and three-wire, 110-volt and 220-volt circuits. All have the same dimensions. The same company has developed a demand attachment for watt-hour meters to indicate the fifteen-minute demand and total kilowatt-hours consumed during any given period.

*Illumination and Lighting.*—Extensive investigations have been conducted during the past year on illumination matters, such as the extent of electric sign advertising, legibility of electric signs, overcoming daylight reflection in show windows, revision of motor vehicle headlamps to comply with legal requirements, the adequacy of street lighting, attracting power of show-window lighting, improvement in optical elements for motion-picture projectors, school lighting, and the effect of artificial light on plant growth. It has been found that only about 3⅓ watts is used for electric advertising per capita, or 5 kw.-hr. per year per capita. By using 1,000 foot-candles to 2,000 foot-candles for illuminating the inside of show windows the effect of daylight reflection can be overcome. The survey of street-lighting practice seems to indicate a tendency toward three to ten times the previously prevailing intensity. As regards the attracting power of light it was found that 40 foot-candles is 33 per cent more attractive than 15 foot-candles and 100 foot-candles is 75 per cent more attractive than 15 foot-candles.

Among the outstanding developments in the illumination field have been the "glassteel" diffuser, the 75-watt white diffusing-bulb, gas-filled incandescent lamp, the 1,000,000-lumen incandescent lamp, the 25,000-lumen gas-filled incandescent lamp for street lighting, the 250-watt concentrated-filament lamp for projection work, a new spray coating for coloring lamps, and improvements in luminous arc-lamp electrodes.

The "glassteel" diffuser is a modification of the RLM reflector. It has an enameled-steel reflector and a glass diffusing globe which together enable some light to be directed at the ceiling. It is adapted to clear gas-filled lamps, producing a brightness of only 2 cp. to 5 cp. per square inch with an efficiency of 65 per cent. It is made in two sizes—18 in. for 100, 150 and 200-watt lamps and 20 in. for 300-watt and 500-watt lamps.

The new spray coating for coloring lamps is practically permanent, cleanable and a good diffuser of light, thereby broadening the field of color lighting.

The new electrodes for luminous-arc lamps are compressed square or oval cross-sections, made in such a way as to increase the life and efficiency. Luminous-arc lamps are still being used extensively for the highest-class illumination, notably in Detroit, Salt Lake City, Buffalo, Toledo, Philadelphia and Pittsburgh.

White-way lighting is extending to business districts, residence streets, parks, boulevards, etc. The totally inclosed semi-indirect prismatic glassware for street lighting is a development of the past year which gives a smooth surface and sharp slope, preventing dust accumulation. The East Cleveland street lighting is a notable example of modern lighting. On residence streets 150-watt gas-filled lamps, staggered 250 ft. on centers, are used; on thoroughfares, 1,000-cp. gas-filled lamps are placed 280 ft. on centers. One-piece rippled-glass globes are used in baskets with porcelain-enameled reflectors and dome prismatic reflectors. On thoroughfares crystal glass is used and on residence streets opal glass. Lamps are fed in multiple from back-of-lot lines.

*Electric Ovens and Furnaces.*—A notable expansion has occurred during the past year in the use of electric heating devices for industrial processes, particularly in heat treating of metals, baking enamels and foundry cores. Small and medium-size ovens with 275 cu.ft. to 1,000 cu.ft. capacity for operation at 100 deg. F. have been developed, and furnaces have been built for baking vitreous enamel on bathtubs with absolute temperature control and freedom from gases and fumes. Electric ovens and low-temperature electric furnaces have also been extensively applied during the past year for melting non-ferrous metals, as well as for heat-treating ferrous metals.

In the higher-temperature furnace field a start has been made in applying large electric steel refining and superheating furnaces in conjunction with blast furnaces by using a Bessemer furnace between them. The possibilities with this combination deserve more study. There is also an opportunity for improvement in quality and saving in metal loss by considering the electric furnace in melting ferro alloys before they are added to the open-hearth furnace.

### ELECTRICITY USED UNDER BOILERS

*Electric Steam Boilers.*—Equipment for generating steam with electric power has aroused interest in various parts of the country, especially where fuel is scarce and surplus water power is available at a low rate. High-tension electric steam generators of the kind announced last January have been installed to the extent of 150,000 kw. in the past year and are operating at 99 per cent efficiency, according to the manufacturer. One big advantage of such boilers is their lower first cost compared with fuel-fired boilers and their flexibility and ease of control. Another electric steam generator has been developed which is also extremely simple, reliable, compact and high in efficiency. Its chief difference from those previously developed is a separation of the steam generating space from the hot well and the provision of adjustable circulation between the two which enables regulation for steam demand and energy input and facilitates forcing.

*Welding Equipment.*—A new constant-current set, a constant-potential set and two portable welding outfits are announced. The constant-current machine is now being tested, but the constant-potential machine, which is rated at 400 amp., is already available. The latter has three resistors (two for metallic and one carbon welding) which permit three separate or combined operations to be performed simultaneously. One portable welding set is driven by a gas engine, and the other is a semi-automatic set which allows the operator to direct the arc but still retains the continuous feed. The demand for more rapid deposition of metal in arc welding has influenced the use of larger metal electrodes and higher currents, namely, 300 amp. and larger.

*Industrial Heating.*—Electricity as a source of heat for industrial plants has also been employed during the last year, notably by the Canadian Cottons Company.

*Motors and Control.*—Several interesting motors and speed regulators have been developed, but the principal

progress has been made in perfecting the applications of motors and control apparatus to various industrial processes, among which are paper making, calendering, newspaper printing, metal rolling and reeling, woodworking, textile manufacturing, hoisting, refrigeration.

A synchronous motor with high starting torque and an induction motor with a rolled sheet copper rotor winding are two outstanding motor developments. Both the stator and the rotor of the synchronous motor can revolve. In starting, the stator is allowed to revolve, then the field is applied, and a band brake is gradually applied to the stator, thereby bringing the rotor up to speed. With this arrangement a starting torque equal to the pull-out torque of the motor can be obtained. The motor is economical of space, avoids clutches and extends the field of application of synchronous motors. The induction motor with the rolled sheet-copper rotor winding has a very high starting torque per ampere, owing to the skin effect of the rotor during starting. The open-slot construction employed does not appreciably increase the no-load current, and the zig-zag leakage is reduced.

A new line of induction motors which can be started on full-line voltage without a starting compensator or excessive starting current is available. The change in secondary resistance is automatic so that it is particularly adapted to push-button starting. Owing to the high-starting torque it can, according to the manufacturer, be selected for full-load running conditions instead of starting torque.

Ball-bearing, polyphase, squirrel-cage and slip-ring motors have been announced which have high power factor and operate silently even with a large number of poles. Another high-power-factor, constant-speed, high-torque motor has also been announced. Rugged construction is provided by an exceptionally large shaft and bearings and a dust-proof housing. The coils are wound in phase groups without connections and are impregnated with insulating compound. Adjustable connection blocks and pull boxes are provided which are adapted to either solid or flexible conduit. The fan blades and improved ventilating path give promise of low temperature operation. For machine-tool drives a multi-speed motor has been developed which has four separate windings.

The "thermaload" starter which was announced last year has been extended in use. Since it automatically resets itself after each tripping it is limited to use with momentary-contact switches, but it is now furnished with hand reset if desired.

For sectional drive where exact speed ratios must be maintained between individual-motor drives a direct-current motor-speed regulator has been developed which involves a mechanical differential attached to the two drives which must be kept in unison. A contactor is operated by the differential if there is any change in the speed ratio, and this actuates a vibrating-type relay which applies full corrective power for speed readjustment. Tests on this regulator, using 100-hp. motors, showed that correction for 100 per cent load change could be made in two seconds.

*Paper.*—Improvements have been made in sectional paper-mill drive and control by two companies which greatly simplify the drive and control and make it more effective in operation. One sectional paper-mill control involves a voltage regulator for each section so that any change in load speed will automatically and instantaneously apply full corrective power to the drive involved. For maintaining constant speed relationship between the various sections, dependence is placed on a synchronous motor tie-in with the main drive. Two contact disks are driven by the synchronous motor and the main drive respectively. These contacts rotate in the same direction, making and breaking contact at a rate depending on the angular displacement between the two disks. The making and breaking of the contact either short-circuits or inserts resistance into the direct-current motor field, thereby maintaining a fixed speed on the direct-current motor. Paper-calender drive and control has been perfected by utilizing a new commutator-type frequency changer to supply the motors when threading in the paper.

Full-automatic, direct-current control for large newspaper presses has also been developed which can operate three octuples, four sextuples, or four decuples and a quadruple. It has a simpler and more substantial pilot motor and pilot switch than formerly.

*Steel Mills.*—Improved control of cold-roll strip reels and rod reels have been reported. The first involves a generator driven by the last stand of rolls; this supplies power to the motor driving the reel. Across the field resistance of this motor is a voltage regulator controlled by the armature current. This combination maintains constant torque and consequently constant tension.

In the control of rod reels, an example of which exists at the Minnesota Steel Company's plant, a small alternating-current generator is driven by the main motor and another by the reel motor, the two driving a mechanical differential which operate a vibrating-type relay if their relative speeds change. This relay acts to increase or decrease the field on the reel motor.

*Wood and Machine Tools.*—In the woodworking and machine-tool fields there is a tendency toward using built-in direct-connected motors. To obtain the high speeds necessary induction frequency changers must be used in some cases. A wood molder having four motors for the cutting head and one four-speed motor for the feed has been developed. The head-drive motors are operated at 3,600 r.p.m. All five motors are controlled from one case, starting Y and running delta. Overload on any one motor will shut down all.

*Hoisting.*—Hoist and crane developments are reported by three manufacturers. One refers to a flywheel balancer set controlled by a current regulator which helps carry the peak loads during intermittent hoisting and stores energy between demands. This is being used by the Lehigh Valley Railroad at Jersey City. Where heavy-duty cycles are encountered in hoisting it is customary to use mill-type motors. Where hoist motors are liable to be abused the tendency is to use automatic control.

For general purposes unit-type portable hoists in half-ton and ton sizes are available for 25-ft. lifts at the rate of 25 ft. per minute. An improved crane brake is available which has interchangeable parts and easily adjustable brakeshoes.

Multi-voltage elevator control and micrometer leveling for passenger elevators has found increasing application during the past year.

*Miscellaneous.*—Among other remarkable electrical developments during the past year are the pallophotophone (or photographic recording and reproduction of sounds), carrier-current interstation communication, large electron valves, machine switching for telephone service, electric propulsion of ferryboats, and renewed interest in steam-railroad electrification, especially in foreign lands.

# The World's Consumption of Electrical Energy

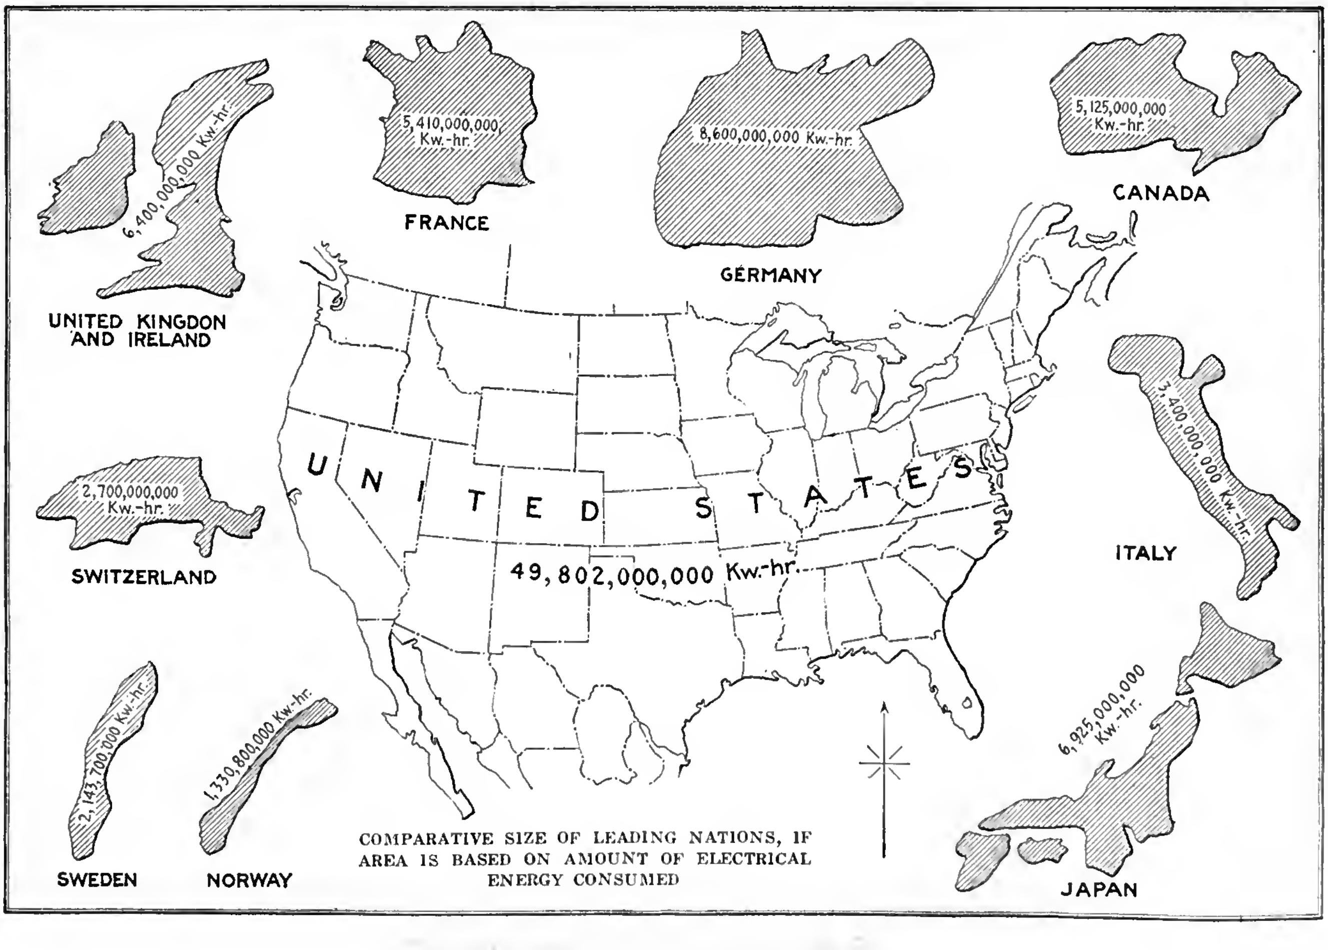
The United States Leads All Nations in Total Energy Consumption, but Switzerland Leads in the Consumption per Inhabitant—Total Generator Rating Placed at 46,427,690 Kw.

ELECTRICAL energy as a source of light, heat and power has woven itself into the domestic, business and commercial fabric of the world as few other forces of all time have done. From the frigid regions to the equator and from the Occident to the Orient nations are vying with each other in the electrification of their factories, mines and railroads and in the electric lighting of their homes. Peoples which are slow to adopt customs of other lands are adopting electrical energy with enthusiasm, until it may be stated with confidence that the central station bids fair to be the great equalizer of the world.

In an endeavor to ascertain the present status of the electrification of the nations in both hemispheres, the ELECTRICAL WORLD sent requests to the American diplomatic representatives in all foreign countries asking for certain data relative to the consumption of electrical energy in these countries for light and power during 1920. Foreign governments co-operated, and replies were received which made possible the presentation of the detail figures in the accompanying table. The world in 1920 consumed a total of 99,456,300,000 kw.-hr. of electrical energy, or at the rate of 57.8 kw.-hr. per inhabitant. Of this amount, 15,183,300,000 kw.-hr., or 15.3 per cent, was consumed for lighting purposes, and 84,273,000,000 kw.-hr., or 84.7 per cent, was used in the industrial activities of the world. It is probable that the energy generated by the steam and hydro-generating plants of the world totaled about 115,000,000,000 kw.-hr. during 1920.

It is estimated that of the 1,720,000,000 inhabitants of the world, only 111,822,000, or 6.5 per cent, are living in electrically lighted dwellings. There is estimated to be a total of 25,349,000 central-station customers, but it must be remembered that this does not in any way represent the total number of consumers of electrical energy, since there are many thousands of private plants making it for their owners' use.

The huge output of electrical energy was made possible by an estimated generator installation of



COMPARATIVE SIZE OF LEADING NATIONS, IF AREA IS BASED ON AMOUNT OF ELECTRICAL ENERGY CONSUMED

SWITZERLAND LEADS IN CONSUMPTION OF ELECTRICAL ENERGY PER INHABITANT

46,427,690 kw., of which 30,192,480 kw., or 65.4 per cent, was operated by fuel power and 16,235,210 kw., or 34.6 per cent, was hydro-electric. The United States Geological Survey has estimated that the minimum potential water powers of the world total 439,008,000 hp., and it is estimated from the most recent data that only 23,695,080 hp., or 5.4 per cent of this great source of power, has been developed. It would seem that the production of hydro-electric energy is still in its infancy.

The consumption of electrical energy in the United States in 1920 was almost exactly equal to the consumption of all the remaining nations of the world combined. Including the energy generated in private generating plants, the United States consumed a total of 49,802,000,000 kw.-hr. during that year, of which 6,870,000,000 kw.-hr., or 13.8 per cent, was consumed for lighting purposes and 42,932,000,000 kw.-hr., or 86.2 per cent, was used in the factories and mines, on the farms and in the operation of the electric railways of the country. During the year 1922 it is probable that more than 55,000,000,000 kw.-hr. was consumed in the United States. Germany was second in electrical consumption, with 8,600,000,000 kw.-hr., if the various British commonwealths are taken separately.

While the United States far outstrips all other nations in total electrical energy consumption, the little republic of Switzerland easily leads in consumption per inhabitant, with 700 kw.-hr. Following in order come Canada, with 612 kw.-hr. per inhabitant; Norway, with 493 kw.-hr. and the United States with 472 kw.-hr.

# Security Prices Advance During 1922

## New Electric Light and Power Bond Issues Total $589,960,990 for the Year—Refunding Operations Were a Feature

IN PERIODS of disturbed business conditions there always arises a decidedly favorable attitude toward bonds of capably managed and conservatively capitalized organizations with stable earning power. Electric light and power companies generally fall within this class, and accordingly in the year 1922 there occurred a period of unprecedented activity in their financing. During the war and for more than two years following

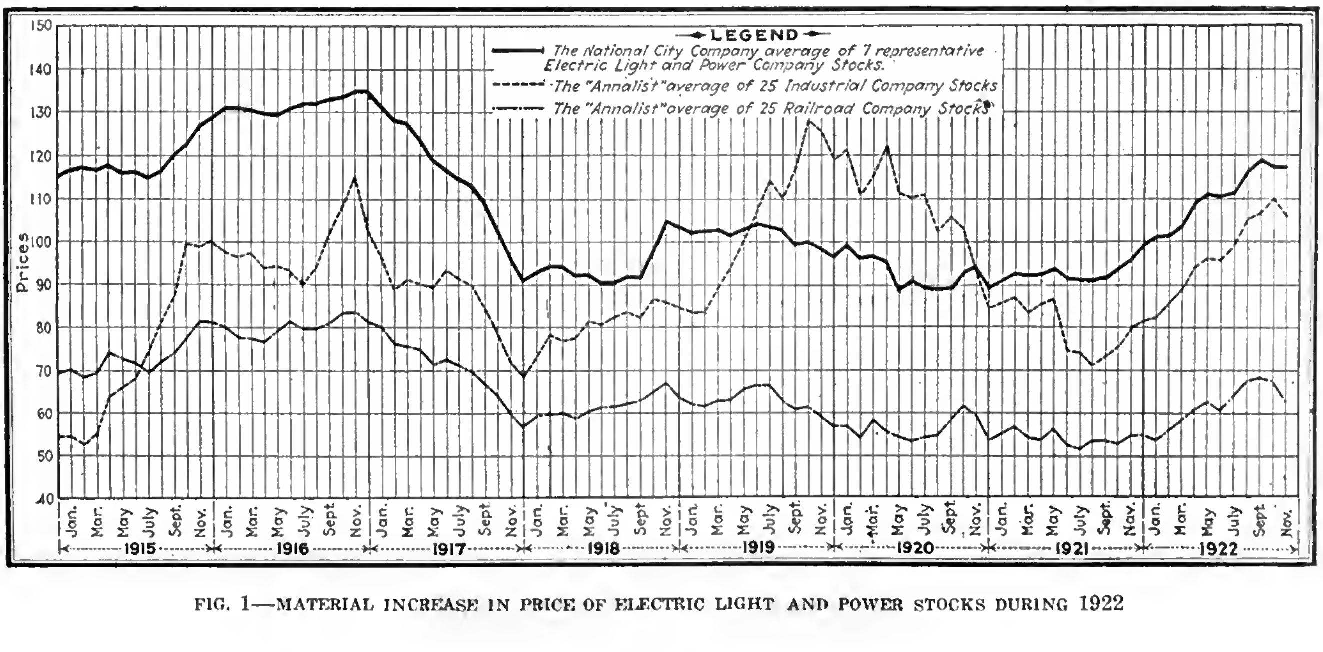

FIG. 1—MATERIAL INCREASE IN PRICE OF ELECTRIC LIGHT AND POWER STOCKS DURING 1922

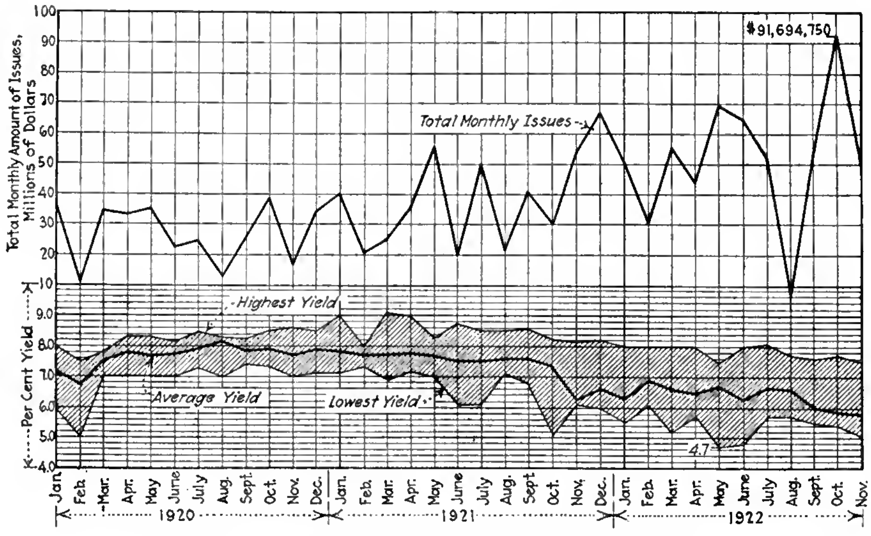

FIG. 2—MONTHLY ISSUES OF ELECTRIC LIGHT AND POWER SECURITIES, AND THE GRADUAL DECREASE IN YIELD

public utilities were hard hit by high operating costs and legal restrictions of rates. New legislation and recent court decisions, among the more notable of which was that handed down by the United States Supreme Court declaring New York State's eighty-cent gas law to be unconstitutional, have placed them on firmer ground and permitted in many cases rates that insure a reasonable return on invested capital.

Great improvement in the financial position of electric light and power companies throughout the United States in the past year attracted the attention of thoughtful investors, with the result that their securities were eagerly sought. Evidence of the increasing demand for and faith in public utility securities is seen in the fact that insurance companies, which invest millions of dollars every year for policy holders, have come to regard utility securities as a most desirable investment. This is a rather recent development—in years gone by the insurance companies invested their funds largely in railroad bonds and real-estate mortgages. Trustees and savings banks, when the state laws permit, are also coming more and more into the utility investment market. The fact that institutions such as these recognize the inherent soundness and desirability of such investments must be taken as significant of their intrinsic worth.

A feature of the year's financing of electric light and power companies was the unusually high percentage of new issues put out to refund called obligations which had been issued at a time when funds were costly. Corporations have been taking advantage of a comparatively easy money market to reduce their fixed charges by issuing new bonds bearing a lower coupon or by augmenting their capital stock largely through sales to their customers. A total of $80,587,290 has been issued in stocks since the beginning of the year. Whereas during 1921 it was possible only in rare cases to issue bonds bearing 5 per cent interest, 43 per cent of the total amount of mortgage bonds issued in the past year bore interest at that rate.

The accompanying graph shows the fluctuations in the rate of return yielded the investor. A comparison with the figures for 1921 reveals a marked decrease in yield, which ranged from the exceedingly low figure of 5.82 to 6.90. January's issues yielded on an average 6.28 per cent, a lower figure than was reached during the entire year 1921. February's yield was the highest of the year—6.90—and from that month until August the average rate of return fluctuated, ranging from 6.22 to 6.74. After midsummer the yield continuously declined until December, when the rate jumped to 6.59.

A further evidence of the optimistic feeling prevailing in the general securities market and in the case of the electric light and power securities as a group is to be seen in the rapid and almost uninterrupted rise in the averages of stocks. It is to be noted that the trend of prices of the seven electric light and power stocks selected by the National City Company has more than kept pace with the increases shown by the industrial stocks and the railroad stocks, records of which are kept by the *Annalist*. The electric light and power stocks have over a long period of years shown fluctuations in price far less in proportion than have the other classes of stocks. The industrials must of course, in connection with deflations in prices, take considerable inventory losses. The electric utilities, however, by virtue of the fact that their only commodities on hand consist of stored fuel and electricity on the wires, are in a truly enviable position on this score.

The future of the electric light and power industry appears to be indeed bright. With more constructive rulings by many public utility commissions, with judicial recognition of the right of companies to charge such rates as will make possible a fair return on investments, and with the sympathetic attitude of a large part of the general public, the central-station companies seem to be on the verge of a period of unprecedented prosperity.

ELECTRIC LIGHT AND POWER SECURITY ISSUES IN 1922

| | Amount of Issue | |
|---|---|---|
| MORTGAGE BONDS (average yield 6.01 per cent): | | |
| 45 issues at 5 per cent | $174,538,000 | |
| 7 issues at 5½ per cent | 28,150,000 | |
| 54 issues at 6 per cent | 158,902,800 | |
| 6 issues at 6½ per cent | 16,045,000 | |
| 19 issues at 7 per cent | 26,140,900 | |
| 1 issue at 7½ per cent | 500,000 | |
| 2 issues at 8 per cent | 725,000 | |
| 134 issues | | $405,001,700 |
| DEBENTURES (average yield 6.60 per cent): | | |
| 9 issues at 6 per cent | $26,800,000 | |
| 2 issues at 7 per cent | 4,500.000 | |
| 11 issues | | 31,300,000 |
| NOTES (average yield 6.29 per cent): | | |
| 2 issues at 5½ per cent | $16,000,000 | |
| 5 issues at 6 per cent | 14,750,000 | |
| 3 issues at 7 per cent | 3,800,000 | |
| 3 issues at 8 per cent | 650,000 | |
| 13 issues | | 35,200,000 |
| PREFERRED STOCK (average yield 6.96 per cent): | | |
| 2 issues at 6 per cent | $5,500,000 | |
| 28 issues at 7 per cent | 54,346,210 | |
| 8 issues at 8 per cent | 19,875,000 | |
| 38 issues | | 79,721,210 |
| MISCELLANEOUS ISSUES (average yield 6.68 per cent): | | |
| 1 issue at 5 per cent | $1,000,000 | |

# Big Strides Made in Industrial Electric Heating

*By J. L. McK. Yardley*
General Engineer
Westinghouse Electric & Manufacturing Company

## Applications of Industrial Electric Ovens and Heat-Treating Equipment Extending — Electric Steam Boilers for Special Service Have Aroused Interest

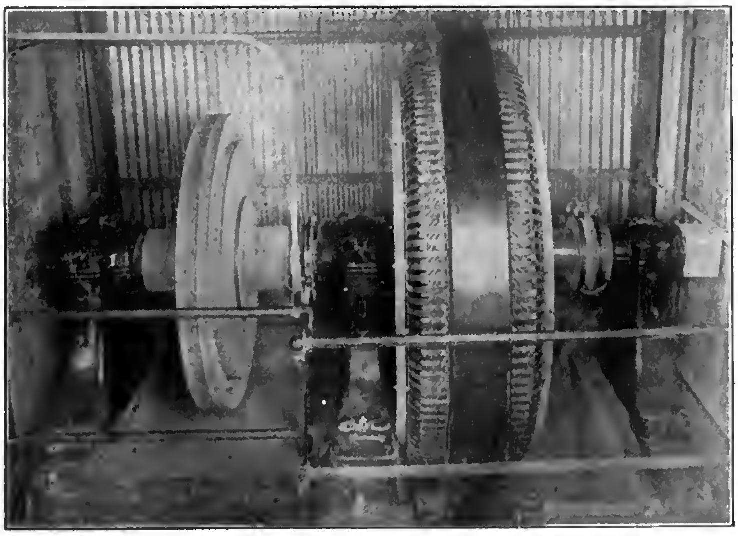
CONTINUED progress is being made in the development and application of apparatus for utilizing electric heat in industrial processes. Most striking, perhaps, are the strides which have been made in electric ovens, heat-treating furnaces and electric steam boilers. Arc-type melting and refining furnaces have become well established, and inductive heating has the inherent advantage of generating heat where it is desired, which makes its potentialities considerable. Rivet-heating apparatus has been developed to the point where it can meet moderate demands at low operating expense. Control apparatus for all of the foregoing apparatus has kept pace with these developments so that accurate and reliable operation is practically assured.

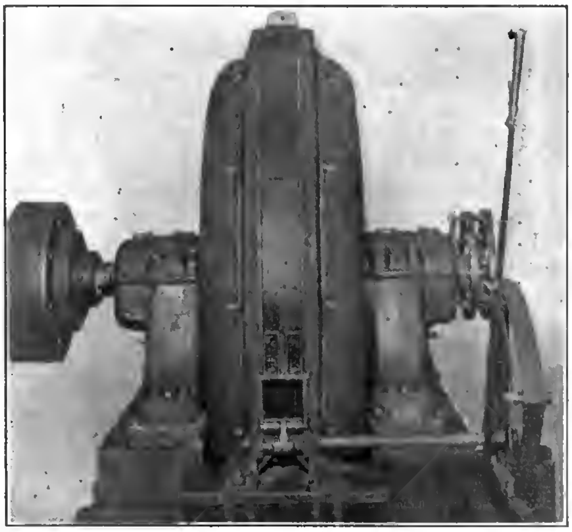
The development of the industrial electric oven rests upon a firm engineering and commercial foundation. Applications in the baking of electrical apparatus, foundry cores, japan, enamel and other processes requiring temperatures between 200 deg. and 700 deg. F. are continually extending. In the smaller sizes there is a tendency toward shelf-type ovens and toward vertical or tower construction for the particular purpose of saving floor space and employing some of the generally unutilized overhead spaces. Fortunately this sort of thing may be done in some low-temperature ovens if a relatively light conveying mechanism may be used, as the total weight is not so great but that the whole installation may be carried upon a comparatively light steel framework. Such possibilities are not inherent in industrial furnaces for higher temperature operations, owing especially to the much greater weight of refractories and heat insulation.

### ELECTRIC FURNACE AT 2,000 DEG. F.

The industrial electric furnace for heat-treatment operations of many kinds gives increasing indication of coming into its own at no far distant date. In the past there has been considerable disappointment through mistakes and inadequacies in initial constructions and through misapplications, due in all cases observed to insufficient analysis and preliminary consideration of the underlying situation, the exact condition the furnace must meet and the changes in conditions which it would introduce. However, experience and knowledge have multiplied. In the approximately 20 per cent chromium and 80 per cent nickel alloy we have a heating element of very long life if it is not mistreated. We have furnace constructions in crucible, pit, chamber

## Simplification Has Occurred in Machine Control and Protection and Improved Designs Are Available





The use of high torque, rotating stator, brake-band type of synchronous motor (shown at right) extends the field of application where space requirements may prevent the use of the clutch connection shown on the left.

and car-bottom types which approach in ruggedness the fuel-fired furnaces without unduly losing in efficiency. However, the details of many process applications must yet be solved by experts. Recent successful installations indicate that, with the help of moderate-priced power, we are honestly entering a period of extensive electrical applications for hardening, tempering, patterning, annealing, cementation or case-hardening and other processes requiring temperatures ranging from 1,800 deg. F. down to, say, 1,200 deg. F. The field for applications of electrical power in heat within this range of temperature is unquestionably one of the largest still potential. The estimate in the N.E.L.A. 1921 Power Sales Bureau report of a potential total connected load in glass annealing of 60,000 kw. covered merely one part of this field.

### Electric Furnace at 2,500 Deg. F.

Probably second to the above is the extensive field of forging operations, supplemented by high-speed steel heat-treatment processes, demanding temperatures within the range of 2,000 deg. to 2,400 deg. F. If the possibility of brass melting in the more than 3,600 brass foundries of the country be included, the potential field for electric power in heat at such temperatures is indeed great. Much commendable work, both in design and in application, has been done. More remains to be done in developing furnaces which will be readily and economically applicable to such processes. The engineering difficulties are great, owing particularly to the fact that the only practical resistor elements available, carbon and graphite, are rapidly oxidizable at the temperatures required. The resistors must, therefore, be absolutely secluded from oxidizing atmospheres in order to have long life and low maintenance. Hence in these applications the competition of fuel-fired furnaces, and in the case of brass of the arc and induction types of electric furnace, has been more difficult to meet.

The electric steam boiler, which is a special form of electrode-type furnace, has aroused considerable interest during the past year or two. The principle was employed on a big scale over fifteen years ago at Niagara Falls in the three-phase water rheostats which were used for loading the then largest 12,000-volt alternators while making acceptance tests. It has been incorporated in a number of very simple boiler constructions in which the amount of steam produced, and hence the amount of power consumed, may be controlled, automatically if desired, by regulating the water level. The electric steam boiler may become a very practical and helpful auxiliary to supplement or temporarily supplant the fuel-fired boiler in industries which require large quantities of steam and which are so located geographically as to have available waste or cheap hydro-electric power. The particular field for such boilers in large sizes would appear to be as an auxiliary to hydro-electric systems in territories where it has been found impracticable to approach 100 per cent load factor with pulp grinding, electrochemical, electrometallurgical or other loads.

It appears more than probable that a host of successful applications will be found for electric steam boilers in small sizes; say 5 boiler-hp. or less, in locations having moderately priced electric power, generated by steam or water power, in special processes, in isolated parts of industrial plants, in garages, in public buildings, in laundries and domestic use, in climates having only brief and irregular periods of low temperature. Such applications probably must usually be new or isolated or beyond the capacity of existing fuel-fired boiler plants. It is obvious, for instance, that when public service companies such as the Boston Edison Electric Illuminating Company will sell steam in quantities less than the output of a 5-hp. boiler at $1.30 per 1,000 lb., and at a smaller price for larger quantities, only very special and exceptional circumstances would permit the existence of an electric steam boiler within reach of its steam lines.

Today there are probably more than a thousand arc-type melting and refining furnaces in the world, of which more than four hundred are in the United States and employed in the iron and steel industry. The special reasons for the expansion of electric steel making are the reduction of wholesale power rates, the extreme flexibility and adaptability of electric furnaces to a wide range of uses, and the quality of the products. With the electric arc furnace a reducing atmosphere can be maintained which enables the removal of sulphur and manganese sulphide, thus making it possible to readily eliminate oxides. The furnace may be used alone or in conjunction with the Bessemer or open-hearth type, or both. It may also be used in connection with the blast furnace or cupola for making semi-steel, gray-iron and malleable-iron castings. Furthermore, it may be operated either acid or basic. The popularity of the arc furnace is increasing most rapidly in the small high-grade steel or iron foundry, owing to its advantages in small units for making frequent small heats. The desirability of relatively high voltage for melting and low voltage for refining is now generally recognized.

### Arc Furnace Coming Back

As a means of melting brass the arc-type furnace is attracting increased recognition, the advantage of rapid operation outbalancing the early criticism that the arc would unduly volatilize the non-ferrous materials. Possibly the best indication of the sound basis on which this application stands may be read in the recent announcement by one of the oldest and best known builders of fuel-fired melting furnaces for brass of a line of electric furnaces for brass melting employing the arc principles. The construction embodies the familiar pair of horizontal electrodes operated from a single-phase transformer; otherwise it retains the seasoned features of the oil-burning furnace, with some modification perhaps.

The possibilities of inductive heating should be kept in mind since it generates heat directly in the material to be heated. When suitable heat insulation is provided, the temperatures obtainable are limited only by the fusion temperatures of the best refractories.

The high-frequency induction furnace has come as a boon to the scientist engaged in the study of properties of matter at high temperature and under controllable chemical conditions. It is commercially promising for heating in vacuum, for melting silver, gold, platinum and precious alloys, and for melting of very high-grade alloys of steel and non-ferrous metals. The units are small, so that a total of over 1,000 kw. installed, or double the amount two years ago, represents a widely diversified field and indicates a growth that appears healthy.

The low-frequency induction furnace is being applied —particularly for commercial uses—in the melting of

non-ferrous metals and the production of brass. In fact, some foundries where continuous operation is the rule use this type of furnace only. New modifications of the low-frequency induction type are being brought out from time to time, indicating the interest that is taken in improving this application, although it seems to be on a successful basis already where established.

An example of the employment of commercial frequencies in a somewhat similar manner is found in the type of rivet heater in which the rivet forms a part of the transformer secondary circuit and is heated by the $I^2R$ losses. The outstanding characteristic of this type is that the individual rivet may be heated exactly when wanted. However, constant attendance or close-control mechanism are necessary to prevent burning; otherwise, if the rivet is not required just when expected, then the energy of heating is wasted.

### New Type of Rivet Heater

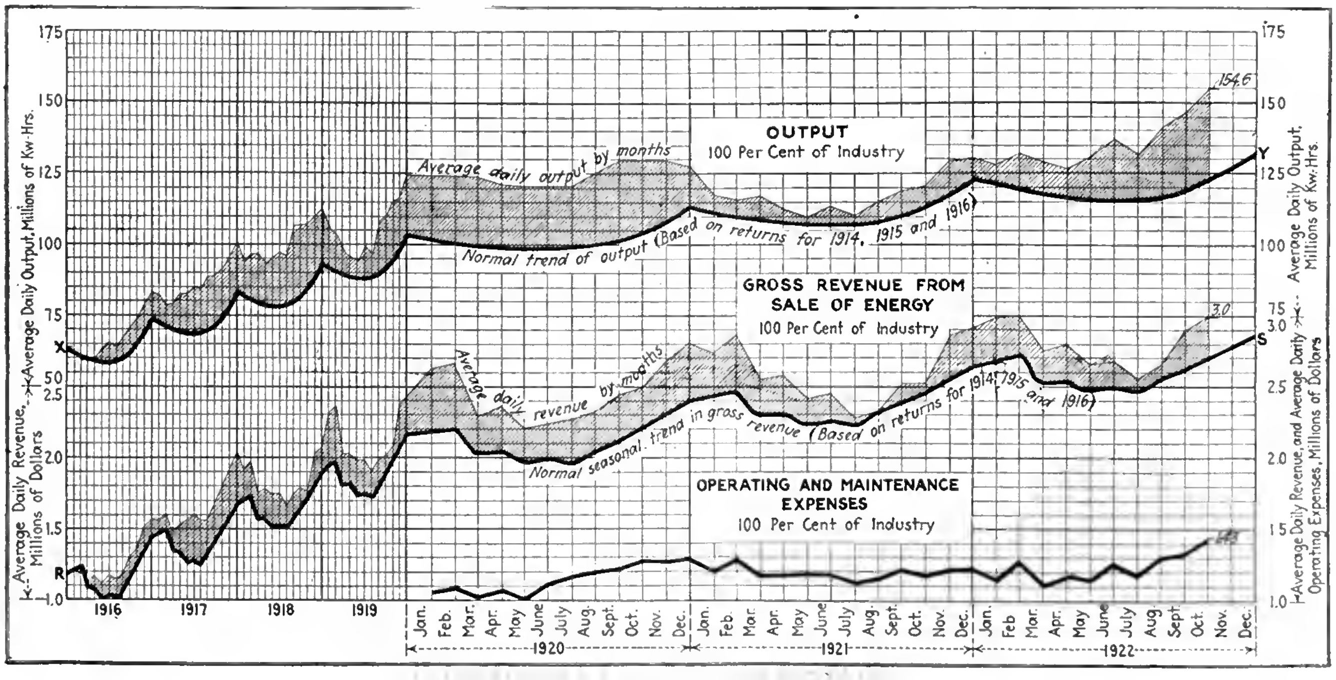
A type of rivet heater which gives promise of becoming popular consists of a chamber capable of holding fifty rivets or so, air-tight, except at the door, perhaps lined with non-oxidizing metal, and surrounded by heating elements and generous heat insulation. Such a heater kept filled with rivets and under pyrometric control is capable of meeting sudden demands for rivets in small quantities at any moment; still, it operates at a very low expense between demands owing to low radiation losses and the absence of attendance.

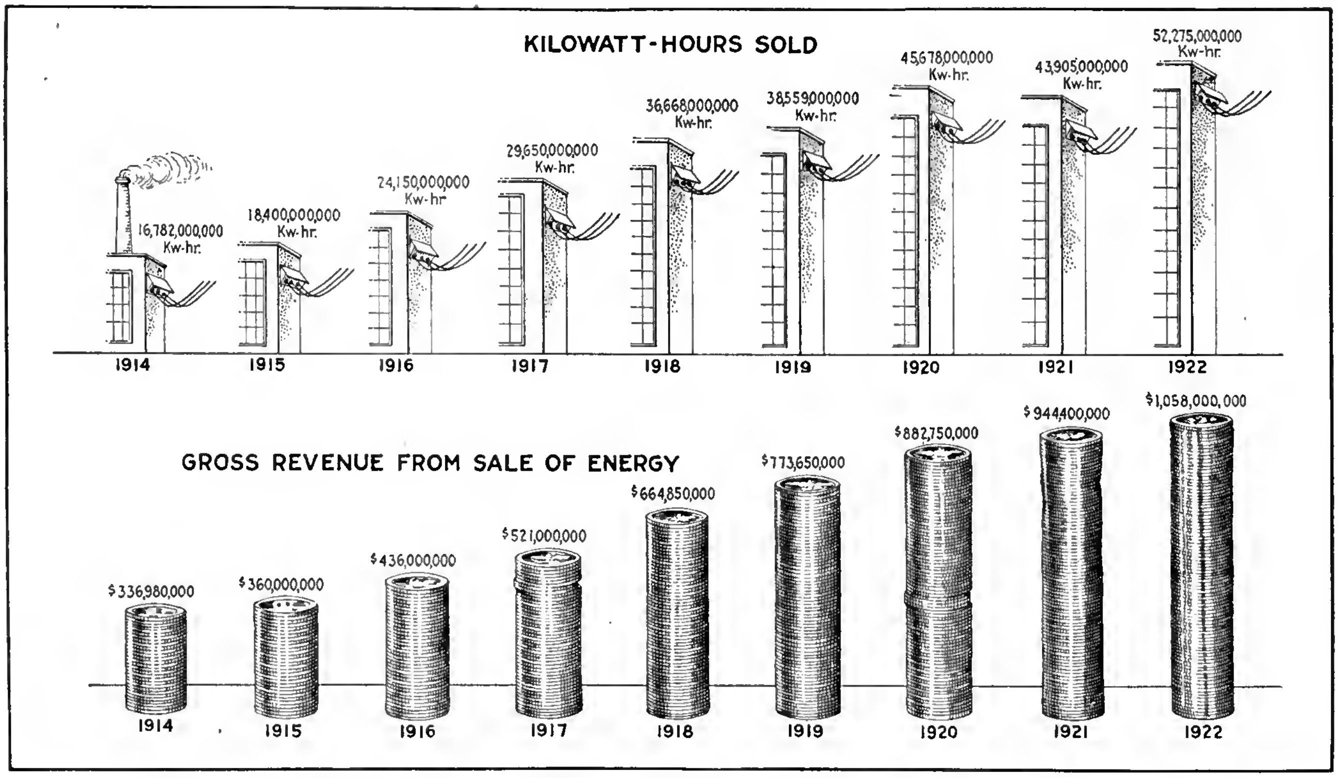
The regulation of the arc-type furnace, owing to the highly concentrated heat and intense temperature of the arc, must necessarily be controlled by current or kilowatt input. Several effective regulators have become fully developed which will hold the input with sufficient accuracy to a constant value according to the setting. The setting is changed during the cycle by the operator, as determined by the maximum permissible power demand and by the particular melting and refining periods desired for the kind and amount of charge. Induction furnaces require special controlling apparatus. For the resistor type of furnaces, at least below 2,500 deg. F., methods of pyrometric control have been fully worked out by which the electrical input in the furnace is controlled according to the temperature of the work itself by means of one or more thermocouples placed in the furnace chamber adjacent to the work. The actual temperature variation below the maximum, within a furnace chamber, over a cycle, of course, depends upon the initial temperature and weight of charge, the amount of stored heat in the furnace walls and the rate at which energy is given up by the heating elements and absorbed by the charge after power is turned on. Radiant-type heating elements disposed as uniformly as possible about the work tend to give up heat at the greatest rate, owing to the resistance to heat flow from the source being a minimum. The maximum chamber temperature and the actual operating temperature after the work has reached the desired temperature are susceptible of the closest possible control by the pyrometric method, inasmuch as commercially available indicating and recording pyrometers are highly sensitive and, through secondary relays, will actuate contactors in the supply circuit upon changes in temperature even so little as one-half of 1 per cent above and below the setting. The accuracy, flexibility and reliability of pyrometric control, more than anything else probably, constitute the appeal of the industrial electric furnace in heat-treatment processes.

# Energy Output More than 52,000,000,000 Kw.-Hr.

THE year which has just closed was one of record accomplishments by the electric light and power industry. For the first time the industry really takes its place among the giants of the business world of America. The upward swing has never been so pronounced as it was during 1922, and it points unmistakably to still greater accomplishments during the coming year.

Statistically, at least, the greatest advance made during the year was in the amount of energy sold, gross income from sale of energy, increase in invested capital,





THE INDUSTRIAL DEPRESSION OF 1921 WAS REFLECTED IN THE SALE OF ELECTRICAL ENERGY, BUT THE YEARLY GROSS REVENUE HAS NEVER SUFFERED A DECREASE

increased installed generator rating, and the large number of new customers added to the lines. It is estimated that 52,275,000,000 kw.-hr. of electrical energy was sold by the industry during 1922, which is an increase of 18.8 per cent over 1921 and 14.4 per cent over 1920, the peak year of post-war industrial activity. It must be remembered that this huge figure does not represent the actual amount of energy consumed during 1922, but is the amount of energy actually sold by the various distributing companies, some of which was sold to other public utilities for resale and so is counted twice in the resulting tabulation.

Data so far issued by the United States Geological Survey indicate that the energy actually generated during 1922 will total about 48,100,000,000 kw.-hr., of which about 8,700,000,000 kw.-hr. was lost in transmission, giving a total of about 39,400,000,000 kw.-hr. as the electrical energy consumed by central-station customers during 1922. It is estimated that this record output figure required an added generator installation in the year of approximately 1,650,000 kw. in the central generating plants of the country. Even with this large addition to the total generator rating many central stations in intensely industrial sections of the country were reporting inability to supply the energy requirements, especially during November and December.

For the first time the electric light and power industry takes its place among the billion-dollar industries of the country in value of products. It is estimated that the gross revenue from sale of energy during 1922 totaled $1,058,000,000, which is $113,600,000, or 12.0 per cent, above that reported for 1921. This large increase is undoubtedly due to the addition of about 1,200,000 new high-revenue domestic lighting customers and about 150,000 commercial lighting customers during the year, although the record industrial energy requirements of the last third of the year must not be overlooked in this connection. It is estimated that the operating and maintenance expenses of the industry totaled $484,000,000 during 1922, which is approximately $52,000,000 over that reported during 1921. The expenses for the year would undoubtedly have been materially less had it not been for the coal shortage and consequent high price of fuel in the last half of the year.

In amount of invested capital, the electric light and power industry assumes a place of added importance as a member of that select group of six industries with a capitalization of more than five billion dollars, the other members of which are chemicals and allied products, food and kindred products, iron and steel, mines and quarries and the textile industry. The capital invested in the electric light and power industry on Jan. 1, 1923, is estimated at $5,100,000,000, which is an increase of $500,000,000 over that of Jan. 1, 1922. The National City Company, which keeps very close new-capital tabulations, estimates that of this new capital invested in the industry during 1922 approximately $250,000,000 was from the sale of securities and $250,000,000 was from reinvestments of earnings in the property.

The accompanying curves indicate that the average daily energy sold during October was 154,580,000 kw.-hr., which was 5.4 per cent above the previous record figure, reached in September. The average daily gross revenue from the sale of energy during October was $3,006,000, which was a few thousand dollars below the record revenue reported during February, 1922. Every section of the country except the South Central and the Mountain Pacific States reported large increases in output over September. The decrease in the Western States was probably due to the seasonal decrease in energy requirements by irrigation customers.

# Hydro Projects Will Total $778,300,000

## Active Applications Filed with the Federal Power Commission Total 334, Involving 17,692,109 Primary Horsepower — Projects Involving 2,531,489 Primary Horsepower Now Under Construction

THE activities of the Federal Power Commission form an excellent barometer of present and future hydro-electric developments in this country. There are very few water powers of any magnitude the development of which does not to some degree affect public lands or navigable streams, thereby falling under the jurisdiction of the Federal Power Commission.

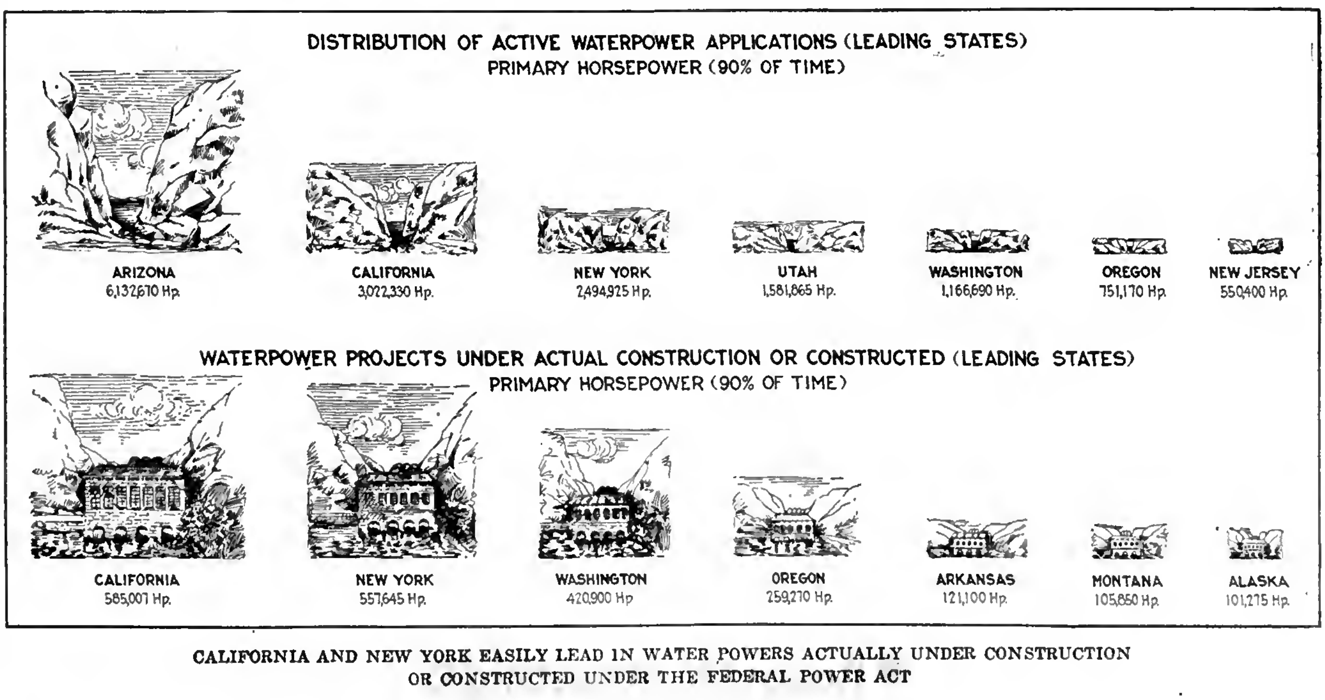
On Dec. 1 334 active applications were on file with the commission, of which thirty-four were for transmission lines. The projects involved in these applications total 17,692,109 primary horsepower available 90 per cent of the time and an estimated installed capacity of 27,804,394 hp. During the fiscal year 1921 a number of deductions were made on account of withdrawals and rejections. These, if included, would involve a total of 21,004,759 primary horsepower and an installed capacity of 31,938,694 hp. The Federal Power Commission has issued sixty-nine final permits and sixty-five licenses, involving a total of 2,531,489 primary horsepower and an estimated installed capacity of 4,898,509 hp. The distribution of these hydro-electric projects by states will be found in Table I.

The estimated capital involved in the water-power projects now under preliminary or final permits and licenses totals $778,300,000, distributed as follows:

| | |
|---|---|
| Investment involved in projects now under preliminary permits, if finally constructed under licenses | $576,000,000 |
| Investment involved in projects under license constructed and under construction | 283,200,000 |
| Investment involved in projects already constructed at time of obtaining license | 80,900,000 |
| Net investment involved in projects now being constructed | 202,300,000 |
| Total investment involved in projects now under construction or to be constructed under license, plus investment involved in projects now under preliminary permits | 778,300,000 |

Assuming that for each kilowatt developed $110 will be spent for transmission equipment, $100 for distribution installation and $750 for customers' lamps, motors and appliances and wiring of houses and factories, a total of about $4,993,000,000 will be spent as a direct result of these developments. Adding these two totals together gives a total probable capital investment of about $5,771,300,000. This figure does not take into consideration the further investment for reserve steam-plant equipment, which would undoubtedly bring the total amount thus invested to well over the six-billion-dollar mark.

Probably the most significant fact to be derived from these figures is the insistent demand all over the country to have water power developed. This is doubtless primarily the result of the post-war coal situation, but the movement has been materially aided by the passage of the federal water-power act. Coupled with this is the thought that east of the Rocky Mountains practically all feasible water power is likely to be developed within a comparatively short time, although in this area coal will probably always be the mainstay for power production. In the West there is ample water power to supply all needs for at least a century, and probably much longer, and as time goes on the relatively cheap power of this region would seem almost inevitably to lead to the building up of industrial centers of considerable magnitude. A start in this direction has already been made. In a few regions such as central California and the Salt Lake basin complete development of the important water powers is already in sight, but in these localities there still remains a possibility—



CALIFORNIA AND NEW YORK EASILY LEAD IN WATER POWERS ACTUALLY UNDER CONSTRUCTION OR CONSTRUCTED UNDER THE FEDERAL POWER ACT

TABLE I—ACTIVITIES OF THE FEDERAL POWER COMMISSION COVER EVERY SECTION OF THE COUNTRY

* Add 3,312,650 hp. for deductions made during fiscal year 1921 on account of withdrawals and rejections for total applications.
** Add 4,134,300 hp. for deductions made during fiscal year 1921 on account of withdrawals and rejections.

one might almost say a certainty—of obtaining large blocks of energy by long-distance transmission lines from regions in which a great surplus of water power is available.

The administration of the water-power act by the Federal Power Commission has been hindered by an insufficient engineering staff, the direct result of small Congressional appropriations. The cost of administering the act has been low, especially when the flood of applications involved is taken into consideration. The commission's expenses for the fiscal year ended June 30, 1921, its first year of operation, were $29,371.74, of which about one-third was the cost of the initial equipment for its offices. The commission deposited in the Treasury $8,963.57 from fees prescribed in licenses issued during that year. The operating expenses for the fiscal year 1922 in round numbers will be $37,000, and receipts, including land rentals, will total $29,000. Therefore, the net cost of operations during the second year will be $19,500, as compared with $20,630.09 for the first year. With the exception of the salary of the executive secretary of the commission, the salaries have been borne by the three government departments, according to the water-power act, and the field work has been largely delegated to the field forces of these departments.

Following is a summary of the cost of administering the federal water-power act during 1921 and 1922:

| | 1921 | 1922 |
|---|---|---|
| Operating expense | $29,371.74 | $37,000.00 |
| Salary expense | 59,878.63 | 81,049.78 |
| Field expense | 20,710.00 | 30,000.00 |
| Gross expense | $109,960.37 | $149,971.78 |
| Deducting administrative fees received from licenses for water-power development | 8,741.65 | 24,500.00 |
| Net cost of administering the act | $101,218.72 | $125,471.78 |

Table II gives detailed cost data on some of the more important projects now under construction. Cost data on other projects under construction appeared in the May 13, 1922, issue of the ELECTRICAL WORLD.

Some valuable cost data are also contained in the applications for transmission lines. The 220,000-volt, single-circuit, three-phase steel-tower line leading from the Pit River development in California is especially interesting. One section of this line consists of 27.8 miles of steel-reinforced 518,000-circ.mil aluminum-steel reinforced cable and 32.2 miles of 500,000-circ.mil stranded copper; the total section is estimated to cost $1,060,000, exclusive of right-of-way or overhead charges. Another section consists of 32.2 miles of 500,000-circ.mil stranded copper and cost $470,000.

# Practical Economies the Keynote

*By Earl E. Whitehorne*
Commercial Editor ELECTRICAL WORLD

### Manufacturer and Distributor Have Determined to Eliminate Waste Through Standardization, Simplification and Curbing Useless Competition

FROM the viewpoint of the manufacturer and the jobber the past twelve months in the electrical industry have been extremely interesting and significant, and the next year promises even more important developments. As in nearly all other industries, the overshadowing problem of the moment is one of practical economies. A great desire is expressing itself through every branch of industry that ways may be found to reduce the cost of the nation's goods through the elimination of waste both in distribution and in production. This has an academic sound, but it remains the fact and it affects all men; and the year has seen a very practical evidence of the determination of both organizations and individuals at least to start some effort that will help toward the realization of such a benefit.

Courage has come back into the business of the country, and there has been much intensive selling both by the manufacturer and the distributor, but it has not been the type of free and open market building with intense absorption in the pursuit of orders that we knew for so long before the war and through the days of boom that followed. There has been an unhappy strain running clear across it. For while men have been busy, they have not been enjoying the measure of prosperity that the volume of business would seem to indicate. Good times were seen to be returning, and yet it was patent to all that these "good times" were unhealthy at the core and it was known that "something" had to be done to cut down costs, relieve excessive prices and produce profits that would compensate for the work and risks entailed. And so a spirit of unrest has existed and there has been a struggle for relief manifested in several directions.

#### The Need for Simplicity

Manufacturers have more generally begun to recognize the need for simplification of their lines through reduction in the great number of excess varieties. They have been scrutinizing their catalogs and devising ways to retire numbers that differ only superficially and duplicate one another in the essentials and by this duplication increase inventories for both the jobber and dealer as well as for the manufacturer, eventually causing increased cost to the ultimate purchaser.

At the present time, to take a common illustration, there are on the market an unconscionable number of sockets. Again, one manufacturer has actually on schedule 3,200 standard motors, most of them differing from one or many others only in some trifling detail that might well be brought to a common standard but for the profligate habit of giving unnecessarily costly service and paying extravagant deference to the whims of the buyer or the endeavor to develop something just a little "different" for a "selling argument." There is no lack of other striking examples within the observation and knowledge of every one.

How to deal with the actual act of simplification—how to proceed—is the unanswered question. That such excesses exist in many lines is recognized freely, but fear of competition interposes many obstacles to action. Many believe that if they "cut out" this type or that, some other firm will specialize upon it and profit at their expense. Moreover, the process of simplification must be so under control that it will not exert an influence against the development and perfection of new inventions and stifle the progress of the art and the industry.

#### The Need for Statistics

It is also the common concern of both the manufacturer and distributor that their part of the electrical industry is today operating almost without statistical knowledge. As a result there has been a tremendous amount of varied and hit-or-miss production and numerous cases of over-stock or under-stock due to ignorance of the market. The industry, for example, does not know how many small motors are made in any period, nor what at any time has been the production or the sales, nor what is the condition of the stocks over the country. It is the same with other commodities.

The practical usefulness of such statistics in these times is clear. For such knowledge would in itself tend to reduce stocks of both raw materials and manufactured products and to decrease the number of styles, types and varieties. It would also produce a greater flexibility in the adjustment of price changes and the maintenance of adequate reserves. Today, when a slump in business comes unexpectedly, no one is cognizant, except in the most general way, either of its cause or its probable duration or effect, and factories proceed as long as possible running at full time and building up stock, buoyed up by the hope that an early reaction will find them in readiness for profitable sales. And this old stock but adds to the confusion and the burden of the situation.

These are all influences in production and in distribution, elements in the present excessive cost of goods, part of the problem which all men of the industry are pondering today. Electrical men are trying to see their way through and out of it and realizing more and more how all are involved in it, the burden that it lays upon the business of the light and power company and the contractor, as well as the manufacturer and jobber. For it is in these fundamentals, these background elements, that the trouble apparently lies.

Through a period of thirty years of rising prices,

increasing prosperity and advancing standards executives of the industry have kept too close a focus upon themselves and their own organization problems of activity and growth and have given little concern to the economics of the industry itself. It has been no part of the bustle of the business day to see that the electrical industry was fabricating all its parts into an efficient and enduring system.

### The Need for Inspection Uniformity

And so, to glimpse another side of it, there has evolved through all the influences of chance a great diversity of state and governmental requirements resulting in a baffling absence of uniformity in inspection standards in different sections of the country. A safety switch, for instance, might be required in Oregon to have its cover hinged on the side, in Colorado at the top, in Ohio at the bottom, and in Connecticut all hinges might be banned and screws required. Wide difference is found in the requirements for fusing and connecting motors and in other details of electrical installation where either fire or safety hazard is involved, varying not only with the state and city but often with the interpretation given to these rules by local inspectors.

Such a condition, developing gradually through lack of guidance and control, has naturally administered a further impulse to the increase of varieties and stocks and added just so much more to the burden. It will inevitably demand some sort of a constructive, remedial treatment that will establish uniformity and eliminate the waste now so conspicuous by setting up common standards that can be applied throughout the land and that will afford a greater measure of stability because they will not change too rapidly or without ample warning so that stocks and production may be adjusted.

These are all parts of the picture, elements in the all-embracing economic problem that is engaging the best minds of industry today. It is a time of close analysis. Men are searching for facts and the process has not yet reached a stage where these facts have been made articulate to any satisfactory extent. But there are plenty of definite evidences of the inclination in the electrical industry through the closer organization of the groups and the greater activity they are exhibiting. The union of the Associated Manufacturers of Electrical Supplies, the Power Club and the Electrical Manufacturers' Club is an expression of it. The twelve months' analysis of the jobbers' cost of doing business which became available this year is an expression of it. The investigation into the cost of merchandising by large central-station companies reported this fall is an expression of it. The organization of separate merchandise departments by the industry's two largest manufacturers, to focus constructive effort on the development of better retailing through the industry, is an expression of it. The closer relations which have been established between these two great manufacturing institutions and the respective groups of jobbers who form their distribution systems is another expression of it. It is a broad mass movement in the right direction, a general impulse driving men to find the truth as their only recourse if the problem that besets them is to be solved.

But there is no place where any one can put his finger on the record of last year and say: "Here is where the movement started. Here is what has been accomplished." It is all in the formative stage in which men have been spending more time in looking beyond their own office walls and studying their industry. And they have done more than this. They have talked and argued out some common principles and purposes and they have taken practical, progressive steps to organize these purposes into co-operative action.

Simplification is a problem of production. First, it is a problem of the individual because each manufacturer first must scrutinize his own line and see where he can save. Then it becomes an industry problem if uniformity and standardization are to be achieved. And already many companies are taking the first steps in this elimination process.

### Problems First of the Individual

The production of statistics is also first a problem of the individual, for each man must make up his own mind that he will develop the statistics that are needed on his own production and contribute them to the knowledge of his industry. Then it becomes a matter of compiling and combining these statistics into mass figures. A considerable degree of progress has been made toward the establishment of such a statistical service from the electrical industry, to report on production, stocks and sales, the figures to be cleared through the United States Department of Commerce in accordance with the plan of Mr. Hoover.

And to a certain degree in the same way the more immediate and pressing problem of waste in distribution is first of all an obligation on the individual. For, although one is apt to think of it as essentially a trouble with and of the jobber, the fact remains that all have a part in it. The line that the manufacturer sells the jobber and the way he sells it is a part of it. The material that the central-station company, contractor or dealer buys from the jobber and the way he buys it is a part of it. For excess varieties, shipping units that require avoidable repacking, overstocking through ignorance of market trends, small-order purchasing and extravagant demands for service all contribute to the price that must be charged when goods are sold. And all this is now being recognized more and more, for the public is insistently demanding a less expensive system of distribution of the goods it buys, and there is a power behind such a demand that cannot be denied.

### Too Much Competition

Steadily comes the growing conviction that at the bottom of it all is an uneconomic excess of competition—too many manufacturers producing duplicating lines in too great variety and too small volume, too many jobbers stocking and selling too many lines of too many articles and both buying and selling them in too many small shipments, too many contractors and retailers doing each so small a part of the available business that too few can prosper. It is the outgrowth of the rapid rise of this electrical industry, which has made it a loadstone to ambitious men. It is the product of boom times and quick expansion. And the inflexible laws of economics will operate and through consolidations and bankruptcy reduce this waste, also a painful but a curative process as it affects the industry in its entirety.

These have been the movements of the past year. These are the trends that will be seen in active progress through the years immediately ahead. And wise is the man who will take heed and look ahead into this evolution, that he may find and take his place in it.

# Commercial Trends of the Year

An Analysis of Central-Station Commercial Practice Shows a Spectacular Awakening to New Thoughts, Activities and Policies

OUT OF the background of the year that has just passed stand some very definite and important trends in central-station commercial practice. There have been no revolutionary changes, no violent contradictions of former theory. Rather there has been a reawakening, part of the general recovery from the commercial doldrums in which the business of the country was so long becalmed. But is has been a spectacular awakening, and out of it have come abrupt transitions of thought and policy that are notable in the commercial history of light and power companies. And some of the incidents of this awakening offer valuable material for guiding thought on the part of executive and department managers who have in their keeping the framing of the programs for commercial development that will function through the next few years. During 1922 the central-station industry apparently succeeded in shaking off the apathy that followed the benumbing influences of the war, when, from the standpoint of commercial organization, the companies found themselves, in a bad way. Salesmen had been transferred to other departments or been discharged or had found for themselves other jobs when the selling activities were curtailed or abandoned. Department managers had gone elsewhere to find a living opportunity or had become so demoralized and discouraged by the restrictions put upon them that for the most part they were either treading water or drifting with what little progressive current they could discover. Executives had turned their minds from the subject and occupied themselves with other things. Then suddenly it came over them all at once that times at last were changing—had changed.

THE ELECTRIC VEHICLE HAS PROVED ITS ECONOMY IN CITY DELIVERY SERVICE

For money had at last become plentiful and cheap enough to borrow and to spend. People had begun to buy things once again with something like the pre-war appetite. It had therefore again become possible to take up the work of creative market development and sell light, heat, power and appliances in the old way or a better way, and to provide capacity where expansion could not be undertaken without it.

This change of heart came in a great, slowly gathering ground swell of sentiment that swept the industry from stem to stern. Department managers felt the unfolding of opportunity for renewed selling and appealed to their chief. The executives thought more and more about it, talked together when they met and gradually gained conviction. Finally the hobbles began to be loosened and commercial staffs were told to go ahead. And it was only a step from there to the point where the executives were beginning to exert pressure upon their selling people to speed up the program for new business, and that is substantially the state of things today. But it is not so simple as it looks, because comparatively few central stations have carried through an organization adequate for the proper handling of the situation now that the time is right and the word has come to go ahead. This commercial reawakening in the central-station world, this new, eager effort to get back to work and sell electric service to the community for all that it may do, has manifested itself in very clear-cut reactions. There is probably no executive and no department manager who would not have preferred to sit back and make a careful analysis of the market and the opportunity—as to both the qualitative and the quantitative aspects. For it is only in the well-balanced selective development of business that the highest returns of profit can be obtained and the highest value in service rendered. But the spirit of the year was all against it. The demand was for something to be done at once, and the facilities for doing the job were almost universally inadequate. Therefore the only course was to turn to the most available source of business and to attempt to specialize on selling that would bring the best results with the minimum of work and delay.

The result has been a very extensive activity in the stimulation of house wiring by central stations, a new movement to develop a better standard of store and window lighting, renewed interest in appliance retailing, followed by a searching inquiry into merchandising policies, and a very much greater attention to the possibilities of the electric vehicle. At the same time the sale of industrial power and heat has stiffened and increased, and a very general movement has been seen in the demonstration of electrical appliances to the public, as an educational influence, and in the organization of co-operative leagues representing all the electrical interests in a community to advance the common cause.

All these things, of course, are not the clear-cut products of the year 1922 alone. In several instances headway had been gathering for some time back, but it is fair to say that the trend crystallized in 1922 into definite form and progress that demands attention.

The trend in wiring has been spectacular. In Cincin-

nati twenty thousand homes were wired last year and 15,000 the year before in a great, intensive drive to put electric light into every household. The work has been done by organized high-pressure selling with a crew of salesmen working from house to house. This campaign is now completing its second year and will continue until the approach to virtual saturation makes it expedient to taper off into the work of equipping with appliances these homes already wired.

There has been intense activity in all sections of the country. Electrical contractors, after their lean years, have actively co-operated whenever the central station has led the movement with selling and publicity, and in every case it has been demonstrated that house wiring can be sold. Out of it has come a new mental attitude toward wiring. The Central Maine Power Company conducted a spirited campaign and in a period of six weeks wired 2,214 homes. In Boston, Philadelphia, Buffalo, Cleveland, Cedar Rapids, Denver and on the Pacific Coast homes that had been long passed by as an unpromising field have been wired through the influence of a selling impulse that emanated from the central station. The central station, therefore, is beginning to recognize the great opportunity for load building that can be developed through the installation of electric facilities in more and more homes. In Cleveland, St. Louis and other cities this has taken the form of a service to furnish wiring plans that is having great influence in increasing the number of outlets going into homes and in bettering the market for appliances.

GOOD ILLUMINATION IS A RECOGNIZED ASSET IN SALES STOREROOMS AND APPLIANCE SHOPS

The trend toward store lighting appeared for two reasons: Present conditions offer tremendous opportunity for improvement; then it is a business that is easily accessible, because the stores are for the most part grouped in a shopping center, and any success in selling improved equipment to them will set up a wave of interest in improved illumination among all merchants. A recent survey in Cleveland developed the fact that 30 per cent of the store lighting and 72 per cent of the window lighting could be classed as poor, and this in itself indicates the amount of business that awaits the central station in this field.

### New Interest in Store Lighting

A very definite effort is being made under the leadership of the N. E. L. A. Commercial Section Lighting Sales Bureau to prepare statistical data on store-lighting practice that will give the salesman the same sort of well-grounded facts that have been in a large measure responsible for the improvement in the standard of industrial illumination. In Chicago, in Boston, in New Orleans, in Duluth, the lighting companies have been particularly active in this work and have made remarkable progress. The attention of the industry has been aroused and store lighting is proving a most profitable source of increased business.

### Merchandising Policies an Issue

The trend in appliance selling has been a matter of almost universal interest. With the general quickening of household buying, dealers and central-station companies have put more and more effort into the sale of household services and the market has responded. In Chicago a system of selling from wagons was introduced, each wagon working in a district, served by a crew of canvassers who sold from house to house, and so successful has the effort been that in spite of the fact that the central station there maintains a very large electric shop and five branch stores, about 60 per cent of all appliance sales are being made by the outside men.

There has also been an interesting movement by a number of central stations toward the establishment of branch stores. The Texas Power & Light Company, the Kansas Gas & Electric Company and the Pennsylvania Power & Light Company have all opened a chain of stores in the various communities they serve, and in these the appearance of the store and the method, stock, prices and policies have been standardized. So well has the idea of central-station merchandising taken hold that the Union Gas & Electric Company of Cincinnati, having sold out its appliance business some time ago to an independent dealer, has bought it back again and is organizing for an energetic appliance-selling campaign. In Philadelphia the company has adopted mail-order methods and a far more aggressive policy.

The whole central-station industry is gradually becoming convinced that the light and power company should sell appliances and at a profit, and this has led to a thorough investigation of the present cost of selling merchandise by a group of the larger companies. As a result it has been demonstrated, as was announced in the fall, that as a class central-station companies are ignorant of their cost and are actually losing money on appliance sales. This has focused the thought of the entire industry on the weakness of present merchandising policy. Much good is bound to result.

### Vehicles to the Front

The electric vehicle is coming surely back to life as a central-station commercial objective. The trend is unmistakable. In New York, Chicago, Boston, New Orleans, Los Angeles and Fresno vehicle departments are now in operation. Realization that one 5-ton truck will consume 10,000 kw.-hr. per year, or the equivalent of 100 flatirons, is making an impression on the minds of executives who are looking about for load. Manufacturers have responded to this encouragement and are advertising to truck owners more energetically and effectively. A parade of 125 electric trucks was staged on Fifth Avenue during the Electric Show in New York, and a fleet of electric taxicabs is now in operation in that city. The electric vehicle is gaining.

Power sales have been maintaining a steady progress, but it is no longer necessary for the power salesman to camp on the prospective power user's doorstep to

secure his motor load. Central-station power salesmen have succeeded in establishing personal confidence, and power users are now ready to accept their statements of the advantages of electric drive.

One feature which has been overlooked is the installation of adequate lighting equipment in factories at the same time that motors are put in. Some companies, notably the one in Dayton, have made headway in this direction. Power customers are depending more and more on the advice of power engineers on motor equipment, particularly in application to special machines. Frequently when new machines are bought from tool manufacturers, instead of ordering motors to come with the machines the central station is called upon to specify the motor.

### Industrial Heating Increasing Rapidly Because of Its Economy

Industrial heating is rapidly coming to the front, and it is expected that it will ultimately exceed the motor load. Installations of enameling ovens with connected loads from 300 kw. to 1,500 kw. have become not uncommon. Strangely enough, the larger installations are easiest to sell, probably because of their great economy, which the larger industries are quick to recognize. The smaller devices, such as muffle furnaces, small heat-treating ovens, soldering irons and so forth, still require considerable educational work.

### Industry Promotion Work

The most conspicuous expression of this awakening of commercial thinking and activity in the electrical industry has, of course, been the organization of the Joint Committee for Business Development to lead a broad industry-wide movement for more and better business. It embraces in its membership today the following associations:

Association of Electragists—International.
Canadian Electrical Association.
Electrical Manufacturers' Council, consisting of the Associated Manufacturers of Electrical Supplies, Electrical Manufacturers' Club and Electrical Power Club.
Electrical Supply Jobbers' Association.
Fixture Dealers' Society of America.
Illuminating Glassware Guild.
National Council Lighting Fixture Manufacturers.
National Electric Light Association.
Society for Electrical Development.

Representing all branches of the industry, this committee is endeavoring to knit together the combined efforts of all into a balanced, progressive campaign that will speed up the development of this waiting market.

### Forming a Co-operative Agency Under the Leadership of the Central Station

The very fundamental of its philosophy is that the central-station company must assume the creative leadership of electrical promotion work in every community, and the emphatic expression of the doctrine has undoubtedly done much to impress upon central-station executives not only the fact that it is time to go after business once more, but that the light and power company must initiate, inspire and guide the local co-operative work. Through the co-operation of the jobbers and contractor-dealers a census of the entire country is being made to determine who are the men in each town best fitted to serve as a committee of three to maintain contact with the Joint Committee for Business Development and become the nucleus of a local league of electrical men. About one thousand five hundred communities have already been analyzed, and the work of establishing committees is going forward.

The Society for Electrical Development is acting as the workshop of the joint committee and actively promotes the organization of electric leagues. At the call of the society a conference of local league representatives was held last fall and a number of new leagues are being established. At the present time there are about forty-five local co-operative associations of this kind in operation.

### Home Electric Gains in Popularity

Meanwhile the "home electric" has gained steadily in popularity and effectiveness. More than eighty of these practical demonstrations of electricity in the home have been exhibited in nearly as many cities to an average attendance of twenty thousand, and thus more than a million and a half people have been able to hear the whole story and see what modern electric service can be made to mean in the household. One central station after another is beginning to realize that here is a great

SMALL HEATING DEVICES HAVE BECOME POPULAR IN INDUSTRIAL SERVICE

opportunity to carry its message to a great self-selected audience of interested householders. And whereas a few years ago the "home electric" was a new idea, an enterprising novelty, today it has reached the stage of common practice among companies that are commercially alert.

Such is the story of the commercial activities of 1922 among the central stations. There has been a conspicuous increase in general activity along the line of business promotion in practically all sections of the country, but it has not been of uniform intensity as applied to all classes of business. It has not been a general advance on the market in which the selling has been directed to all possible sources of opportunity, although that has been the desire. Rather it has been an effort to turn "prospects" into new load and income wherever the short-handed and disorganized commercial personnel could make the quickest contact and produce the most effective results. Undoubtedly it indicates the course which will be followed in the coming months. It promises progress, particularly in wiring, in store lighting and in merchandising. At the same time through invention of new devices and a greater realization of uses for electricity opportunity is afforded to secure a great volume and diversity in load and to more readily secure a variety of business.

# Letters from Our Readers

A Place Set Apart for Suggestions, Comments and Criticisms, to Which All Men of the Electrical Industry Are Cordially Invited to Contribute

## Co-operation the Keynote of Expansion

*To the Editors of the* ELECTRICAL WORLD:

I would like to suggest to you a matter that has been in my mind for many years with reference to the necessity for co-operation between the various branches of the industry. I have the viewpoint of a consulting mechanical and electrical engineer and also that of an operator interested, in the capacity of consulting engineer, in the operation of public utilities, and still again that of the electrical contractor, having spent considerable time in that business a number of years ago.

The operator devotes much effort to increase the sale of electrical energy through elaborate window and store displays, commissions to employees, monthly-payment plans, display advertising and house-to-house canvasses. The ELECTRICAL WORLD has been of great assistance to the business in stimulating interest in this development.

The consulting engineer has recognized the growing demand for electricity and has kept pace with this development by educating clients in the advantages of modern appliances and of outlets ample in number and capacity to take care not only of present demand but of possible future needs. Consulting engineers have designed feeders and sub-feeders of such capacity as would give proper service under increased demand. The ELECTRICAL WORLD has again materially aided such efforts to lighten the efforts of the operators in their sale of electrical devices.

The electrical contractor, however, needs education along the line of co-operation. In his efforts to get business he destroys the confidence of the public in the operator and consulting engineer and the entire electrical profession.

He frequently condemns the equipment sold by the operator as being inefficient in comparison with equipment which the contractor himself sells, and he does not base his statements on any tests or accurate information. He frequently condemns the operator's sales efforts, not realizing that these efforts are helping to increase his own business. He frequently condemns the design made by consulting engineers in order to suggest a reduction in number or capacity of outlets or a reduction in feeders and sub-feeders, thus enabling him to make a reduced price, though not one commensurate with the actual saving in material and labor, and thus permanently limiting the use and sale of energy-consuming devices together with the labor of installation. The electrical contractors go so far as to look upon the engineers as competitors in their endeavor to make designs for architects for which they receive little or no pay.

These same contractors frequently go to the owners instead of the architects when they find that some other contractor has made a design and suggest that the other contractor is a favorite of the architects and that no one else will get a fair deal in the architect's office. At times this may be true, but such condemnation again destroys confidence in the entire profession.

When contractors make designs it occasionally happens that, for example, they call for an excessively long run of heavy feeders where a much shorter run is possible, or lead-covered cable is specified where none is required, and then they submit bids on their own specifications, offering a reduction in price on the change to a correct design. Such practice is neither clever nor consistent with good business.

There is no reason why a contractor should not make designs if he receives compensation for them, but generally he could devote his whole time more profitably either to designing or to contracting, but not to both. When he does make the design it is more ethical not to submit a bid on it, as the dual position of contractor and engineer is as difficult to fill successfully as is the dual position of general contractor and architect.

The electrical contractors need to adopt a code of ethics similar to those of the Rotary Club and other professional and business organizations. The ELECTRICAL WORLD could be of material assistance in educating the contractor to seeing the possibility of an increase in business to himself and to the consulting engineer, manufacturer, jobber, dealer and operator if he would co-operate in the encouragement of more liberal but not extravagant design.

The contractor could materially assist in educating architects and builders in the employment of consulting engineers for the proper design of electrical installations, and thus avoid what is at present the unnecessary and unprofitable burden of free designs by the contractor.

Co-operation is the keynote of expansion and continued success of the entire electrical industry.

HERMANN C. HENRICI.

Henrici-Lowry Engineering Company,
Kansas City, Mo.

## Size of Automatic Stations

*To the Editors of the* ELECTRICAL WORLD:

From time to time a question is asked as to the maximum size for which an automatic station or an automatic substation can be recommended. This question is becoming more prominent as the economies shown by automatic stations come to be appreciated by operators. It is one to which a specific answer cannot be given, since in each case the maximum size depends upon the circumstances. As a matter of fact, the maximum size of an automatic station presents no technical difficulties. The size is in almost every case limited by the financial considerations. For example, no one questions the installation of a 2,000-kw. automatic railway substation or a 5,000-kw. automatic hydro-electric station. However, it would be questionable if any one would recommend installing a 200,000-kw. completely automatic station.

An analysis of the problem makes it apparent that the dominating factor in the maximum size of an automatic station is the relation between the attendance charges and the fixed charges based on capital investment. Where the attendance charges are high compared with the fixed charges a complete automatic station is, in practically all cases, warranted. Where the attendances charges are only a relatively small percentage of the fixed charges complete automatic operation does not seem warranted.

It may be seen from this review that there is no fixed maximum limit for the size of an automatic station, but that this limit is one dictated largely by financial parameters.

# Central Station and Industrial Practice

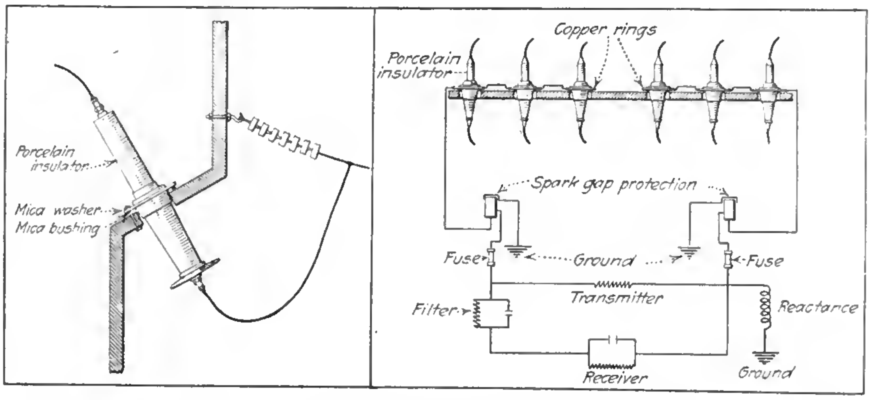
**Installation, Operation, Maintenance, Test and Repair of Generation and Distribution Equipment, and Methods of Economically Utilizing Electric Service in Large Industrial Plants**

## Telephony Over Power Lines in Europe

SATISFACTORY communication is being conducted over high-voltage power lines in Europe on at least a dozen systems. Use is made of a carrier frequency superimposed on the low-power frequency, and the transmission line and ground are employed to complete the oscillatory circuit. The cost per station is from $3,000 to $4,000, and some of the important installations are:

| Country | Location | Distance, Miles | Voltage |
|---|---|---|---|
| Germany | Golpa-Rummelsburg | 90 | 110,000 |
| Germany | Hirschfelde-Dresden | 60 | 110,000 |
| Germany | Harbke-Nachterstedt | 30 | 50,000 |
| Switzerland | Geneva-Lusanne | 45 | 55,000 |
| Sweden | Untra-Vartan | 90 | 110,000 |
| Norway | Aarlifoss-Skien | 50 | 65,000 |
| Norway | Askim-Kristiania (Toien) | 50 | 65,000 |

One of the first installations was that between the Aarlifoss Power station and Skien, Norway, a distance of 50 miles. Each station has a 10-watt transmitter, receiver, calling apparatus, switchboard with provision for automatically charging the storage battery and a 600-volt motor-generator. All this apparatus is in the room where the transmission lines lead out, while the telephone transmitter and receiver are on the desk of the engineer in charge of the station. By lifting the receiver off the hook the tubes are lighted, the motor-generator is started, and high-frequency waves are sent out which operate a relay in a resonant circuit, causing a bell to ring. When the receiver at the distant station is raised the bell is disconnected, tubes are lighted and the motor-generator started. Different wave lengths are used for transmission and reception, namely 1,560 m. and 1,720 m., so that two-way speech is possible.



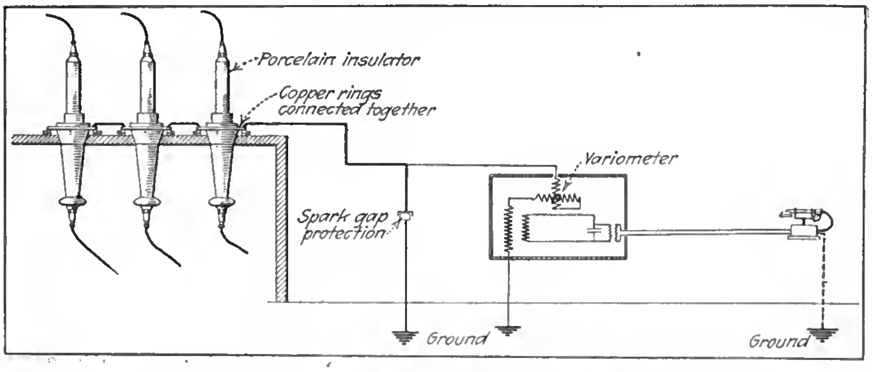
EVEN WITH TRANSMISSION LINE BROKEN OR GROUNDED INTELLIGIBLE CONVERSATION IS POSSIBLE WITH CARRIER CURRENT SYSTEM

Left—Coupling of telephone apparatus to 110,000-volt line by means of copper rings around center of bushing. Right—Coupling apparatus for two 110,000-volt lines.

Coupling the apparatus to the high-tension lines was a difficult problem. At first wires were strung below the lines as far as the first or second tower from the station. This construction did not give desirable results, however, as the capacity between the coupling antenna and ground was much larger than between the antenna and the transmission line, resulting in considerable loss.

At the present time roll-paper condensers are used between the carrier-current apparatus and transmission lines operating at voltages up to 75,000. In the system between Aarlifoss and Skien and that between the transformer stations at Askim and Kristiania (Toien), which were only recently installed, these condensers have an outside diameter of about 3 in. and a length of about 4 ft. Two of these are connected in series and are tested at ten times transmission voltage so as to insure protection to as great a degree as possible from high voltage on the telephone apparatus. Additional protection is secured by means of a spark gap with low break-down voltage and large current-carrying capacity (200 amp. at 2,000 volts to 3,000 volts), fuses and insulation of the open oscillating circuit of the apparatus from the closed oscillating circuit.

With high voltage (80,000 to 110,000) the cost of condensers becomes prohibitive and the danger from high voltage increases. At these voltages the coupling is made by means of a copper ring concentric with the entrance insulator at the building wall. Since there is a voltage of approximately 100 between this ring and ground, it is insulated from the wall by three porcelain insulators. Where there is only one three-phase line, the rings around the three entrance insulators are connected together and used as coupling capacity to the transmission line. In this case the ground is utilized to complete the



COUPLING OF TELEPHONE APPARATUS TO A 110,000-VOLT TRANSMISSION LINE AND GROUND

oscillatory circuit. Where there are two transmission lines capacity rings are used on the second line instead of a ground return.

This system of telephony has marked advantages over ordinary line telephony in that it is only little affected by even large disturbances on the transmission line. Even with one or two conductors of a line broken or grounded, it is possible to carry on intelligible conversation. When the system was first installed at Aarlifoss and Skien, interesting tests were carried on to see to what extent the line could be damaged and communication still possible. The two stations are connected to the same conductor, and there are two three-phase lines. Not only was the conductor to which the stations were connected broken, but the whole three-phase line was broken and grounded in three places, and it was still possible to communicate.

CLIFFORD N. ANDERSON,
New York, N. Y. Engineer.

## Comparative Cost Data for A.-C. Substations

SOME preliminary cost data have become available for purposes of comparing automatic and manually operated substations. These figures should be of interest to any one considering the installation of automatic stations. The difference in the cost of construction for the stations cited in the accompanying tables is not marked, though it should be noted that their capacities are not on a strictly comparable basis.

Operating expenses, however, vary in a marked degree, those of the lowest-cost manual station being from five to ten times those of the two automatic stations per kilowatt-hour handled, while the two remaining manual stations multiply these differences by from two and one-half to three.

COST OF ALTERNATING-CURRENT SUBSTATIONS

| | Automatic Station, A | Manual Stations, 1 | 2 | 3 |
|---|---|---|---|---|
| Designed capacity | 12,000 | 10,000 | 10,000 | 6,000 |
| Installed capacity | 6,000 | 10,000 | 6,000 | 4,500 |
| Cost per kva. installed capacity | $30.00 | $26.00 | $26.00 | $33.00 |
| Estimated cost per kva. at full rated capacity | 24.00 | 26.00 | 20.00 | 28.00 |
| Estimated ultimate cost per kva. at full rated capacity with spare transmission line and transformer | 32.00 | ...... | ...... | ...... |
| Estimated cost of self-restoring equipment for circuits and additional cost of high-capacity oil switches over those regularly used in manually-operated stations per kva. of rated capacity | Approx. 3.50 | ...... | ...... | ...... |

Regarding the design of automatic substations, provision is made in must cases for a liberal duplication of transmission facilities from sources of supply as well as duplicate transforming equipment with a complete spare unit in reserve. Protective and control equipment for incoming lines and transformers is usually adapted for multiple or unit operation of lines or transformers, or both, this being supplemented with added protection against overloading and overheating of transformers.

One of the most important features to be considered in any station of this type is the selection of switching equipment of adequate capacity to meet successfully any conceivable emergeny.

Perhaps the most radical departure from usual practice in manually operated stations is the almost universal elimination of double high-and-low-tension buses. The newer construction includes either no high-tension bus and a single low-tension bus or sectionalized single high-and-low-tension buses with manually operated non-automatic switches installed between sections for emergency use.

## Better Voltage Regulation Increases Output

A SEVERE loss of business due to low voltage was suffered by a power distribution company serving three towns with a combined population of 1,500. This company bought all of its energy from a transmission company. The writer was called upon to estimate the reduction in output due to the low voltage and to suggest means for correcting this trouble. The solution of this problem brought out some facts which it is thought will prove of general interest.

No reliable records of the power demand and voltage being available, the necessary data were secured by the installation of a curve-drawing voltmeter and a wattmeter. The records for a single day are shown in the accompanying illustration. The regulation is seen to be very poor, about 15 per cent. The peak load is 120 kw. and the load factor about 40 per cent. The load was supplied over a single-phase line of No. 6 B. & S. copper, 30 miles long, at 13,200 volts.

Having the load curve and the voltage curve, the load curve can be corrected to what it would have been if the voltage had been held at 120 volts and the load had consisted entirely of lamps by the use of the lamp-voltage-lamp-power consumption curve. Such a correction was made, as shown in the curves. Taking the area between the two curves, the increase in energy was found to be 5.5 per cent. This is the possible increase in gross receipts due to perfect regulation unless peak load customers pay a higher energy rate than the weighted average energy rate of all the customers. The fig-

ure represents also the loss of gross income under the conditions of poor regulation. This figure will vary from day to day as the load varies with the changing seasons.

The yearly loss must be estimated from the daily load charts. In the case under consideration the conditions on the day tested were assumed to hold for a six-month period and the loss was neglected for the next six months.

A study of the load curve indicates overlapping of the power and lighting loads at 5:30 p.m. Any discrepancy in the calculations due to assuming that the entire evening load is caused by lamps will be counterbalanced by the error due to assuming that there are no lamps or heating devices in operation during the daytime. The morning peak, between 7 and 7:30, is probably due to lamps and heating appliances.

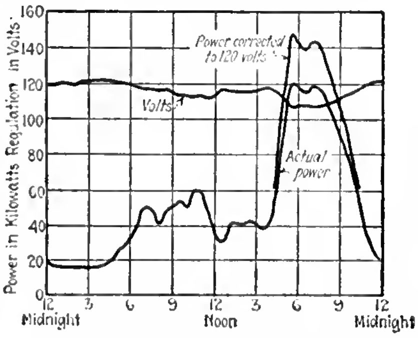
### Various Methods of Correction

Knowing the magnitude of a loss in revenue, every manager wishes to know how the loss may be reduced and how much the reduction will cost. Voltage losses can be reduced by increasing the size of the copper composing the transmission line or can be overcome by installing regulators. An examination will now be made as to the relative cost of each of these methods. In order to have the discussion concrete, the following assumptions will be made: Cost of generating station and transmission line, $175 per kilowatt capacity; annual gross receipts, $50 per kilowatt of peak load at full voltage; annual operating expenses, 70 per cent of gross receipts; cost of coal and water, 50 per cent of operating expenses. The load curve given is the average load curve encountered in small towns.

The only increase in expenses caused by having perfect regulation will be that due to the increased coal and water used. A 5.5 per cent increase in energy sold will therefore cause a 3.6 per cent increase in receipts after deducting the cost of the increased coal and water used. This will increase the net income available for payment of fixed charges and dividends by 12 per cent or $1.80 per year per kilowatt of peak load. The actual increase may be greater than this, because under prevailing rates the increased energy consumption is largely due to residence customers, who pay the highest energy charge.

Doubling the wire will cost in this case about $30 per kilowatt and decrease the regulation to half its former value, neglecting the voltage drop in the line transformers. This will result in an increase in income of 90 cents per kilowatt, or 3 per cent on the additional investment to the property.

The regulation can also be reduced to half its former value by adding a wire and making the transmission line three-phase at an expenditure of about $20 per kilowatt. This will result in an increase in income of 90 cents per kilowatt, or 4.5 per cent on the additional investment. A regulator can be installed for about $11 per kilowatt, resulting in practically perfect regulation and securing an increase in net income of $1.80



INCREASE IN ENERGY CONSUMPTION DUE TO BETTER VOLTAGE REGULATION

per kilowatt, or 16 per cent on the additional investment.

The reduction in the line-resistance losses by installing larger copper or making the line three-phase will make a better showing for these methods of improving the regulation. The cost of the losses in the regulator will cause a poorer showing to be made by the regulator. The superiority of the regulator will still hold good, and the voltage regulation will be better when a regulator is used.

One utility manager reports an increase in business of 10 per cent during the year following the installation of voltage regulators. It has been common experience that complaints as to rates being high usually follow a lowering of the standard of voltage regulation. No electric power company can therefore afford to get along without a fairly comprehensive voltage survey being made often enough to determine whether the regulation is satisfactory on all parts of the system.

## No Dangerous Strains from Sudden Steam Discharges

NO DEGREE of shock whatever was shown when the effects of large sudden steam discharges from boilers were investigated by the American Society of Mechanical Engineers' research sub-committee on sudden initial pop lift of safety valves. The results obtained by this committee, of which P. G. Darling is chairman, were presented at the recent annual meeting of this society. The tests were conducted to determine whether there is a shock to the boiler which under any condition may become dangerous or cause damage when a relatively large steam discharge is suddenly released or such a discharge from a boiler is suddenly stopped, as in the opening and closing of a safety valve.

The tests covered sudden steam discharges which in size, relative to boiler capacities, were far in excess of the capacity of any safety valve which would ever be attached to the boiler. With a 75-boiler-hp. Almy water-tube boiler at the plant of the Crosby Steam Gauge & Valve Company at Boston (actual test in this case being made by the Massachusetts Institute of Technology) the maximun discharge tried was approximately three times the total safety-valve requirement of the A. S. M. E. Boiler Code. On a 94-boiler-hp., 300-lb.-pressure Babcock & Wilcox boiler installed in the plant of the Consolidated Safety Valve Company at Bridgeport, Conn., more than seventeen times the total valve capacity for the boiler was instantaneously relieved in the attempt to produce a shock. When it is considered that two or more valves would be called for by the A. S. M. E. Boiler Code, the sudden steam relief that was tested at Bridgeport would be thirty-four or more times the largest valve which would generally be used with this boiler. The locations of the pressure indicators in the Bridgeport test, selected because considered the most likely points to receive shock, are believed to be representative enough to justify the conclusion that no shock would be detected from an attachment at any other place.

In the opinion of the committee the investigation might be continued with prolonged trials on different types of boilers under different conditions of steaming, and with additional points of attachment for the pressure indicators. However, con-

sidering the fact that no degree of pressure increase or shock whatever was detected under the severe steam-discharge conditions tried, the committee believes that it is extremely unlikely that any boiler conditions would be found so radically different as to produce a shock. In other words, if a pressure-increase shock could be produced by any reasonable boiler operation, the committee believes that the conditions of their tests were representative enough to insure detection of such shock.

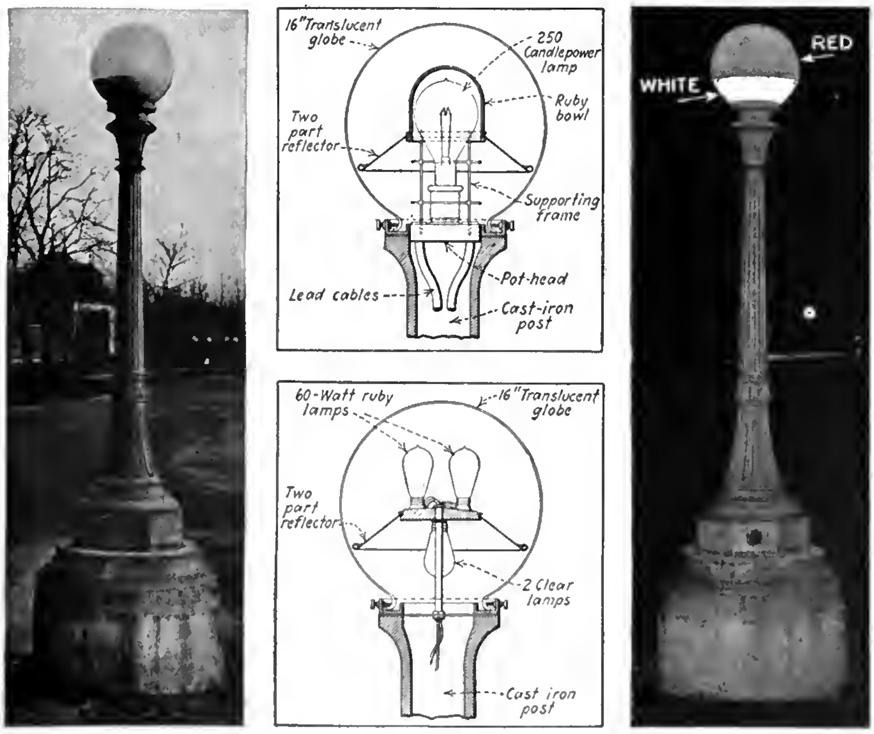
## Combined Red and White Safety Isle Fixture

TO SECURE the proper functioning of safety isle lighting units, it is necessary that they be of a character easily seen both in daytime and at night. While a red globe placed at the top of a pole in the center of the zone has certain advantages in that when the light is on it may be clearly seen, it is open to the objection that the base of the post is not sufficiently lighted. These illuminating fixtures can be installed for a small portion of the cost of illuminated signs for the same purpose and the maintenance cost is practically negligible.

The objection has been entirely overcome by the simple and inexpensive fixture shown in the accompanying illustrations and employed by the South Park Commission in Chicago. A number of these fixtures have been tried out for some time at busy intersections on Chicago's boulevards and have been found very satisfactory. A translucent globe is used in place of the usual expensive ruby globe. The fixture for the lights on multiple circuits consists of a conical metallic reflector constructed in two parts which is assembled after being placed within the translucent globe. The globe in turn is carried on a four-lamp cluster supported from the globe holder below. This is shown at the bottom center. The cluster is arranged with two ruby incandescent lamps above and two clear lamps below as illustrated and is supported from the globe holder at a predetermined position. When the globe is placed on the holder the assembled shade adjusts itself on the cluster and divides the globe into two compartments. The upper position of the globe shows red while the lower portion illuminates the safety zone surrounding the fixture.

Day and night views of a safety isle equipped with the fixtures are shown on the left and right of the illustration. A number of the fixtures are proving very satisfactory as boulevard crossing signals. In this case the fixture is used on the regular series boulevard lighting standards (top center), the lamp cluster being replaced by the use of a ruby-glass inverted bowl inclosing the upper part of the standard series tungsten lamp. The reflector is supported from this ruby-glass bowl. The illuminating effect of the street light is not affected by the installation of the fixture as only the upward rays are utilized for creating the red signal.

FRANK BRUEGGEMAN,
Assistant Mechanical and Electrical Engineer.
South Park Commissioners,
Chicago, Ill.



ARRANGEMENT OF BOULEVARD CROSSING AND SAFETY ISLE LIGHTING FIXTURES USED BY SOUTH PARK COMMISSIONERS IN CHICAGO

The white light from the bottom of either fixture, as shown in center, illuminates the lighting standard and prevents automobile drivers from running into it. The top of each globe is red and gives the driver warning of the presence of the standard. Day and night views of the safety isle fixture are given on either side.

## Standard Busbar Ratings Adopted

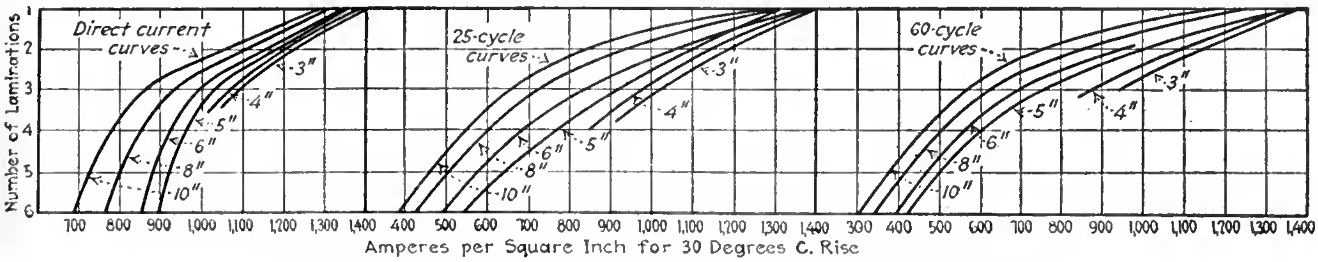
CERTAIN revisions of the rules on application and rating of busbars and connection bars have been developed by the Power Switchboard and Switching Equipment Section of the Electric Power Club and adopted as standards at the fall meeting of the club at Asheville, N. C.

The standard now specifies that all busbars shall be rated on a basis of temperature rise instead of current density. The current-carrying capacities of the usual sizes of copper buses, based on a 40 deg. C. ambient temperature, are given in the accompanying curves. These curves are to be used for currents not exceeding 3,000 amp. The spacing between laminations is $\frac{1}{4}$ in., each lamination being $\frac{1}{4}$ in. thick. A spacing of 8 in. is left between phases. Slightly increased capacity is obtained by replacing each $\frac{1}{4}$-in. lamination with two $\frac{1}{8}$-in. laminations and using $\frac{1}{8}$-in. spacing because of the increased radiating surface. However, this advantage is gradually offset by increased inductance as the number of laminations increases per phase and as the spacing of phases decreases.

The standard practice in the rating and application of busbars and connection bars as revised is as follows:

On account of the variation in radiation, skin effect and reactance due to the arrangement of busbars, ampere ratings of bus and connection bars shall be based upon temperature rise instead of on a constant-current density.

A contact pressure of 250 lb. per square inch shall be the minimum for good engineering practice in



CURRENT-CARRYING CAPACITY OF THE USUAL SIZES OF COPPER BUSES BASED ON 40 DEG. C. AMBIENT TEMPERATURE

bolted or clamped connections of bars.

All contact surfaces of buses and connections shall be cleaned by sandpapering or other suitable means immediately before bolting.

On account of the low temperature at which the oxidization of copper commences a maximum operating temperature of 70 deg. C. shall be used in the design of copper buses and the connections thereto, except that on extended bus systems isolated from apparatus where unusually heavy contact pressure is employed at joints and connections a maximum temperature of 80 deg. C. may be used.

## Meter Testing Aided by Use of Test Panels

TO FACILITATE the testing of large power meters, provide greater safety for the tester and comply with the new electrical safety order of the Industrial Accident Commission of California, the Southern California Edison Company has developed and standardized a plug-type meter-testing panel. Most power companies in California use the over-all or primary method of testing their meters, which introduces complications on account of the difficulty of connecting the testing equipment into the circuit without interrupting the customer's service.

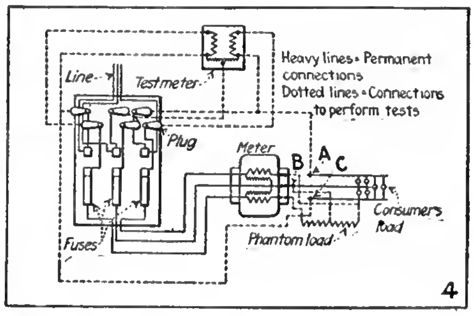
The panel shown in Fig. 1, with meter and relay mounted, is neat and inexpensive and by means of the test receptacles provides a ready means of testing the meter in a minimum of time and with greater safety to the tester. A small panel retained by wing nuts and sealed covers the plug receptacles, except when the meter is being tested. This type is constructed on one panel, the main-line switch being installed elsewhere. Fig. 2 is a rear view of this same panel, showing the method of installing the receptacles for connection to their proper line and load wires for three-phase installations.

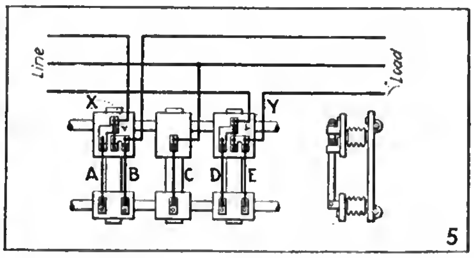
Another standard test pane is shown in Fig. 3. In this type the meter, main-line switch, test panel and motor-starting compensator are all mounted on the same angle-iron frame. The wiring diagram shown in Fig. 4 for use with this panel indicates the connections for testing the meter either with phantom load or using the customer's load. A large percentage of meters are tested with the customer's load, making it unnecessary to isolate the meter for phantom-load testing. Such cases are those of pumping plants, refrigeration machinery, etc., where the load is fairly constant.

The two installations described above are made up to and including 440-volt service. With voltages above 440 and up to and including 2,300, a special test panel is used. The method in primary testing is similar to that heretofore described, with the exception that no phantom loading is attempted unless a water rheostat is available and is used for test load.

A still further development in test equipment is found in the diagram shown in Fig. 5. This type of installation is used mainly in substations and for the larger customers who take 10,000-volt or 15,000-volt delivery. Provision has also been made in this type of installation for connecting the testing equipment into the circuit without interrupting the customer's service. By opening certain of the switches shown all connections may be made to the dead end of these switches with safety to the tester. W. R. FRAMPTON,

Superintendent Meter and Test Department,
Southern California Edison Company,
Los Angeles, Cal.





NEAT AND INEXPENSIVE PANELS PROVIDE MEANS OF TESTING METERS IN MINIMUM OF TIME AND WITH SAFETY

Fig. 1 — Plug-type meter-testing panel adopted by Southern California Edison.

Fig. 2—Rear view of panel shown in Fig. 1, showing method of making connections.

Fig. 3—Test panel in this type of installation is mounted in connection with main-line switch. All wiring is in conduit.

Fig. 4—Testing consumer's meter with phanton load without disturbing the load; wiring diagram for panel shown in Fig. 3.

Fig. 5—Connections for 15,000-volt test switch. Under normal conditions of operation all disconnecting switches are closed as shown. When cutting in for testing purposes, switches A, B, C, D and E are opened and connections are made on the lower terminals. After connections are made, the switches A, B, C, D and E are closed and X and Y are opened, cutting in the testing equipment, after which the test may be made with safety.

# Central Station Business

Advertising, Selling and Service Methods
Commercial Organization and Management, Customer and Trade Relations, Public and Financial Policies, and Reports of Company Plans and Experiences

## Commercial Problems for 1923

**Need of Organizing New-Business Departments for More Efficient Operation and the Training of Suitable Salesmen Principal Causes of Concern**

CENTRAL-STATION new-business managers are confronted by a number of outstanding commercial problems which must be worked out during the year 1923. In the order of their importance these problems may well be grouped as bound up in: First, improved new-business organization; second, training competent salesmen; third, a definite merchandising policy with an accurate method of cost keeping; fourth, careful planning for a selective development of business in the territory; fifth, closer attention to the quality of residential wiring and to the adequacy of store lighting; sixth, proper allocation of expenditures for advertising and the promotion of new business; seventh, development of electric transportation.

Central-station executives, after their war-time experience with power shortage, are unanimous in the belief that new business of a highly diversified character should be built up. However, they feel that the old pre-war policy of "new business for the sake of additional load" will not fit present-day conditions. Consequently, while new business should have a load-building value where it involves the sale of energy-consuming devices, these sales should be made at a profit and this particular branch of the commercial department must be put on a self-suporting basis. The possibilities of commercial development, judging by the past growth of the industry, are almost unlimited, and it is generally believed that now is the time to put sales departments on a firm and lasting basis.

### New-Business Organization

Of first importance, naturally, is the question of departmental organization. The work of the central-station sales department may be divided into two general heads—(1) selling energy or load building, and (2) selling energy-consuming devices at a profit, or merchandising. While the two are intimately related, it is important that their activities be kept distinctly separate in order that accurate records may be kept of what each accomplished.

Load building involves the sale of energy from which profit will be realized, and the cost of such commercial operations should be charged to the promotion of the business. Much more thought is needed as to the kind of business which it is most profitable for a company to go after, and while this is governed to a considerable extent by the industrial nature of the community, it is essential that a company know just what the power, commercial and residential potentialities of its territory are. Therefore a survey of the territory to show where new customers can be taken on and how the loads of existing customers can be increased is necessary in order to lay out a fitting sales program. Large power and commercial customers will not be overlooked because of their size, but it is easy to underestimate the value of the many smaller users of energy which make up the real bulk of the business. In order, though, to reach out and get this prospective business, it is necessary for the central station to maintain actively at work a force of salesmen who can represent the company in the territory.

Here is probably the most puzzling problem of all for the new-business manager. There are not many central-station salesmen or representatives left. During the war many of them went into other fields, and those that remained have, through their added experience, now become rather highly specialized in some particular line—power, industrial heating or illumination—or else they have gone with a smaller company as commercial manager. This makes it necessary to find and train an almost entirely new lot of salesmen. This was considered sufficiently difficult in former days, when an old, experienced salesman could take a new man out and break him in, but now it must be met in some other manner. For a while it seemed that it would be possible to obtain salesmen by advertising for canvassers, in the belief that it would not be necessary for these men to know very much about the electric light and power business. This has not worked out well because the caliber of the men who present themselves in answer to advertisements is low. They cannot be classed as other than peddlers, and the turnover in salesmen is exceedingly high. Only by sifting all applicants carefully can any really good salesmen be found. The ratio of salesmen retained to the total number employed during a year runs as high as one in twenty in one company.

### Selecting Salesmen

However, the situation is by no means hopeless, and a solution is being found by several companies in employing as salesmen only the highest grade of men they can find. It will be necessary to offer higher compensation in some cases, but this will be offset by the fact that more conscientious men are obtained. This practice has several advantages. Men with better selling experience will be attracted to the central station. They are men who will gain knowledge of the business more quickly and will not, as a rule, require so long a training period nor so much supervision. They will be steadier because they are not looking for a stop-gap job for a few months. For the most part, they want a permanent place, and where the remuneration is sufficient they can be counted on to stay.

The matter of finding younger men to train as salesmen presents a somewhat different problem, for quite often they are not sure that they want to remain in the central-station business, and even so they may not be adapted to the selling end. Some companies are solving

this question by taking on a certain number of young men each year in a cadet capacity as they graduate from high school or college, and by giving them about three months' experience in each of the different departments the kind of work for which they are best suited is determined at the end of a year or eighteen months. By reason of this practice those who reach the commercial department will make very capable salesmen.

### Salesmen's Compensation

One thing more which will seriously affect the question of finding the right men for salesmen is the methods of compensation. Probably no two companies use exactly the same basis for paying salesmen. Methods vary, the most usual forms being flat salary with no commission, salary plus commission, drawing account with commission and straight commission. Some companies have tried out all these forms of compensation and have yet to determine which is the most satisfactory. This lack of uniformity is a serious handicap in developing and retaining permanent sales forces, and a more nearly standard method could well be adopted. A set rule, of course, could not be used by all companies, but in making up a schedule of compensation two important elements should be considered. First, commission or salary should be proportionate to the value of the business, and, second, the salesman should receive compensation sufficiently liberal to keep their enthusiasm from lagging from month to month. Opportunity for advancement is one other element, aside from actual compensation, which will go far in holding a sales force together and keeping men on their toes.

The problem of merchandising is an interesting one. Whether or not the central-station company shall merchandise electric appliances may depend upon the local situation. But the fact that some companies which discontinued their appliance-sales departments are now reviving them on a larger scale than formerly indicates that it is advisable in many instances for the central station to show the way in merchandising practice. In all such cases the business is to be conducted along ethical lines, with a view to making a profit.

To do this merchandising must be made self-sustaining. Its cost of operation must be kept entirely separate from other commercial activities, and it should not look for or expect financial support from the company because of its load-building value. This is not only poor business for the company, but it is a form of unfair competition with other legitimate electrical dealers.

When a company has definitely decided to go into merchandising it must carefully analyze the local situation with reference to the location of its store to the best advantage. The electrical store itself or appliance salesroom, as the case may be, must be equipped as a real store and not be merely a makeshift display room as an adjunct to the cashier's window where customers pay their bills. Furthermore, if the central-station company would make a profit from its merchandising, it must learn to be a merchant. Costs of doing business must be kept accurately and stocks and turnover must be most carefully watched so that leaks may be stopped. The idea that should be kept ever foremost is that the business is being conducted to make a profit.

In developing the fields for new business the central station should not devote attention to one class of business at the expense of another. Where this has happened in the past it has not been intentional, for after the lighting load had brought about the high daily peak it became imperative that a day load be found, and after the power load got under way it grew so rapidly that in 1920 it came near swamping the electric light and power companies. Therefore in the future it is advisable to keep some semblance of balance between the lighting and power loads because of the well-known advantages of diversity, particularly diversity in revenue in times of industrial depression.

### Residential Load

The possibilities of additional lighting business are only just now being fully appreciated. In the residential sections many companies measure their degree of success by the number of customers connected, and they feel that the increasing number of meters indicates that they are rapidly approaching the point of saturation and must look to other fields for more business. However, it is pretty generally admitted that the lighting of the average home is inadequate, that the sale of appliances is hampered by the lack of a sufficient number of outlets, and that a campaign for the education of the public to a more complete use of the service must be made.

Electrical homes will prove of enormous value in stimulating public interest and new homes will be wired properly. But the educational work,

## Electric Heating May Exceed Motor Load

THE rapid development of the electric heating load is typified in this large oven for baking enamel on automobile fenders. The oven is 12 ft. wide, 8 ft. high and 134 ft. long and has a demand of 450 kw. Heating engineers maintain that there exists in every industrial plant manufacturing processes which can be made more economical through the application of electric heat. They also predict that this load will, in the not very distant future, exceed the motor load by a ratio of between two and three to one.

particularly as to old costumers, cannot stop there. It should be carried to them by the central-station salesmen, through direct mail and newspaper advertising and by practical demonstrations of home lighting. If residential customers are to be profitable customers, they should be fairly generous users of energy, and to this end the value of adequate wiring for better lighting and the utilization of appliances should be fully impressed on them by the company. This is one of the big jobs that the central station must learn to do.

### Commercial Lighting

Store lighting also still offers an opportunity for load building no less than that offered by home lighting. In fact, it has been proved that only 30 per cent of the stores in an average city have adequate lighting. This class of business is quite often at the very door of the central station, and it is not difficult to demonstrate to a merchant the value of good lighting. Therefore the central station can to advantage develop one of its salesmen as an illuminating engineer who can perform a distinct service for commercial lighting customers and at the same time build up a highly profitable load for his company. The problem here is first to develop the salesmen and then to implant in the minds of the merchants an appreciation of the profit value of a high standard of illumination.

### Heating and Motor Loads

Power business is coming more easily to the central station because of the admitted economy of central-station service as compared with the isolated plant, but it must not be forgotten that this is largely the result of years of tedious missionary work on the part of the power salesman. In that time he has developed the personal confidence of his "prospects" in what he says and in the company back of him and now we see the results of this work. With the increasing motor load the field of industrial electric heating is developing, and the most optimistic heating engineers expect that this load will soon overshadow the motor load by a ratio of three to one. In this field again the power salesman must carry on his personal campaign of education until he establishes the confidence of the skeptical "prospect," when the business will come on the lines with perhaps greater rapidity than the power business. This kind of industrial business always means long pull ahead and needs sympathetic and patient support from central-station executives.

Closely allied with the power business is the growing popularity of the electric vehicle in the field to which it is adapted. So far the central-station company has not been able to give the proper attention to electric transportation because so many other things appeared to demand attention first. The great obstacle has been inertia in taking hold of the electric vehicle and doing a real selling job. But there is an opportunity for team work and co-operation between the central-station men and the vehicle and battery manufacturers. The problem depends much, however, on the establishment of suitable service facilities.

In many of its new-business operations the central station has what might well be termed traditional handicaps to overcome. It has long been the policy to conduct the sales department with the sale of more energy as its main purpose. If a deficit was shown, it was charged to promotion of the business. But the development of the industry has reached a point where the new-business department should be able to pay its own way. Central-station executives and commercial managers recognize this and are bending their efforts in that direction. Several definite changes in policy will go far to bring it about.

First, there must be a fundamental change in the philosophy of these departments; that is, the aim should be to merchandise for profit, not for the sale of energy. Second, there should be an improvement in the technic of retail operation to include proper cost figures with more sales per dollar of operating expense. Third, there should be adequate margins of profit. Fourth, there should be greater efficiency in spending money for promotion, advertising and other new-business expense. Fifth, there should be established a stable and permanent commercial organization which will not change with the seasons. Sixth, there should be a careful analysis of the local territory with the view to planning a definite sales program which will then be religiously adhered to.

# What Some Companies Did in 1922

## New-Business Activities Which Marked the Commercial Reawakening of Central Stations Generally in All Sections of the Country

AT THE beginning of 1922 a strong upward swing in business was under way, and the year as a whole was characterized by solid, consistent improvement along commercial lines in the central-station industry. This condition was by no means confined to any particular section or group of states, but rather the quickening of business activity was general and uniform throughout the country.

The revival in merchandising extended all over the Eastern and New England States and the experiences of individual companies is typical. The Massachusetts Lighting Companies had the best year in appliances in its history. The Worcester (Mass.) Electric Light Company's merchandise sales to Dec. 1 totaled \$109,119, against the entire 1921 total of \$110,731. The increase over 1921 to the above date was \$17,463, and the holiday trade was expected to carry this gain far ahead. Appliance sales in the Tenney companies have been running about double those of last year for months, and in some cases even better. Electric radiators, vacuum cleaners, hollow ware and irons have moved in great volume. The Boston Edison Company alone sold 1,600 radiators after August. The Pittsfield (Mass.) Electric Company opened a new appliance store on a main thoroughfare late in the fall, with excellent results. In communities served by non-merchandising central stations, like Fall River, Springfield and Greenfield, Mass., business for electrical dealers shared in the incoming tide of prosperity. The electric shop of the Narragansett Electric Lighting Company, Providence, R. I., did a land-office business in appliances in the year just closed.

Store-lighting activity developed in many communities almost into a race among competitive merchants and neighboring manufacturers to install modern illumination at higher intensities. In Boston the Bureau for Better Illumination rounded out the year with a total of two thousand visitors, and its work will be continued in 1923. A great wave of new business is now sweeping in as a

result of the educational work of this bureau. A number of New England central stations are planning to do intensive work in illuminating engineering this year, and the demand is active for men trained in this specialty.

With better industrial conditions power sales have risen rapidly of late. By Feb. 1 one customer of the Bristol & Plainville (Conn.) Electric Company will have increased its demand from 3,000 kw. to 6,000 kw. Seven hundred horsepower in shoe factories alone has lately been installed by the Haverhill (Mass.) Electric Company. Industrial electric heating developed steadily during the year at Hartford, Manchester, Worcester, Boston, Springfield and other places in New England. Small-plant betterment work absorbed a large connected load in new motors throughout this district. In Providence an industrial electric heating store was opened during the year, this being probably the first of its kind in the United States. Power business developed in the Montpelier, Vt., district, and the diversified service of the Central Maine Power Company increased substantially. Conditions improved much during the year among the power customers of the leading hydro-electric companies.

Industrial electric trucks and tractors were in improving demand in 1922, as manufacturing conditions strengthened. Electric road trucks sold slowly until about Sept. 1, when a turn for the better occurred which has been well sustained and which makes the 1923 outlook better than for many years.

### House Wiring in New England

There were so many wiring campaigns in New England in 1922 that space will not permit more than a brief reference to them. The Tenney companies' plan allowing two years to pay was most successful. The Central Maine Power Company put through an intensive campaign resulting in 2,214 contracts in five weeks. The Worcester Electric Light Company obtained two and one-half times as many house-wiring contracts in 1922 as in 1921. To Nov. 1, 1921, the company took on 523 new house-wiring customers, representing an outlay of $82,769 and the installation of 1,121 new meters. At Providence, in Salem, Fitchburg and Malden, Mass., in Boston and many other places the past year's activity in house wiring has been striking.

The Elmira (N. Y.) Water, Light & Railroad Company continued its policy of increasing the residential load by the sale of domestic appliances and by the end of the year expected to add something over 1,000 kw. by this means. The value of such a load is shown by the fact that the company's income from its residential customers has been 20 per cent greater than in 1921.

At Norfolk, Va., the Virginia Railway & Power Company concentrated its efforts on ice and cold storage plants, with the result that it has contracted for 3,000 kw. additional, which will bring the company's refrigeration load to 5,000 kw.

### Central and Southern Companies

In the Central and Southern States the commercial activity was no less marked. The Commonwealth Edison Company's appliance sales in Chicago have increased and the outside selling force has been augmented until there are now 150 salesmen working from the company's trucks. Their sales for the year will total over $1,000,000. The Duluth (Minn.) Edison Electric Company is employing two lighting salesmen who are constantly calling on commercial lighting customers with excellent results.

The Union Gas & Electric Company continued its house-wiring campaign in Cincinnati and expected at the close of the year to have contracted for wiring 20,000 old houses as compared with 17,000 in 1921. This company retired from merchandising several years ago, but has again gone in for the sale of electric appliances stronger than ever and has leased a building for this purpose.

The New Orleans Public Service Incorporated has given particular attention to building seasonal business where needed to balance its load and has taken on a very profitable raw-water ice-plant load. This company has also established an electric vehicle department which has already produced very satisfactory results in increased business. The Consumers' Electric Light & Power Company, also operating in New Orleans, has pursued a merchandising policy with a view to load building and earning a profit and has conducted active campaigns to increase its commercial lighting load and the sale of electric appliances. This company is now making a survey of all customers to ascertain what appliances they are using and to interest them in further use of the service.

In the West and on the Pacific Coast also there has been a marked growth in the appliance business. In some sections this amounts to an increase of 40 per cent over the business done in 1921. This is attributed primarily to the convenience-outlet campaign which is beginning to show real results from the publicity work of the past few years. The California Electric Co-operative Campaign now recognizes other channels than the electrical dealers in the merchandising of appliances as a large percentage of the sales are through the department, hardware and furniture stores.

The possibilites of commercial lighting have become apparent and a survey of a large number of stores made by the California Co-operative Campaign during the past year indicated that the intensities varied from three-quarters of a foot-candle to 18 foot-candles, showing the necessity of intelligent illumination work. One merchant in a large California city, who a year ago made an investment of $10,000 in window lighting, finds that adequately illuminated show windows are the best means of advertising and selling and in moving to another location has ordered wiring, fixtures, lamps and other equipment costing $25,000. The Co-operative Campaign is now constructing a portable window-lighting exhibit which will be taken from place to place, and special merchants' day programs will be put on.

### Western Power Development

In power there has been a steady, natural development. In the Northwest there has been a noticeable increase in the use of electric drive in the lumber industry because of its great economies and flexibility. In California there are now three thousand wells being pumped with electric motors on the lines of one central station alone. There has also been a healthy increase in electric pumping for irrigation.

The California Co-operative Campaign will lay particular stress on education within the industry and education of the public. Ten electrical homes will be shown during the year. These will be in charge of high-class demonstrators who will be thoroughly competent to "sell" the electrical idea. Particular stress is to be laid on the use of electric ranges and water heaters. Ten illuminated billboards will be erected on the main arteries of travel of the state to tell the message twenty-four hours a day.

# Digest of Electrical Literature

Including Brief Abstracts of and References to Important Articles Appearing in the Scientific and Engineering Press from All Parts of the World

## Hydro-Electric Development and Steam Equipment

*Operating Features of the Montville Power Station.*—Numerous instruments and carefully kept records have aided in maintaining high operating efficiency in this 20,000-kw. plant of the Eastern Connecticut Power Company. A comprehensive description is given of the coal-handling methods, feed-water preparation, boiler operation, equipment and transmission and distribution systems. Several typical log sheets used at this station are included.—*Power Plant Engineering*, Dec. 15, 1922.

*Calculation of High-Pressure Penstocks.*—A. HRUSCHKA.—If the methods suggested by different authors for calculating penstocks for hydro-electric plants are compared, many contradictory details will be found which, if followed, will result in widely differing data. The author has therefore studied the different methods, has eliminated what appeared to him faulty and has compiled a comprehensive collection of data and formulas upon which to calculate the forces in a penstock and to design the penstock. Two main classes of penstocks are being used, the axially movable type, with anchors in the form of stuffing boxes or dilatation joints, and the solidly anchored pipe-line type, without dilatation joints but with yielding elbows at points off the straight path. The many individual forces occurring during the operation of a penstock are mathematically investigated, and finally their combined action, as it manifests itself at the anchors of the pipe line or in the elbows, is calculated. The proper dimensions of the cement blocks or pillars supporting the line are given from an investigation of the mechanical forces exerted by the line upon these points. The present boom in the erection of hydro-electric plants, especially in countries lacking an adequate coal supply, makes this elaborate treatise especially timely.—*Elektrotechnik und Maschinenbau*, Nov. 12 and 19, 1922.

## Generation, Control and Switching

*Cooling of Turbine Generators.*—A. R. SMITH.—A difficulty in thoroughly cleaning the air used for cooling turbine generators has led to the introduction of the recirculating system. The various methods for cooling the air when recirculated are discussed in this article, which compares all systems of generator cooling from numerous standpoints. With the direct system it is possible to discharge the air into the boiler room and burn it. With the indirect system using surface coolers it is possible to absorb all or part of this heat by circulating the condensate through the surface cooler.—*General Electric Review*, December, 1922.

*Air Flow in Electrical Machinery.*—C. J. FECHHEIMER.—The manner in which a vapor flows is one of the most important and perhaps the most difficult of the problems of mechanics. Only recently have quantitative solutions been obtained for certain cases, and these have come with the advent of the aëroplane, by use of which studies have been successfully made. An attempt is made to describe the laminar and turbulent flow of air in electrical machines, and a few applications are described.—*Electric Journal*, November, 1922.

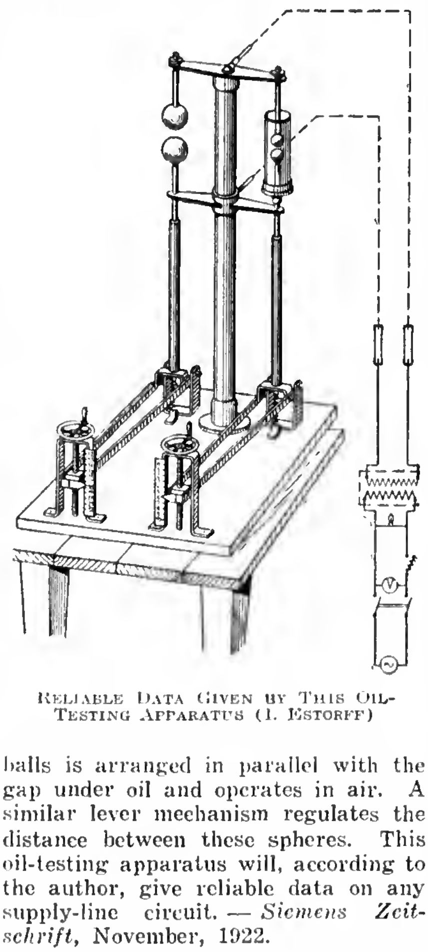
## Transmission, Substations and Distribution

*Modern American Practice on Power Transmission.*—Y. FUKUDA.—A review article showing the progress made in America in high-voltage transmission. The author also deals with the Boston-Washington Superpower Zone, backwater suppressor, low-head, high-speed water turbines, automatic water plants, the use of aluminum cables, insulators for extra-high-voltage transmission, electric vehicles, electrification of steam railways and load-dispatching and plant-inspection methods.—*Journal of the Institute of Electrical Engineers of Japan*, November, 1922.

*Electric Power in Iron and Steel Works.*—A. DAVIDSON.—The author gives a user's opinion on the question of alternating current versus direct current in iron and steel works. He claims that direct current is not suitable for all purposes, and the choice is, therefore, between alternating current for the large motors, with direct current for the small motors, and alternating current throughout. In either case three-phase generation should be used. The finances of the possible schemes are discussed, and the last is shown to be the cheapest. Certain technical questions, such as speed control, power factor and frequency, etc., are dealt with, the author showing that he supports the alternating-current system.—*Electrician*, Nov. 24, 1922.

## Units, Measurements and Instruments

*Oil-Testing Apparatus.*—I. ESTORFF.—It is customary to measure the dielectric strength of oil for oil switches or transformers with a fixed spark gap inserted into a sample of the oil, raising the voltage on the gap gradually until breakdown and reading the tension on a voltmeter. To insure reliable test data a pure and undistorted sinusoidal voltage must be used to feed the transformer. What appears to be a simpler apparatus is described in this article. Instead of a fixed spark gap, an adjustable gap is used, the movable electrode being arranged at the short end of a ten-to-one lever. Turning a handwheel on an insulated spindle increases or decreases the distance between the sphere electrodes, placed one above the other in a glass vessel containing the oil, and indicates at the same time their distance. This feature does away with the necessity of a gradual increase of the voltage and obviates, therefore, the regulator or the variable choke coil. To be independent of the form of the voltage wave, a second sphere gap with 50-mm.



RELIABLE DATA GIVEN BY THIS OIL-TESTING APPARATUS (I. ESTORFF)

balls is arranged in parallel with the gap under oil and operates in air. A similar lever mechanism regulates the distance between these spheres. This oil-testing apparatus will, according to the author, give reliable data on any supply-line circuit. — *Siemens Zeitschrift*, November, 1922.

*Measuring the Rotary Magnetic Hysteresis Losses.*—TETSUTARO MIYAZAKI. — Many investigations into rotary magnetic hysteresis have been made, but the results show a great discrepancy. This is thought due to the errors of various measuring methods as well as the difficulty of separating the hysteresis losses from the masking effects. Instancing the irregularity of the electromagnetic field brought into existence by the unsymmetrical forms of test pieces, the author describes a comparatively accurate method consisting of measuring the torque of a solid spherical test piece in a rotary magnetic field.—*Journal of the Institute of Electrical Engineers of Japan*, November, 1922.

### Illumination

*Illuminating Engineering Society Papers.*—The December issue of the society's transactions contains several papers presented at the Swampscott (Mass.) convention. The first two papers are "Overcoming Daylight Reflections in Show Windows," by Ward Harrison and H. T. Spaulding, and "The Effect of Light on the Drawing Power of the Show Window," by Walter Sturrock and J. M. Shute. Abstracts of these two papers may be found in the convention report on page 759 of the Oct. 7 issue of the *Electrical World.* A tentative draft of a code of luminaire design drawn up by the committee to co-operate with fixture manufacturers (M. Luckiesh chairman) is a third paper. An attack upon the problem of glare from the angles of visual acuity and shade perception is the basis of research undertaken by a sub-committee on this subject, headed by Louis Bell, which submitted a report. Abstracts of these papers may be found on page 761 of the Oct. 7 issue of the *Electrical World.* A complete discussion of all the papers is included in the transactions.—*Transactions of the I. E. S.,* December, 1922.

### Motors and Control

*Equalization of the Energy Demand in Coal Mines and Rolling Mills.*—T. STEIN.—The difference is pointed out between energy variations of the minute and of the hour character as regards duration, and it is shown how they originate and how they affect the operating machinery. An equalization of the minute variations is accomplished by the steam capacity of boilers, by exhaust-steam accumulators and by flywheels. A live-steam accumulator permits the equalization of hour variations for both the heat generation and the heat demand. Their use may result in coal economies of from 10 per cent to 15 per cent. A number of diagrams show steam and electric connections for different operating conditions, and the most suitable electric machines for these systems are described.—*A. E. G. Mitteilungen,* October, 1922.

### Heat Applications and Material Handling

*Electrical Developments in Iron and Steel Works.*—JAMES SMITH.—The author reviews recent developments in the use of electricity in iron and steel works. He deals with lifting and handling appliances. Details are given of modern cranes, magnets, shunting locomotives, charging machines, stripping machines, plate-handling devices and excavating appliances. The electrical equipment used for driving and controlling these machines is described.—*Electrician,* November, 1922.

*Standards for Resistance Welding Transformers.*—For this special class of machinery it is essential that careful consideration be given to the viewpoint of the manufacturer, user and central-station man, in order that a rating may be arrived at which will be equitable to all. For this purpose the sub-committee on rating of welding machines of the American Welding Society has proposed standards for resistance welding transformers. These standards include continuous rating, intermittent rating, classification of insulating materials, method of loading transformers in temperature tests, input tests under load conditions, no-load and load losses, efficiency, power factor, voltage, insulation and nameplate rating.—*Journal of the American Welding Society,* November, 1922.

### Electrophysics, Electrochemistry and Batteries

*Spectro-Photo-Electrical Sensitivity of Argentite.*—W. W. COBLENTZ.—An investigation made into the effect of crystal structure upon photo-electrical sensitivity as observed in two crystal forms of silver sulphide, argentite and acanthite. Experimental data are given on the effect of temperature, of the intensity of the radiation stimulus and of mechanical working of the material upon the spectro-photo-electrical sensitivity of argentite. These observations are then compared with similar data previously published on acanthite. From a comparison of the reactions of these two crystal forms of silver sulphide under various conditions it appears that the crystal structure has a marked effect upon photo-electrical sensitivity.—*Scientific Paper No. 446 of the Bureau of Standards.*

### Traction

*Electric Locomotives for South African Railways.*—A short article giving briefly an account of the seventy-eight locomotives which have been ordered for the South African Railways for the electrified section of the main track between Glencoe and Pietermaritzburg, a distance of 171 miles. These locomotives are designed to haul passenger and freight trains over the electrified area and are so arranged that they can be worked alone or with other locomotives in multiple-unit operation.—*Electrician,* Nov. 17, 1922.

*Paris-Orleans Railway Electrification Is Progressing.*—The large number of locomotives which have been ordered for initial installation will be largely of French make, but America will furnish the control equipment. Details of the control equipment and the rigid test to which they were put are described.—*Electric Railway Journal,* Nov. 4, 1922.

### Telegraphy, Telephony, Radio and Signals

*General Equations of a Balanced Alternating-Current Bridge.*—VLADIMIR KARAPETOFF.—Owing to the developments in the art of electrical communication and to the improvements in the sources of high-frequency sinusoidal currents, the use of the Wheatstone bridge for the measurement and comparison of inductances and capacities has increased considerably. For this reason the author deduces a general equation of the alternating-current bridge which would comprise the various actual bridge arrangements of any specific case. These formulas have enabled new bridge arrangements to be devised without deducing fundamental equations or constructing vector diagrams.—*Philosophical Magazine,* November, 1922.

*The Wave Filter and Its Inductance Coil.*—A theoretical and experimental investigation concerning wave filters with the view of studying their properties and the conditions under which they can attain maximum efficiency, especially in the case of radio receiving instruments. An ideal filter ought to transmit smoothly within a definite range current of any frequency with minimum attenuation. However, because of resonance effect between the filter and receiving instruments, and further because of the attenuation of the filter being variable, depending upon the impedance of the receiving instrument, the wave amplitude of the receiving current fluctuates with the frequency within the range. In causing a band-wave filter in which one factor—either inductance or capacitance—is omitted to transmit completely a wide range of frequencies it is difficult to suppress abruptly currents of frequencies lying just outside either limit of the intended range.—*Researches of the Electrotechnical Laboratory,* Tokyo, Japan.

### Miscellaneous

*Helpful Relations Between the College and the Industries.*—R. L. WALES.—To present a fairly complete analysis of the problem the author has assembled facts and suggestions concerning it. In training men to be of service to the industry, the end in view, the personal qualifications of the student, the courses of study, the duration of the training period and the character of the instruction are controlling factors. The problem may be analyzed from two points of view, one considering the possible contributions of the college to industrial success and the other the reciprocal relation of the industries to the college. The duty of the college is to supply adequately trained men for the various phases of industrial leadership and operation and to serve as a center of information to which the industries may turn for assistance in the solution of technical problems. In training industrial leaders the need is suggested for stressing fundamentals rather than specializations through a type of teaching that develops in the student the habit of getting down to simple rock-bottom principles. Besides supplying trained men, the colleges may be of the greatest value through their organization for consultation and research. The industries in turn may help by impressing on the students the reality of engineering and the usefulness of engineering training.—*Engineering Education,* November, 1922.

# News of the Industry

**Chronicle of Important Events and General Activities, Announcements and Reports of Association Meetings, Court Decisions and Commission Rulings and News of Electrical Men**

## A Seven-Mile Power Cable

**Great Western Company to Lay 11,000-Volt Submarine Cable Under San Francisco Bay**

WHAT will, it is said, be the largest and longest submarine power cable ever installed will be laid across San Francisco Bay about Jan. 10 by the Great Western Power Company, at a cost of approximately $500,000, to bring additional hydro-electric power into San Francisco and to make possible a reduction in the amount of electricity it has been necessary to generate in the company's steam plants. The cable will be approximately seven miles in length and will be laid from the south end of Brooks Island, near Richmond, to Pier 41 in San Francisco. It will be an 11,000-volt, three-conductor, 500,000-circ.mil cable capable of transmitting 10,000 kw.

Because of the unusual size of the cable it was shipped from the factory of the American Steel & Wire Company coiled on gondola freight cars instead of on reels. Gondola cars of the largest capacity obtainable were used, and the cable was shipped in 4,800-ft. lengths, nine cars in all being required. The entire length of 38,500 ft. of cable will be coiled in circular pancake-like coils on a special cable-laying barge with all splices made, so that the submarine conductor may be laid in one continuous operation. It is estimated that about seven hours will be required for laying the cable. This is the method employed in laying transoceanic cables, but it is the first time it has ever been used for laying a long submarine power cable.

## Washington Court Reaffirms Phillippay Decision

The decision of the Supreme Court of the State of Washington in what is known as the Phillippay case (see ELECTRICAL WORLD for Aug. 12, 1922, page 345), denying damages to a telephone company for inductive interference from a power line of the Pacific Power & Light Company, was unanimously reaffirmed by the court on Jan. 2. In this case the court held that the prior occupancy of a highway by the telephone company did not give it the right to collect the cost of metallicizing its line from the power company when the latter's transmission lines were properly built.

In reaffirming its decision the court said: "The statement in the opinion of the department to the effect that priority in time does not give a superior right seems to have caused some alarm. Let it be said that this statement must be read and understood as applying only to the facts of the particular case."

## Public Ownership Man Put on California Commission

Four appointments by Governor Stephens of members of the California State Railroad Commission have just been announced. Clyde L. Seavey, city manager of Sacramento, was appointed for a term of six years to succeed H. Stanley Benedict of Los Angeles, whose term expired on Jan. 1. The other appointments were Harley W. Brundige of Los Angeles, now president of the commission, to a four-year term to succeed the late Harvey D. Loveland; Egerton Shore, member of the State Board of Control, to a four-year term to succeed Chester H. Rowell, resigned, and James T. Whittlesey of San Francisco to the unexpired two-year term of Mr. Brundige.

The appointment of Mr. Seavey, who is a strong advocate of public ownership, was a surprise. Seavey was one of those instrumental in framing the water and power act defeated at the state election in November and was active in its support.

## Pacific Gas & Electric Rates to Be Reduced

A new schedule of rates for the Pacific Gas & Electric Company has been ordered by the California State Railroad Commission, effective Feb. 20. The new schedules are based on a valuation of $109,723,695. This valuation has been placed upon the properties of this large California utility, serving twenty-seven counties in the central and northern part of the state, after an investigation by the commission lasting over a period of nearly two years. The company claimed a valuation of $170,711,271 as a basis for rate-making purposes. In determining the valuation the commission followed its practice of using the historical reproduction cost method.

Under the new schedules lighting rates will be reduced about 12 per cent, power rates generally will be reduced about 10 per cent and a uniform schedule will be made applicable to all parts of the system.

Rates for San Francisco are fixed so as to do away with discrimination between competitive districts of the city.

The decision was handed down on Dec. 30.

## Coal and the Utilities

**J. W. Lieb and Others Tell the United States Commission the Facts of the Situation**

A PRESENTATION of facts regarding coal supplies to public utilities during and since the war was made to the United States Coal Commission at Washington on Wednesday of this week by John W. Lieb as chairman of the joint fuel committee of the three national utilities associations. All the members of the commission were present.

Mr. Lieb said that because of the depletion of normal coal reserves public utilities would approach April 1 virtually dependent upon coal received on their contracts and such as might be purchased in the "spot" market. He declared that a strike would result in inability of the utilities to supply electrical energy, gas or street-railway and interurban transportation. Statistics regarding the three utility industries represented were given showing the extent to which the public depends upon their services. The suggestion was made that the commission should consider the feasibility of requiring railroads and mines to develop some method of coal storage. It was also suggested that consideration should be given to the feasibility of backing up the utilities' coal contracts with strict priority orders. A third suggestion was that a method be worked out whereby utilities may be assured at all times of coal complying with specifications regarding heat-unit content, volatile content, low ash content, etc. Suggestion also was made as to the desirability of a method whereby coal producers would offer attractive seasonal prices and operators attractive seasonal freight rates, in order to encourage storage of coal not only by public utilities but by others consuming large quantities. Many additional facts were stated by Mr. Lieb, who was questioned at length by members of the commission regarding all phases of the electrical industry.

Following Mr. Lieb's presentation special statements regarding the three industries and their problems were made by O. H. Fogg for the American Gas Association, Judge C. L. Henry for the American Electric Railway Association and M. H. Aylesworth for the National Electric Light Association. Chairman Hammond of the commission requested that specific data be furnished to the commission regarding matters brought out. The commission will report to the President on Jan. 15.

## Smith for Home Rule

**Favors Constitutional Amendment to This End and Sweeping Changes in Commission Law**

GOVERNOR SMITH of New York in his inaugural message at Albany this week made recommendations for "home rule" of utilities and sweeping changes in the public service commission law along the lines which have been predicted and have already received much publicity. He also made a declaration in favor of state development, ownership and control of water powers, postponing specific advice on this matter till later in the legislative session. On the regulation of utilities he said in part:

"Probably no political principle has received so much statewide discussion as the question of a greater grant of power by the state to municipalities over such things as are wholly local. The cities of the state today, and particularly New York City, find themselves restricted by what is really a charter of limitation. The phenomenal growth of the cities brings up constantly for settlement new problems that the city should be left free to determine without interference by the state.

"The Legislature of 1921 passed an amendment to the constitution to bring this about which is now pending before your honorable body for passage the second time. If, in your judgment, this amendment accomplishes the purpose, it should promptly pass. If objections raised against it are of a minor nature it might be well to pass it any way and then start the legislative machinery again looking to further amendment that will cure any defect to which any real objection has been made. . . . Whatever action is taken on the present amendment at this session, I suggest for your consideration the initiation of a new amendment that would give to the communities of the state that full degree of local self-government which they are demanding and to which they are justly entitled. . . .

"Illustrative of this whole principle has been our treatment of the subject of control of public utilities. . . .

### ATTACKS STATE REGULATION

"The Public Service Commission of the state exercises regulatory powers over all public service corporations except railroads within the city of New York. In the fifteen years that have passed since the organization of the two public service commissions we have had fifty-four commissioners and the Public Service Commission has not yet succeeded in being much more than an object of political patronage. I think that I am within the truth when I say that the theory in itself never commanded a great amount of public respect. It makes little difference upon what you predicate it. The people in cities are unable to understand why the state interfered with the things that they believe to be local to themselves.

"In the last reorganization of the State Public Service Commission in 1921 the people of the state found that the control that they exercise over their own public utilities through their franchise agreements was taken away from them and vital portions of the contracts were nullified and the powers formerly exercised by the cities were transferred to the Public Service Commission. No defense can be made of this as it constitutes an absolute denial of self-government and home rule in the matter of contracts in all the cities of the state. The Public Service Commission is merely the agency of the state for the exercise of police power. There is no reason why the state should not select a municipality as its agent. To my mind we would get a better result.

"There are certain public utilities that are not within the confines of a single city, as their operations are either between cities or statewide. As to these utilities the state must retain its powers of control and regulation. It may also be that some of the cities of the state may be unwilling to assume the obligations of regulation. We must not force it upon them, as that would again constitute an interference with home rule. . . .

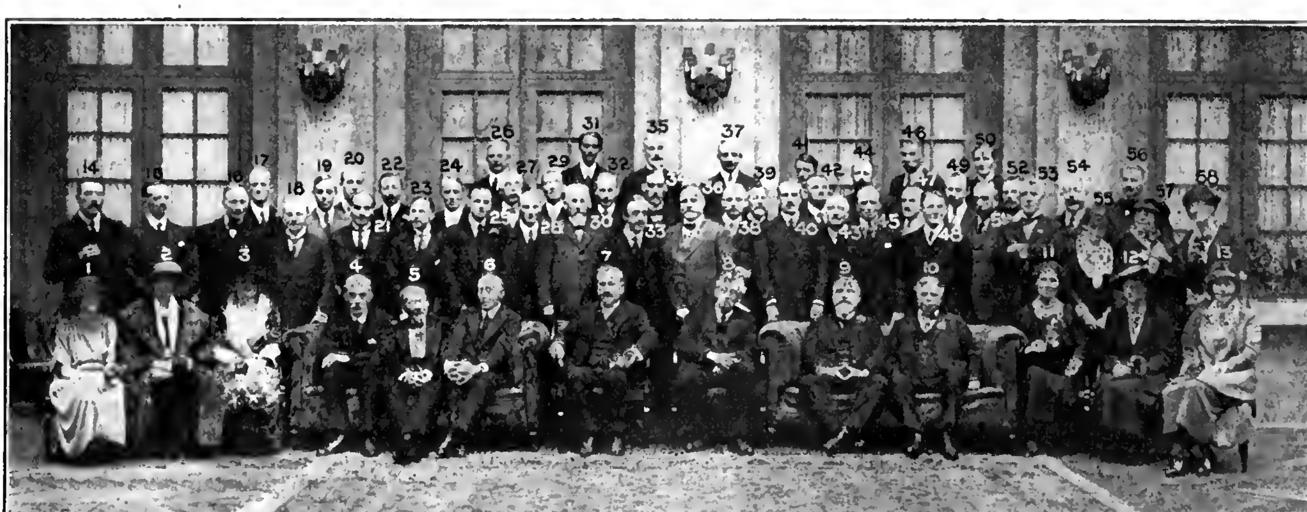
"In order to carry out this policy, the present Public Service Commission should be abolished and power given to the Governor to appoint not more than three commissioners to regulate such utilities as will not be regulated by the cities, either because they operate outside the corporate limits of a city or because the city may, by proper resolution, request the state to do it.

### FOR MUNICIPAL OWNERSHIP

"I recommend that in the preparation of the legislation to abolish the present Public Service Commission the power heretofore held by cities over the terms of their franchises be returned to them, where it belongs. . . .

"Directly in line with this program

## Delegates to the International Electrotechnical Commission Session at Geneva



4. Sir Richard Glazebrook (Great Britain).
5. Dr. Strecker (Germany).
6. Signor Semenza (Italy).
7. Dr. Mailloux (U. S. A.).
8. Colonel Crompton (Great Britain).
9. M. Boucherot (France).
10. Dr. Wheeler (U. S. A.).
14. M. Girault (France).
15. Colonel Gunton (Great Britain).
17. Mr. Hobart (U. S. A.).
18. Prof. Kloss (Germany)
19. Mr. Magalhaes (U. S. A.).
20. Mr. Cooper (U. S. A.).
21. Signor Barbagelata (Italy).
22. M. Belli (Switzerland).
23. Mr. Skanoke (Norway).
24. Mr. Rodgers (Great Britain).
25. Mr. Hunter (Great Britain).
26. Dr. Sharp (U. S. A.).
27. Mr. Meares (India).
28. Dr. Fleischmann (Germany).
30. M. Brylinski (France).
31. Mr. Good (Great Britain).
33. Mr. le Maistre (England).
34. M. de Montmollin (Switzerland).
36. Mr. Huber (Switzerland).
37. Mr. Roth (France).
38. Mr. Everest (England).
39. Mr. Hunziker (Switzerland).
40. Signor Vannotti (Italy).
41. M. Darries (France).
42. Dr. Sulzberger (Switzerland).
43. Prof. Morelli (Italy).
44. M. Dupont (Belgium).
45. Mr. Collens (U. S. A.).
46. Prof. Lorin (France).
48. Mr. Skinner (U. S. A.).
49. Dr. Rüdenberg (Germany).
51. Mr. Smith (England).
53. Gen. Harries (U. S. A.).
54. Mr. Doane (U. S. A.).
56. Mr. Rechniewski (France).

is the municipal ownership of public utilities. Public utilities have become so essential to the life of our great cities that the cities themselves should be permitted to purchase, build, own or operate them when a municipality determines this to be in its best interest."

## Activities of Power Board

**Loose Project Formally Disapproved—Advocates of Girand Plan Welcome Fall's Retirement**

AS ANTICIPATED (see ELECTRICAL WORLD, Dec. 16, page 1349), the Federal Power Commission has formally declined the application of Col. C. E. Loose for a license covering a power project on the East Walker River, in California. This action insures the use of the reservoir site in question for irrigation purposes.

After investigation the commission has ruled that navigation will not be affected by the proposed development of the River Falls Power Company of Andalusia, Ala., which desires to erect a 30-ft. dam in the Conecuh River near Palsaliga Creek.

The questions involved in the use of the so-called Narrows site on the Ouachita River, 10 miles below Hot Springs, Ark. (see ELECTRICAL WORLD, Dec. 23, page 1407), will be considered at a hearing before the commission, which will be held probably in the week of Jan. 15.

### THE GIRAND DEVELOPMENT

With Secretary Fall's retirement from the Cabinet announced for March 4, the proponents of the Girand development at Diamond Creek on the Colorado River are in hope that the new Secretary of the Interior will take a different stand on that proposal. It is believed that the Girand license would have been authorized had not Secretary Fall been in a position to block it. Mr. Fall wanted the government to construct the works necessary to the utilization of the waters of the Colorado River. The two other Secretaries who with him have composed the Federal Power Commission are understood to favor the Girand project so that the Arizona copper companies and other interests may have at the earliest time the power of which they are in such great need. The water-power act provides, however, that no license shall be granted for a project affecting any reservation of the United States unless the Secretary having administrative control sanctions the plan. In this case the Hualpai Indian reservation follows the south bank of the Colorado in the Diamond Creek area. This gave the Secretary of the Interior legal power to block the project single-handed.

In that connection an interesting development is the activity of the Southern California Edison Company at Glen Canyon, just above Lee's Ferry. It is understood that the California Edison has drilled that area and has found solid rock at levels which would be entirely satisfactory for dam foundations.

## Street-Lighting Tables for 1923

FOLLOWING its practice for thirty-four consecutive years, the ELECTRICAL WORLD has prepared tables showing the proper time for lighting and extinguishing street lamps. The tables for 1923 are now ready, and a copy of them will be sent free to any subscriber upon request to ELECTRICAL WORLD, Tenth Avenue and Thirty-sixth Street, New York. For more than one copy a charge of 25 cents each is made to cover a portion of the postage, printing and compilation costs.

## New York State Amends Its Plea on Power Act

The United States Supreme Court has granted the motion of the State of New York for leave to amend its bill of complaint and amended bill in the suit to test the validity of the federal power act and to restrain the Federal Power Commission from exercising jurisdiction over certain waterways in New York. In its amended petition the state claims that the exercise of alleged unlawful authority by the Federal Power Commission will subject the state to a multiplicity of lawsuits and deprive it of the constitutional right to handle affairs within its own boundaries when they do not affect other commonwealths.

Since 1903, the petition declares, the state has spent more than $200,000,000 on its waterways, and it is preparing to spend large sums for the development of navigation and for hydro-electric projects on the St. Lawrence, Mohawk, Hudson and Oswego Rivers. The state contends that its rights of ownership are challenged and that the Federal Power Commission is going beyond the regulation and control of waterways for the specific purpose of navigation. Such control, the state in its amended petition claims, is all that the water-power act sought to confer and the only authority that can be exercised properly by the Federal Power Commission.

## Alabama Power to Take Over Montgomery Utilities

The two lighting companies of Montgomery, Ala., with the street-railway system and the gas service, are to be taken over by the Alabama Power Company as soon as the approval of the Public Service Commission is granted. Thomas W. Martin, president of the Alabama Power Company, has announced the purchase of the properties following the advocacy of the transfer by the Montgomery Chamber of Commerce and other local interests. No statement concerning the purchase price was made. The Montgomery Light & Traction Company and the Montgomery Light & Water Power Company, which own the electric light and power, street-railway and gas services of the city, have been administered by a court receiver for several years.

Negotiations for the sale were, according to announcement, begun some months ago by the Chamber of Commerce, as the result of inquiries from companies which desired to locate in the Montgomery district if adequate power at suitable rates could be obtained. W. F. Black, secretary of the chamber, said that some of these prospective industries had found that power rates did not compare favorably with those in other parts of the South. Mr. Black predicted that this condition would be changed if the Alabama Power Company obtained control, and as a result of representations made to the chamber in person by Mr. Martin and Vice-president R. A. Mitchell the members unanimously adopted a resolution favoring the transfer.

## Role of the Engineer

**Two Sections of American Science Association Devote Meetings to Its Consideration**

ENGINEERING was represented at the Boston gathering of the American Association for the Advancement of Science last week in two of the many sections—Section K (social and economic sciences), of which Dr. Henry S. Graves of the Yale Forestry School is chairman, and Section M (engineering), of which the chairman is F. M. Feiker, vice-president McGraw-Hill Company, Inc. At a joint session of the two sections John T. Black, State Health Commissioner of Connecticut, spoke on "Conservation and Industrial Waste," and William S. Murray, New York, on "Conservation of Power." O. C. Merrill, executive secretary of the Federal Power Commission, and Gen. Harry Taylor, Corps of Engineers, U. S. A., were unable to present their papers because of badly delayed train schedules.

"The Place of the Engineer in Civilization" was the keynote of the meeting of Section M. Dr. Ira N. Hollis, president of Worcester Polytechnic Institute, led the discussion, instancing the factors of transportation and communication as vitally touching the activities of men in every walk of life and dwelling on the need for the engineer to make an analytical study of the facts governing the solution of present-day problems. A similar point of view was expressed by Harrington Emerson, who alluded, as did Dr. Hollis, to the engineer's control of the instruments of production. Dr. J. B. Tyrrell told of the growth of the mining industry in Canada. The paper of C. F. Scott, professor of electrical engineering at Yale, was read in his absence by Dr. D. C. Jackson. It dealt with new phases of

engineering education and pointed out that the large part played by engineering in modern life made it essential that the training of engineers be approached with a new viewpoint of the engineer's place in the community.

Contributions from several delegates laid stress on the contention that the next step in engineering is to relate the problems of the material advance in civilization to the human problems of civilization.

# Philadelphia & Reading Plans Mine System

### Five or Six Large Modern Electric Power Stations Are to Be Tied Together to Feed Coal-Mining Machinery in Two Pennsylvania Counties

ONE of the largest purely industrial electric systems in America, and probably the largest in the world devoted solely to coal mining, is planned by the Philadelphia & Reading Coal & Iron Company for the operation of its coal mines in Schuylkill and Northumberland Counties, Pennsylvania. It will eventually comprise five or six large modern power stations, tied together in one great system supplying power for the company's forty-odd operations, for the Pottsville shops and for incidental uses. The individual plants will generate from 15,000 kw. to 20,000 kw. each, and the total power will be at least 100,000 hp.

There will be 85 miles of high-tension line, carrying a current of 23,000 volts, and additional secondary mileage in the way of service connections and direct cables to the mine pumps. These pumps will operate without the voltage being reduced. Some of the pumping installations are already finished.

#### What the Development Means

The Philadelphia & Reading project will bring about the almost universal substitution of electricity for other forms of power in operating the company's mine and breaker machinery, and it also implies the elimination of seventeen engine-driven non-condensing power plants—sixteen at mines and one at the Pottsville shops.

Two modern electric plants which will be incorporated in the new system already are in operation—a 5,000-kw. plant at Good Spring and a 4,800-kw. plant at Locust Spring. These plants are tied together now in a system which runs from Brookside, in the west end of Schuylkill County, to Pine Forest, a little north of Pottsville, thence north to Indian Ridge, near Shenandoah, and thence west through the Mahanoy Valley to Locust Spring. Fifty-five miles of primary high-tension line is already built. A line is now under construction from Locust Spring to Bear Valley, west of Shamokin, and later a short link will run from Bear Valley to North Franklin at Trevorton, the extreme northwest of the Reading properties. Next summer a line will be run south from Pine Forest to Pottsville, to supply the shops, and another line will run from Pine Forest to Silver Creek on the east. At Silver Creek one of the proposed new plants will be built.

An additional extension from Indian Ridge to North Mahanoy and the territory now supplied by the old North Mahanoy plant will round out this high-tension network. The old electric plants will not be scrapped but will be retained as emergency units.

The great extent to which electricity is used by the Reading, even under the present system of isolated stations, is shown by the fact that it is now operating more than 100 miles of underground trolley line, has 140 electric locomotives in service, operates 106 electric pumps and charges about 9,000 electric lamps for miners.

The Good Spring plant, opened in June, 1919, was the first unit designed for the proposed new system, and it typifies in a general way what will be done at other plants. This station was placed at Good Spring because that point is central for the Tremont district, because ample supplies of barley coal were available at that colliery, and because Pine Creek, near by, supplied sufficient water for effective operation. The boiler plant and dynamo room are constructed of brick and steel. There are seven Stirling water-tube boilers generating 4,500 hp. and fitted with Coxe traveling stokers. Coal is supplied from overhead bunkers, which are fed by a conveyor line from a large bin, the bin in turn being supplied with coal by an aërial tramway running to the foot of the breaker. Ashes are disposed of by a flushing system which washes them into a large tank, whence they are hauled by a 20-ton car to the spoil bank.

The generating equipment consists of 5,000-kw. steam-turbine generators operating at a pressure of 150 lb. and condensing at a vacuum of 28.5 in. The condensers are of the barometric type.

Power is generated at 6,600 volts and conducted to an eleven-panel switchboard equipped with indicating and recording instruments for measuring electric current. It is controlled through oil circuit breakers and is distributed to the colleries in the Tremont district at a line voltage of 6,600. For long-distance transmission there is a transformer station which steps up the potential to 23,000 volts, and it is carried through the rest of the circuit at that voltage. At each colliery supplied from this high-tension line a transformer station is installed equipped for measuring and controlling the power consumption at that mine, the voltage being stepped down from 23,000 to 2,300 for colliery distribution. At present there are twenty-two transformer stations installed, having a combined capacity of 25,300 kw. Oxide film lightning arresters are installed.

## Progress of Metric System

Substantial progress toward the wider adoption of the metric system in America was emphasized on Dec. 30 at the annual meeting of the American Metric Association in Cambridge, Mass., in connection with the national convention in the same city of the American Association for the Advancement of Science. Well-attended sessions were held at the Massachusetts Institute of Technology. Dr. George F. Kunz, New York, presided.

Dr. A. E. Kennelly emphasized the value of common units in applied science, in his address upon "The Metric System in Electrical Engineering." He described the metric basis of electrical measurements, pointed out the growing popularization of metric terms through radio and other channels, and predicted the ultimate general adoption of the metric system in the United States.

B. L. Newkirk, General Electric Company, Schenectady, N. Y., in a paper on "The Metric System in the Electrical Industry," reviewed the growth of metric measurements in the past half-century and pointed out that there is no hope of getting the non-English-speaking world to adopt non-metric units. If the world is to "get together" at all, it must be on a metric basis.

Superintendent Meyer of the American Bosch Magneto Company, E. A. Marsh, consulting superintendent American Waltham Watch Company, and T. H. Miller of the De Laval Separator Company reviewed the successful use of the metric system in their plants, and Walter Wood of Philadelphia emphasized its business-getting value in selling material to foreign countries. Howard Richards described the use of the metric system in the shops of France and Germany, as observed last summer.

Interest in the meetings was increased by the appearance of opponents who spoke on behalf of the Secretary of War, the United States Navy and industrial organizations that look with disfavor upon the general use of the metric system.

During its convention the American Association for the Advancement of Science reaffirmed its belief in the metric system and passed a resolution recommending the use of metric units by scientific men in all papers of a professional character, with non-metric units in parentheses.

## Water-Power Control Issue Reappears in Maine

State development of storage reservoirs is expected to come up again for consideration at the next biennial session of the Maine Legislature, which convenes at Augusta on Jan. 8. It is understood that Senator Ralph O. Brewster of Portland will introduce a constitutional amendment giving the state the right to create and finance water-storage districts, build dams and establish reservoirs for power development, and that the measure will have the backing of Governor Baxter, long an advocate of this policy.

# New Plant in Anthracite Field

## East Penn Electric Company Expects First 50,000-Kw. Section of Its Power House at Pine Grove, Pa., to Be Finished This Summer —Extreme Simplicity a Marked Characteristic

THE first 50,000-kw. section of the East Penn Electric Company's plant at Pine Grove, Pa., which is four or five miles from the anthracite mines, will be completed about June or July. With a cooling pond and a regulating reservoir to conserve the flow of Swatara Creek, on which the plant is built, sufficient circulating water will be obtainable for a 300,000-kw. development, according to the J. G. White Engineering Corporation, which designed the plant. Among its chief features are its sectional development and its extreme simplicity, the object being to minimize the number of operators required. The station is laid out for 50,000-kw. extensions with the boiler aisles at right angles to the turbine hall, permitting the change of turbine and boiler sizes or even the use of powdered fuel. Although traveling-grate stokers are employed in the section now nearing completion, it is most likely that the extensions will use powdered coal and possibly larger turbo-generators.

Anthracite "fines," containing 11,500 B.t.u. and 20 to 25 per cent ash, will be received by railroad and dumped into track hoppers, elevated to an outdoor overhead bunker at the end of the firing aisle and from there carried by means of weighing larries along the boiler-room aisle to the stoker hoppers. This arrangement has permitted the use of lighter steel in the boiler house. Outdoor storing and reclaiming of coal will be performed by a locomotive crane. The ash hoppers will dump directly into railroad cars. These cars as well as coal cars will be switched by steam-storage locomotives.

### STOKERS AND BOILERS

Extra long (18-ft.) forced-draft traveling-grate stokers capable of operating at 300 per cent of nominal rating with natural draft are being installed with direct-current motor drive. The stack will be 350 ft. high. To relieve pressure on the furnace firebrick and also to facilitate replacement of sections, the furnace-wall facing is horizontally sectionalized by interlocking tile courses, each of which supports only six courses of firebrick.

Because of the limitation imposed by the width of forced-draft traveling-grate stokers available at the time of beginning the plant, it was considered economical to install boilers with only 8,000 sq. ft. of heating surface per unit, but they are arranged in batteries with ventilated walls between them, this ventilation being facilitated by the interlocking tile construction. Larger boilers can be used next time because wider stokers will be available. The boilers are designed for 300 lb. pressure and 600 deg. to 650 deg. total temperature and are twenty tubes high, with the superheater placed above the sixth row. The entire length of the lower six rows of tubes is exposed to the radiant heat of the furnace. No economizers will be used, because the coal burned is cheap.

The simplest possible piping layout will be employed without crossovers and interconnections, but the very best material and workmanship obtainable will be incorporated to prevent any contingency arising which would require a more flexible arrangement. By making use of de-aërators it has been possible to use wrought-iron feed-water pipes.

FIRST 50,000-KW. SECTION OF THE PINE GROVE (PA.) PLANT AS IT WILL APPEAR WHEN COMPLETED

The house turbines which supply all power for station auxiliaries are operated at such a load that their exhaust steam will maintain the feed-water temperature at 240 deg. constantly. Such operation is permitted by a tie-in transformer between the house generator and outgoing transmission line, containing a total of 20 per cent reactance, to prevent disturbances on the line interrupting auxiliary service.

Surface condensers with divided water boxes and two circulating pumps are employed, the latter being driven in such a way that they can operate on siphon feed or against spray-head pressure, or both.

### FIRST GENERATORS RATED AT 12,500 KW.

Two 12,500-kw., 12,000-volt generators with direct-connected exciters and face-plate regulators will be used in the initial installation. The generators will be tied directly with 12,000/66,000-volt, three-phase transformers without intermediate circuit breakers or low-tension buses. Emergency excitation will be provided.

All auxiliaries except the stoker drives and part of the boiler-feed pumps are driven by alternating-current motors, the stoker drive being direct current and the non-electrical boiler-feed pumps turbine driven. The alternating-current drives will be supplied by 2,300-volt feeders, local substations and steel-inclosed control equipment. Most motors will be operated at 2,300 volts, but where a lower voltage is necessary transformers will be installed in the local substations. As mentioned before, the auxiliary service will be supplied by a 2,300-volt house generator from duplicate buses. Local substations will be provided for each turbo-unit to serve the circulating and condensate pumps and small house-lighting transformers, for the boiler-house auxiliaries and for the emergency exciters and miscellaneous equipment.

No signals except a general standby signal will be used between the main switchboard room and the turbine room. Instead, a loud-speaking telephone will be used in the switchboard room, while head sets with telephone jacks will be installed at convenient points around the turbines and auxiliaries. In addition to this equipment there will be an automatic intercommunicating system.

### RELAY PROTECTION

Differential protection will be provided for the generators and transformers which will trip the main high-tension circuit breakers, the generator field switch and the neutral switch. Overload protection will not be provided for the generators except in the form of bell-alarm and signal indications on each generator. However, overload and balanced protection will be provided on the outgoing lines.

The 66,000-volt outdoor substation is very compact, this being made possible by a judicious use of a new design of motor-operated disconnecting switch throughout. Two double-circuit transmission lines will run from the substation to a 69,000/24,000-volt substation at Fishbach, Pa., where distribution will be carried on at 24,000 volts.

# Boston Electrification Project Revived

Comprehensive plans for the electrification of railroads in the Boston metropolitan district will be discussed at a conference to be called early this month by Mayor Curley, following a report by Walter Stuart Kelley, an electrical engineer who has been investigating the subject for some time. Leading mercantile, transportation, financial and other interests, with the Department of Public Utilities and other public officials, will be asked to participate. Electrification of railroads and other improvements have been discussed before legislative committees and the public utility commission off and on for years, and it is hoped that through unifying public and official views progress may this year be made toward the ends so long recognized as desirable.

## Boston Versus Cleveland

**Electric Service Conditions in the Two Cities Compared in Massachusetts Rate Case**

EXTENDED comparisons between the engineering and economic conditions affecting service costs were presented at a recent hearing in the Boston Edison rate case before the Massachusetts Department of Public Utilities by L. L. Elden, electrical engineer of the Edison Electric Illuminating Company of Boston. On behalf of petitioners for a reduction in Boston rates below the present maximum of 9.5 cents, considerable stress has been laid in these proceedings upon the 5-cent maximum rate of the Cleveland Electric Illuminating Company. Mr. Elden went to Cleveland a few weeks ago to study the plant and operating conditions there in this connection, and upon his return he presented an exhaustive analysis of the estimated effect of applying Cleveland conditions to Boston Edison operations, showing that were conditions comparable substantial reductions might be effected in the Boston rate.

The Boston Edison company's contention in this protracted rate case is that comparisons of operation among different companies are useless unless conditions are similar, and that where conditions are dissimilar differences in prices are not only justifiable but required. There are a number of fundamental differences between the Cleveland and Boston conditions. The Cleveland company, with a peak demand only about half as much again as Boston's, sells nearly twice as much energy. Within comparable areas there are about a thousand substantial industrial power customers at Cleveland against two hundred at Boston. The Cleveland company's load factor is higher, and because of the company's ability to sell large blocks of energy at high tension its distribution efficiency is much better than Boston's. Cleveland serves 293 square miles against Boston's 570, and the former has 30 per cent as much underground cable mileage to maintain as does the latter, approximately one-third as many miles of conduit and about half as many manholes. Boston has about twice as many poles to maintain, and the cost of overhead-line maintenance at Boston would be reduced by 45 per cent if Boston enjoyed Cleveland conditions. Twenty times as much street-lighting cable is in use at Boston, which maintains a 6.6-amp. street-lighting service against a 4-amp. service in Cleveland. Shorter circuits and fewer lamps per mile at Cleveland favor that company, as well as the use of 4,000 volts in street lighting compared with 6,000 volts and 8,000 volts at Boston.

### THREE SUBSTATIONS TO ONE

Boston operates thirty-two substations against ten in Cleveland having attendants. If Boston's peak load could be handled within a Cleveland area, twenty-two substations could be eliminated and the attendance reduced from 238 to 60. Twelve storage batteries could be eliminated at Boston if Cleveland's output and Boston's peak could be handled in the Cleveland area on the basis of Boston operating costs. Boston furnishes lamps and renewals in its rate schedule; Cleveland does not. Cleveland supplies a very large high-tension output to street railways, whereas Boston supplies railways with low-tension energy, requiring additional investment in substations and equipment not needed by the Cleveland company. In many other features detailed in Mr. Elden's testimony it was shown that the "spread" between the two maximum rates of these cities was founded upon economic and engineering conditions.

The next hearing in the Boston rate case is scheduled for Jan. 11. In the meantime reports are current that the city authorities may conclude that with the realization of the voluntary and planned rate reduction program announced some months ago by the company as its goal it may be expedient to drop further proceedings before the commission.

## Brief News Notes

**Continental Company Buys Nebraska Utility.**—The Continental Gas & Electric Corporation has contracted to purchase immediately the Lincoln (Neb.) Gas & Electric Light Company. President Rufus E. Lee of the Continental company is laying plans to make this newly acquired property the center of a large Nebraska system. Increases in plant capacities will be necessitated.

**Houston Company to Expand.**—The Houston (Tex.) Lighting & Power Company, it is officially announced, contemplates the erection in the near future of a power plant on the Houston Ship Channel to be known as the Deepwater station. The tentative plans call for an ultimate development of 150,000 kw. and the present installation of 40,000 kw. The plant is to be ready for operation early in 1924.

**American Gas & Electric Acquires Ohio Service Company.**—A controlling interest in the Ohio Service Company is reported to have been sold to the American Gas & Electric Company of New York by the United Service Corporation of Scranton, Pa. The new owner will, it is said, operate the Ohio Service Company, which serves many Ohio towns with electric light and power, in connection with the Ohio Power Company at Canton.

**United Illuminating Company to Increase Stock.**—The United Illuminating Company, New Haven and Bridgeport, Conn., has arranged for an increase of capital stock, issuing 9,805 shares at \$100 par to stockholders, at the rate of one new share for each seven now held. The rights expire Jan. 20, 1923, and payments are to be made as follows: Twenty per cent by February 10, 40 per cent by June 10 and 40 per cent by Oct. 10.

**Ohio Utility Financing Close to Million Mark.**—Public utilities in Ohio sold \$91,750,379 in securities during the first ten months of 1922, according to a report from the Ohio Committee of Public Utility Information. Distributed as to population, this means that more than \$15 for every man, woman and child in Ohio was invested in additional capital for all classes of utilities. Of this total, the electric light and power utilities received \$39,902,188, or 43.5 per cent. Most of the recent issues have been absorbed by the utilities' customers.

**Electrification Project Between Dallas and Denton.**—Engineers are now employed in working out the plans for the electrification of the 32-mile stretch of track of the Missouri, Kansas & Texas between Dallas and Denton, according to C. W. Hobson of Dallas, head of the Southwest General Electric Company. One of the changes on the line that will have to be made will be the installation of a block signal system. The electric interests will bear the entire cost of electrification, Mr. Hobson said, under the agreement with the railroad.

**"Service at Cost" Proposed for Colorado Springs.**—The franchise of the Colorado Springs (Col.) Light & Power Company expires early in 1923, and the company has proposed to the City Council that the city arrange to accept as a renewal of the franchise "service at cost," the city to distribute the electricity over its own wires. The City Council is deliberating upon further development of the Pike's Peak hydroelectric project, which, if fully developed at a cost of about \$1,800,000, would give the city a municipally owned plant.

**Consolidation in Washington State.**—Arrangements have been completed for a merger of the Tacoma Gas & Fuel Company and the Puget Sound Gas Company with the Mountain States Power Company. All three companies are controlled by the Standard Gas & Electric Company, and President H. M. Byllesby states that their plants are modern and efficient and that the earnings of all of them should increase, slowly in the case of Tacoma and Puget Sound, but rapidly in the case of Mountain States Power Company. The properties are contiguous and are susceptible to the economies of unified management.

**Consolidation Will Save \$100,000 a Year.**—The proposed absorption by the Interstate Public Service Company of Indianapolis of seven companies owned by the same interests that own the Interstate Company will reduce the fixed charges of the companies approximately 100,000 a year, Harry Reid, president of the first-named company, testified recently before the Indiana Public Service Commission. He said that the absorption would reduce by \$1,848,106 the securities and debts now against the properties and that much better financ-

ing, more direct operation, less overhead expense and more scientific management all around would result from a merger.

**Wisconsin University to Teach Meter Theory and Operation Again.**—The University of Wisconsin will for the third time give a short, intensive course for electric metermen at the College of Engineering Laboratories, Madison, from Jan. 29 to Feb. 2. Questionnaires have been sent out to determine the qualifications of the men desiring to attend, in order to classify them into groups of equal experience. The work will be divided into five sections—indicating instruments, watt-hour meters, instrument transformers, demand meters, and miscellaneous work. A small fee will be charged. C. M. Jansky is professor of electrical engineering.

**Transportation to Denver N. E. L. A. Meetings.**—A special compartment car will be reserved for delegates from the East to the meeting of the Commercial National Section of the N. E. L. A. to be held in Denver on Jan. 24-26. This car will be attached to the "Lake Shore Limited" leaving New York by the New York Central route on Saturday, Jan. 20, at 5.30 p.m. and reaching Chicago at 4 p.m. Sunday. Sunday night will be spent in Chicago, and the car will be attached to train No. 9, over the Burlington route, leaving Chicago at 10.30 a.m. Monday and arriving in Denver at 3.30 p.m. Tuesday. The total one-way fare is $107.61. Reservations should be made at once through Clarence L. Law, chairman transportation committee, New York Edison Company, Irving Place and Fifteenth Street, New York.

**St. Louis Utility Changes Name.**—The Union Electric Light & Power Company, St. Louis, has been granted permission by the Public Service Commission of Missouri to change its corporate name to the St. Louis Electric Light & Power Company. The transfer of assets of the latter concern to the Missouri Electric Light & Power Company and the further transfer of assets to the new Union Electric Light & Power Company was also authorized. These changes are part of the reorganization and refinancing plan of the Union Electric Light & Power Company made necessary by the construction of its new Cahokia plant on the Mississippi River. Under a recent order of the commission, the authorized capital stock of the new company will be $25,000,000 preferred and 650,000 shares common stock of no par value.

**Davis Bridge Dam Power House.**—Work on the New England Company's Davis Bridge development is progressing rapidly. The dam will be 200 ft. high, about 1,200 ft. wide at the base and will extend across the valley of the Deerfield River for about 1,200 ft. The power house, to be built below Readsboro, Vt., will be about 60 ft. x 110 ft. in plan with a substructure of concrete located on a ledge and a superstructure of brick-steel construction. Since the power house will be about 150 ft. from the river bank, the tailrace is being excavated across the intervening flat, and the material is being used to grade the outdoor transformer and switching station area. Two vertical units of about 20,000 hp. each are to be installed first.

**Lecture Course Planned by Oklahoma A. and M.**—Plans have been completed for a series of eight lectures on public utility subjects to be delivered at the Oklahoma Agricultural and Mechanical College at Stillwater during the present school year. These lectures will cover various branches of the public utility industry and will be delivered by officers and executives of local utility companies. The first lecture was given on Dec. 11 by George A. Davis, assistant to the vice-president, in charge of public relations of the Oklahoma Gas & Electric Company. His subject was "What Is a Public Utility?" The other lectures are scheduled to be presented before the engineering school and the general student body. This service has been started by the speakers' bureau of the Oklahoma Utilities Association.

## Associations and Societies

**New York Section, I. E. S.**—Theater lighting will be the topic of the meeting of this section of the Illuminating Engineering Society on Jan. 11. It will be discussed by lighting engineers who are connected with prominent theaters.

**Middle West Division, N. E. L. A.**—A conference of the Middle West Geographic Division, N. E. L. A., is called by President Bell to meet at the Muehlebach Hotel, Kansas City, on Wednesday, Jan. 10, at 10 a.m., to consider finances and other matters of interest to the industry.

**Coming Meetings of A. I. and S. E. E.**—The Philadelphia Section of the Association of Iron and Steel Electrical Engineers meets tonight (Jan. 6), when W. J. De Voe will speak on automatic electric services. The Cleveland Section will hold its annual dance and "get-together" meeting on Jan. 13. The Chicago Section will hear an address on "Radio" by a General Electric Company engineer on Feb. 14.

**January Section Meetings of the A.I.E.E.**—The following Institute section meetings have been scheduled for January, 1923: Boston, Jan. 9, "The Doble Method of Testing Insulators," Frank C. Doble; Detroit-Ann Arbor, Jan. 12, "Electric Transportation System of a Large City," H. M. Gould; Pittsburgh, Jan. 9, "Alternating-Current Substations for City, Industrial and General Distribution Work," A. H. Kehoe; New York, Jan. 19, "The Modern Physics," Dr. M. I. Pupin; Pittsfield, Jan. 18, "Power Development at Niagara," J. L. Harper; Toronto, Jan. 12, "Industrial Heating"; Jan. 26, "Large Power Distribution and Control," P. E. Hart; Worcester, Jan. 18, "The New England Power System," S. C. Moore.

**Electrical Club for Sacramento.**—Nearly a hundred representatives of the electrical industry of Sacramento, Cal., met with a large delegation from the San Francisco Electrical Development League last month to discuss the advisability of forming a permanent electrical club in the Sacramento district. The purposes of the club would be social, educational and commercial. A resolution favoring its formation was passed.

**Western Association of Electrical Inspectors to Discuss Code Revision.**—At the eighteenth annual meeting of the Western Association of Electrical Inspectors, which will be held at the Hotel Sherman, Chicago, Jan. 23, 24 and 25, almost the entire program will be devoted to presentation and discussion of proposed changes in the National Electrical Code. The meeting will thus be one of the most important the association has held. It is planned to have the chairman of each standing committee or the chairman of each technical sub-committee of the electrical committee of the National Fire Prevention Association present the changes in the code related to the work of each committee and explain the reasons for and import of each suggestion.

### Coming Meetings of Electrical and Other Technical Societies

[A complete directory of electrical associations is published on page 78 of this issue of the ELECTRICAL WORLD.]

Federated American Engineering Societies—Washington, Jan. 11-12.

National Council Lighting Fixture Manufacturers—Cleveland, Jan. 15-20. C. H. Hofrichter, 231 Grodon Square Bldg., Cleveland.

Lighting Fixture Dealers' Society of America—Cleveland, Jan. 15-20. J. L. Wolf, Electrical League, Hotel Statler, Cleveland.

Western Association of Electrical Inspectors—Chicago, Jan. 23-25. W. S. Boyd, 175 W. Jackson Blvd., Chicago.

Iowa Engineering Society—Des Moines, Jan. 23-26.

Wisconsin State Association of Electragists—Milwaukee, Jan. 24-26. H. M. Northrup, 23 Erie St., Milwaukee.

Association Municipal Electrical Utilities of Ontario—Toronto, Jan. 25-26. S. R. A. Clement, 190 University Ave., Toronto.

Electrical Supply Jobbers' Association—Central Division, Chicago, Feb. 13-14; Atlantic Division, New York, Feb. 14; executive committee, Atlantic City, Feb. 15-16. Franklin Overbagh, 411 S. Clinton St., Chicago.

American Institute of Electrical Engineers—New York, Feb. 14-16. F. L. Hutchinson, 33 West 39th St., New York.

American Institute of Mining and Metallurgical Engineers—New York, Feb. 19-21.

American Physical Society—New York, Feb. 24. D. C. Miller, Case School of Applied Science, Cleveland.

Oklahoma Utilities Association—Oklahoma City, March 12-14. O. D. Hall, 1106 First National Bank Bldg., Oklahoma City.

Southwestern Division, N. E. L. A.—Oklahoma City, March 14-16. S. J. Ballinger, San Antonio Public Service Co., San Antonio, Tex.

Illinois State Electric Association—Chicago, March 16-17. R. V. Prather, 305 Mine Workers' Bldg., Springfield, Ill.

Wisconsin Utilities Association—Milwaukee, March 22-23. John N. Cadby, 445 Washington Bldg., Madison.

American Electrochemical Society—New York, May 3-5.

National Electric Light Association—New York, June 4-8. M. H. Aylesworth, 29 West 39th St., New York.

## Recent Court Decisions

**Contracts Voided for Want of Mutuality.**—In suits brought by the incorporated town of Laurens and other towns in Iowa against the Northern Iowa Gas & Electric Company the United States Circuit Court held that contracts between the towns and the electric company obligating the company to furnish electricity to the towns without requiring the towns to purchase the electricity, except as they might desire, cannot be specifically enforced, the contracts being void for want of mutuality.

**Telephone Workman Maintaining Wires on Electric Light Company's Poles Not Trespasser.**—A telephone workman climbed an electric light pole bearing telephone wires on which he had been told to work and was killed by contact with electric light wires insufficiently insulated (Cappuccio vs. Hammonton Electric Light Company). The defendant claimed that the workman was a trespasser, that there was no proof of negligence on its part and that the man was guilty of contributory negligence since he wore no rubber gloves and did wear spurs. The Supreme Court of New Jersey ruled against the defendant on all three contentions, pointing out that the question of gloves and spurs was in this case immaterial since the victim of the accident made contact with the high-tension wire with his knee. (118 At. 712.)*

**Contract Rates Binding Until Exercise of State Regulatory Power.**—In Sumter Gas & Power Company vs. City of Sumter, the United States Circuit Court of Appeals for the Eastern District of South Carolina found that where a city is empowered to make regulations with respect to streets, but is not empowered to make contracts fixing the rates to be charged by corporations given the right to use streets, the state has a right in the exercise of its police power to change the rates fixed by the contract giving a company the right to use the streets; but where the state does not exercise its right to change such rates, the rates are binding on both parties and cannot be changed by the court. A further finding was to the effect that where a city without the right to so do entered into a contract with a company fixing the maximum rates to be charged by the company the Legislature by ratifying such contract could make it an irrevocable contract with the same force and effect as if the statute authorizing the city to regulate rates had been enacted cotemporaneously with the ordinance granting the company the franchise fixing the rates, since the company, having accepted the agreement and received the benefits, could not complain of its subsequent legislative sanction and ratification. (283 Fed. 931.)

**Contributory Negligence as a Question of Law.**—Two boys, walking along a path at night, came into contact with a loose wire hanging from a telephone line and swung it in such a way that it came into contact with a trolley transmission line and both boys were killed. The Supreme Court of Pennsylvania, in Sebring vs. Bell Telephone Company and Flesher vs. Same, has declared that the boys were not guilty of contributory negligence as a matter of law, that the proximate cause of the injury was rightly left to the jury to determine, and that the telephone company was guilty of negligence in not inspecting its line, from which testimony showed that the loose wire had hung for weeks. (118 At. 729.)

**Rule Requiring Deposits Held to Be Discriminatory.**—The Court of Appeals of Kentucky has declared for the plaintiff in Barriger vs. Louisville Gas & Electric Company, finding discriminatory a rule whereby about 10 per cent of the consumers were required to put up deposits or furnish a written guaranty that their bills would be paid, while about 90 per cent were not required to furnish security of any kind, all the consumers being charged the same rates for services rendered. The deposit was ordered returned to the plaintiff with the interest due, but the court refused to allow him to sue for similar relief to about three thousand others, holding that the claims of other consumers were several and could not be joined in one action. (244 So. 690.)

**Power of Courts to Reverse Ohio Commission.**—Pointing out that on reviewing an order of the Ohio Public Utilities Commission it is not the province of the court to fix a rate or make stipulations concerning the service to be furnished, but only to determine whether the commission's order is unlawful or unjust, the Supreme Court of Ohio reversed the commission in an action brought against it by the city of Cincinnati because of a new schedule of telephone rates authorized by the commission. No authoritative opinion was filed because the judges did not agree on their grounds for the judgment. The chief justice, however, held that the company had failed to sustain the burden of proof and criticised the method of valuation followed. (137 N. E. 36.)

**No Recovery for Injury to Boy Courting Danger.**—An eight-year-old boy was injured when, in order to get a birds' nest, he climbed to the high part of a railroad bridge and touched a bare electric wire 19 in. from the strut which he had climbed. Damages awarded his guardian were affirmed by the United States Circuit Court (Fruchter vs. New York, New Haven & Hartford Railroad), and the case was appealed to the United States Supreme Court on a writ of certiorari. This court has reversed the judgment and remanded the case, finding an absence of any evidence that the railroad company directly or by implication invited or licensed the boy to climb to the point from which he touched the wire, in opposition to the supposed theory of the trial jury that the structure was both dangerous and attractive to children and that failuse to supply proper guards, human or mechanical, constituted negligence. (43 S. C. R. 38.)

*The left-hand numbers refer to the volume and the right-hand numbers to the page of the National Reporter System.

## Commission Rulings

**Franchise-Tax Exemption Not a Factor in Valuation.**—In reducing from the \$104,000 requested to \$78,100 the amount of 7 per cent preferred stock which the San Diego Consolidated Gas & Electric Company would be permitted to issue to purchase the Coronado system of the United Light, Fuel & Power Company, the California Railroad Commission excluded from the valuation \$25,000 said to represent the value of the exclusive franchise rights possessed by the Coronado Company in its territory. No value, the commission maintained, can be placed on a franchise on the theory that an existing utility can operate without payment of a franchise tax while a new utility would have to pay such a tax.

**Public Rights in Water Powers.**—Seventy-six investigations undertaken by the Public Utilities Commission of Utah into contracts made between the Utah Power & Light Company and large users of power were brought to a close recently when the commission ordered the standard schedules to apply to the Bamberger Electric Railroad with some special allowances. In this case the equity of special rates from the power company to the railway company was predicated upon the value of certain water rights which the railroad company had surrendered, the power company acquiring the benefit inherent in them. The commission refused to entertain a valuation of these water rights based on comparison with the cost of coal. The State of Utah, it pointed out, has splendid natural advantages regarding the development of water rights, and to put "value upon water rights equated to the competitive cost of coal which must later be capitalized and reflected in rates paid by the consumers would operate to deprive the public of these natural advantages and be destructive of public right. To value water rights solely upon this basis would benefit hugely the owners of these water rights who secured them under state and federal laws at nominal expense and would be inimical in the end to the very parties who now propose it. The benefit of available water power should move to both the producer and consumer of water power. This cannot be under any such theory."

# Men of the Industry

Changes in Personnel
Accomplishments, Responsibilities, Honors, Appointments and Activities of Men Engaged in all Branches of the Electrical Industry

## Friends Honor Dr. Weston

Dr. Edward Weston, head of the Weston Electrical Instrument Company, was the guest of honor at a dinner given on Thursday evening, Dec. 28, at the Hotel Commodore, New York City. Prof. Michael I. Pupin of Columbia was toastmaster and the guests presented Mr. Weston with a silver loving cup. Dr. Weston is a charter member of the American Institute of Electrical Engineers and a past-president of the organization.

**H. V. Rees**, who has been with the Fruit Growers' Express Company for some time, has joined the commercial department of the Ohio Power Company.

**F. L. Ball**, local manager of the Fitchburg (Mass.) Gas & Electric Light Company, has been elected vice-president of the Fitchburg Chamber of Commerce.

**Otto E. Osthoff**, vice-president of H. M. Byllesby & Company and of the Standard Gas & Electric Company, has withdrawn from these corporations and their subsidiaries as of Dec. 31.

**M. F. Riley** of New York, president of the Birmingham Water Works Company, has resigned to become president of the Potomac Public Service Company of Maryland, which is also a subsidiary of the American Water Works & Electric Company.

**Yasuhige Hayashi**, managing director of the Uji River Electric Company and vice-chairman of the board of directors of the Nippon Electric Company of Osaka, Japan, recently visited California and made a study of high-tension transmission systems. He is especially interested in the transmission of energy at 220,000 volts.

**Clarence A. Whitmyer** of the General Electric Company succeeded George R. Lunn as Mayor of Schenectady on Jan. 1, when Mr. Lunn became Lieutenant-Governor of New York. Mr. Whitmyer, who is president of the Common Council, has obtained a year's leave of absence from his position with the General Electric Company and will serve the remaining year of Mr. Lunn's term as Mayor.

**R. S. Johnson**, senior student in electrical engineering, has been appointed to the electrical fellowship maintained by the Wisconsin Utilities Association at the University of Wisconsin on the nomination of Edward Bennett, professor of electrical engineering at the university. The fellowship is maintained to encourage research work on problems whose solution helps to improve the quality of service rendered by public utilities and to bring students more closely in contact with the operating difficulties of the different companies. This year Mr. Johnson will devote his research work to the problems involved in eliminating electric disturbances on telephone circuits.

## Major Bennion Receives the Distinguished Service Medal

Major Howard S. Bennion, the assistant chief engineer of the Federal Power Commission, a post he has held since the commission was created, has been presented with a distinguished service

H. S. BENNION

medal by the Secretary of War. The medal was awarded to Major Bennion for his accomplishments as chief of camouflage with the American Expeditionary Forces.

Major Bennion has served with the Corps of Engineers since his graduation from West Point in 1912. He was graduated from the Army Engineer School in 1915. After the armistice Major Bennion was placed in charge of road maintenance throughout a large portion of the devastated area in France. With the completion of that service he was made a member of the United States Liquidation Commission in Paris and later was made executive officer of the Chief Engineer of the American Expeditionary Forces.

**Capt. Clarence S. Jarvis** of the United States Army Engineering Corps was the speaker at the weekly luncheon of the Provo (Utah) Rotary Club Dec. 8. He spoke on the engineering features of the Colorado River project and outlined engineering problems involved in the building of the dam.

## E. C. Headrick Chosen to Advisory Board of Electrical Body

E. C. Headrick, an electrical contractor of South Denver, Col., and a member of the advisory board of the Electrical Co-operative League, has been elected to serve on the executive committee of the Association of Electrical Contractors and Dealers. Mr. Headrick, who is the first Denver man to be named on this board in many years, will represent the Mountain Division of the Association of Electragists International, comprising Colorado, Wyoming, Utah, New Mexico, Arizona, Montana and a part of Idaho. He succeeds E. H. Hardley of Salt Lake City. For several years Mr. Headrick was president of the local association of electrical contractors and dealers, and he is a past-chairman and one of the organizers of the Electrical Co-operative League.

**Warren R. Voorhis**, who has been associated with the American Water Works & Electric Company, Inc., New York City, for several years, was recently elected a vice-president of the company by the board of directors.

**S. A. Wills**, formerly power engineer for the Atlantic City Electric Company, has been transferred to the Ohio Power Company's Canton office. Both these companies are properties of the American Gas & Electric Company.

**Paul Wilson**, who for seven years has managed the office of the San Joaquin Light & Power Company at Madera, Cal., has been promoted to the position of district manager at the Fresno office. Mr. Wilson took up his duties there on Jan. 1.

**James A. Bennett**, Meriden, Conn., has been appointed sales manager of the Connecticut Telephone & Electric Company, Meriden, Conn., manufacturer of electrical and telephone goods. Mr. Bennett succeeds Charles E. Stahl, resigned.

**John W. Carpenter**, vice-president and general manager of the Texas Power & Light Company, has just completed a trip of several weeks through the cotton-mill regions of the United States. He made the trip to complete a survey of the textile situation with the view of assembling complete data for use of communities on the lines of his company's transmission system and for others in Texas who may desire the information.

**H. W. Watt**, engineer of electric distribution of the Westchester Lighting Company, has returned from a meeting in Albany of the managing committee of the Electric Section of the Empire State Gas and Electric Association. Mr. Watt said that the committee plans to map out a program of study of new processes and developments in the electric central-station field with a view to the general adoption by companies in New York State of any feature found to possess possibilities of economy or operating efficiency.

### Changes at Schenectady

Vice-president G. E. Emmons of the General Electric Company recently announced a reorganization of the general manufacturing department of the company effective on Jan. 1. It includes the appointment of H. F. T. Erben, heretofore manager of the Schenectady works, as vice-chairman of the manufacturing committee and ranking member of the general manufacturing staff.

The vacancy thus created in the position of manager of the Schenectady plant has been filled by the advancement of Charles E. Eveleth, who had served since Sept. 1 as assistant works manager under Mr. Erben. Mr. Eveleth becomes works manager. J. A. Smith will continue as general superintendent and in the absence of Mr. Eveleth will be in charge of the works.

The general manufacturing department, of which Vice-president Emmons is in charge, will be as follows: H. F. T. Erben, vice-chairman of manufacturing committee and ranking member of the staff; J. T. Broderick, secretary of the manufacturing committee; L. G. Banker, general purchasing agent; M. C. Fitzgerald, manager of transportation department; W. C. Fish, manufacturing engineer; W. B. Curtiss, supervisor of production; G. S. Maxwell, supervisor of costs; E. Z. Steezer, supervisor of industrial relations.

**James J. Withrow** is now manager of the Sheridan County Electric Company, Sheridan, Wyo., replacing Judson Bibb.

**W. B. McGorum** has been transferred from the statistics department of the Stone & Webster organization to the Key West (Fla.) Electric Company.

**N. S. Patterson**, formerly superintendent of the meter department of the Natrona Power Company, Casper, Wyo., is now resident manager of the Big Horn Utilities Company.

**John S. Ferguson**, formerly associated with the Massachusetts Institute of Technology, has joined the statistics department of the Stone & Webster organization.

**H. V. Schreiber**, associated with the Charles B. Hawley Construction Company of Washington, D. C., is at present in New Zealand, where he will spend five or six months.

**E. A. Hanff**, formerly electrical engineer with the Pittsburgh Electric Furnace Corporation, has become associated with William Swindell & Brothers, Pittsburgh, in the electric furnace department.

**William E. Horner** is now superintendent of the Heber (Utah) City Light & Power Company, succeeding E. Parley Cliff, who died last May. Mr. Horner has been associated with the company for more than ten years.

**Alexander Macomber** of the engineering firm of Macomber & West, Boston, has been elected treasurer of the Charlestown (Mass.) Gas & Electric Company, succeeding Samuel J. Fowler, who is retiring from active connection with the company, though continuing as a director. Mr. Macomber, who is well known in utility circles throughout New England, will continue his active connection with his engineering firm.

**Roy E. Heffner**, until recently instructor in the department of electrical engineering, Cornell University, has become affiliated with the John B. Stetson University, Deland, Fla., where he will teach in the newly organized engineering college.

**C. O. Mailloux**, president of the International Electrotechnical Commission, returned to this country recently. Mr. Mailloux sailed for Europe early in November to attend the meeting of the commission held in Geneva.

**G. I. Dorr** has resigned his position with the Star Electric Motor Company and will be affiliated with the sales department of the Continental Electric Company, Inc., manufacturer of electric power apparatus. Mr. Dorr will make his headquarters at the main office of the company at Newark, N. J.

**C. M. Stevenson**, who was district sales manager at Toledo, Ohio, for the Colonial Steel Company until the branch was discontinued, has severed his connection with the organization, having been elected a director and appointed general manager of the Reinforced Switch & Manufacturing Company, Pittsburgh, manufacturer of a patented reinforced switch and fuse clip.

### L. W. Staunton New Brandes Advertising Manager

L. W. Staunton, former research manager of the Herold-Garber Company, Indianapolis, has been appointed advertising manager of C. Brandes, Inc. Previously Mr. Staunton was in charge of the merchandising section, department of publicity, Westinghouse Electric & Manufacturing Company, in which capacity he had considerable responsibility in the production of radio publications. Most of Mr. Staunton's business experience has been along advertising and sales lines. Previous to his connection with the Westinghouse company he was affiliated with the publicity department of the Taylor Instrument Company of Rochester, N. Y.

### A. S. M. E. Gives Prizes

Prof. Robert C. Heck of Rutgers College has been awarded life membership in the American Society of Mechanical Engineers for a paper on "Steam Formulas." R. H. Heilman, industrial fellow at the Mellon Institute, Pittsburgh, and F. L. Kallam, graduate student at Leland Stanford, Jr., University, were awarded junior prizes of the society. Mr. Heilman's paper dealt with "Heat Losses from Bare and Covered Wrought-Iron Pipe at Temperatures Up to 800 Deg. F." Mr. Kallam won the honor for a "Preliminary Report on the Investigation of the Terminal Conductivity of Liquids."

### Dr. Franklin Heads American Chemical Society

Dr. Edward C. Franklin, professor of organic chemistry at Leland Stanford, Jr., University, has been elected president of the American Chemical Society, succeeding Dr. Edgar F. Smith of the University of Pennsylvania.

Dr. Franklin was a member of the advisory board of the United States Bureau of Mines in 1917-1918 and physical chemist of the United States Bureau of Standards and consulting chemist of the Ordnance Bureau of the army during the war. His work on liquid ammonia as an electrolytic solvent is familiar to all chemists. Dr. Franklin was born at Geary City, Kan., and is a graduate of the University of Kansas.

## Obituary

**Solomon Lewenberg**, formerly a member of the Massachusetts Gas and Electric Light Commission, died at Boston on Dec. 24. Mr. Lewenberg, who was born in Boston in 1876, was a lawyer by profession. He served on the commission from 1916 to 1919.

**Frank Kivel**, publicity manager for the Denver Gas & Electric Light Company, died recently at the age of forty-two. Mr. Kivel, who was a native of New Hampshire, went to Denver about fifteen years ago. He was a member of the publicity committee of the National Electric Light Association. Interment was at Dover, N. H.

**James P. Dusenberry**, aged seventy-eight, a director of the Public Service Corporation of New Jersey and formerly its treasurer, died of heart disease on Dec. 24 at his home in Newark, N. J. He was treasurer of the old Newark Gas Light Company, and when it was absorbed by the Public Service Corporation he became treasurer of the latter. He retired from that post eight years ago.

**Charles Perry Lindsley**, vice-president of the Lindsley Brothers Company of Spokane, Wash., died at Hot Lake, Ore., Dec. 27, at the age of fifty-five years after an illness of several months. Mr. Lindsley was president of the Lindsley Brothers Canadian Company, Ltd., at Nelson, B. C., and vice-president of the Barnes-Lindsley Manufacturing Company, manufacturer of Douglas-fir cross-arms at Portland, Ore. He was one of the promoters of the Cœur d'Alène Electric Railway Company and the Pend d'Oreille River Navigation Company and a pioneer in the lumber and cedar-pole industries. He was born in Neenah, Wis., going to Spokane in 1901, where he, with his brothers, E. A. and G. L. Lindsley, organized the Lindsley Brothers Company, which is one of the largest producers of Western red-cedar poles in the United States and Canada.

# Manufacturing and Markets

Devoted to the Discussion of Business and Economic Problems of the Producer and Distributor, with Market Reports, Trade Activities, Foreign and Construction News

## Review of the 1922 Electrical Market

**Total Production Estimated at $920,000,000 — Wholesome and Steady Growth a Feature—Economic Trend Steadily Progressive—Slight Setbacks Were of Constructive Character**

By H. M. Cunnington
Trade and Markets Editor Electrical World

A WHOLESOME and steady growth marked the manufacturing division of the electrical industry in the year just ended. Total production of the year is conservatively estimated at $920,000,000. This figure compares with $625,000,000 in 1921, a year of depression, and with $1,250,000,000 in 1920, the peak of the boom period.

According to reports from a large number of manufacturers, the production of electrical and allied mechanical equipment has been almost phenomenal. Orders have come chiefly from central-station companies, as distinguished from other users of electrical equipment, although the industrial-plant users of electrical equipment were at one time large buyers. The unprecedented demand from central-station companies during 1922 is attributed by many manufacturers to the fact that public utilities were unable during the war to make necessary extensions, repairs and improvements, owing to the unavailability of equipment and scarcity of money at reasonable prices. As a result, utilities have not expanded at a normal rate during the last four or five years, but now they are in an enviable financial condition and money is available at more reasonable rates, which enables them to make up for past inactivity and buy in heavier volume. Some manufacturers also report a large demand for electrical and allied equipment which is directly or indirectly the result of increased building.

A notable expansion in the use of industrial heating devices, furnaces, ovens, etc., is noted. As compared with 1921, the volume of applications of this nature for the year just ended showed an increase of more than 50 per cent in kilowatt capacity. This particular method of applying electricity for industrial heating has now been on a practical commercial basis for about six years, during which time the heating units installed have aggregated about 500,000 kw. in capacity.

### New Construction Helped All Lines

The greatest factor entering into the increased consumption of electrical apparatus and supplies has been the record-breaking volume of construction started and completed during the year. Conduit stocks have been abnormally low all through the latter nine months as a principal result, wire mills have rushed to keep up with orders, and manufacturers of all relative supplies have progressed accordingly. As was to be expected, with the general growth of demand, a gradual stiffening of prices of conduit, armored cable and wire occurred in the market during the year.

In general, the economic trend of the electrical industry was almost steadily progressive. Even when slight setbacks occurred, they were of constructive character. Prolonged strikes in the railroad and coal industries only temporarily checked progress of manufacturers in gathering together their raw materials for production and timely shipments. Although manufacturers encountered other obstacles, substantial recovery in the industry would not have come if previous far-reaching readjustments had not eliminated many of the weak spots and placed business on a more stable basis.

**Lamps.** — All through the year there has been an increased demand for blue sign lamps. The demand for better street lighting, lamps and equipment has shown a marked increase, due to the recognition of the fact that good street lighting is effective in increasing the speed safety of traffic and in reducing crime. A large number of cities which have held back in semi-darkness for a period of years are now taking advantage of lower costs to make much-needed improvements. In view of the extensive building program, much attention has been given the subject of school lighting. In the past year several large cities gave careful consideration to this subject—for the first time. There has been a notable increase of interest in equipment suitable for the lighting of all classes of outdoor sports, fostered, no doubt, by lower installation cost.

### Conduit Stocks Low During the Year

**Conduit.** — All during the year the lowest stock in the wiring line was rigid conduit. Raw-material shortage was the principal reason for this condition. When shipments from the mills did commence to improve, heavier demands from the building industry caused greater concern. Prices were strong throughout the year.

**Motors.** — Business in motors showed constant improvement all through the year Although small-order sales dominated the market, their persistence and tendency to multiply offered much encouragement to the manufacturer and jobber of first-class products. During the past year sales of motors were subject to extremely acute competition and were accompanied by more "proposition" work and technical analysis than has been the case for a long time. On this account certain new designs of motors have made better headway in the market than might have been expected, and the competition between makers of advanced designs and some of the older builders of motors was exceptionally sharp for the amount of business offered.

**Control Devices.** — During the earlier months of the year competition was very keen among manu-

facturers of control devices. In comparison with the business of later months very little business was in the market. Between January and May prices were reduced materially and some attractive orders were secured merely on price bases, and special prices were made in special cases. During the latter half of the year business picked up and there was some strengthening of prices.

**Switchboards and Panelboards.**—Although business in switchboards and panelboards was sluggish during the first five months, a continued increase became apparent in the middle of the year and improvement continued throughout the remaining months. Conditions in the northern part of the country were slightly better than in the southern sections. Construction, as in other lines, caused the curve of sales to mount rapidly in the last half of the year.

**Residential Meters.** — Consumption of watt-hour meters (house type) is conservatively estimated at 1,750,000 for the year 1922. Manufacturers have reported that production of this article is well over the 1,900,000 mark. The associated activity of meter protective and safety equipment also had a remarkable development.

**Hollow Ware.** — Excellent business in appliances for table service was enjoyed throughout most of the year. A leading manufacturer of these devices states that during the last few weeks stocks were greatly reduced and in some cases jobbers' stocks were cleaned out by the unordinary heavy purchasing during the Christmas season. Heavier appliances were active throughout the year, which was contrary to jobbers' expectations. Toasters, irons, grills and percolators were particularly strong throughout the year, and during December some manufacturing by night shift was reported. Very little complaint is heard from the consumers in the matter of prices and interest seems to be increasing each month. Raw materials were not plentiful throughout the year because of poor railroad transportation. However, there is improvement in that quarter and easier and more profitable days are promised for the manufacturers.

**Dry Batteries.** — Although production of dry batteries was almost 20 per cent lower than the 50,000,000 manufactured in 1921, the market during the past year was one of strength, considering the ever-increasing popularity of bell-ringing transformers and other apparatus which are rapidly taking the battery's place in the market. During the year large numbers of batteries were sold to the radio enthusiasts. Railroads and the automotive fields were also large purchasers.

### STORAGE BATTERIES GAINED MATERIALLY

**Storage Batteries.** — A gain of 25,000,000 in production of storage batteries was shown in 1922, due to the increased activity in the radio line and in automobiles.

**Trucks.**—Business men today are looking into the question of delivery costs as never before and are finding that too great a percentage of their gross receipts is being spent for delivery charges. With accurate costs from their own haulage and delivery records, they have found that electric trucks are very much more economical for haulage and delivery on city routes than either gasoline trucks or horses. The sales of electric trucks during the twelve months just ended indicate a steadily increasing demand. Production in 1921 was 1,000, compared with 1,250 in 1922. The year 1922 found a much greater demand for electric trucks for city deliveries, and the outlook for 1923 is excellent. There are now nine manufacturers of electric street trucks, with every probability that some of the gasoline-truck manufacturers wil be included by the end of 1923.

### BETTER SELLING HELPED VACUUM CLEANERS

**Vacuum Cleaners.** — By better training of salesmen and improving selling methods manufacturers and jobbers of vacuum cleaners have developed a greater potential market than they had in the years 1920 and 1921. There was very little "order taking" during the year; instead, it was twelve months of stiff competition and directed sales efforts. It is said that 700,000 vacuum cleaners, valued at $35,000,000, were manufactured during the year just ended. This is an increase of 100,000 cleaners over 1921, but a large decrease of 325,000 cleaners from the year 1920. Better general business conditions, of course, caused this improvement in the market. Shipments generally were prompt all during the year, averaging from one to ten days. Very few price reductions were made during 1922, although a few manufacturers during the days of heavier competition included attachment sets free in order to gain better attention.

**Farm - Lighting Plants.** — Large crops for the farmers have permitted the expenditure of more money for general improvements in the rural districts. According to one of the largest manufacturers of these sets, sales have been very large. The outlook for the future winter months is very encouraging. Deliveries have been affected somewhat by the recent railroad tie-up, but the year ended showed decided improvement. Exports have been unusually good.

**Wiring Devices.** — Gradual improvement in the demand for wiring devices is noted. The expansion of the building industry was a helpful factor in the situation. Plants throughout the country ran full

† Eleven months. ‡ Highest ratios.

time through the year. Raw material was plentiful and buying was well distributed. Foreign trade went to very low levels, the exchange situation barring much expansion in that field.

**Poles.** — During the months of March, April and May producers of poles showed their confidence in that market by raising their prices twice. The first time was the middle of March, when the increase was confined to a few sizes. Prices previous to March had been descending for more than a year. This current increase, it was pointed out, was a definite sign that the market was again on the up grade and that the producers, as opposed to the small brokers or selling agencies, were once more in control of the situation. Demand in all sections of the country remained good, with some sections, such as the Southwest, particularly active. Stocks generally were good, although not too heavy, and producers found little trouble in making shipments until the recent rail difficulties.

**Porcelain.** — A noticeable improvement in the low-tension or dry-process electrical porcelain business was evident all through the year. This improvement was particularly noticeable in the demand and distribution of standard items as sold by the jobbing trade. These products entered directly into the construction of the many new building erected.

# Business Conditions

A Survey of Important Developments in the Electrical Market Including Data on Production, the Sales Outlook, Credits, Exports, the Metals and Other Conditions Affecting Cost, Supply and Demand

## Hydraulic Turbine Business Has Favorable Outlook

Although underlying factors are somewhat different from what they were last year, there is no reason why this year's hydraulic-turbine business should not be at least as favorable as it was last year. This is the opinion of Arnold Pfau, hydraulic department, Allis-Chalmers Manufacturing Company, Milwaukee. He says that one factor which seems to deserve even more serious consideration than it probably did last year is the uncertain political situation in Europe, which is bound to affect our country. He says:

"If our foreign markets remain closed or poor to say the least, our industries will naturally work at small load factor so that the power now available will be sufficient. If the price of coal is not materially reduced, there should naturally be a strong tendency to utilize water, which would necessarily favor new developments and possibly reconstruction of present equipment."

## Says Electric Washer Sales Gained 44 per Cent

A year ago the American Washing Machine Manufacturers' Association issued a statement through the ELECTRICAL WORLD to the effect that the year 1922 would show steady and substantial gains in washing-machine sales. According to E. B. Seitz, secretary of that organization, that prediction has been fulfilled. For the first eleven months of last year the gain for all washers has been approximately 37 per cent over the corresponding period of 1921; the gain for electric washers has been about 44 per cent. Every month has shown an improvement over the preceding month with the exception of July, the strike month, and November, beginning the pre-inventory decline. The volume in dollars for the year should show nearly a 50 per cent increase for the electric machines, indicating that somewhat stronger prices have prevailed.

Washing-machine manufacturers confidently expect this improvement to ontinue throughout the year 1923. They are buying against increased production and in many cases enlarging manufacturing capacity to provide for a thriving year's business. Among the pertinent reasons given for this optimism are: First—There were more than 1,200,000 homes wired in 1922, and a very high percentage of these were wired for the sole purpose of enabling the housewife to have the use of electrical appliances. Second — Sales are easier on a rising market. Third—"Orphaned" washing machines of bankrupt companies have disappeared from the market. Fourth—A more thorough appreciation of the other man's problem prevails as between manufacturers and dealers. Fifth—The great electrical program for America will undoubtedly reach its widest stage of development in 1923.

## Recent Tariff Decisions

Union of South Africa.—It has been decided that wireless-telegraph apparatus, including broadcasting sets, is subject to an import duty of 20 per cent ad valorem under the Union of South Africa tariff. British goods are entitled to a rebate of 3 per cent.

Australia.—According to recent decisions, the following import duties are leviable under the Australian Commonwealth customs tariff: Accumulators for stationary use and plates for use therewith, 10 per cent ad valorem under the general and 5 per cent under the intermediate tariff, British goods free; electrical equipment, consisting of motors, controllers, switches and auxiliary apparatus, for the operating of "bogy" and other tramcars, 10 per cent under general and free under intermediate and British preferential tariffs; electric regulator equipment for controlling two 100-kw. alternators and 600-kva. rotary converters, including transformers and switchgear, 10 per cent, 5 per cent, free; 600-kva. synchronous condensers, 10 per cent, free; 600-kva. synchronous converters and mixed-pressure turbines (ordered prior to March 1, 1922), 10 per cent, 5 per cent, free.

## Brazil Offers Opportunities

The market for electrical goods in Brazil promises to develop considerably in the next few years. The position of the United States is very good and American firms are well represented in the field. At the present time American products are in good demand, with Germany felt as the nearest competitor.

## Possibilities in Nanking

Market possibilities for electrical goods in the Nanking district of China are by no means limited, when it is considered that this area contains 50,000,000 to 60,000,000 inhabitants, with numerous large cities and towns as yet without electric light plants. In fact, the electric light only made its advent there in the last decade and the rapid extension of the use of electricity has been remarkable.

Chinese buyers show a decided unwillingness to purchase by correspondence, and the use of catalogs and literature alone are equally ineffective. The greatest success has been achieved by firms that either maintain their own representatives in Shanghai or have given agencies to American firms in that center which are equipped to handle electrical materials and supplies to advantage. It is considered best to give agencies only to firms having Americans in their employ. Otherwise they very often do not push the American product.

## The Metal Market

**Consumption in All Metals Continues Excellent—Higher Copper Prices—Lead Remains Inactive**

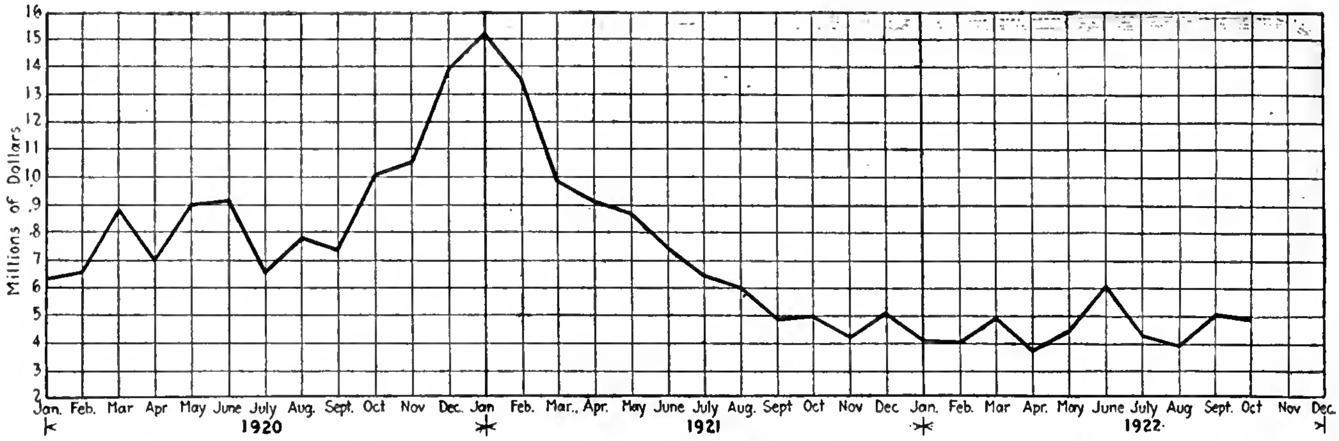
All of the producers who were selling copper at 14.50 cents a week ago seem now to have raised their price to 14.75 cents, delivered, although it might be possible for large consumers with plants in and about New York City still to obtain copper for early delivery at the lower price. There is some tendency among producers who are well sold up to quote 14.87½ cents, but this price so far has been largely a nominal one, although it would be difficult to obtain copper for April or later delivery at much under that figure. Fundamental conditions are so good that producers are decidedly optimistic. Consumption in all metals continues excellent.

The lead market has been decidedly inactive, and few important orders have been placed, and these mostly at average prices. Plenty of lead seems to be available at 7.25 cents, New York, even for prompt delivery. In the Middle West supplies of spot metal are not so large, but most consumers are satisfied with January shipment. St. Louis prices are showing a slight tendency to advance. Desilverized is commanding about 5 points premium at some consuming centers in the Middle West.

The slightly weaker zinc market is attributed by some producers to a stagnant domestic market and by others to a poor demand from abroad compared with a few weeks ago. Probably both are correct. At any rate, it has not been difficult to obtain metal for both prompt and forward delivery in ordinary tonnages. Although some business has been quoted at 7 cents, it has practically all been confined to carload lots. The premium for prompt shipment has disappeared. High grade is selling at 7.75 to 8.25 cents.

NEW YORK METAL MARKET PRICES

| | Dec. 27, 1922 Cents per Pound | Jan. 3, 1923 Cents per Pound |
|---|---|---|
| Copper | | |
| Electrolytic | 14.50 | 14.75–14.87½ |
| Lead, Am. S. & R. price | 7.25 | 7.25 |
| Antimony | 6.40 | 6.35 |
| Nickel, ingot | 36.00 | 36.00 |
| Zinc, spot | 7.05 | 7.05 |
| Tin, Straits | 38.00 | 38.87½ |
| Aluminum, 98 to 99 per cent | 23.00 | 23.00 |



TOTAL OF ELECTRICAL APPARATUS EXPORTS FROM THE UNITED STATES DURING THE YEARS 1920, 1921 AND 1922

## Electrical Apparatus Exports in 1922

Although the total of electrical apparatus exports during the year just ended are far below the peak of the boom years, 1919 and 1920, a healthy condition persists in spite of the difficulties in the foreign markets.

The highest amount of the year, a figure of over $6,000,000, was lower than the lowest amount in all of the year of 1920 and the first six months of 1921. The lowest amount of exports was in April, when they fell below the $4,000,000 mark.

The figures for the first ten months of 1922 are very low in every instance when compared to the months of the two previous years; in no instance will any of these approach previous years' figures.

The greatest recorded drop in exports was for motors, falling from over fifteen million dollars in 1921 to $2,534,137 for the first ten months of 1922. In 1920, motor exports were $13,263,657, and in 1919 they were $10,635,476.

Fan exports held up fairly well throughout the year. They are expected to end the twelve months of 1922 with a total near to $800,000, which figure compares with $1,270,153 in 1921, with $1,365,766 in 1920 and with $1,421,160 in 1919.

Copper wire and cable exports are almost 70 per cent lower than they were in 1921, and it is said that the amounts for the months of November and December will not help these exports in any material way. Last year the total for ten months amounted to $2,895,193, compared to $9,029,525 in 1921, $8,178,539 in 1920 and $8,815,212 in 1919.

Dry batteries exports were other heavy losers during the year. The total for the whole year 1922 is expected to reach close to $1,000,000. This amount compares with $3,821,645 in 1921, $6,633,542 in 1920 and with $5,998,223 in 1919.

Total exports of rheostats and controllers for the twelve months of 1922 are expected to reach or to exceed $800,000.

EXPORTS OF DRY BATTERIES, MOTORS, RHEOSTATS AND CONTROLLERS, FANS, LAMPS, COPPER WIRE AND CABLE, DOMESTIC HEATING AND COOKING APPARATUS DURING 1919, 1920, 1921 AND THE FIRST TEN MONTHS OF 1922

| | Jan. | Feb. | March | April | May | June | July | Aug. | Sept. | Oct. | Nov. | Dec. | Totals |

# The Week in Trade

Prices When Quoted Are Those Reported at the Opening of Business on **Monday** of This Week for Points West of the Mississippi River and on Tuesday for All Eastern Points

THE year 1923 opens with very low appliance stocks in all sections of the country. Construction programs for the coming winter and spring months are most favorable to the whole industry. Some lengthening in motor deliveries for the East is reported. The recent advance in copper is now reflected in the wire market. Prices for sockets and pole-line hardware are firmer. Fixtures and lamps generally are more active than two weeks ago. The outlook for 1923 business is full of optimism.

### Year Starts with Action

**New York.**—The first week of the new year started with more action and lower stocks than did the first week in January, 1922. Wiring-device prices show added strength, motors are in great demand and stocks are low. Fixtures are active with firm prices. Increasing activity in wire is shown. Armored cable has changed from a steady to active demand, and the supply is higher than a few weeks ago. Demand for poles has fallen from active to slow. Pole-line hardware is also slow, as well as the demand for porcelain. Supply of fuses is somewhat better than a week ago. Lamp stocks are higher. Demand for heating appliances has changed from active to slow. Calls for radio sets and parts are fewer following the heavy holiday buying. Betterment in the washing-machine and vacuum-cleaner markets is reported.

**Chicago.**—With most of the electrical jobbers studying inventories, last week passed rather quietly. Jobbers are all pleased with the Christmas trade since they say it was better than last year's by 10 to 20 per cent. Changes in both price and demand have been few. High-tension manufacturers report another active week. One company sold two 66,000-volt, 9,200-kva. outdoor substations to a utility in the Southwest and two 33,000-volt substations for the Middle West with capacities of 600 kva. and 900 kva.

**Boston.**—New England's new trade year opened with greatly depleted appliance stocks, lengthening deliveries on motors, scarcity of rigid conduit and an upward trend in prices. The recent advance in copper price has been reflected in wire, and quotations in sockets and pole-line hardware are firmer. The demand for lamps continues very active, and in some quarters deliveries tend to lengthen. Fixture sales are exceedingly active and building operations continue at favorable rate. Deliveries are giving trouble on products from the Middle West and steel-making districts, and railroad embargoes are impeding the flow of washing machines and other products into this section. Optimism is widely felt regarding the outlook for the 1923 business.

**Atlanta.**—The holiday trade just past has been probably the greatest in the history of this section, all jobbers reporting a very successful season, with a small carry-over and good collections. The regular industrial trade, of course, has shown the inactivity generally expected during this time of the year, due to stock taking and closing of books for the calendar year. A very prompt revival, however, is expected, as it is necessary to replenish stocks for the expected demand for 1923. The building trade continues active. A great deal of residential building is going on, particularly in Atlanta. A large number of the industrial organizations are adding to and improving their present equipment, and in addition to this a number of industries are seeking and finding satisfactory locations in this section of the country. The Atlanta bank clearings for the year just closed will exceed those of 1921 by a hundred million dollars, and as the majority of this gain was experienced during the latter part of the year, the bankers and industrial leaders are extremely optimistic over the prospects for 1923.

**Cleveland.**—There is every indication that good business will continue as orders on hand assure production until well into the spring. Stocks are low and demand is strong for the season. Central-station business is very promising, statistics and indices showing an increase of 28 per cent in power consumption for the year 1922 compared with 1921. Although appliances have been in good demand, dealers believe they overestimated the holiday trade, the conservative faction scoring again. Stocks are low, however, and demand fair. Credits continue to be rather tight, but bank deposits are increasing. Although business casualties were greater during the past year, the employment situation has been relieved most satisfactorily. Builders and building contractors are confident of another successful year and many large undertakings are planned.

### Busy with Inventories

**St. Louis.**—The usual after-the-holidays recession in sales obtained during the week, merchandising being exceptionally quiet and many industrial concerns being busy with inventories. However, dealers' and jobbers' stocks of merchandise were considerably reduced by the holiday buying, and replacement orders are now being made. Prospects for power-apparatus sales during the coming year are excellent, and a large quantity of industrial building is planned. It is indicative of the general improvement in manufacturing that Federal Reserve Bank reports for this district show increases in November, 1922, as compared with November, 1921, of 30 per cent in industrial consumption of central-station power, of 7 per cent in sales of boots and shoes, of 38 per cent in stove sales, 42 per cent in wire-rope sales, 30 per cent in steel output, 47 per cent in flour production, 20 per cent in furniture and 24 per cent in electrical goods. Similar increases are reported in virtually all other lines of industry. The fundamental and underlying conditions are good. There is virtually no involuntary non-employment, agricultural conditions are promising and farm prices are getting nearer their proper relative level, profits are again appearing, old debts are being liquidated, money rates are easier, and there is general confidence in the future.

### Collections Slightly Slower

**New Orleans.**—Collections are slightly slower than they were one month ago. This is largely due to the fact that residential construction has been in the lead, and electrical installations in residences are made almost entirely by the "curbstone contractors" who are so eager for jobs that they are apt to underbid on them and have trouble meeting their bids. Business in electrical devices has been seriously injured by the department stores. These establishments have made "leaders" of electrical equipment, selling at cost, below cost or so near to cost that a profit cannot be considered. This situation has kept electrical dealers from stocking heavily and from pushing devices on the market. Their advertising, they reason, would simply go to increase the sales of the department stores.

**St. Paul-Minneapolis.** — Central-station business is at a standstill with no construction of new power or telephone lines. Stocks of small-size conduit are slightly bettered by recent shipments. Better calls for wiring devices and lamps are reported. House wiring is very active. The electrical industry generally has just had the most favorable year since the war. Commercial fixtures are moving quickly.

**Salt Lake City.**—A survey of a dozen or more representative wholesale lines shows an increase in sales ranging from 10 to 15 per cent for November, 1922, over the same month in 1921. Jobbers of electrical merchandise have planned their budgets for the new year on conservative lines but with a view of handling a larger volume of trade. January, 1923, finds jobbers in a healthy condition. As to stocks, there are few shortages. There is some non-employment, but pending construction will furnish work for all as soon as winter has passed.

**Denver.**—Complete returns on Christmas business in Denver and the surrounding territory bear out conditions reported just prior to the holidays. Buying started slowly in electrical lines and sales records showed an immediate jump when a co-operative advertising campaign was started in the papers.

# Demand, Supply and Price Trend of Eighteen Commodities as Sold in Fourteen Cities

Explanation:
Demand: Steady, Slow or Active
Supply: Normal, Low or High
Price Trend: Firm, Decreasing or Increasing

Those jobbers and dealers who tied in with the campaign obtained splendid results. Five leading jobbers report all seasonal merchandise moved, including large quantities of staples such as flat-irons and curling irons. Tree-lighting outfits have been cleaned out for first time since the war. It is conservatively estimated that Christmas sales were 50 per cent better than in the previous year. Depletion of stocks has assisted in taking annual inventories. Replacement will take place gradually, looking toward increased sales again in early spring. On the whole, jobbers' stocks are low, which with average demand will give good orders to manufacturers in all lines. The motor market is inactive.

San Francisco.—A 50 per cent increase in the value of building permits was the average registered by California cities in 1922 over 1921. Total for year, estimated: Los Angeles, $120,000,000; San Francisco, $50,000,000, and Oakland, $25,000,000. Next year is expected to show a similar increase, but this may be limited by labor and raw-material shortages.

Jobbers report a big year in sales volume, ranking close to the two post-war years, but one comparatively low in gross profits owing to keenly competitive conditions, mainly caused by overproduction and diverted efforts by former war factories. A résumé of Christmas sales shows a good movement in smaller appliances, somewhat better than last year, but a rather poor sale for larger appliances, despite special appeals to holiday purses. Several manufacturers are planning early spring campaigns to balance the usual seasonal lull in building and to endeavor to put retail sales in better proportion with construction. Dealers' business has not kept pace with the contractors.

Portland-Seattle.—Electrical jobbing houses have been closed for the most of the holiday week for inventory purposes. They report business for the past year to have been very good, and Christmas trade is estimated to be from 30 to 50 per cent better than a year ago. Holiday lines were practically cleaned out and hold-over stocks are small. In any case this satisfactory condition is attributed to more careful buying than formerly. There has been a great deal of electrical contracting work during the past year due to the large amount of building in this section, but much of this business has been taken on a close margin which is not conducive to a healthy financial condition. Electrical dealers are apparently in a somewhat better condition, and one of the leading firms reports that December will show the best monthly record in their history. An active demand and a low supply continue in conduit.

# Activities of the Trade

Devoted to News of the
Manufacturer, Jobber, Agent, Contractor and Dealer, Including Important Orders and Contracts for Apparatus and Equipment

## New Production Record Made by Philadelphia Wire Firm

The average weekly production of the Philadelphia Insulated Wire Company, Philadelphia, from the period of July 1 to Dec. 15 was 108,970 lb., according to officials of that company. This is a new high record for the firm. In 1917, the best previous year in its history, the average weekly production, based on the entire year, was 70,000 lb. In 1921 the average weekly production over the period of July 1 to Dec. 15 was 21,600 lb. The company's total production for 1922, it is estimated, was 4,500,000 lb., which was approximately 1,500,000 lb. in excess of the 1917 figure.

## Pettingell-Andrews Adds to Line

The Pettingell-Andrews Company, Boston, has taken a territorial agency for the "Yale" line of electric flashlamps, manufactured by the Yale Electric Corporation, Brooklyn, N. Y. This house will also distribute the "Thor" vacuum cleaner of the Hurley Machine Company, Chicago, in addition to other products of this manufacturer as hitherto jobbed by the Boston company.

## To Sell "A & F" Heating Material

In order to provide a better service and allow undivided attention to manufacturing, the Arthur-Fowler Company has concluded an agreement with the Washington Electric Supply Company of Spokane for the distribution of "A & F" range boiler heaters, flexible tank covers, "Enamet" covers, utility tanks and its entire line of heating and insulating material.

The Arthur-Fowler Company reports a remarkable growth of sales of plastic water heaters for the year 1922 and an increase of over 200 per cent in the sale of utility tanks and range boiler covers.

## S. A. Woods Motor Line Enlarged

Motors up to and including 50-hp. rating in polyphase designs are now being marketed by the S. A. Woods Machine Company, Boston, which has been expanding its business steadily during the past year. To a representative of the ELECTRICAL WORLD M. F. Fitch, sales manager of the motor division, stated recently that within the year the factory organization has been increased in size and that a better volume of business was enjoyed than was the case in 1921. Despite some difficulties in the supply of raw material, motors are being manufactured for stock as well as for immediate distribution, and no orders have been lost during the year because of inability to make specified deliveries. Plans are in effect to increase the company's sales representation in the Middle West and on the Pacific Coast. Mr. Fitch declared that the outlook for 1923 is excellent in the motor field.

## Black & Decker Announce Drill Price Reductions

Following a reduction from $39 to $28 in the price of the Black & Decker quarter-inch portable electric drill on Nov. 10, the Black & Decker Manufacturing Company announces further cuts on certain popular items which are now being manufactured in such quantities as to make the following reductions possible:

| Item | Old Price | New Price | Reduction |
|---|---|---|---|
| Quarter-inch drill | $39 | $28 | $11 |
| Half-inch special | 85 | 68 | 17 |
| Bench drill stand | 33 | 28 | 5 |
| Post drill stand | 36 | 32 | 4 |
| Six-inch electric bench grinder | 56 | 38 | 18 |

## Walker & Pratt Appointment

J. F. Senior has been appointed sales representative of the Walker & Pratt Manufacturing Company, Boston, with headquarters at Omaha, Neb. He will cover the Middle West. The Southeastern district will be covered by E. H. Beyersdorfer, with headquarters at Cincinnati. The company's electric range business is improving, and the outlook for the new year is excellent, according to officials of the company.

## Manufacturer of Royal Cleaners Reports Increasing Business

In order to provide more space for manufacturing purposes, the P. A. Geier Company, Cleveland, manufacturer of Royal electric cleaners, has moved its executive offices and service department from the St. Clair Avenue plant to another plant at 540 East 150th Street. The old office space thus available, amounting to more than 15,000 sq.ft., will hardly more than relieve congestion, and provision for enlargement is being contemplated.

The Geier company, which also manufactures vibrators, hair cutters and dryers, reports a steady increase in business in all departments. Several sales contests during the past year have given gratifying results. One of these conducted during the summer season when the appliance business normally suffers a slump, resulted in sales equal to the best month in the company's history, while a contest just concluded has so stimulated the trade as to make the present factory enlargement imperative.

## General Electric Announces Bonus to Employees

The General Electric Company announced on Christmas Day that supplementary compensation equaling 5 per cent on earnings for the six months ended Dec. 31 would be paid on or about Feb. 1 to each employee receiving $4,000 or less per year who has completed five years of continuous service at the close of the year and who is still in the employ of the company at the date of distribution of the extra compensation.

The official statement says: "The payments will be made to employees in one-year 7 per cent investment bonds in ten-dollar units or multiples thereof and the balance, if any, in cash. The payment is made in bonds in the hope that it may become part of the recipients' savings instead of being used for current expenditures."

Gerard Swope, president of the company, says in the statement that no change in the policy of paying supplementary compensation will be made without one year's notice, but that a change may at any time be made without notice in the character of securities in which such supplementary compensation is paid.

## Koehler Manufacturing Company Business Very Active

Excellent business is reported by the Koehler Manufacturing Company, Marlboro, Mass., in both storage-battery safety lamps and battery plates, following a recent inquiry. This company was incorporated in 1917 with H. G. Powning as president and W. S. Field as secretary and treasurer. Owing to the constantly increasing volume of business it has been necessary to expand the plant until at present it occupies a total floor space of more than 50,000 sq.ft. in four manufacturing establishments. A new two-story brick-and-steel building has recently been completed which is occupied by the tap and die and press departments. Two of the company's plants are now producing nearly 100,000 storage-battery plates weekly.

## Westinghouse Springfield Factory Has Larger Force

The Westinghouse Electric & Manufacturing Company had 3,400 employees working at its East Springfield (Mass.) plant Dec. 31, or 400 more than on Nov. 1, according to Works Manager Arthur B. Reynders Small motors have for the time being distanced automotive and radio equipment as the leading product, though an improved radio demand was noted during the pre-holiday period. Revival of industries and farm prosperity are credited with the demand for small motors which now puts orders several months ahead of production. Having used up its reserve supply of parts, the factory is building motors complete throughout, and this is partly responsible for the recent increase of the plant force over the November basis.

## Frank Ridlon Head Anticipates Busy Year

Business during 1923 will show marked improvement over 1922, according to a press statement by Edward G. Young, president Frank Ridlon Company, Boston. Mr. Young reported that the sale of motors by his house had increased substantially during 1922 and that both the repair and engineering departments were fully manned during the past year. The construction department of this organization, which is one of the oldest and largest merchandisers of used and new motors in the country, is now located at Brockton, Mass., under the name of the Hallstone-Ridlon Electrical Company. Electrical supplies and appliances are distributed from this point, and business has grown so much of late that it has been difficult to handle the volume offered. Commenting on electrical price trends, Mr. Young stated that in his opinion prices cannot be expected to fall lower at present, and that an upward movement is more likely than a drop. Motor prices, he stated, are 40 to 50 per cent below the 1921 peak.

## Sanford Riley Stoker Acquires Ground Coal Company

The Sanford Riley Stoker Company announces that it has acquired control of the Ground Coal Engineering Company, Chicago, designer and builder of pulverized-fuel installations. This acquirement will supplement the company's stoker work for industrial furnaces. The Ground Coal Engineering Company has been incorporated under the laws of Massachusetts and will be a subsidiary of the Sanford Riley Stoker Company with headquarters in Worcester.

It is also announced that the Underfeed Stoker Company of Canada, Ltd., Toronto, will represent the Sanford Riley interests in Canada. The headquarters of William Pestell, sales manager of the Sanford Riley firm, have been transferred to Worcester from New York City. The office of sales in the New York territory will be retained at 103 Park Avenue, New York City.

## Wico Company's Business Grows

The Wico Electric Company, Springfield, Mass., has decided to occupy on March 1 the first unit (400 ft. x 90 ft.) of its new plant in West Springfield. Construction of a second unit will begin soon afterward. Figures for the first eleven months of 1922, Treasurer Edward L. Stoughton says, show an increase of 216 per cent over the corresponding period of 1921. A good business has been done in motorcycle batteries, and there has been a big expansion in magnetos for stationary engines. A new magneto for small high-speed motors has just been introduced and will soon be put in quantity production. The company purposes to double its production force on occupying its new building.

**The Tri-City Electric Company**, Newark, N. J., announces that the office of the president and general manager, held in the past by Joseph Spurr, has been assumed by George M. Ellis, formerly vice-president and general manager of the Mohawk Electric Supply Company, Syracuse, N. Y. H. C. Calahan, formerly of the New York office of the General Electric Company, will be associated with Mr. Ellis in the capacity of sales manager.

**The Hurley Machine Company**, West Twenty-second Street, Cicero, Ill., manufacturer of electric washing and ironing machines, is taking bids for a one-story addition, 61 ft. x 130 ft., to cost approximately $35,000. Edward N. Hurley is president of the company.

**The Robinson Electric Company**, 1135 North Fortieth Street, Philadelphia, has leased property at 809 Race Street for branch works.

**The Seyler Manufacturing Company**, Pittsburgh, manufacturer of pole-line and high-tension hardware, has recently broken ground for several new buildings, increasing its floor space an additional 15,000 sq.ft. The buildings in this section will be used for the manufacture of brackets and specialties.

**The Monitor Controller Company**, Baltimore, manufacturer of automatic motor starters and controllers, announces that it has recently appointed J. E. Wood in charge of its Cleveland sales office. The company recently opened a new sales office at 609 Whitney Central Building, New Orleans, in charge of P. E. Lehde.

**The Electrical Dealers' Supply Company**, Chicago, has acquired a site, 256 x 325 ft., on Diversey Boulevard, near Oakley Avenue, for a new three-story plant, estimated to cost $150,000, to be used for the manufacture of electrical fixtures and equipment. Bids will be taken at once for the structure and it is expected to be completed early in May. Samuel M. Crowen, 10 South La Salle Street, is architect. Simon Frankel is president of the company.

**The Marine Electric Company**, Louisville, recently reported a business of more than $100,000 for 1922, with prospects of a volume in excess of $150,000 in 1923. The company is working on installations of light, power and telephone systems.

**The American Electric Service & Maintenance Company**, Springfield, Mass., has practically doubled its force for repairing transformers in the last four months. A. M. Scofield, general manager, estimates that 60 per cent more business was done in 1922 than in 1921, with an even larger increase in sight for 1923. The company finds that its plant, completed last spring, is inadequate, and plans to add to its space the present Wico Electric Company factory, adjacent to its own quarters in Liberty Street, on the removal of the former to West Springfield on March 1. This will make possible the addition of new equipment to effect a more rapid and efficient service.

**The Sangamo Electric Company**, Springfield, Ill., announces that it has recently appointed R. H. Wilson district representative with headquarters in Tulsa, Okla., to cover southern Missouri, Arkansas, Oklahoma and a part of Texas. The company also announces the appointment of the Enterprise Electric Company, Lincoln, Neb., as its agent in that territory.

**The Arrow Electric Company**, Hartford, Conn., manufacturer of wiring devices, announces that Edward P. Doherty has recently joined its sales organization. Mr. Doherty will travel part of the company's Southern territory and will have his headquarters in Atlanta. He will cover South Carolina, Georgia, Florida and border towns of North Carolina. For the last four years, Mr. Doherty has sold wiring devices in all of the Atlantic Coast States.

## Oldest Vulcanized-Fiber Manufacturer and Others Consolidate

Consolidation of the oldest manufacturer of vulcanized fiber in the world, the American Vulcanized Fibre Company, Wilmington, Del., with the National Fibre & Insulation Company and the Keystone Fibre Company, Yorklyn, Del., is announced. The merger was effective Jan. 1. The consolidated concern is known as the National Vulcanized Fibre Company.

J. Warren Marshall, former president of the National Fibre & Insulation Company, is president of the new company and will have charge of the production end of the business. Claude W. Sutton, who was president of the American Vulcanized Fibre Company, is vice-president and in charge of sales.

The American Vulcanized Fibre Company was formed in 1873, only four years after the process of vulcanizing fiber was discovered, and was responsible for the first commercial production of this commodity and for its adaptation to many uses. The National Fibre & Insulation Company came into existence in 1904, and the Keystone Fibre Company two years later. The consolidation was brought about by an outright purchase of the assets of the American Vulcanized Fibre Company by the shareholders of the National Fibre & Insulation Company. The Keystone Fibre Company was a selling agency only, operated by the National Fibre & Insulation Company. Economics of management and a notable strengthening of marketing service will be effected by a joining of facilities, it is expected. The central offices of the National Vulcanized Fibre Company are at Wilmington, Del.

## Foreign Trade Notes

EXTENSION TO ELECTRIC SYSTEM IN BAURU, BRAZIL.—A loan of 1,500,000 milreis has recently been floated by the Companhia Paulista de Forza e Luz, *Commerce Reports* states, for the purpose of increasing its service in the northeastern section of the State of São Paulo. The proposed work includes a 2,000-hp. hydro-electric generating unit for the power plant at Bauru, a 60,000-volt transmission line from Salto do Avanhandava on the Tiete River to Bauru, and three substations, one of 1,000 kw. capacity and two of 2,000 kw., and additional distribution lines.

COMPANY FORMED TO INSTALL AN ELECTRIC PLANT IN JUTLAND, DENMARK.—A company will be formed on a co-operative plan, the central organization to be known as the Sonder Jyiland Hojspaendings Vaerk, *Commerce Reports* states, to erect a large power station at Aabenraa to supply electricity in South Jutland. Money for the proposed plant has been assured through the assistance of the State.

ELECTRIC PLANT PROPOSED FOR COBDOGLA, AUSTRALIA.—A scheme has been submitted to the South Australian government for the erection of a central power plant at Cobdogla to supply electricity for all the Murray River settlements between Cadell and Chaffey, a distance of about 170 miles. It is proposed to install a plant at Cobdogla to extract alcohol from wood fuel and use it for motive power for the proposed plant. The Adelaide Electric Supply Company is also considering supplying electricity in this district from its plant at Osborne, or in case the Moorlands lignite deposit proves to be a paying proposition a power station may be established at Moorlands. The distance from Osborne to Cobdogla is about 100 miles, and from Moorlands to Cobdogla about 80 miles. This proposal has nothing to do with the project for developing the water power of Murray River and carrying out water conservation works at Lake Victoria, the Hurme Reservoir, Jorumbarry and Wentworth, which, according to the annual report of the Murray River Commission, has already cost £1,255,141.

FOREIGN TRADE CONVENTION.—The tenth national foreign trade convention of the National Foreign Trade Council will be held at New Orleans on April 25, 26 and 27, 1923, it was announced by O. K. Davis, secretary of the council. As in former years, leading foreign traders from every part of the United States and every line of industry, as well as a considerable number of business men from foreign countries, will be in attendance at the convention.

## Foreign Trade Opportunities

**Following are listed opportunities to enter foreign markets. Where the item is numbered further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number.**

Purchase or agency is desired in Italy (No. 4,841) for small radio receiving sets and apparatus.

An agency is desired in Norway (No. 4,861) for electric vibrators (massage) and wireless-telephone apparatus.

An agency is desired in Hungary (No. 4,865) for medium-priced automobiles and automobile accessories, including self-starters, dynamos and self-igniters, etc.

Purchase is desired in Italy (No. 4,875) of electric bulbs and other electrical accessories for house and office use and radio receiving sets.

An agency is desired in Norway (No. 4,883) for radio telephones.

Purchase or agency is desired in Italy (No. 4,887) for adjustable electric reading lamps and shades for residences.

An agency is desired in Mexico (No. 4,909) for electrical supplies and machinery and automobile supplies.

An agency is desired in Chile (No. 4,910) for electrical machinery, construction material and railway supplies, etc.

An agency is desired in Switzerland (No. 4,912) for electric washing machines.

Purchase is desired in Switzerland (No. 4,766) of mica and micanite, insulating varnish and synthetic resins for insulating.

Purchase is desired in Australia (No. 4,787) of electric lighting plants for country use of 1½ hp. up and of farm-pumping engines.

Purchase is desired in Turkey (No. 4,808) of household refrigeration plants, particularly those electrically operated.

Purchase is desired in Mexico (No. 4820) of X-ray units.

Purchase is desired in Mexico (No. 4,826) of electric motors, alternating-currents, and planing machinery for a sawmill.

Purchase and agency is desired in Poland (No. 4,829) of table telephone apparatus, copper wire, lead-covered cable, dry batteries and storage batteries.

Purchase is desired in Switzerland (No. 4,833) of friction and rubber insulating tapes.

Purchase is desired in Spain (No. 4,821) of rails, switches, trolley wire and machinery for an electric car-line repair shop.

NEW TELEPHONE SYSTEM FOR CHINA.—According to advices from Consul Carlton bids will soon be asked for the construction of a modern telephone system in Amoy City, South Fukien, China, to cost about $400,000.

## New Apparatus and Publications

OIL ENGINES.—The De La Vergne Machine Company, foot of East 138th Street, New York City, is distributing bulletin No. 180, covering its type "SI" oil engines. Bulletin No. 181 describes its vertical Diesel engine type "SI."

MECHANICAL STOKERS AND FURNACE EQUIPMENT.—The Combustion Engineering Corporation, 43 Broad Street, New York City, has issued a booklet which gives a description of all its products.

CAST-STEEL VALVES.—"Reading Cast-Steel Valves" is the title of a circular issued by the Reading Steel Casting Company, Inc., Bridgeport, Conn., in which it describes a new line of "Reading" cast-steel gate valves recently placed on the market. Circular No. 2 covers the "P. & C." new bronze union-bonnet renewable-disk globe and angle valves, and No. 3 the "P. & C." bronze regrinding union-bonnet globe and angle valves.

LABOR-SAVING TOOLS.—The Paragon Power Specialties Company, Hartford, Conn., is distributing a booklet covering the "Paragon" labor-saving tools for the boiler room.

RADIO DETECTOR.—The Hutchinson Radio Company, 342 Madison Avenue, New York City, has recently placed on the market a radio detector under the name of "Phonophane."

WATER-TUBE BOILERS.—The George T. Ladd Company, First National Bank Building, Pittsburgh, is distributing bulletin No. 20, covering the "Ladd" water-tube boilers. Bulletin No. 21 issued by the company gives a supplementary description of its large water-tube boilers installed at the River Rouge plant of the Ford Motor Company.

PULVERIZED-FUEL SYSTEMS.—The Combustion Engineering Corporation, 43 Broad Street, New York City, is distributing a leaflet entitled "A Record of Performance with 'Lopulco' Pulverized-Fuel Systems," showing boiler tests made with powdered coal in two large power stations.

STEAM-JET AIR PUMPS.—Bulletin No. 116 issued by the Wheeler Condenser & Engineering Company, Carteret, N. J., covers its various types of steam-jet air pumps.

METERS.—The Bailey Meter Company, 2015 East Forty-sixth Street, Cleveland, is distributing bulletin No. 33 describing the "Bailey" fluid meters for steam and water. Bulletin No. 7 calls attention to its various products, including boiler panel, multi-pointer gage, ash-pit loss recorder, etc.

SMALL MOTORS.—The Master Electric Company, 438 First Street, Dayton, Ohio, is manufacturing a new motor in sizes from ⅛ hp. to 1½ hp. Its lines of "Master" motors is from ⅛ hp. to 1½ hp. The company has issued its 1923 data book and price list, covering its products.

GEAR-SPEED REDUCERS.—The Jones Foundry & Machine Company, 4,401-51 West Roosevelt Road, Chicago, has issued catalog No. 26, covering the "Jones" spur gear-speed reducers.

RADIO SUPPLIES.—"Rasco Has It" is the title of catalog No. 8 issued by the Radio Specialty Company, 96-98 Park Place, New York City, covering its line of "Rasco" radio supplies.

# Construction News

**Projects, Plans, Bids and Contracts, Contemplated or Under Way**

## New England States

CLAREMONT, N. H.—The installation of a new street-lighting system is under consideration by the Selectmen.

WAKEFIELD, MASS.—Bonds to the amount of $50,000 have been authorized to place the high-tension lines underground. The Edison Electric Illuminating Company of Boston will expend $135,000 to put its high-tension lines underground from the Woburn station to the Wakefield line. The town will place the wires underground from the Wakefield line to the distributing station.

NORWICH, CONN.—The Eastern Connecticut Power Company is negotiating for the plants and system of the People's Light & Power Company and the Danielson & Plainfield Gas & Electric Company, which operates in Danielson, Plainfield, Brooklyn, Dayville and several other towns in that vicinity.

STAFFORD SPRINGS, CONN.—The Rockville-Willimantic Lighting Company contemplates extending its service to West Stafford, Forestville and Orcutville, a distance of about 3 miles.

## Middle Atlantic States

BROOKLYN, N. Y.—The stockholders of the Brooklyn Edison Company voted to increase in capital stock from $30,000,000 to $50,000,000. Of the proceeds $15,000,000 will be utilized to erect a new generating station at Hudson Avenue and the East River, to have an ultimate capacity of 400,000 kw. and other power-plant extensions. In addition the company will expend an average of $500,000 a month during 1923 for new machinery and equipment for existing power houses, substations and extensions to transmission lines.

GLENS FALLS, N. Y.—Arrangements are being made by E. J. Worden to erect an electric power plant on Canada Street. The surplus water of the Lake George Water Company will be used to generate electricity, which will be available in emergencies on the Worden properties.

LONG ISLAND CITY, N. Y.—Motors, controllers and other electric power equipment will be installed in the proposed plant of the Latham Lithographing & Printing Company, 32 West Forty-second Street, New York, to be erected on Woodside Avenue, at a cost of about $1,000,000.

OGDENSBURG, N. Y.—The Ogdensburg Paper Company will install electric power equipment in connection with a proposed addition to its plant, to cost about $150,000.

RUSH, N. Y.—The question of having the transmission line extended from East Henrietta to Rush is under consideration. The cost is estimated at about $6,000.

CAMDEN, N. J.—The Philadelphia & Reading Railway Company will build an electric generating plant at its local terminal, now in course of construction, to cost about $3,000,000. Four electrically operated ferry slips will be installed.

ELIZABETH, N. J.—Motors, controllers and other electric equipment will be installed in the printing plant to be erected by the Elizabeth *Daily Journal*, 74 Broad Street, to cost about $200,000. C. Godfrey Poggi, 275 Morris Avenue, is architect.

NEWARK, N. J.—Bids will be received by the Board of Education, City Hall, until Jan. 10 for electrical work in the addition to the Milford school. Robert D. Argue is secretary.

WILDWOOD, N. J.—The Ottens Ice & Cold Storage Company will install electric power equipment in its proposed ice and cold-storage plant, to cost about $70,000. Mark B. Reeves, Wildwood Trust Building, is architect.

ALLENTOWN, PA.—The Pennsylvania Power & Light Company is negotiating for the purchase of a number of power companies in Northumberland County and will merge the systems. Additional transmission and distributing lines will be erected.

DRUMS, PA.—The Pennsylvania Power & Light Company will build a transmission

line to Drums for local service. A line also will be erected from Shamokin to a substation at Island Park.

ERIE, PA.—A permit has been granted to the Erie County Milk Association to erect a new power house on Peach Street between Twentieth and Twenty-first Streets.

LEBANON, PA. — The Keystone Macaroni Company will build a one-story power house at its local plant.

LEMOYNE, PA.—The West Shore Lumber Company will build a one-story power house, 40 ft. x 60 ft.

PHILADELPHIA, PA.—The Philadelphia Electric Company has acquired the Penn Electric Light Company and plans extensions and improvements.

YORK, PA.—The installation of municipal electric plant, to cost about $250,000, is reported to be under consideration by the City Council.

APPOMATTOX, VA.—Arrangements are being made to rebuild the municipal light and power plant, recently destroyed by fire. C. A. Hancock is chairman of the committee.

WASHINGTON, D. C.—Bids will be received by the General Purchasing Officer, Panama Canal, until Jan. 19 for electrical and mechanical equipment, including lightning arresters, electrical wire, etc. (Circular 1506).

WASHINGTON, D. C. — Bids will be received by the Chief Signal Officer, United States Army, until Jan. 12 for telephone supplies (Circular PR-13538-1 CP). Also, until Jan. 11 for 2,400 dry batteries (Circular PR-13260-2CP).

## North Central States

BAD AXE, MICH. — The Great Lakes Electrical Company, recently organized, plans to erect a transmission line to furnish service in this section, including Brown City, Mayville and Elkton. Power will be supplied by the Detroit Edison Company, which will extend its transmission line from Port Huron to a point near Brown City. John Clark, Bad Axe, heads the new company.

GRAND RAPIDS, MICH.—The Consumers' Power Company contemplates extensions and improvements to its local system, to cost about $400,000.

LANSING, MICH. — The Durant Motor Company contemplates doubling the capacity of the power plant at its local works.

MOTTVILLE, MICH.—The Middle West Utilities Company, 72 West Adams Street, Chicago, has acquired a power site on the St. Joseph River for a power plant, to cost $400,000. It will be operated by the Michigan Gas & Electric Company, a subsidiary.

PORT HURON, MICH.—The New Egyptian Portland Cement Company, Ford Building, Detroit, plans to install a power house in connection with its new local plant.

DELPHOS, OHIO.—The Northwestern Ohio Power Company is erecting a new electric transmission line from the local plant to Van Wert, where the current will be distributed in Convoy and Ohio City.

GEORGETOWN, KY. — The Kentucky Traction & Terminal Company is planning to rebuild its local electric substation, recently destroyed by fire.

PADUCAH, KY.—Plans are being prepared by the Pillsbury-Becker Engineering Company, 119 South Eleventh Street, St. Louis, for an ice-manufacturing plant for the Paducah Electric Company, to cost about $700,000.

STEFF, KY. — The Spring Lick (Ky.) Coal Company, recently organized, contemplates the installation of electric power and mechanical equipment at its properties near Steff. George W. Heheman, Prospect, is president.

MOUNT VERNON, ILL. — The Mount Vernon Car Manufacturing Company will install electric power equipment at its proposed addition, to cost about $250,000.

CHETEK, WIS.—The Wisconsin Hydro-Electric Company, Amery, has acquired the property of the Chetek Light & Power Company.

MARSHFIELD, WIS.—To meet the increasing demand for electrical service extensive additions will have to be made to the municipal electric plant. The installation of a 7,500 kw. turbo-generator unit is under consideration. The question of securing electricity from the transmission systems of the Wisconsin-Minnesota Light & Power Company, Eau Claire, or the Wisconsin Valley Electric Company, Wausau, is also under consideration.

STEVENS POINT, WIS.—Plans are being prepared by L. E. De Guere, Wisconsin Rapids, engineer, for a two-story paper mill and hydro-electric plant, to cost about $300,000.

STRATFORD, WIS.—The Stratford Light & Power Company contemplates building a hydro-electric plant with steam auxiliary power station and distribution system, to cost about $65,000.

THREE LAKES, WIS.—The Council is considering issuing bonds for the installation of a municipal electric lighting system, energy to be secured from the municipal electric plant at Eagle River.

TOMAH, WIS.—The plant and holdings of the Tomah Light & Power Company have been acquired by the Middle Wisconsin Power Company. The new owners, it is understood, will connect its lines with the transmission system of the Central Wisconsin Power Company and will distribute electricity to a number of towns in this vicinity.

RED WING, MINN.—The City Council has engaged L. P. Wolf, St. Paul, consulting engineer, to prepare preliminary plans for a municipal electric plant and pumping station for waterworks and also for an ornamental lighting system. The cost is estimated at about $350,000.

ST. PAUL, MINN.—The St. Paul Gas Light Company is reported to have purchased an island in the Mississippi River at the edge of the city on which it proposes to build a hydro-electric plant, to cost about $1,250,000.

ST. PAUL, MINN.—A ten-year construction plan involving an expenditure of $80,000,000, has been announced by the Northern States Power Company. Work will soon start on the first unit, which is a new steam-driven power plant on the Mississippi River at St. Paul. The second unit, a hydro-electric plant, will be located on St. Croix River, near here, and will be built in 1923. The cost of the two plants is estimated at $10,000,000.

DAVENPORT, IOWA.—The Rural Power Company has been granted franchises to erect electric transmission lines on a number of roads in Scott County.

EXCELSIOR SPRINGS, MO.—The North Missouri Power Company, which has acquired the property of the Excelsior Springs Water, Gas & Electric Company and plants in several other towns in this part of the state, is considering the construction of a new power plant.

FRANKLIN, MO.—The Missouri, Kansas & Texas Railroad Company, St. Louis, has plans under way for the erection of a power house, in connection with a new engine house and shops, to cost about $85,000.

KANSAS CITY, MO.—The Santa Fé Railway Company plans to build a series of power plants in connection with the proposed electrification of its main trunk line. The Keese Engineering Company, Los Angeles, is preparing preliminary plans.

RUTLEDGE, MO. — The citizens have voted to secure electricity for local service from the Edina (Mo.) Light Company.

LINCOLN, NEB.—The Continental Gas & Electric Company, which has acquired the property of the Lincoln Gas & Electric Company, is preparing plans for an addition to the local power plant.

## Southern States

GREAT FALLS, S. C.—The Great Falls Power Company has increased its capital stock from $17,000,000 to $20,000,000, part of the proceeds to be used for extensions and improvements.

ATHENS, GA.—The Georgia Brick Company will rebuild its power house and manufacturing plant, recently damaged by fire, causing a loss of about $40,000.

JACKSONVILLE, FLA.—The City Commission will install a new lighting system on Twenty-sixth Street from Myrtle Avenue to Davis Street.

CHATTANOOGA, TENN. — The Dixie Spinning Mill, Inc., will build a power house in connection with its proposed plant, comprising nine mill units, to cost about $5,000,000.

CHATTANOOGA, TENN.—Plans have been completed by the Western Union Telegraph Company, 195 Broadway, New York City, for the construction of a general repair plant in Chattanooga, to cost about $250,000.

KNOXVILLE, TENN. — The Cherokee Brick Company, recently organized, will build a power house in connection with its proposed plant to be erected near the city, to cost about $250,000. J. Albert Robbins is president.

PIKEVILLE, TENN.—The Pocahontas & Sewanee Coal Company will install electric power equipment at its mines.

HALEYVILLE, ALA.—Plans are under consideration for the installation of a municipal electric plant and waterworks system. The equipment will include two 100-hp. engines and two 65-kw. generators.

BURBANK, OKLA.—Preliminary plans are under way for extensions and improvements in the municipal electric plant and system.

CLINTON, OKLA.—Plans are being prepared by V. V. Long & Company, Colcord Building, Oklahoma City, engineers, for extensions to the municipal electric light plant and waterworks system.

NOWATA, OKLA.—The proposal to issue $111,000 in bonds for new pumps, a 2,000,000-gal. reservoir, power plant and mains will be submitted to the voters on Jan. 23.

CANTON, TEX.—A bond issue of $50,000 has been sold, the proceeds to be used for a municipal electric plant and waterworks.

DALLAS, TEX.—Plans for the proposed municipal public market in Dallas provide for a power house and ice-manufacturing and refrigerating plant. The cost is estimated at $500,000. Charles L. Sanger is chairman of the municipal market committee.

FORT WORTH, TEX.—A bond issue of $250,000 is being arranged for extensions to the municipal light and power system.

FORT WORTH, TEX.—W. P. Gilbert will install electric power equipment in his proposed ice-manufacturing plant in the Hemphill Heights section, to cost about $75,000, of which $45,000 will be used for machinery.

PERRYTON, TEX. — The citizens have voted to issue $100,000 in water and light bonds.

WICHITA FALLS, TEX.—The installation of an electric power plant to supply electricity for the ornamental lighting system and street lamps is under consideration.

## Pacific and Mountain States

WINTHROP, WASH.—The Upper Methow Valley Light & Power Company, recently organized, plans to supply electricity for lamps and motors in the Methow Valley.

BANDON, ORE.—The Council has authorized a special election to vote on the proposal to issue $40,000 in bonds for extension to the municipal hydro-electric system.

ALHAMBRA, CAL. — An ornamental street-lighting system will be installed on Garfield Avenue between Hellman Avenue and Ramona Boulevard.

AZUSA, CAL. — The Azusa Ice & Cold Storage Company plans to rebuild its power house and plant, recently destroyed by fire, causing a loss of about $100,000.

FORTUNA, CAL. — John F. Williams, Fortuna, and associates have applied to the State Water Commission for permission to construct a hydro-electric plant on the North Fork of the Eel River, Mendocino County, with initial installation of 22,600 hp., to cost about $2,000,000.

FULLERTON, CAL. — The Placentia Orange Growers' Association will install electric power equipment at its proposed local precooling and refrigerating plant, to cost about $150,000.

GLENDORA, CAL.—The Southern California Edison Company will make extensions and improvements to its local distributing system, to cost about $20,000.

NEEDLES, CAL.—The Santa Fé Railway Company, Kerckhoff Building, Los Angeles, will install electric power equipment in connection with its proposed local ice and precooling plant, to cost about $250,000.

PETALUMA, CAL.—The Petaluma Ice & Cold Storage Company will install electric power equipment in connection with its proposed plant addition at East Petaluma, to cost about $100,000.

SAN FRANCISCO, CAL.—The lighting committee of the Board of Supervisors has recommended replacing the gas lamps on Fifth Street from Market to Mission Street with electric lamps. The committee also voted to increase the number of street lamps on Mason Street from Market to Sutter Street.

STOCKTON, CAL.—Electric power equipment will be installed in the ice and precooling plant to be erected by the Terminal Cold Storage & Warehouse Company, to cost about $250,000. N. E. McLean, 16 California Street, San Francisco, is architect.

TAFT, CAL. — Preliminary plans are under way for the installation of an ornamental lighting system on Fourth and North Streets.

TURLOCK, CAL.—The Turlock Irrigation District has applied to the State Water Department for permission to construct a hydro-electric plant on the Tuolumne River, to cost about $480,000.

WEIPPE, IDAHO.—The E. T. Chapin Pole Company, Spokane, Wash., contemplates the construction of a power house in connection with its proposed mill, to cost about $100,000.

TONOPAH, NEV.—The Bellehelen Merger Mines Company will install electric power equipment in connection with its proposed new mill, to have capacity of 50 tons a day.

## Canada

WINNIPEG, MAN.—Tenders will be received by the Public Utilities Committee until Jan. 25 for three transformers for the proposed standby plant. The cost is estimated at $210,000. J. G. Glassco is manager of the Winnipeg hydro-electric system.

ST. JOHN, N. B.—The New Brunswick Electric Power Commission is considering a hydro-electric development at Nepisiquit Falls, to cost about $500,000. C. O. Foss is engineer.

STAMFORD, ONT.—The officials of the township are plannnig to have the lines of the Hydro-Electric Power Commission of Ontario extend through the township. The cost is estimated at $38,000.

TORONTO, ONT.—Plans are under consideration by the Hydro-Electric Power Commission of Ontario for another hydro-electric project on the Niagara River, to develop an additional 50,000 hp. Adam Beck is chairman of the commission.

MONTREAL, QUE.—The Southern Canada Power Company contemplates another large hydro-electric development on the St. Francis River next year, to develop about 30,000 hp.

MONTREAL, QUE.—Plans have been prepared by the Back River Power Company, care of J. R. Walker, 35 Common Street, for construction of a dam across the Rivière des Prairies, just below Visitation Island, to develop 50,000 hp. T. Pringle & Son, 20 St. Nicholas Street, are engineers.

# Electrical Patents

**Announced by U. S. Patent Office**

(Issued Dec. 12, 1922)

1,438,636. TERMINAL PROTECTOR FOR ELECTROLYTIC CONDENSERS AND RECTIFIERS; J. Coulson, Wilkinsburg, and C. J. Rottmann, Pittsburgh, Pa. App. filed March 13, 1918. Water vapor maintained about the electrode terminals.

1,438,646. SWITCH AND FUSE BOX; H. F. Hitner, Pittsburgh, Pa. App. filed Dec. 9, 1920. Multiple-fuse blocks with switch for each block.

1,438,649. MOTOR-CONTROL SYSTEM; H. D. James, Edgewood Park, Pa. App. filed March 13, 1920. Dynamic braking of series electric motors.

1,438,690. TROLLEY SWITCH; A. Bogdanski, Cohoes, N. Y. App. filed Sept. 27, 1922. Facilitates passage of trolley over switch.

1,438,722. ELECTROLYTIC ANODE; R. A. Price, Berwyn, Ill. App. filed March 7, 1921. Anode hook and suspending bar to reduce high-resistance contact.

1,438,728. ELECTRIC STARTING MOTOR; H. Steinhart, Stuttgart, Germany. App. filed Dec. 31, 1919. Two-circuit automobile starter.

1,438,732. TELEPHONE EXCHANGE SYSTEM; W. C. Weaver, East Orange, N. J. App. filed Dec. 27, 1918. Toll-line operator's signal.

1,438,736. TELEPHONE SYSTEM; S. B. Williams, Jr., Brooklyn, N. Y. App. filed Jan. 16, 1920. Automatic switches for interconnecting lines.

1,438,742. ELECTRIC IRON; G. R. Blakesley, Edgerton, Wis. App. filed Dec. 2, 1920. Switch under handle for controlling current.

1,438,743. TELEPHONE-EXCHANGE SYSTEM; E. H. Clark, New York, N. Y. App. filed Oct. 4, 1918. Automatic system terminate in semi-automatic exchange.

1,438,744. TELEPHONE EXCHANGE SYSTEM; E. H. Clark, New York, N. Y. App. filed Feb. 7, 1919. Indicator for automatic system connected to manual exchange.

1,438,751. CONDUIT FOR THERMO-TEMPERATURE CIRCUITS OF GRAIN TANKS; L. H. Des Isles, Chicago, Ill. App. filed July 6, 1918.

1,438,753. RHEOSTAT; H. A. Douglas, Bronson, Mich. App. filed June 1, 1922. Spiral winding with rotating contact.

1,438,758. MACHINE SWITCHING DEVICE; C. L. Goodrum, New York, N. Y. App. filed Feb. 24, 1919. Automatic or semi-automatic type.

1,438,789. RELEASING DEVICE FOR OVERLOAD SWITCHES; L. Schon, Essen-on-the-Ruhr, Germany. App. filed Dec. 3, 1920. Time-limit device.

1,438,799. INCRUSTED METAL DESIGN ON CERAMIC SUBSTANCES AND PROCESS OF MAKING SAME; E. Warrin, Upper Montclair, N. J. App. filed June 30, 1920. Combined etching and electroplating process.

1,438,828. METHOD AND APPARATUS FOR SELECTIVELY TRANSFERRING ELECTRICAL OSCILLATORY ENERGY; H. W. Houck, New York, N. Y. App. filed March 29, 1920. Generation, transmission and reception of oscillatory energy.

1,438,833. CONTROLLING SYSTEM FOR SIMULTANEOUSLY FIRING A NUMBER OF GUNS FROM A CENTRAL STATION; P. Kaminski, Berlin-Pankow, Germany. App. filed March 29, 1921.

1,438,841. TELEPHONE-EXCHANGE SYSTEM; A. E. Lundell and E. H. Clark, New York, N. Y. App. filed Sept. 6, 1919. Machine-switching equipment.

1,438,854. COUPLING TRANSFORMER FOR RADIO SYSTEMS; R. S. Piper, Chicago, Ill. App. filed June 15, 1922. Inductive coupling between antenna and secondary circuit.

1,438,858. INSULATING TUBING FOR ELECTRICAL CONDUITS AND METHOD OF MAKING SAME; O. Rey Zurich, Switzerland. App. filed May 1, 1919.

1,438,866. ELECTRIC RAILWAY BRAKE; W. H. Sauvage, Buffalo, N. Y. App. filed June 8, 1920. Brake operated by motor.

1,438,934. ELECTRIC REGULATION; J. L. Creveling, White Plains, N. Y. App. filed Aug. 17, 1916. Voltage regulator for generator.

1,438,936. ELECTRICAL FURNACE; A. Eimer, New York, N. Y. App. filed Aug. 24, 1921. For melting silica, quartz, etc., for molding.

(Issued Dec. 19, 1922)

1,438,938. TRANSMISSION SYSTEM; J. F. Baldwin, Jr., East Orange, N. J. App. filed March 29, 1920. Four-wire repeater telephone systems.

1,438,944. ELECTRIC REGULATOR; R. D. Conway, Chatham, N. J. App. filed July 24, 1919. Arrangement for regulating current flow in a circuit.

1,438,945. ELECTRIC REGULATOR; R. D. Conway, Chatham, N. J. App. filed July 24, 1919. Means for insuring constant flow of current over a circuit obtained by using thermionic tubes.

1,438,946. ELECTRIC REGULATOR; R. D. Conway, Chatham, N. J. App. filed Dec. 8, 1919. Means for insuring constant flow of current through a circuit.

1,438,947. ELECTRIC REGULATOR; R. D. Conway, Chatham, N. J. App. filed Dec. 9, 1919. Constant-current system controlled by thermionic tubes.

1,438,953. LIGHTNING ARRESTER; G. R. Folds, Evanston, Ill. App. filed July 12, 1919. Saw-tooth arrester construction for communication systems.

1,438,954. LIGHTNING ARRESTER FOR COMMUTATION SYSTEMS; G. R. Folds, Evanston, Ill. App. filed Nov. 12, 1919. Means for electrically separating line and ground springs.

1,438,959. AUTOMATIC TELEPHONE-EXCHANGE SYSTEM; J. W. Lattig, Bethlehem, Pa. App. filed Aug. 29, 1904. Circuit arrangement for machine switching system.

1,438,960. AUTOMATIC TELEPHONE-EXCHANGE SYSTEM; J. W. Lattig, Bethlehem, Pa. App. filed Aug. 29, 1904. Meter-control relay for recording calls.

1,438,961. PRINTING-TELEGRAPH SYSTEM; A. E. Lundell, New York, N. Y. App. filed May 25, 1918.

1,438,969. VACUUM TUBE; L. R. Spengeman, Jersey City, N. J. App. filed Sept. 17, 1918. Top of electron-tube filament held taut by spring.

1,438,974. PIEZO-ELECTRICAL VOLTAGE INDICATOR; E. C. Wente, New York, N. Y. App. filed Nov. 13, 1920. Instrument for recording wave forms of alternating current.

1,438,976. ELECTRIC REGULATOR; P. I. Wold, East Orange, N. J. App. filed June 8, 1918. Regulating motors or generators with thermionic tubes.

1,438,987. HIGH-FREQUENCY TRANSLATING CIRCUITS; L. Espenschied, Hollis, and H. A. Affel, Brooklyn, N. Y. App. filed Sept. 30, 1919. Arrangements for modulating currents of various frequencies.

1,438,988. HIGH-FREQUENCY TRANSLATING CIRCUITS; L. Espenschied, Queens, and H. A. Affel, Brooklyn, N. Y. App. filed Sept. 30, 1919. High-frequency translating circuits for modulating currents of various frequencies.

1,438,989. HIGH-FREQUENCY TRANSLATING CIRCUITS; L. Espenschied, Queens, and H. A. Affel, Brooklyn, N. Y. App. filed Sept. 30, 1919. Modulation of several frequencies by means of an arc.

1,439,016. PROJECTOR ELECTRODE; W. R. Mott, Lakewood, Ohio. App. filed July 28, 1919. For motion-picture machines.

1,439,036. VOLTAGE-REGULATING CIRCUIT; S. Suekoff, Chicago, Ill. App. filed July 10, 1920. Automatically maintains constant-voltage on storage battery.

1,439,071. SECRET-SERVICE CORD CIRCUITS; H. D. Currier, Chicago, Ill. App. filed March 20, 1915. Telephone system using link or cord circuits.

1,439,094. HEATING BAG; H. Gingras, Quebec, Can. App. filed April 17, 1922. Heating element between two stones that are surrounded by asbestos.

1,439,117. TELEPHONE INSTRUMENT; J. S. Newman, Cleveland, Ohio. App. filed Aug. 16, 1915. Relates to carbon transmitting equipment.

1,439,121. HEATING UNIT FOR SADIRONS; A. E. Reimers, Middletown, N. Y. App. filed Dec. 13, 1920. Heating element and its casing independent unit.

1,439,123. METHOD OF MAKING ELECTRICAL RESISTANCE UNITS AND THE LIKE; L. T. Richardson, New Brunswick, N. J. App. filed Oct. 27, 1920. Resistance units covered with vitreous or similar fired coatings.

1,439,124. AUTOMATIC TELEPHONE SYSTEM; R. G. Richardson, Chicago, Ill. App. filed Feb. 14, 1916. Employs finder switches for connecting calling line with a selector switch.

1,439,130. AUTO SIGNAL; O. Schwimmer, Los Angeles, Cal. App. filed Jan. 10, 1919. Indicates direction of travel.

1,439,134. MODULATING METHOD AND SYSTEM; L. J. Sivian, East Orange, N. J. App. filed April 7, 1919. Generation of oscillations having amplitude which varies according to a desired wave form.

1,439,155. STORAGE-BATTERY INSULATOR; F. J. Erickson, Minneapolis, Minn. App. filed July 14, 1921. Plate separators of rubber.

1,439,212. PORTABLE AUDIPHONE TRANSMITTER; C. E. Williams, Chicago, Ill. App. filed Nov. 5, 1920. For partially deaf people.

1,439,213. TELEPHONE-EXCHANGE SYSTEM; S. B. Williams, Jr., Brooklyn, N. Y. App. filed April 24, 1919. Interconnecting apparatus for telephone lines.

1,439,335. ELECTRIC STOVE; A. Selvatico, Milan, Italy. App. filed Aug. 13, 1921. Air circulated internally and around element and reflected against oven plate.

1,439,340. HIGH-TEMPERATURE PREHEATER FOR FLUIDS; P. St. Clair, Jr., Niagara Falls, N. Y. App. filed May 24, 1919. For various synthetic ammonia processes.

1,439,363. RECEIVING SYSTEM FOR RADIANT ENERGY; J. H. Hammond, Jr., Gloucester, Mass. App. filed Dec. 13, 1919. Insulator for supporting antenna upon marine vessel.

1,439,387. WRAPPING MACHINE; W. M. Wheildon, Ashland, Mass. App. filed Jan. 14, 1921.

1,439,404. ILLUMINATED TOOL; C. L. Cotharin, Chicago, Ill. App. filed March 11, 1922. Detachable handle contains flashlight battery and bulb.

1,439,408. FLASHLIGHT; I. L. Ferris, Bridgeport, Conn. App. filed Sept. 14, 1921. Adjustable mounting for lamp bulb to permit focusing.

1,439,427. AUTOMATIC TELEPHONE EXCHANGE; F. A. Lundquist, Chicago, Ill. App. filed July 19, 1917. Improvement in mechanical construction of line switches.

1,439,429. BATTERY HOLDER; A. S. Lyhne, Bridgeport, Conn. App. filed Feb. 12, 1921. Facilitates the changing of dry cells.

1,439,430. WEATHERPROOF BATTERY CASE; A. S. Lyhne, Bridgeport, Conn. App. filed Feb. 12, 1921. Dry-cell case for bicycles, boats, etc.

1,439,438. ELECTRIC FLUSH RECEPTACLE; W. J. Newton, Bridgeport, Conn. App. filed April 24, 1920. Adjustable wall case and outlet-box type provided with face plates.

1,439,457. STORAGE-BATTERY CLIP; H. E. Walker, Chicago, Ill. App. filed May 10, 1921.

1,439,471. INCANDESCENT LAMP; P. E. Hohl, Cleveland, Ohio. App. filed May 4, 1921. Construction facilitates insertion and renewal of filament.

1,439,480. FORMING FLANGES ON TUBES AND SIMILAR ARTICLES; G. H. Phelps, Warehouse Point, Conn. App. filed July 8, 1921. By application of resistance heating.

1,439,483. AUTOMOBILE STORAGE-BATTERY-CHARGING SYSTEM; J. A. Ritter, Lansdowne, Pa. App. filed Feb. 1, 1922.

1,439,495. RADIO RECEIVING APPARATUS; H. M. Williamson, Chicago, Ill. App. filed Sept. 25, 1922. Provided with apparatus to filter out static or foreign waves.

# Directory of Electrical Associations

Printed in the First Issue of Each Volume

ALABAMA LIGHT AND TRACTION ASSOCIATION. Secretary-treasurer, J. P. Ross, Birmingham Railway, Light & Power Co., Birmingham, Ala.

AMERICAN ASSOCIATION OF ENGINEERS. Secretary, C. E. Drayer, 63 East Adams St., Chicago, Ill.

AMERICAN ASSOCIATION OF OPERATING ENGINEERS. Secretary, H. C. Bristol, Calderwood, Tenn.

AMERICAN ELECTRIC RAILWAY ASSOCIATION. Executive secretary, J. W. Welsh, 8 West 40th St., New York City.

AMERICAN ELECTROCHEMICAL SOCIETY. Secretary, Colin G. Fink, Columbia University, New York City.

AMERICAN ENGINEERING STANDARDS COMMITTEE. Secretary, P. G. Agnew, 29 West 39th St., New York City.

AMERICAN INSTITUTE OF CONSULTING ENGINEERS, INC. Secretary, F. A. Molitor, 143 Liberty St., New York City.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS. Secretary, F. L. Hutchinson, 33 West 39th St., New York City. Board of directors meets bi-monthly. Sections and branches in the principal electrical centers throughout the country.

AMERICAN INSTITUTE OF MINING AND METALLURGICAL ENGINEERS. Secretary, F. F. Sharpless, 29 West 39th St., New York City.

AMERICAN SOCIETY FOR TESTING MATERIALS. Secretary-treasurer, C. L. Warwick, 1315 Spruce St., Philadelphia, Pa.

AMERICAN WELDING SOCIETY. Secretary, M. M. Kelly, 29 West 39th St., New York City.

ARKANSAS UTILITIES ASSOCIATION. Secretary, R. I. Brown, Little Rock Railway & Electric Company, Little Rock, Ark.

ASSOCIATED MANUFACTURERS OF ELECTRICAL SUPPLIES. General secretary, Frederic Nicholas, 30 East 42d St., New York City.

ASSOCIATION OF EDISON ILLUMINATING COMPANIES. Secretary, Preston S. Millar, 80th St. and East End Ave., New York.

ASSOCIATION OF ELECTRAGISTS INTERNATIONAL (formerly National Association of Electrical Contractors and Dealers). Secretary, Farquson Johnson, 15 West 37th St., New York City, N. Y. Direct membership throughout the United States and Canada.

ASSOCIATION OF IRON AND STEEL ELECTRICAL ENGINEERS. Secretary, John F. Kelly, Empire Building, Pittsburgh, Pa.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS. Secretary-treasurer, Joseph A. Andreucetti, Chicago & Northwestern Railway, Room 413, C. & N. W. Terminal Station, Chicago, Ill.

CANADIAN ELECTRICAL ASSOCIATION, affiliated with N. E. L. A. Secretary, Louis Kon, 65 McGill College Ave., Montreal.

COLORADO PUBLIC SERVICE ASSOCIATION. Secretary-treasurer, Miss Minnie B. W. Baker, 900 15th St., Denver, Col.

COMMERCIAL NATIONAL SECTION, N. E. L. A. National chairman, O. K. Hogue, Commonwealth Edison Co., Chicago, Ill.

ELECTRIC CLUB OF CHICAGO. Hotel Morrison, Chicago, Ill.

ELECTRIC POWER CLUB. Executive secretary, S. N. Clarkson, Kirby Bldg., Cleveland, Ohio.

ELECTRICAL MANUFACTURERS' CLUB. Secretary, H. E. Hackenberg, National Carbon Co., 30 E. 42d St., New York City.

ELECTRICAL MANUFACTURERS' COUNCIL. Executive secretary, Frederic Nicholas, 30 East 42d St., New York City.

ELECTRICAL SAFETY CONFERENCE. Secretary, Dana Pierce, 109 Leonard St., New York City.

ELECTRICAL SUPPLY JOBBERS' ASSOCIATION. General secretary, Franklin Overbagh, 411 South Clinton St., Chicago, Ill.

ELECTRICAL SUPPLY JOBBERS' ASSOCIATION, ATLANTIC DIVISION. Secretary, E. Donald Tolles, 165 Broadway, New York City.

ELECTRICAL SUPPLY JOBBERS' ASSOCIATION, PACIFIC COAST DIVISION. Secretary, Albert H. Elliot, 502 Flatiron Building, San Francisco, Cal.

EMPIRE STATE GAS AND ELECTRIC ASSOCIATION. Secretary, Charles H. B. Chapin, Grand Central Terminal Building, New York City.

FEDERATED AMERICAN ENGINEERING SOCIETIES. Secretary, L. W. Wallace, 26 Jackson Place, Washigton, D. C.

FLORIDA ENGINEERING SOCIETY. Secretary, J. R. Benton, Gainesville, Fla.

GEORGIA ELECTRICAL ASSOCIATION. Secretary-treasurer, W. C. Drake, Atlanta, Ga.

GREAT LAKES GEOGRAPHIC DIVISION, N. E. L. A. Secretary-treasurer, R. V. Prather, 305 Illinois Mine Workers Bldg., Springfield, Ill.

ILLINOIS STATE ELECTRIC ASSOCIATION. Secretary-treasurer, R. V. Prather, 305 Illinois Mine Workers Bldg., Springfield, Ill.

ILLUMINATING ENGINEERING SOCIETY. General secretary, Samuel G. Hibben, 29 West 39th St., New York City. Sections in New York, Philadelphia, Chicago and Boston. Chapters in San Francisco, Cleveland and Toronto.

INDIANA ELECTRIC LIGHT ASSOCIATION. Secretary, Thomas Donohue, Lafayette, Ind.

INSTITUTE OF RADIO ENGINEERS. Secretary, Alfred N. Goldsmith, College City of New York, New York.

INTERNATIONAL ASSOCIATION OF MUNICIPAL ELECTRICIANS. Secretary, C. R. George, Houston, Tex.

INTERNATIONAL ELECTROTECHNICAL COMMISSION (International body representing various national electrical engineering societies contributing to its support). General secretary, C. le Maistre, 28 Victoria St., Westminster, London, S. W., England.

IOWA SECTION, N. E. L. A. Secretary, M. G. Linn, Des Moines Electric Co., Des Moines, Iowa.

KANSAS PUBLIC SERVICE ASSOCIATION. Secretary-treasurer T. T. Parker, Kansas Electric Power Co., Emporia, Kan.

KENTUCKY ASSOCIATION OF PUBLIC UTILITIES. Secretary, E. F. Kelly, Louisville Railway Company, Louisville, Ky.

LIGHTING FIXTURE DEALERS' SOCIETY OF AMERICA. Secretary, J. L. Wolf, Electrical League, Hotel Statler, Cleveland, Ohio.

MICHIGAN ELECTRIC LIGHT ASSOCIATION. Secretary, Herbert Silvester, Edison Bldg., Ann Arbor, Mich.

MIDDLE WEST GEOGRAPHIC DIVISION, N. E. L. A. Secretary-treasurer, Horace M. Davis, Bankers' Life Bldg., Lincoln, Neb.

MISSISSIPPI ELECTRIC ASSOCIATION, affiliated with the N. E. L. A. Secretary, W. A. Sullivan, Gulfport & Mississippi Coast Traction Co., Gulfport, Miss.

MISSOURI ASSOCIATION OF PUBLIC UTILITIES. Secretary-treasurer, F. D. Beardslee, 315 North 12th St., St. Louis, Mo.

NATIONAL COUNCIL LIGHTING FIXTURE MANUFACTURERS. Secretary, Chas. H. Hofrichter, 233 Gordon Square Bldg., Cleveland, Ohio.

NATIONAL ASSOCIATION OF ELECTRICAL INSPECTORS. Executive secretary, T. H. Day, 59 Deerfield Ave., Hartford, Conn.

NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES COMMISSIONERS. Secretary, James B. Walker, New York Transit Commission, New York City.

NATIONAL ELECTRIC LIGHT ASSOCIATION. Executive manager, M. H. Aylesworth, 29 West 39th St., New York City.

NATIONAL ELECTRICAL CREDIT ASSOCIATION. Secretary, Frederic P. Vose, 1347 Marquette Building, Chicago, Ill.

NATIONAL FIRE PROTECTION ASSOCIATION. Chairman of electrical committee, Dana Pierce, 109 Leonard St., New York City. Secretary of electrical committee, Ralph Sweetland, 141 Milk St., Boston, Mass.

NATIONAL SAFETY COUNCIL. Secretary, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

NEBRASKA SECTION, N. E. L. A. Secretary-treasurer, Horace M. Davis, Bankers' Life Bldg., Lincoln, Neb.

NEW ENGLAND ELECTRICAL CREDIT ASSOCIATION. Secretary, James A. Loring, 99 Bedford St., Boston, Mass.

NEW ENGLAND GEOGRAPHIC DIVISION, N. E. L. A. Secretary, Miss O. A. Bursiel, 149 Tremont St., Boston, Mass.

NEW MEXICO ELECTRICAL ASSOCIATION. Secretary-treasurer, Charles E. Twogood, Albuquerque, N. M.

NEW YORK ELECTRICAL CREDIT ASSOCIATION. Secretary, W. J. Kreger, 47 West 34th St., New York City.

NEW YORK ELECTRICAL LEAGUE. Secretary, Albert Goldman, 555 East Tremont Ave., New York City.

NEW YORK ELECTRICAL SOCIETY. Secretary, George H. Guy, 29 West 39th St., New York City.

NORTH CENTRAL ELECTRIC ASSOCIATION (Geographic Division N. E. L. A.). Secretary, H. E. Young, Minneapolis General Electric Co., Minneapolis.

NORTHWESTERN GEOGRAPHIC DIVISION, N. E. L. A. Secretary-treasurer, George Quinan, Puget Sound Power & Light Co., Seattle, Wash.

OHIO ELECTRIC LIGHT ASSOCIATION. Secretary, D. L. Gaskill, Greenville, Ohio.

OKLAHOMA UTILITIES ASSOCIATION. Acting secretary, O. D. Hall, Oklahoma City.

PACIFIC COAST ELECTRICAL ASSOCIATION (Geographic Division N. E. L. A.). Secretary, S. H. Taylor, 527 Rialto Bldg., San Francisco, Cal.

PENNSYLVANIA ELECTRIC ASSOCIATION (State Section N. E. L. A.). Secretary, H. M. Stine, 212 Locust St., Harrisburg, Pa.

PUBLIC SERVICE ASSOCIATION OF VIRGINIA. Secretary, R. M. Booker, Newport News & Hampton Railway, Gas & Electric Co., Hampton, Va.

PUBLIC UTILITIES ASSOCIATION OF WEST VIRGINIA. Secretary, A. Bliss McCrum, Charleston, W. Va.

RADIO CLUB OF AMERICA. Secretary, Renville H. McMann, 15 Warren St., New York City.

ROCKY MOUNTAIN ELECTRICAL CO-OPERATIVE LEAGUE. Secretary-treasurer, R. M. Bleak, Kearns Building, Salt Lake City, Utah.

ROCKY MOUNTAIN GEOGRAPHIC DIVISION, N. E. L. A. Treasurer, A. C. Cornell, Denver, Col.

SOCIETY FOR ELECTRICAL DEVELOPMENT, INC. Assistant to the president, W. L. Goodwin; secretary, J. Smieton, Jr.; treasurer, R. F. Paige, 522 5th Ave., New York City. Annual meeting second Tuesday in May; directors' meetings second Tuesday in May and November; executive committee meetings every sixty days.

SOCIETY FOR THE PROMOTION OF ENGINEERING EDUCATION. Secretary, Dean F. L. Bishop, University of Pittsburgh, Pittsburgh, Pa.

SOCIETY OF INDUSTRIAL ENGINEERS. Secretary, G. C. Dent, 327 So. La Salle St., Chicago, Ill.

SOUTHEASTERN GEOGRAPHIC DIVISION, N. E. L. A. Secretary, Charles A. Collier, Georgia Railway & Power Co., Atlanta, Ga.

SOUTHWESTERN GEOGRAPHIC DIVISION, N. E. L. A. Secretary, S. J. Ballinger, San Antonio Public Service Company, San Antonio, Tex.

SOUTHWESTERN PUBLIC SERVICE ASSOCIATION. Secretary, E. N. Wills, 403-4 Slaughter Bldg., Dallas, Tex.

TRI-STATE WATER AND LIGHT ASSOCIATION. Secretary-treasurer, W. F. Stelglitz, Columbia, S. C.

UTAH ASSOCIATION OF ELECTRAGISTS. Secretary, Blaine Gray, Salt Lake City, Utah.

VERMONT ELECTRICAL ASSOCIATION. Secretary-treasurer, A. W. Peterson, Saint Albans, Vt.

WEST VIRGINIA-KENTUCKY ASSOCIATION OF MINE, MECHANICAL AND ELECTRICAL ENGINEERS. Secretary-treasurer, Herbert Smith, 211 Robson-Pritchard Bldg., Huntington, W. Va.

WESTERN ASSOCIATION OF ELECTRICAL INSPECTORS. Secretary, W. S. Boyd, 175 West Jackson Blvd., Chicago, Ill.

WESTERN SOCIETY OF ENGINEERS, ELECTRICAL SECTION. Secretary, E. S. Nethercut, 1735 Monadnock Block, Chicago, Ill.

WISCONSIN STATE ASSOCIATION OF ELECTRAGISTS. Secretary, H. M. Northrup, 23 Erie Street, Milwaukee, Wis.

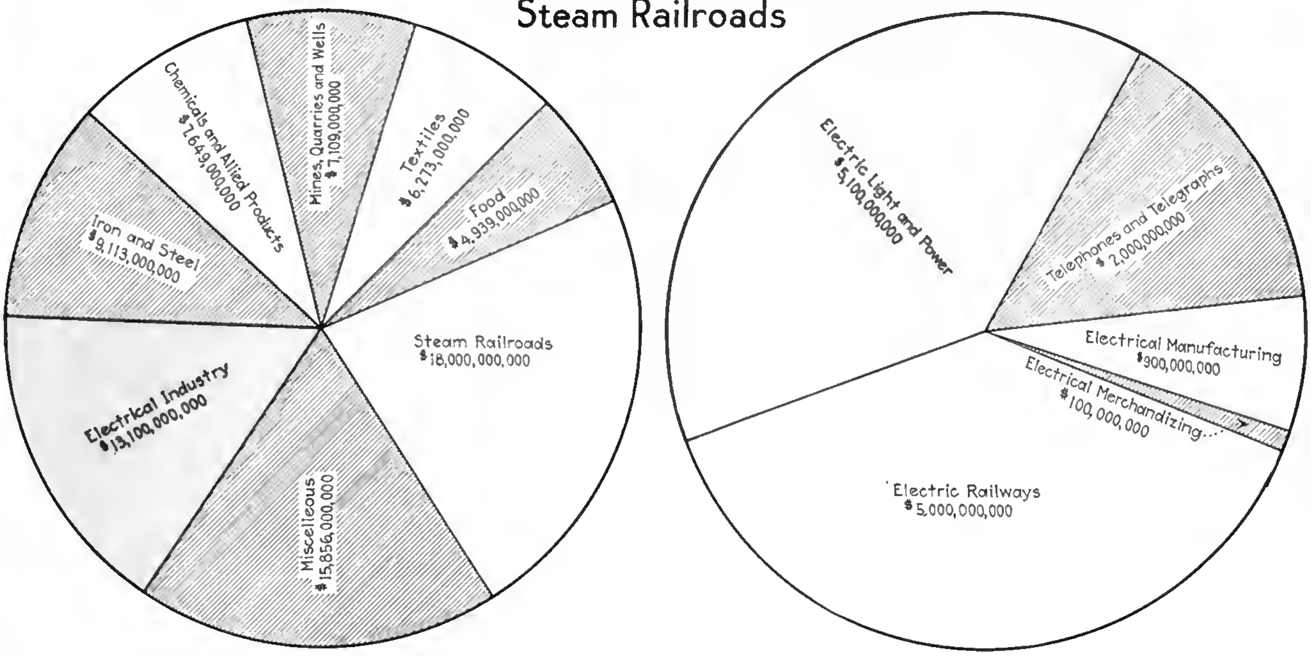
WISCONSIN UTILITIES ASSOCIATION. Executive secretary, John N. Cadby 445 Washington Bldg., Madison, Wis.

WYOMING UTILITIES ASSOCIATION. Secretary, C. Luscombe, Western Light & Power Co., Boulder, Col.

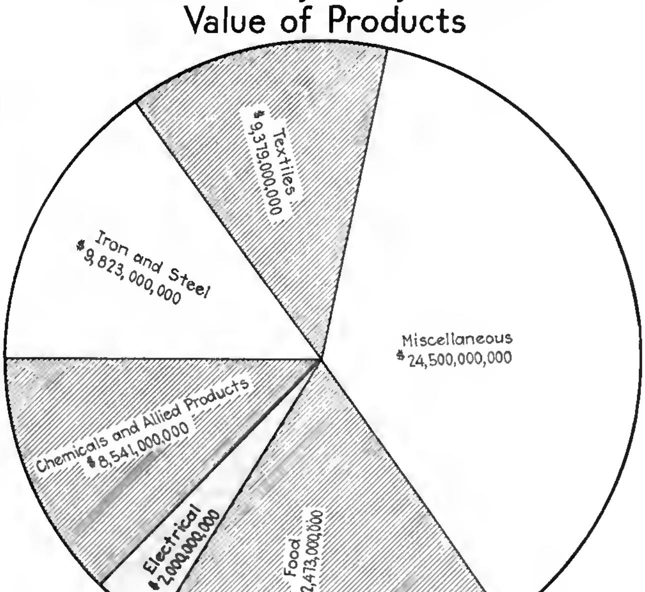
# Business Facts for Electrical Men

Selected Statistics Presented Graphically for the Use of All Interested in Analyzing the Trend of the Electrical Business

## The Capitalization of the Electrical Industry is exceeded only by the Steam Railroads



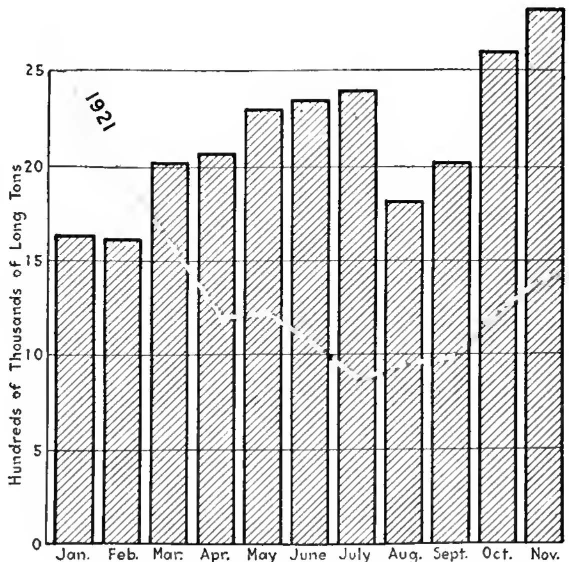
## Food Industry easily leads in Value of Products



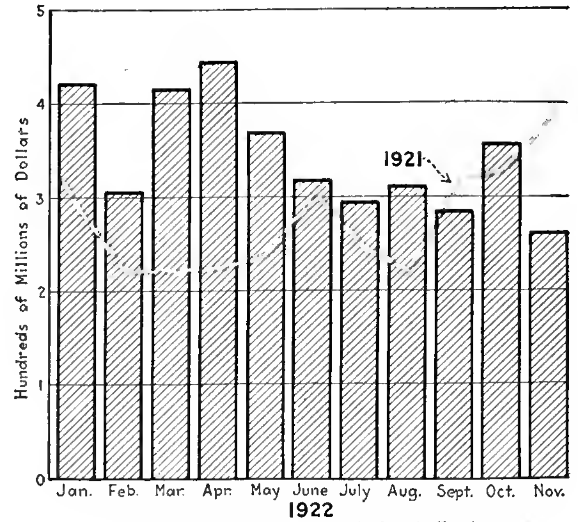
### The Place of the Industry

FROM its small beginning in the last quarter of the nineteenth century, the federation of American activities which is known as the electrical industry has become second only to that backbone of American business life, the steam railroad. Not only is this true as regards the amount of money invested in the two industries, but in influence and indispensability this newcomer is today pressing the railroads for premier place.

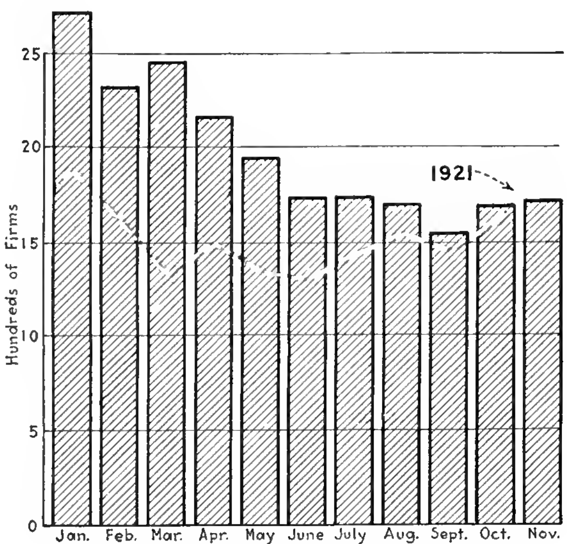
Within the family itself the same contest exists between the electric light and power companies and the electric railways. In this instance, however, it would appear that the electric railways are running a losing race. The end of 1923 should see the electric light and power companies many hundreds of millions ahead in number of dollars invested.



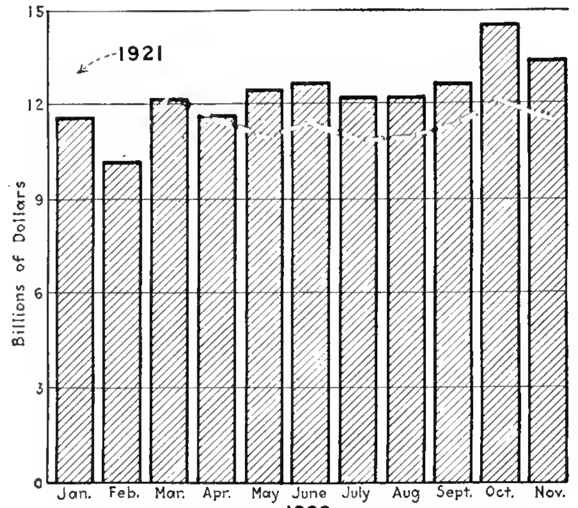
1922
Pig-Iron Production



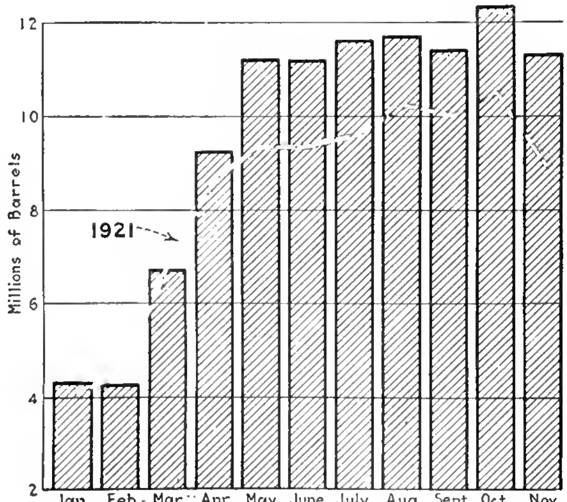
1922
Total Bond Sales, New York Stock Exchange



1922
Business Failures



1922
Bank Clearings
(Outside of New York City)



1922
Portland Cement Production

# The Business Horizon Is Clear

AT THIS TIME of the year it is customary for business to pause long enough to take account of the progress made during the twelve months just elapsed, and from this standpoint to make some conjectures as to the coming months of the new year. Most industries can view the progress of the past year with a feeling of satisfaction in spite of the many difficulties which have been experienced. At the close of 1922 there are no serious obstacles in sight which should hinder further advances during the early part of the new year. The unsettled conditions in foreign countries, particularly in Europe, are still depressing our trade, and, to a certain extent have, no doubt, kept the prices of agricultural products below the level of other commodities. However, within the past two months this latter condition has, in a measure, been relieved, and the apparent progress toward a settlement of the German reparations question during the past week is certain to bring added relief to the industry of America and of the world at large.

Electrical World

*The consolidation of Electrical World, Electrical Engineer and American Electrician*

Published by McGraw-Hill Company, Inc.

W. H. Onken, Jr. Editor — Harold V. Bozell Editor

*Volume* 81 New York, Saturday, January 13, 1923 Number 2

# *An Achievement in Efficiency by Electric Utilities*

CONSERVATION has long been uppermost in the mind of every manager and operator of an electric public utility. While the word has usually been associated with water power, it is equally applicable to steam power.

For years engineers have insisted on and manufacturers have produced apparatus of greater reliability and efficiency. With rising costs of labor, fuel and equipment, it was necessary for utility operators to exert themselves to the utmost if the cost of service to the customer were to be kept down. How well the task has been performed and to what extent coal has been conserved let the government say.

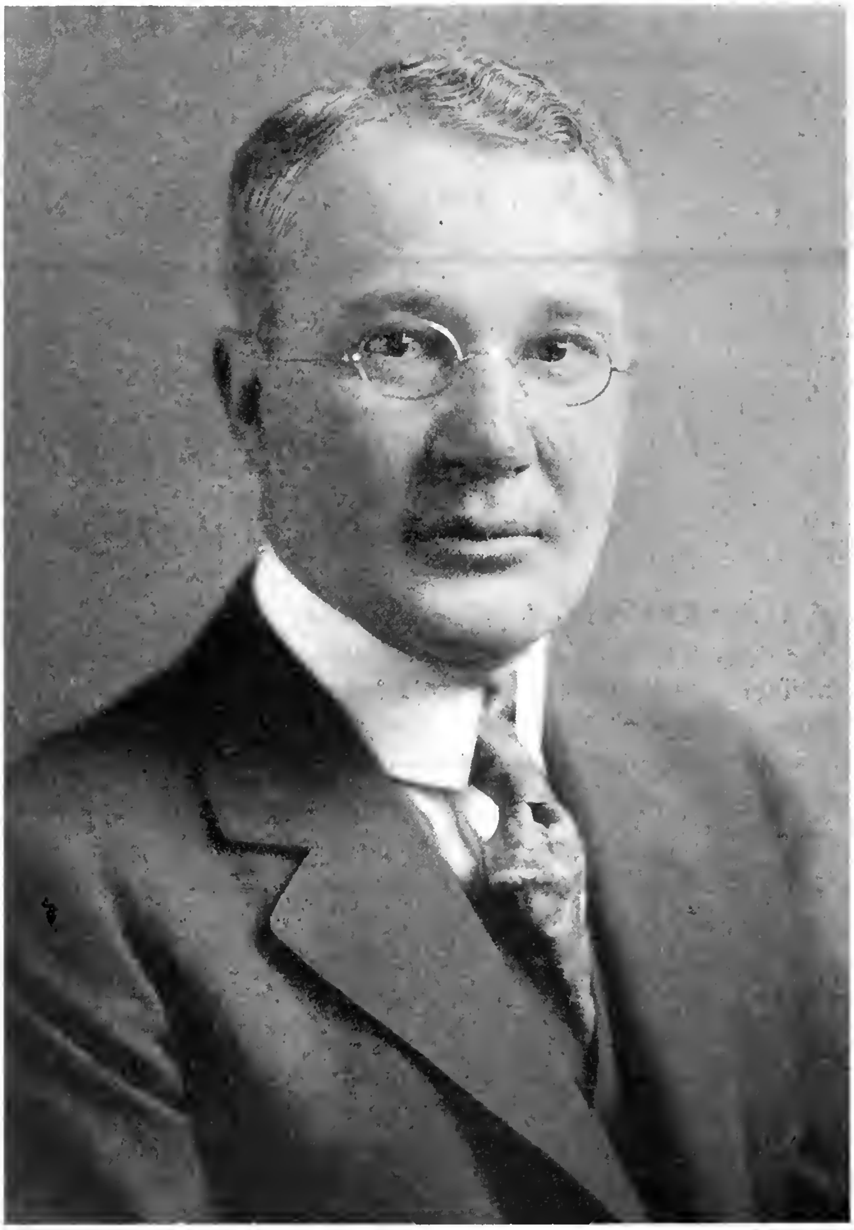
BURIED in the circular on "Production of Electric Power and Consumption of Fuel," issued by the United States Geological Survey on Jan. 4, 1923, is this tribute: "An examination of the table showing the average daily consumption of fuels by electric public utility plants shows that the fuel consumed in November, 1919, and in November, 1922, was very nearly the same. The production of electricity, however, in November, 1922, was about 25 per cent greater than in November, 1919, indicating a remarkable increase in efficiency in the utilization of fuels and in plant operation during the past three years. This represents the saving of about 750,000 tons of coal and its equivalent in other fuels in a single month as compared with November, 1919."

STATISTICS compiled by the government show that the average daily consumption of fuel by electric light and power companies during 1922 was slightly less than the average for 1919. Yet there were 13,000,000,000 more kilowatt-hours generated in 1922 than in 1919!

Thus there was an actual saving in fuel in 1922 as compared with 1919, due to the greater efficiency of electric public utilities and to water-power development, of at least 15,000,000 tons. Truly this is a most creditable showing for an industry already quite efficient, and is a wonderful tribute to the enterprise, skill and resourcefulness of those who have put their thought and labor into it.

# Wigginton E. Creed

*A man with progressive views on public policy, utility regulation and the development of national resources in the West.*



FUNDAMENTALLY the theory of the American nation is based upon the rights and duties of the individual, with government a necessary provision for safeguarding the common interests. There is perhaps no figure in the public utility field today who is more imbued with this idea than Wigginton E. Creed, president of the Pacific Gas & Electric Company. He believes that individual enjoyment of rights and performance of duties is best expressed in private operation of business. This belief has been well expressed during Mr. Creed's leadership of the Pacific Gas & Electric Company since 1920, but it had its inception long before. As president of the East Bay Water Company, just previous to taking up his present work, he had already distinguished himself by his progressive views on public policy, utility regulation and competent organization. He tolerates nothing less than good service from public servants, but in return he asks for public confidence.

Mr. Creed was born in Fresno, Cal., and educated in the public schools of Oakland and the University of California. After graduation in 1897 he taught school for some time in order that he might continue his study of the law. An active legal practice followed, but even while so employed his interest had begun to focus upon the public utility problem, and when questions of municipal rates threatened to prove troublesome for the Contra Costa Water Company Mr. Creed was persuaded to take charge of the litigation for that company. So thorough was his mastery of the situation that upon the successful termination of the case he was besought to take the presidency of the company and thus became the chief figure in its reorganization and complete financial rehabilitation. Since that time he has been actively associated with the public utility business in California.

With a keen, analytical mind and a grasp of financial problems which enables him to handle business situations with ability Mr. Creed combines great force in public speaking. He understands the importance of public relationships and is today one of the most distinguished figures in the public utility field, not only in the West, but in the nation at large.

In addition to his public service work, he is active in the management of many industrial organizations. As chief executive of the Columbia Steel Company he has been instrumental in preparing for an extension of the steel industry on the Pacific Coast.

As president of the Pacific Gas & Electric Company Mr. Creed has been influential in the building of a chain of five hydro-electric plants on the Pit River to develop 600,000 hp. of electrical energy for the use of San Francisco and other coast cities.

### Regional Research Overcomes Many Objections

IT HAS been said by skeptics that the sum total of achievements of a committee is inversely as the cube of the number of its members. This applies in particular to national committees of volunteer workers widely scattered geographically. When it comes to research, a kind of work which demands utmost concentration and continuous effort, the exponent 3 in the above adage must be probably raised considerably. Its exact value will be found in time from the meager results of the work of some of the research committees organized by the National Research Council.

We therefore note with pleasure an improvement in the usual method of committee work in the so-called regional research recently adopted by the American Welding Society. It seems that a year or two ago such a regional research committee (on arc welding of cast iron) was organized, with all the members living in and around Albany and Schenectady. The committee made splendid progress; in fact, as stated in the *Journal* of the society, the progress was at a rate approximately four times as fast as could be expected from a nationally scattered committee. Whatever the unit of "slowness" used in this statement and by whatever means the ratio of four to one was determined, the local committee evidently acquitted itself so well that such regional research is now to be used in other activities of the American Welding Society.

The advantages claimed for this plan are as follows: (a) It permits the holding of regular, frequent meetings without unnecessary loss of time and expenditure of money on the part of committee members. (b) It permits sustained interest of members as the frequency of meetings and their regularity do not allow time for the members to forget what happened at the previous meeting. Useless repetition of discussion is largely eliminated. (c) A particular investigation may be carried to a successful completion in a very short time. (d) It promotes interest in research in a particular locality and renders financing of the costs of investigations much easier.

It is to be hoped that this plan, if successful, may be followed by other national engineering societies.

### Tactful Announcements of New Business

WHEN a central-station company obtains a contract from a user of industrial power who has long been on the sales department's list of difficult "prospects" it is only natural that jubilation should be felt in the utility organization. The service to be supplied may be auxiliary or it may displace an isolated plant or other source of power no longer equal to the demands of economy or plant expansion. The mere fact of admission is so gratifying to the central-station manager whose men have been working on the problem, perhaps for years, that there is often a temptation to spread the good news abroad and sometimes, we fear, to overemphasize the part central-station service will henceforth play in the affairs of the industrial establishment.

Faith in the future acquisition of more business may be strong in the central-station family, but in telling local communities that this or that industrial plant has "come over" the utmost care should be taken to state the exact facts of the situation. Any attempt to capitalize a large industrial-power contract by leaving the newspaper reader or other person told of the change to infer that the central station is going to be the "Mr. Fixit" of the community is very poor policy. Manufacturers who have long operated private plants are often proud of their equipment and personnel, and announcements of the adoption of central-station service should be free from objectionable "slants."

A newspaper advertisement or story which expresses or implies the idea that a victory has been won over the industrial plant by the central-station company, or which intimates that the service to be supplied cuts more figure than it actually does in the plant's activities, is a mistake. Of course, it is hardly a secret if an industrial concern decides to buy central-station energy; but tact in announcing such a contract and a disposition to show the new customer a copy of the reading or advertising matter before it goes out will help to insure good feeling all around. No customer should be exploited without his consent. The economies of central-station service are too well established to require ill-advised and blatant announcements of what is going to be done. It is far better to make news announcements simple and accurate, with the approval of the customer, leaving until later the publication of results.

### Phenomenal Increase in Water-Power Development

WHEN the policy of the national government with relation to water-power development was expressed in the act of 1920 the assumption was that privately owned and publicly regulated electric utilities would undertake to harness the water courses of the country for the general welfare. To that end the law was designed as well as the rules and regulations drawn up under it. That the plan was wise and practicable is proved by the results. More water-power developments are under construction at the present time than at any previous period in the nation's history. Since the act was passed the Federal Power Commission has issued sixty-nine final permits and sixty-five licenses involving installations aggregating 5,000,000 hp. Thus within two years the country has witnessed 300 per cent more water-power development than was constructed under federal authorization in the twenty years preceding the

passage of the present act, showing that water-power development may be promoted or retarded according to the character of the governing laws. It is of course fortunate that the administration of the water-power laws is in the hands of so experienced and qualified an engineer as O. C. Merrill, whose vision broadens with the passing years.

According to statistics published in last week's issue there were on file on Dec. 1 with the Federal Power Commission three hundred applications for water-power development, involving a maximum installation of 27,-800,000 hp. Not all of this is capable of immediate development, but the record shows that approximately three-fourths of a billion dollars is involved in projects now under permit. The electrical industry could not at once command all of the money necessary to carry out complete development of all the water powers of the country, nor is other industry in any position at once to absorb the power. While it is recognized that development must precede use, and that the two must travel hand in hand, it must be recognized that the greatest water powers are remote from the great industrial centers. That is to say, industry hovers along the Atlantic seaboard, whereas our greatest water powers are west of the Rockies. There are, however, great water-power possibilities in the Appalachian region and these are being developed as quickly as capital can be martialed and use found for the power.

The country is thoroughly educated to the use of more and more water power, and the constant bickering and strife over coal production simply serves to hasten the day when every watercourse capable of economic development will be harnessed. Great as has been the progress within the past two years, indications are that this phenomenal rate of growth will not only be maintained but considerably increased within the next decade. Economic conditions are so shaping themselves as to bring this about.

## Power Factor and the Consumer

ONE of the broadest fields for economic engineering effort is to be found in connection with power-factor improvement. Each year there is a wider recognition of the necessity for establishing standards limiting the amount of reactive power to be supplied by the central station. In the relation between consumer and utility the final word in power-factor correction rests with the consumer. The small user of power is in general the greatest offender, and the reason for this is obvious. Limitations exist in the type of equipment he can utilize in his business, involving questions of speed, size and number of motors, etc. This class of consumer rarely selects his own equipment, but he relies on machinery or motor salesmen, his contractor or the power sales force. With changes in type or amount of production his power demands may change so that a correctly designed installation at the start yields a low power factor under the new conditions.

Surveys made by some of the larger companies indicate the necessity of periodic power-service tests if the best interests of the consumer are to be conserved. There is no sovereign remedy for power-factor troubles. As is elsewhere pointed out in this issue in an article by L. J. Murphy, power-factor correction is a real engineering question and each case must be handled with due consideration of all the economic features which are involved.

## The World's Work in Electricity

TO SUMMARIZE the world's consumption of electrical energy would appear to be a colossal task. It does not, of course, admit of exact knowledge, but every country can with some degree of precision estimate its own quota, and the final addition may be reckoned at least a good approximation to the truth. Such a calculation is more likely to understate the facts than to overstate them, because in every country there are electrical plants which may escape notice because of their small size or isolation, and their aggregate output might add materially to the figures reported. The ELECTRICAL WORLD'S tabulation, which was presented in last week's issue, relates to the last year for which data are obtainable from the far-spread territory included, and the prodigious total of kilowatt-hours consumed in 1920 rises to substantially a hundred billion. Two years' additional growth has doubtless caused even this aggregate to be surpassed. Whatever sources of minor error may affect the total, the general relations between the uses of electricity in one or another region appear with reasonable accuracy, and comparisons of this sort are decidedly instructive.

Of course, it is a familiar fact that electrical output on the North American Continent is relatively very large. It is, indeed, more than half—about 55 per cent —of the total, of which percentage about nine-tenths is in the United States. It is interesting, however, to know that Canada outruns us in the uses of electricity. A larger percentage of her population live in electrically lighted abodes than is the case south of the international border, and the total kilowatt-hours consumed per inhabitant in Canada is 30 per cent greater than here. When we cast about from country to country to see where the next place in the line belongs we find that as regards general distribution the third honor goes to New Zealand. Japan, however, follows the United States in the actual number of inhabitants living in electrically lighted dwellings, thereby offering a market for domestic appliances second only to that of the United States. Again, Switzerland, although slightly inferior in the distribution of electric light as such, heads the entire list in the total use of electrical energy, with 700 kw.-hr. per year per inhabitant. With more than three-fourths of her total available water power already developed, surely the little republic is making wonderful use of its "white coal."

On the whole, however, the world's water power is very badly developed indeed, less than 6 per cent of the potential minimum being already utilized. In percentage of water power kept busy Switzerland naturally stands at the head, with Germany a very close second and the United Kingdom a bad third, but still a little ahead of the United States.

The world as a whole is producing nearly twice as much electrical energy from fuel-burning plants as from water power. The moral should be evident. We have in the United States coal-burning and oil-burning plants rated roughly at 18,500,000 kw., as against hydro-electric properties rated at less than 6,000,000 kw. Canada, with relatively more water and less coal, reverses the ratio in a very striking manner, nearly 90 per cent of the generator rating being from water power. If our fuel supply is to be saved, we must from grim necessity turn more and more to water. With half the world's consumption of energy, the United States is using approxi-

mately two-thirds of the world's whole output in steam-driven apparatus. Consider what the economic results would be if our water power were put to as good use as that in Switzerland or Germany.

With the present grave fuel situation, it should be sufficiently clear that we cannot afford to go on for long in our present path, that we must at all hazards make better use of our water power, and that the efforts of our governments should be turned to encouraging rather than hampering the immediate utilization of every stream that gives hope of economic development.

### Uniform Classification of Accounts

CALIFORNIA at times chooses to follow her own notions rather than join with her sister states for the sake of uniformity. Where the honor or rights of the state are concerned such a course is commendable. No state can guard too jealously those rights and privileges not vested in the national government by the Constitution. We are not sticklers for uniformity merely for uniformity's sake, because that fetish stifles initiative. Too often it "gets by" under the guise of efficiency. However, there are uniformities which, viewed from any angle, are desirable, and to reject them is not always wise or prudent. We are surprised to note, therefore, that the California Railroad Commission has adopted the classification of accounts of the Federal Power Commission instead of that just promulgated by the National Association of Railway and Utilities Commissioners. The latter classification was revised especially to meet the desires of Far Western companies for a functional set-up of fixed-capital accounts, and, with other amendments passed at Detroit last month, the classification was presumed to meet all the requirements of utilities and state regulatory bodies. The Federal Power Commission's classification, although based largely on that of the commissioners, has injected into it certain mandatory practices of the Interstate Commerce Commission which are not applicable to the electrical industry and which do not conform with accepted principles of accounting. Knowing the progressiveness of the California Railroad Commission, we cannot feel that it will long retain an obsolete accounting system in place of one that is demonstrably sound and workable.

### More Light Needed on Transients

GOOD service, continuous and dependable, is the ideal of electric utilities, and the energies of the engineers engaged in developing the art are largely devoted to the realization of this ideal. But this very feature of dependable service is one of the real limiting factors in promoting the more extended use of high-voltage systems. Upon the technical or engineering limits involved in extending the voltage upward, and therefore in extending the economic transmission distance of transmission lines, research and thought have made less headway than in most other electrical lines since the time of Maxwell.

As is well known, whenever a change occurs in the steady conditions of an electrical system abnormal disturbances in the nature of high voltage or current surges are introduced. These disturbances may occur when energizing a line, opening a line, putting on a load or paralleling two lines, or they may result from grounds or short circuits. Whatever their cause, they seldom occur twice in the same place or form, and too frequently they cause service interruptions.

The problem of gaining accurate knowledge of these transients and of protecting the system against interruption is far from a solution. To start with, only the fundamental fact is known that these time and space transients occur in different parts of the system and involve an energy change and dissipation. An exact knowledge of the alternation and distortion of the disturbing waves is missing, and to complicate matters there is a disagreement of opinion as to the actions which cause attenuation and distortion.

It is agreed that Joulean and dielectric losses produce both distortion and attenuation, but in what degree is still a question. Authorities like Steinmetz and Carson disagree as to the effect of radiation and even as to the mechanism of propagation of these waves, and thus quantitative underlying principles are missing whereby the practical equipment can be made to eliminate the disturbances or render them harmless.

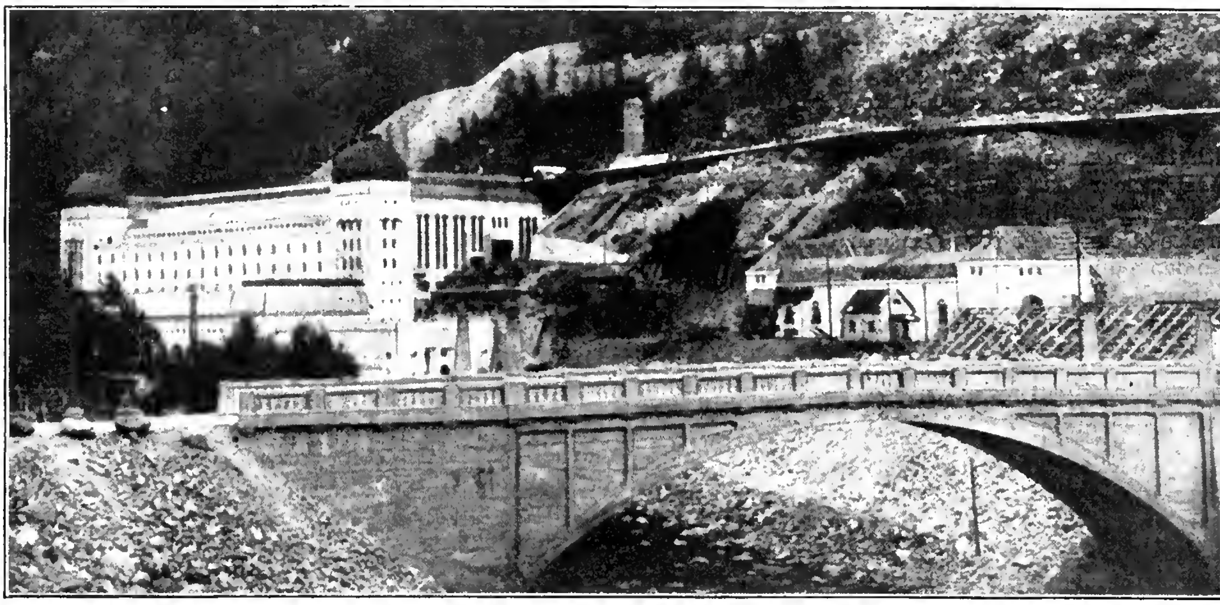
Research work of the highest grade is needed on this problem because its solution will have a tremendous influence on the introduction of the economies resulting from the more extensive use of high-tension interconnected systems.

### Transmission or Distribution, Which Is It?

ALMOST always when discussion concerning lines for the carrying of electrical energy arises those taking part in it fall into confusion in using the terms "transmission" and "distribution." This is usually because the meaning of the words is thought of in terms of voltage. Circuits of a given voltage may perform transmission functions on one property and distribution functions on another. This confusion of terms is bad enough in technical and operating discussion, but in matters of accounting it is almost past remedy. Accounting classifications are usually designed to maintain a separation of the two property values. Owing to the shifting of lines from the performance of one function to the performance of the other it is a question whether any accounting classification that has existed over a fairly long period of years can be unraveled so as to tell the true story of investment as between the two.

To get away from the confusion it will be necessary to think of circuits in terms of functions performed rather than in terms of voltage. An analysis of the mental conception of the two things that seems to exist in every discussion indicates that "transmission" covers the bulk transfer of power from a generating point for some distance to a center of distribution, such as a substation, from which it is taken over other circuits. "Distribution" covers the circuits carrying the energy from the point where it is delivered by bulk transmission circuits to the final consumer. Suggestions have been made in private and informal discussions that the definitions indicated by the above distribution would go a long way toward clearing up the confusion, since the separation is based on functions performed rather than on an arbitrary assumption.

The determination of the question will have added significance of great importance to consumer and operator alike if the recent recommendation of the utility rate committee of the National Association of Railway and Utility Commissioners becomes standard practice. This committee recommended that "transmission" systems be considered a part of "plant" in valuation, rate-base and rate-analysis studies.



# European Power Stations Are Noted for Their Architecture

# Automatic Substations Success in St. Paul

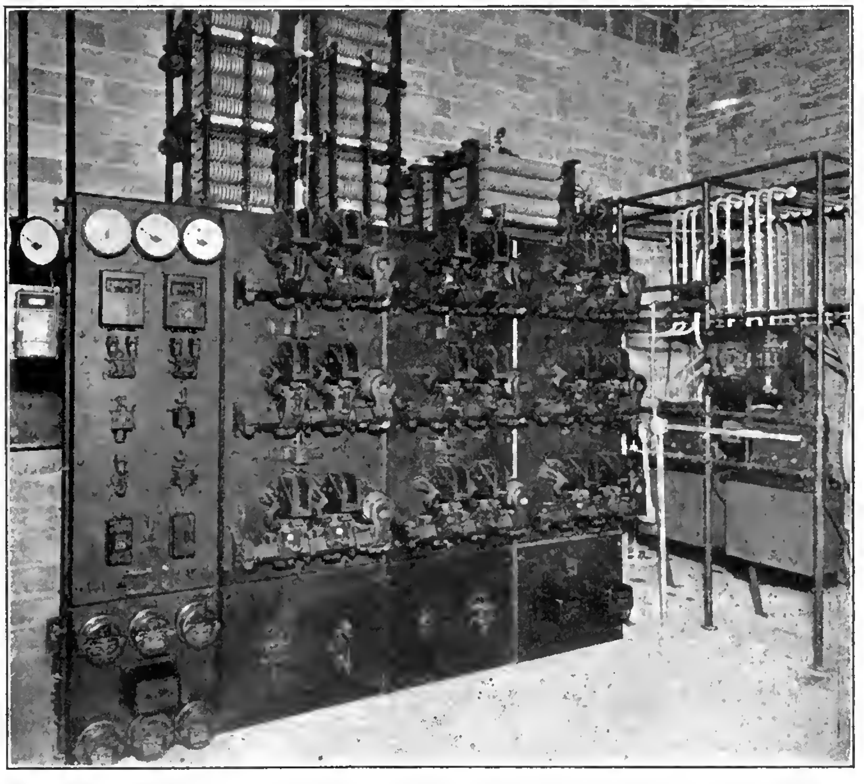
## Two Years' Experience of St. Paul Gas Light Company Brings Entirely Satisfactory Results—Both Alternating-Current and Direct-Current Stations in Use

By ROBERT REINBOLD
*Superintendent of Switchboards St. Paul Gas Light Company*

**WHAT is the legitimate field of the automatic substation? This article describes the main features of two installations in St. Paul which have proved so successful over two years of service that it is difficult to discuss operating problems. In short, the installations have functioned with only routine adjustments that cannot be styled troubles and have become a necessary part of the system. The natural inquiry is why should such substations not be applied to all situations, particularly the big direct-current areas in the big metropolitan centers. Engineers who have investigated them for the larger service point out that they are so far installed on small Edison networks with a maximum of approximately 25,000 kw. in load, where it is the policy to restrict direct-current load and where future growth will not justify substations with operators, and that possibly they can be applied in the lightly loaded outer territory surrounding a large direct-current territory. Whether they can be adapted to a heavily loaded business district where faulty operation of a single relay could drop loads up to 10,000 kw. and cause progressive disturbances to the rest of a network carrying 100,000 kw. or upward is a question to which the investigators have not been able to return a satisfactory answer. As an instance of success in the smaller field the St. Paul installation, embracing both an alternating current and a direct-current substation, is worth studying and affords evidence of worthy service in this application.**

ABOUT two years ago the first three-wire full automatic motor-generator applied to an Edison three-wire direct-current system was put in operation. This station, owned by the St. Paul Gas Light Company, has continued in successful operation ever since. In this article it will be described along with an alternating-current automatic substation owned by the same company and built during the summer of 1920.

The fulfillment of a contract to supply direct current to a large building then being erected made it necessary either to run more direct-current feeders from the nearest station, located three blocks distant, to boost the direct-current network already somewhat overloaded at this point, or to install a new station in or near the building. The load on the nearest substation had reached the practical limit of its capacity, making additional equipment imperative, but no space for it was available. Insufficient duct space in the street made the running of new feeders an expensive undertaking. The load expected from the building was less than 500 kw.; therefore manual operation was not to be considered. Thus the decision which brought about the first attempt at full automatic operation was a matter of economy and circumstance.



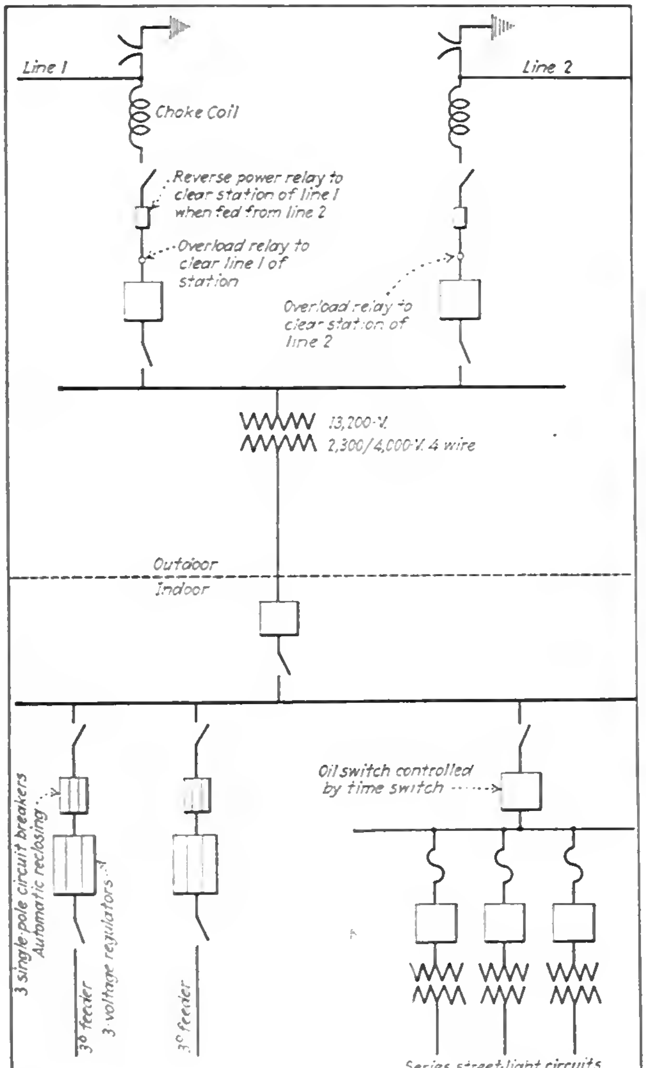
SWITCHBOARD AND MACHINE INSTALLATION AT THE AUTOMATIC DIRECT-CURRENT SUBSTATION OF THE ST. PAUL COMPANY

The apparatus is guarded from the effects of high temperature by temperature relays and an unusually complete ventilating system.

This station is in the new building, on the floor of the engine room below the sub-basement. The generator is rated at 125/250 volts, 500 kw., three-wire, with a nearly flat voltage characteristic, drooping slightly beyond full load. The motor is synchronous, rated at 1,200 r.p.m., three-phase, 4,000 volts, 60 cycles, direct-connected to the generator and mounted on the same bedplate with it. The automatic equipment is of the lock-out type, and each operation is carefully "shadowed" to prevent trouble in the event of failure on the part of any relay. The motor is protected against burn-out from continued overload or abnormally high room temperature at normal load, owing to failure of the ventilating system, by a temperature relay. All bearings are also protected by temperature relays. Each opening in the walls of the station is guarded by a self-closing fire door held open by a fuse link.

An 8-in. tile wall separates the station equipment from other equipment on the same floor, forming an inclosure about 20 ft. x 20 ft. in size and 24 ft. high. The floor is about 50 ft. below the street level, making ventilation somewhat difficult, since it was found not feasible to run a ventilation duct outside the building. The difficulty, however, was overcome by installing two exhaust fans in

the wall near the floor to move the cold air into the room, and a large opening near the ceiling on the opposite wall permitted the heated air to escape into the engine room and sub-basement. This has at no time caused uncomfortable temperatures in the sub-basement, since the space is large and below the street level. Placing of the fans near the floor makes inspection and repairs easier than if they were installed near the ceiling in the usual way. These fans have a total capacity of about 16,000 cu.ft. per minute. The smaller fan runs only when the station



TYPICAL WIRING DIAGRAM OF ALTERNATING-CURRENT AUTOMATIC SUBSTATION USED BY THE ST. PAUL GAS LIGHT COMPANY

is in operation, but it was found an advantage to have the other fan run continuously, so that if the station is automatically shut down on account of overload the room and motor temperature is quickly brought down to a point where the station will automatically return to service.

The operating conditions required the equipment to be so arranged that in the event of low voltage on the direct-current network caused by trouble at the manual station the control will automatically insert resistance between the station and the system, thus keeping the voltage up to standard on the building service. The resistors are protected by temperature relays, which control the automatic switches connecting the station with the network, thus enabling the station to separate itself automatically from the network if the voltage reaches a very low value and causes overheating of the resistors.

It was found very important that the operator at the nearest direct-current station should know at all times what the automatic station is doing. Therefore two wires were run between these stations and the neutral of the direct-current network is being used as common return, forming two circuits, one of which is connected to the secondaries of a current transformer in one of the motor leads of the automatic station and at the manual station to an ammeter, thus providing the operators with indications of the load carried by the automatic station. The other circuit is connected to a signal lamp at the manual station and is controlled by the resistor-contactor at the automatic station. It indicates to the operator the cutting in of the resistor between the network and the station.

At the manual station advantage is taken of the flat voltage characteristic of the generator at the automatic

TO SAVE SPACE THE USUAL SWITCHBOARD PANELS ARE OMITTED IN THE SEMI-OUTDOOR TYPE ALTERNATING-CURRENT AUTOMATIC SUBSTATION OF THE ST. PAUL COMPANY

Instruments, relays and reclosing devices are placed on small transite panels mounted on the switch-supporting structures.

station when the operator, if necessary, shifts the load to or from the automatic station by a slight change in the voltage at the manual station.

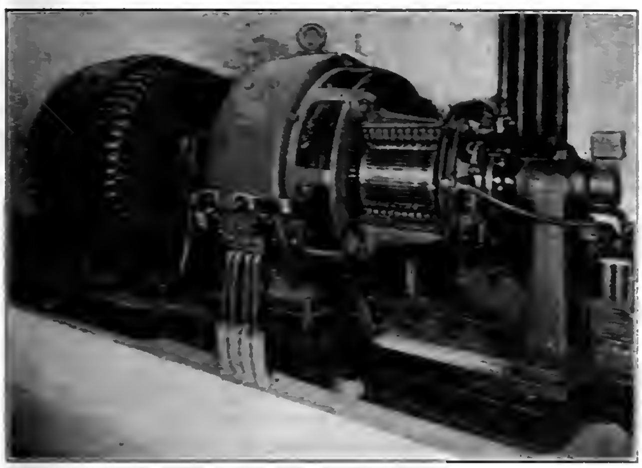
One of the difficulties and almost the only one to be overcome during the trial immediately following the completion of the installation was the "coming in" out of step of the motor on recovery of the alternating-current voltage after a momentary failure before the generator voltage had fallen to a sufficiently low value, since the motor fields were connected permanently across the generator leads. This possibility was removed by placing a contactor in the motor-field circuit to open the field when the running switch of the motor opened, thus at once reducing the generator voltage to zero. The contactor automatically recloses when the motor starting switch closes, permitting the generator to build up.

The operation of the automatic station has been entirely satisfactory, and it has also proved very valuable in emergencies such as those caused by heavy-voltage fluctuations due to the failure of a transmission line throwing all synchronous apparatus out of step. In all such cases the automatic station immediately came back, and with the storage battery, which also comes in automatically under such conditions, carried

the entire direct-current load until the manual stations could be returned to service. This station is visited daily to change charts on graphic instruments and read the meters. Once a week a general inspection is made and all contacts subjected to dust and arcing are cleaned.

### THE ALTERNATING-CURRENT STATION

The alternating-current automatic station referred to in the beginning of this article is of the semi-outdoor type. All of the high-tension equipment, consisting of transformers, lightning arresters, oil switches, etc., is located in the yard. Feeder regulators, oil circuit breakers, constant-current transformers and instruments for street lighting are in the station building. The station being in a residence district, special effort was made in the design of the building and its surroundings to insure an attractive appearance. The building is of brick and concrete construction and fireproof throughout. Floor drains are provided for each oil circuit breaker and feeder regulator, so that in case



ONE OF THE MOTOR GENERATORS USED IN DIRECT-CURRENT SUBSTATIONS

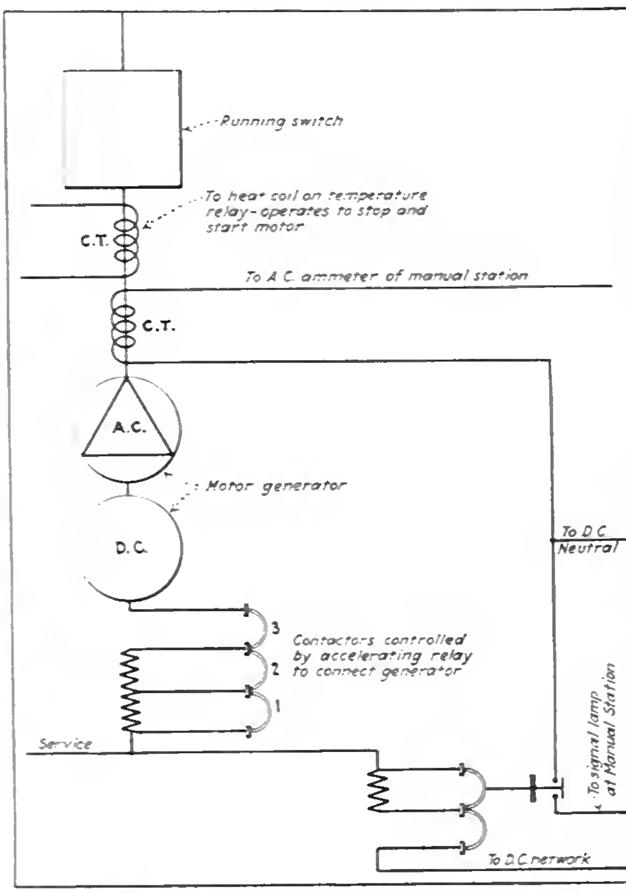
an oil container is ruptured the oil is quickly drained out of the building into a tank buried in the yard, thus removing fire hazards.

Space was provided for three 1,000-kva., four-wire, three-phase, 2,300/4,000-volt feeders with a single-phase regulator and single-pole independently controlled oil circuit breaker in each phase. Each circuit breaker is provided with an overload relay and a reclosing device, the latter set to reclose the breaker twice before locking out. The time interval between opening and closing is two and one-half seconds. The overload relays are set for 135 per cent load and a definite minimum time setting of 1 second at 1,000 per cent of load. This has been found completely successful thus far. Numerous cases of line trouble from severe storms have caused the reclosing device to operate several times without a single outage of more than two and one-half seconds, which affords evidence of reliability in service.

Only one ammeter is used for the load indication on these feeders. Transfer of the ammeter is made to any phase of either of the feeders by simple arrangement of three three-circuit ammeter switches, leaving room for an additional feeder to be connected through another ammeter switch.

Overload relays, reclosing devices and ammeter switches are mounted on small transite panels set in the framework supporting the busbars, disconnecting switches and oil circuit breakers, thus doing away with the usual switchboard panels, and a considerable saving of space is effected thereby.

In addition to the two 1,000-kva. regulated feeders there are seven 30-kw. constant-current transformers, including the necessary equipment for seven series street-lighting circuits. These transformers are connected to an auxiliary bus through oil switches and to the main bus through an oil switch controlled by a time switch. In this manner the turning on and off of the street-lighting circuits is taken care of automatically. One small marble panel is used for each series circuit on which are mounted an ammeter and an oil switch. These panels are arranged in pairs, allowing space



TYPICAL WIRING DIAGRAM OF DIRECT-CURRENT AUTOMATIC SUBSTATION USED BY THE ST. PAUL GAS LIGHT COMPANY

between pairs for passageways to the rear of the panels and to permit removal and replacement of the transformers.

Two alarm bells are placed in the station. One vibrates slowly and rings whenever a feeder switch is locked out automatically owing to a permanent short circuit on the feeder. The other bell, which vibrates rapidly and is muffled, rings only when the station is dead owing to failure of the 13,000-volt trunk lines which feed it. The use of alarm bells in an unattended station seems strange until it is explained that a device has been installed in connection with the telephone which enables the load dispatcher to listen in from any telephone in the city to ascertain the operating conditions of the station. If an outage is reported, the trouble dispatcher may listen in and know whether it is caused by an open breaker, dead station or line trouble. The control current for closing and opening switches is 24 volts direct current, supplied by four 6-volt, 80-amp.-hr. automobile-

starting batteries. These are tested daily and recharged once a month by means of a small portable arc rectifier located in the station.

The outdoor part of this station consists of four 600-kva., 13,200/2,300-volt step-down transformers, fed by two 13,000-volt trunk lines through two 25,000-volt outdoor-type oil circuit breakers and protected by two electrolytic lightning arresters. Normally, however, only one line is in use; the other is used only in emergencies and controlled at the steam station. The metering is done on the high-tension side and outdoor metering transformers are used. The meters and relays are installed in the building. All supporting framework is made of 1¼-in. iron pipe and standard reamed fittings. Copper tubing is used for both high-tension and low-tension bus, and the spare transformer is provided with leads so that it can be connected in a few minutes.

### Routine Inspection

This station is visited twice daily, except Sunday, when only one visit is made. The purpose of these visits is to test the series circuits, batteries and reclosing devices, charging the arresters, changing charts on the graphic instruments and reading the meters.

Another station, which contains both alternating-current and direct-current equipment, is being changed from manual to automatic operation and will embody nearly all the automatic features contained in the stations above described together with new features since developed. Automatic operation of stations generally shows very gratifying results both in economy and service, but each case must be decided individually as no standard procedure can be laid down which will be suitable in all or perhaps even the majority of cases. Manual operation of stations cannot equal automatic operation. It is impossible for any combination of operators so to co-ordinate their movements that the results equal in promptness and accuracy those of automatic operation.

For the successful operation of automatic stations rigid inspection must be the rule. This inspection must be systematic, periodical and thorough. Spasmodic and superficial inspection will lead to neglect and unsatisfactory operation and possibly to disastrous results.

# Power Progress in Sweden

**Large Increase in High-Tension Transmission Mileage —Interconnected System Is Now Favored by Co-operative Committee**

AT A RECENT meeting of the Swedish Engineering Association the activities during the last five-year period of the Royal Swedish Board of Waterfalls were outlined by W. Borgquist, chief director of the association's electrical department. The speaker pointed out that, while the increase in aggregate generating capacity of the Swedish state plants has been rather moderate, the total installed capacity growing from about 160,000 kva. to 250,000 kva., there has been a tremendous development of transmission and distribution facilities. During the coal crisis of the war an insistent cry for electric service was raised by communities, industrials and farmers everywhere, and the construction of distribution lines therefore was rushed at top speed all over the country. During the last five years the total length of state-operated high-tension lines then increased from 700 km. to 1,500 km., while the length of secondary distribution lines operated at 20,000 volts to 10,000 volts in the same period increased from 800 km. to about 3,700 km. The return of the central Swedish system reached a maximum of 8 per cent during 1917, but since then it has been slowly sinking, last year's books showing a margin of 5.3 per cent. At the close of 1921 the total investment amounted to about 130,000,000 crowns,* exclusive of stations now under construction.

An important phase in last year's development was the building of a 315-km., 132,000-volt tie line right across Sweden, from Trollhättan to Västeras. This line is the first in Europe to be operated at so high a voltage, and the towers are so constructed that after reinsulation the voltage may be raised to 220,000 volts if conditions warrant. Through this line the state plants in middle Sweden are connected into a great central block, with a generating capacity of about 200,000 kw. This has made possible the establishment during times of water shortage of a rational load-dispatching service, controlled from a central office in Stockholm. At times of surplus power from Trolhättan about 20,000 kw. has been transmitted over the line, which has allowed the steam reserve plant at Västeras to remain idle most of the time. An important link in the power-conserving scheme is the new hydro-electric station at Motala. Owing to its position between two lakes this plant offers excellent opportunities for establishing complete hydraulic regulation over a period of a week, and therefore it should be of great importance as a peak-load plant. The ultimate capacity of the station is 25,000 kw., only one-third being yet installed.

### Superpower System Planned

The Trollhättan tie line is intended to form the first link in a system of extra-high-tension trunk lines which may ultimately span not only Sweden, but Norway and Denmark as well, thus forming an inter-Scandinavian superpower system. It is only a question of time when another link in this system will be built north from Västeras to some large power sites in Norrland, which have been purchased by the Swedish government. Another extension is planned from Trollhättan to the south end of Sweden, to connect the state "central block" with the system of the South Sweden Power Company, Sweden's biggest power enterprise, with a generating capacity of 70,000 kw.

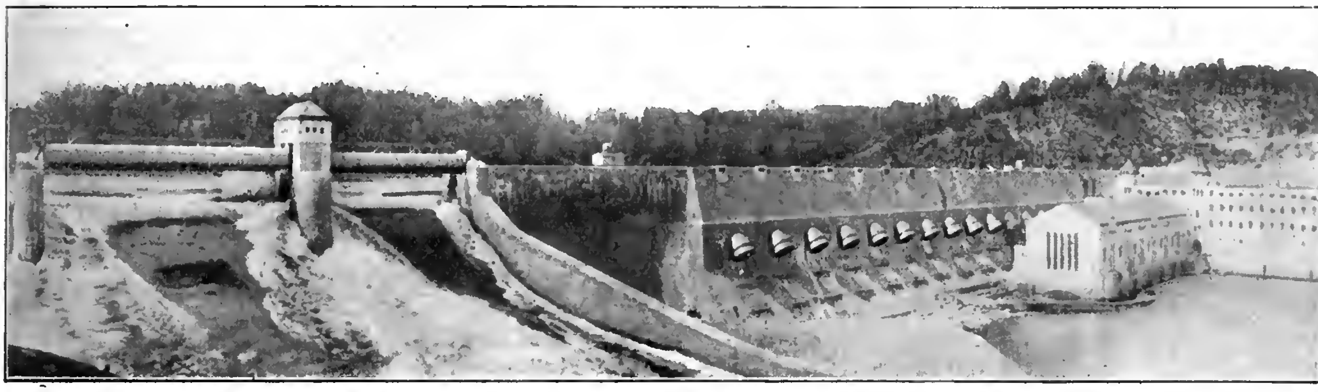
The bigger problem of the inter-Scandinavian system is being studied by a committee of two representatives from each of the three countries involved. The private power system in south Sweden is already connected to the Danish network by a cable in the Strait of Oresund, but plans are under consideration to lay down cables for higher tension and to connect these to a line over Trollhättan to the Norwegian power plants along the river Glommen. There is here not only a question of establishing seasonal power interchange between Sweden and Norway, but the trunk-line system actually would serve to transmit energy from the large water-power resources of Norway right through Sweden and over to a future Danish high-tension distributing system. Interest centers at present on the problem of stability of such a vast system, containing a great number of synchronized stations, widely spaced, where the voltage lag from the first generator to the last consumer will be considerably in excess of 90 deg.

*At the old rate of exchange a Swedish crown was equivalent to about 33 cents.

# Hydraulic Power Plant Practice in Northern Europe

## Skeptical Regarding Outdoor Installations—Connecting Generators and Transformers Directly—Higher Reactance and Regulators—Oil Circuit Breakers with Multi-Contacts and Explosion Chambers

By CLIFFORD N. ANDERSON
*Engineer, Dwight P. Robinson, Inc.*



VAMMA STATION, ON THE GLOMMEN RIVER, DEVELOPS 200,000 HP. IT HAS BEEN IN OPERATION SINCE 1915 AND FURNISHES POWER TO CHRISTIANIA

IN NORTHERN Europe one invariably finds that the native engineer gives a large amount of credit to the American engineers for being ultra-practical, but takes credit to himself for being theoretical and for ability to incorporate the artistic in the commonplace. Take, for example, the outdoor switching station. This seems to be confined chiefly to American engineering practice; the European is afraid of it. He is afraid we are leading him astray. He isn't accustomed to observing his transformers and circuit breakers standing in the rain or half covered with snow, and cannot be reconciled to the idea. "It may be all right over there," he will say, "but the climate is too wet over here."

Yet, the few examples the Europeans have are working wonderfully well. Conditions about as severe as any which could be imposed on an outdoor station are found at the station of Bjolvo, situated on the Hardanger fjord on the west coast of Norway. The precipitation here is unusually heavy, with rain nearly three hundred days out of the year, and in winter the station is at times almost half buried in snow. In the six years that this station has been in operation there has not been the least trouble. One of the engineers of the Allgemeine Elektricitäts Gesellschaft said that probably one reason why outdoor stations were not used in Europe was because a start had not been made on them during the war. As far as he could see, a transmission line was only the extension of the buses inside the station, and there ought to be no reason why outdoor stations would not work. In fact, he held, there were conditions under which they most certainly should be recommended.

The power houses as a rule are very attractive, and some of them might be mistaken for medieval castles or similar buildings. Inside walls are tinted with delicate colors, plaster frieze near the top, tiled baseboards and trimmings, clustered lights in the ceiling and ornamental wall luminaires adding to their attractiveness.

Of late years there has been a tendency in Germany to build the switching bay in one or two floors with the transformers separated from the circuit breaker and bus section. All the heavy machinery is thus on the ground floor, the oil breakers on both sides of the bus being operated from a common aisle and the condition of the knife switches being visible to the operator from the ground floor. A typical example is shown in the accompanying illustration which indicates the manner in which the high-tension lines are led outdoors. This method of protecting the entrance insulator from rain and weather is very popular and almost universally employed by German engineers.

The switching gallery in existing stations usually overlooks the generator room. The newer stations are, however, being built with the control room separated from the generator room, communication with it being made by means of visual signals. Generator and circuit-breaker control are operated from benchboards, while transmission-line control and instruments are mounted on vertical boards. The benchboards are constructed of sheet iron, pebbled and bronzed, and are really more attractive than slate or marble and easier to install.

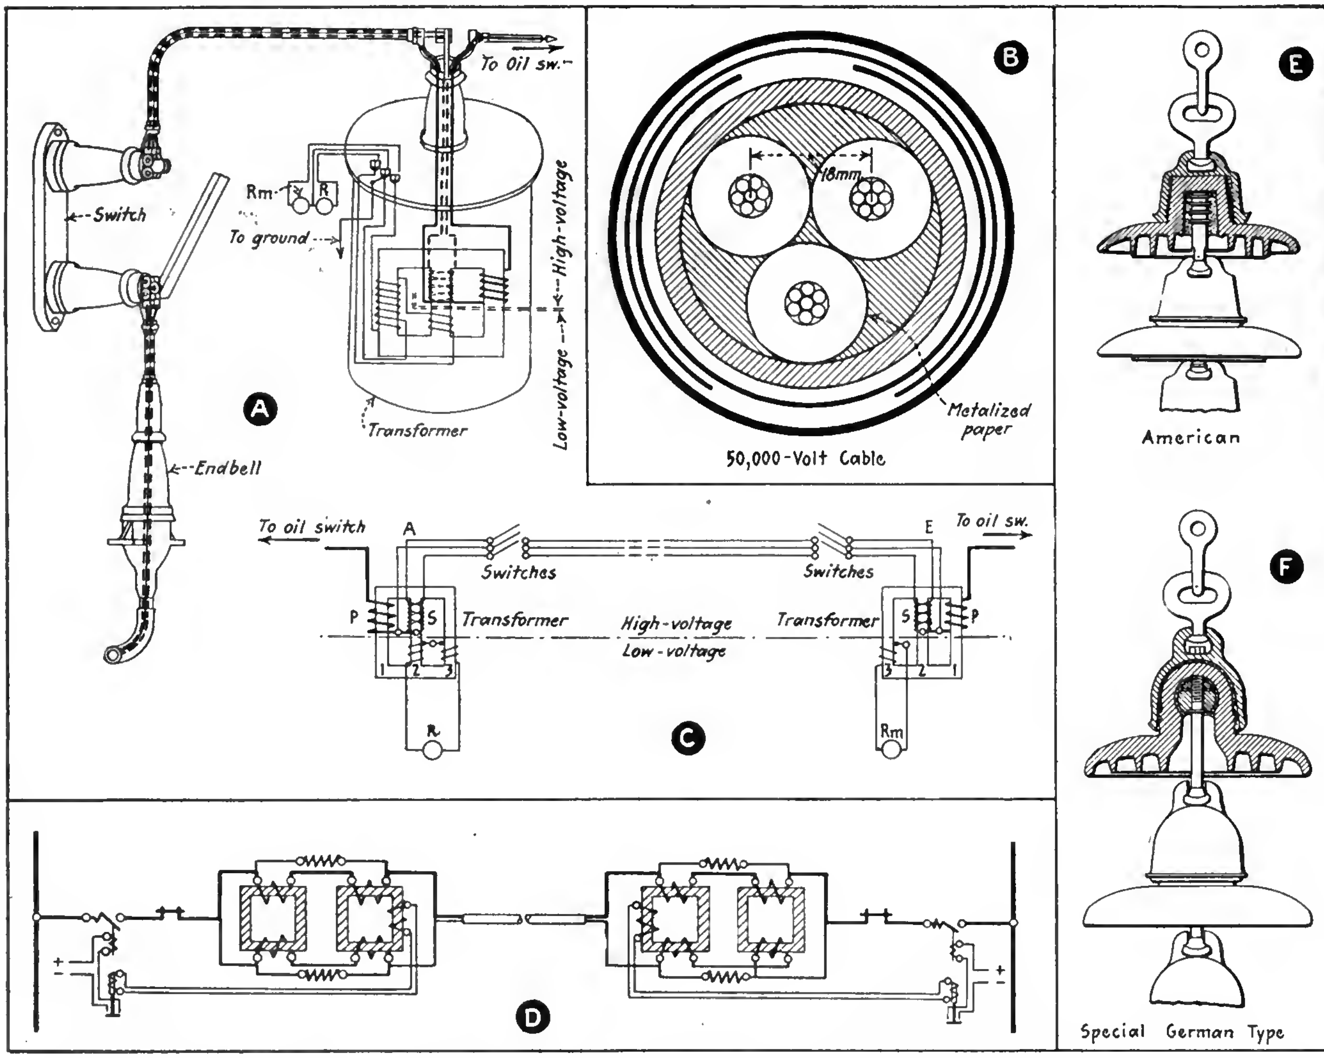
### Connecting Generators and Transformers Directly

Generators are generally wound for 6,000 volts. There are stations built for 10,000, 11,000 and even 15,000 volts, but the tendency of today is toward the lower voltage. The critical breakdown voltage with the machine insulation used abroad, due to brush discharges, is about 35,000 to 40,000 and cannot be raised even by increasing the insulation thickness two or three times. With a safety factor of one to four for 10,000

volts, it is one to seven for 6,000 volts. A higher generator voltage can therefore be secured only at the expense of the safety factor.

With the advent of the larger present-day units the tendency is to regard the generator and the transformer as a unit and to connect them directly together without circuit breakers. Notable German examples of this are the 50,000-kw. generators at the Goldenberg power station and the 25,000-kw. generators at Hirschfeld and Golpa. Formerly generators were built with reactances of only 3 per cent to 4 per cent, and the short-circuit currents might go up to five, ten or even 30 times normal current. Now generators are built with reactances of 7, 8, 9, and even up to 25 and 30 per cent, so that the short-circuit current is reduced to 60 to 80 per cent of normal current with no load excitation and to 1.6 to 1.8 times normal current with light load excitation. In spite of this the short-circuit currents are too large to admit of the low-tension bus system, and breakers as well are avoided. The increase in inherent reactance is at the expense of regulation, but this is taken care of by potential regulators. For more than 500 r.p.m. these generators are more expensive than the ones previously built, but those under 500 r.p.m. are less expensive.

With a ground on one phase of the high-tension transmission lines, the voltages of the other two phases to ground rise to line voltage. On account of the capacity series coupling between the transformer primary and the secondary windings, the potential of the unaffected phases to ground is distributed over the capacitative series-coupled transformer and the generator to earth in inverse proportion to the capacity of these parts. The capacity of the transformer in relation to the generator is often quite large, and so the generator's voltage to ground may rise to such a high value that it may puncture the generator windings. In order to prevent this, and to limit the current in case of a ground, an ohmic resistance from 0.5 ohm to 2 ohms per generator, computed from the charging current, is connected between the neutral of the generator and ground. The material for the resistance has been of thin resistance bands in a water bath utilizing the cooling water of the transformers. Relays are placed in this circuit which operate the generator oil circuit breakers as soon as the current exceeds 20 per cent normal. With modern power stations where the generator is directly connected with its transformer the relay acts upon the breakers on the high-tension side of the transformer and also simultaneously decreases the generator excitation.



A, C AND D—PFANNKUCH AND LYPRO SYSTEMS OF CABLE PROTECTION. B—CROSS-SECTION OF 50,000-VOLT, THREE-PHASE CABLE. E AND F—COMPARISON OF TYPICAL AMERICAN AND SPECIAL GERMAN PORCELAIN INSULATOR CONSTRUCTION

In general, all relay protection, consisting of

excess-current relays set for 20 per cent overload, reverse-power relays on the high-tension side of the transformer, differential relays utilizing the current transformer in the generator neutral, and excess-current relays on the high-tension side of the transformers, act together upon the high-tension breakers and upon the generator excitation. Demagnetization of the fields is accomplished by opening a short-circuiting switch, which introduces a high resistance in the excitation circuit, or by short-circuiting the field.

### Cables Used Between the Generators and Transformers

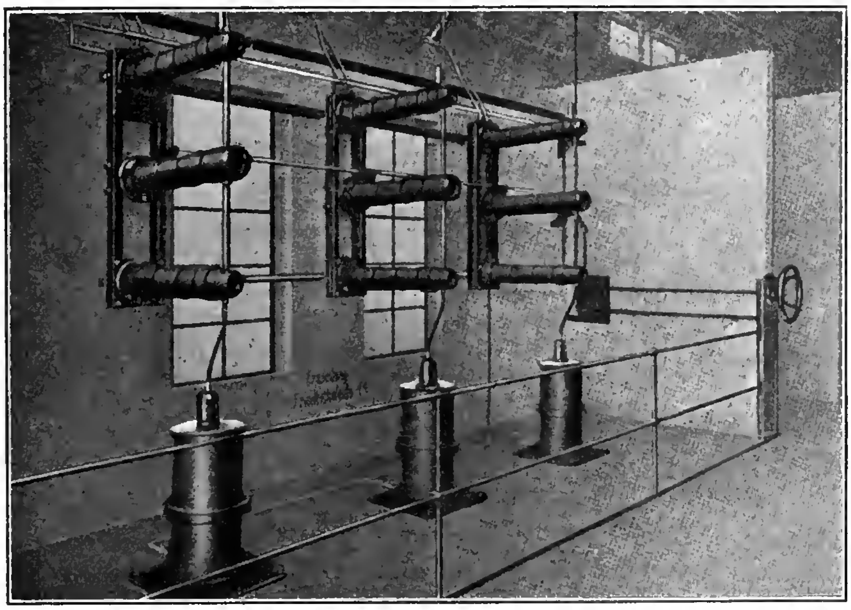
Whenever possible the connection between the generator and the transformer is made by cable instead of by busbars. If a failure occurs on the transmission line, waves with a steep wave front may be set up and capacitatively transmitted to the low-tension side of the transformer. If the connection is by means of buses, these waves may be transmitted directly to the generator and may cause burning out of coils. Cables have a large capacity which attenuates these waves. (In the Golpa station, in Germany, with four 23,000-kva. units installed, nine three-phase copper cables of 185 sq.mm. in cross-section are used.) Where it is not possible to use cable, capacity is sometimes connected in parallel with the busbars. As an added supplement to the condensers, 300 ft. or more of cable is used. As the capacity between primary and secondary windings of large transformers ranges from 0.2 mfd. to 0.5 mfd., the charging currents may be quite large and the precautions are well worth while.

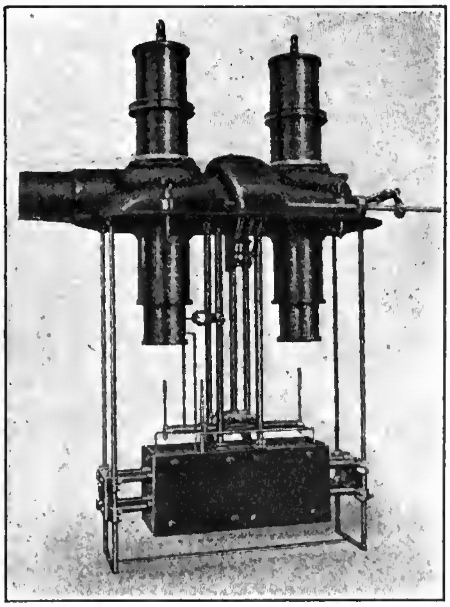
Three-phase transformers are used almost exclusively in Europe as contrasted with three single-phase transformers here. These are now built up to 60,000 kva. rating, and examples are installed at the Rheinisch Westfälian Elektricitätswerke. The transformers are connected delta on the low side and star on the high side.

In order to economize on oil in the large transformers, the container is built as small as possible and consequently the casing is very close to the windings. The windings are therefore in three layers, of which the inside and the outside layers are low-tension and the middle one high-tension. With this method the delta-star system of connection must be used, otherwise stray fields will set up eddy currents in the casing of the transformer.

At the present time transformers are being fitted with reactance coils in the line, but as the transformers are being built with larger and larger safety factors, they will probably be discontinued. For example, a 110-kv. transformer for a Bavarian power station was tested for half an hour at 220 kv. Two per cent of the entrance coils and 2 per cent next to the neutral should stand the operating voltage between two neighboring coils for two minutes. The rest of the coils should stand a potential of 60 kv. between two adjacent coils. Reactance coils for such transformers are considered superfluous.

Oil-circuit-breaker explosions are not feared so much now as formerly. Inflammable oil, even if desirable, cannot be used on account of its attack on the contacts making them unfit for use after several weeks. The English insulate the conductors and insist on a safety factor of seven. Siemens-Schuckert builds containers of extra-heavy boiler plate, while the Allgemeine Elektricitäts-Gesellschaft employs a quenching chamber. With 30 atmospheres pressure inside the quenching chamber there is a pressure of only 0.5 atmosphere on the container wall. For large currents, rapid breaking contacts of 0.01 second are used, and for 110 kv. or more four contacts are used. A 110-kv. breaker with ten contacts manufactured by Brown-Boveri for a power station in Bavaria was tested for 250 kv. and 260 amp., making the rupturing capacity 300,000 kva. Oil breakers for three-phase lines over 35,000 volts are built as three single-phase units. In Germany all large transformers are equipped with breakers employing "fore" contacts, which introduce a resistance before the circuit is actually made. It is noticed on long transmission lines where this type of breaker is not used that occasionally flashover of the entrance insulator at the distant station occurs. The resistance is calculated so





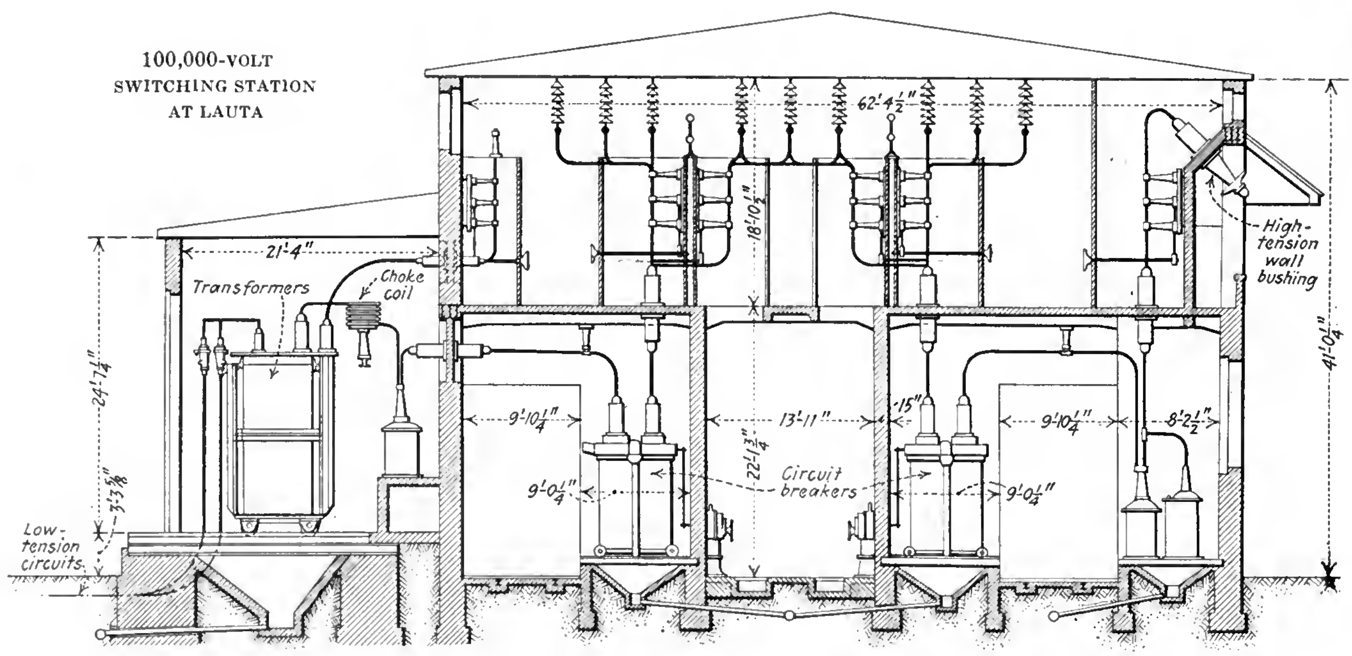
LEFT—100,000-VOLT DISCONNECTING SWITCHES WITH PAPER INSULATORS. RIGHT—100,000-VOLT CIRCUIT BREAKER WITH PAPER TERMINALS

that the charging current causes a 70 to 80 per cent loss in the uncoupled voltage.

Considerable use is made in Germany and to some extent in the Scandinavian countries of apparatus for automatically connecting two generators in parallel. The type most used is one manufactured by Voight & Haefner which employs a voltage relay, a phase relay and a time relay. The operator adjusts the voltage and the frequency of the two machines as near to the same values as possible, and when they are in phase for a sufficient length of time, as determined by the time relay, the generator circuit breaker is closed automatically. The setting of the time relay may be varied, but is usually around five to six seconds.

Of late years large-capacity current transformers (200 amp. or more) have been of the air type as these have been found to stand up better under strong dynamic forces. They are well suited for instruments and relays but not accurate enough for meters. Instrument transformers were formerly fused, but it was found that the fuses burned out frequently without cause, so that now only knife switches are used.

100,000-VOLT SWITCHING STATION AT LAUTA



### Paper Insulators and Porcelain Units Operating in Compression

Considerable interest has been manifested in large insulators of other material than porcelain because it is difficult to get porcelain insulators of the size required for voltages above 110,000. Excellent results have been obtained with paper insulators. The advantages claimed are that they are virtually unbreakable, their length can be adjusted by placing them in a lathe and in case of a flashover the outside layers can be removed, the surface relacquered and the insulator again put in operation. They cannot, however, be used out of doors, and in regions where the humidity is high they cannot even be employed indoors, as the paper is hygroscopic and breakdowns result. In one hydroelectric station in Norway which sought to use them the insulators became badly charred, due no doubt to moisture from the ouside. They are used extensively, however, for bus supports and for large disconnecting switches. They present an attractive appearance. A visit to the large transformer factory of the A.E.G. at Oberschöneweide, near Berlin, disclosed the fact that all its high-voltage transformers have paper-insulator terminals. These are provided with brush-discharge rings which increase the breakdown voltage 50 to 60 per cent.

### Suspension Insulators Assembled in Parts After Separate Firing

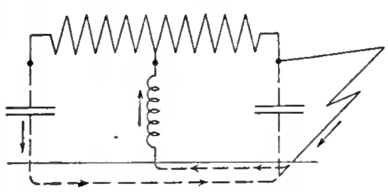
An unusual and ingenious development in suspension insulators, which is pointed to with a great deal of interest, is shown in an accompanying illustration. Since porcelain shrinks a little on firing, the small doughnut-shaped ring is first fired and shrunk. It is then just small enough to enter the spherical cavity in the top of the insulator, after which the cap and ring are fired together. The ring does not shrink any more, but the outside cap will shrink sufficiently to keep the ring in place inside the cavity. A nut of suitable shape is then placed on the bottom of the ring, and the ring and nut are turned so that the latter is at the top of the cavity, when the bolt is inserted. Paper is used as a buffer, furnishing an elastic medium between the bolt and the porcelain ring, and cement is placed between the ring and the cap to distribute the pressure.

The claims for this insulator are long life because of prevention of breakages due to different expansion coefficients of porcelain, cement and iron; a large unit capacity, resulting in better voltage distribution on a string of insulators, and a higher breakdown voltage due to better field distribution.

Cables are used more in Europe than in the United States. The limits usually placed on cables are 80,000 volts for single-conductor and 40,000 volts for multiconductor cable. Cables rated at 30,000 volts, three-phase, are quite common, and 50,000-volt, three-phase cables have been manufactured. At high voltages, however, the thickness of the insulation required makes the cable hard to handle and expensive. Besides, dielectric losses are great. Measurements on a 165-mile cable system of three-phase conductors, each of 250,000 circ.mils, showed a dielectric loss of 113 kw. at 30,000 volts.

Great claims are made for cable protective systems, of which the A.E.G. and Siemens-Schuckert both have their systems. These will be briefly described.

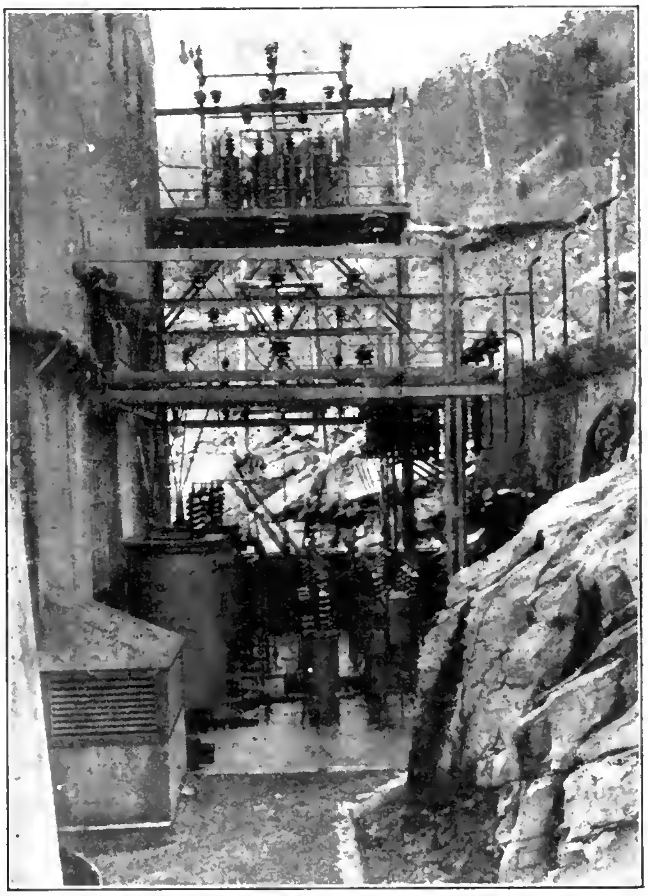
In the Pfannkuch system of the A.E.G. the individual conductors in the outer layer of the cable are purposely rather poorly insulated from each other and from the central core by means of paper. The odd and even conductors are connected together respectively so that there are really three paths through the cable. By means of a special differential transformer at each end the potential of the one path is raised slightly above that of the core and the other is diminished to a like degree. This potential is about 20 volts to 50 volts. In case of mechanical injury or injuries affecting the electrical qualities of the cable the slight insulation between the neighboring conductors is broken down, more or less, and the potentials of the different paths are varied. Through the differential transformer and connected relay the circuit breaker acts instantly. No pilot wire is needed; the action is independent of the direction of the current and external currents, and the circuit is broken while the damage to the cable is being done and really before the short circuit or ground is fully a reality. The only disadvantage claimed by the manufacturers is that a specially constructed cable is necessary and therefore cannot be applied to systems where the cable is already in.



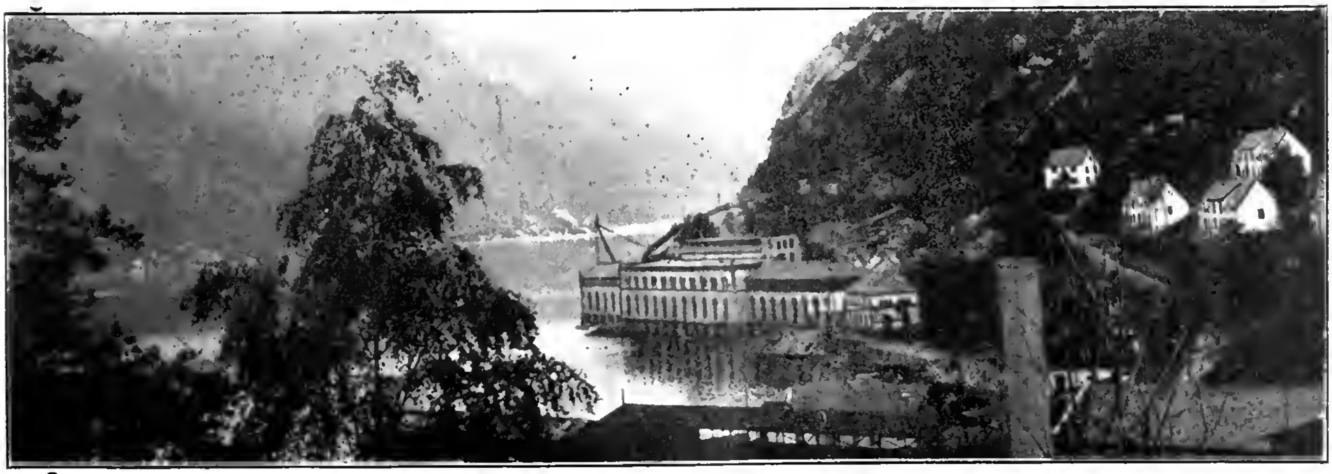
THE PETERSEN COIL INTERPOSES A LOCAL RESONATE CIRCUIT IN THE GROUND CONNECTION

The Lypro system of Siemens-Schuckert is similar to the one just described with the slight exception that there are only two paths through the cable instead of three and that the voltage difference is 120 volts.

A discussion of protection against high voltages would require an article in itself, and hence the matter can only be briefly summarized here. For a long time the European engineer has felt at a loss in regard to high-voltage protection. He has tried countless types of apparatus—horn gaps and multigaps with all their modifications, condensers, water-drip apparatus and other things, but they have all, with the possible exception of horn gaps and series resistance, fallen into disuse and installations have been disconnected. Electrolytic arresters are only used in a few American installations and oxide-film arresters are practically unheard of. Within the past few years, however, a device has been found which Europeans believe is a cure for many of their troubles—the Petersen coil and its modifications. It has been welcomed enthusiastically and is being installed in all the new stations and many of the old ones. As an instance of its popularity it may be recounted that Professor Petersen, while visiting a large hydro-electric power station in Norway where a large number of different types of protection apparatus were installed, including electrolytic equipment, told them to throw it all in the scrap heap and install a Petersen coil—and they did it! It is to be hoped, how-



AN OUTDOOR INSTALLATION AT THE BJOLVO STATION OPERATES SATISFACTORILY, ALTHOUGH OFTEN PARTIALLY COVERED WITH SNOW



A 140,000-HP. DEVELOPMENT AT SORFJORDEN HAS FIFTEEN PELTON UNITS

ever, that real data furnishes the evidence in favor of the coil, but such data was not found.

Dangerous voltages may arise from an innumerable number of causes, but the majority fall into three classes—switching phenomena, intermittent grounds and atmospheric disturbances.

It is recommended that the reactance coils composing the Petersen coils should be installed whenever the current due to ground on the high-tension side is in the neighborhood of 5 amp. or more. In computing this current it is considered that 100 km. of transmission line operated at 10,000 volts and 50 cycles has a current of about 2.5 amp. without ground wire and one of 3 amp. with ground wire. For cable systems the current ranges from 40 amp. to 100 amp., depending on cross-section and voltage. The coil is said to be most effective when the frequency of the oscillatory circuit formed by the capacity to earth of the whole system and the reactance of the coil is equal to the normal transmission frequency.

As the A.E.G. manufactures the Petersen coil, other manufacturing companies have their special coil. The Siemens-Schuckert is of the transformer type with the neutral of the star-connected primary grounded and a variable reactance introduced in the delta-connected secondary. It was admitted by a Siemens-Schuckert engineer that there was no question that the Petersen coil was an excellent device for handling voltages up to 50,000, but he was afraid of resonance disturbances above that. The coil manufactured by Brown-Boveri is practically the same as the Petersen coil with the exception that it is calculated for 25 per cent dissonance.

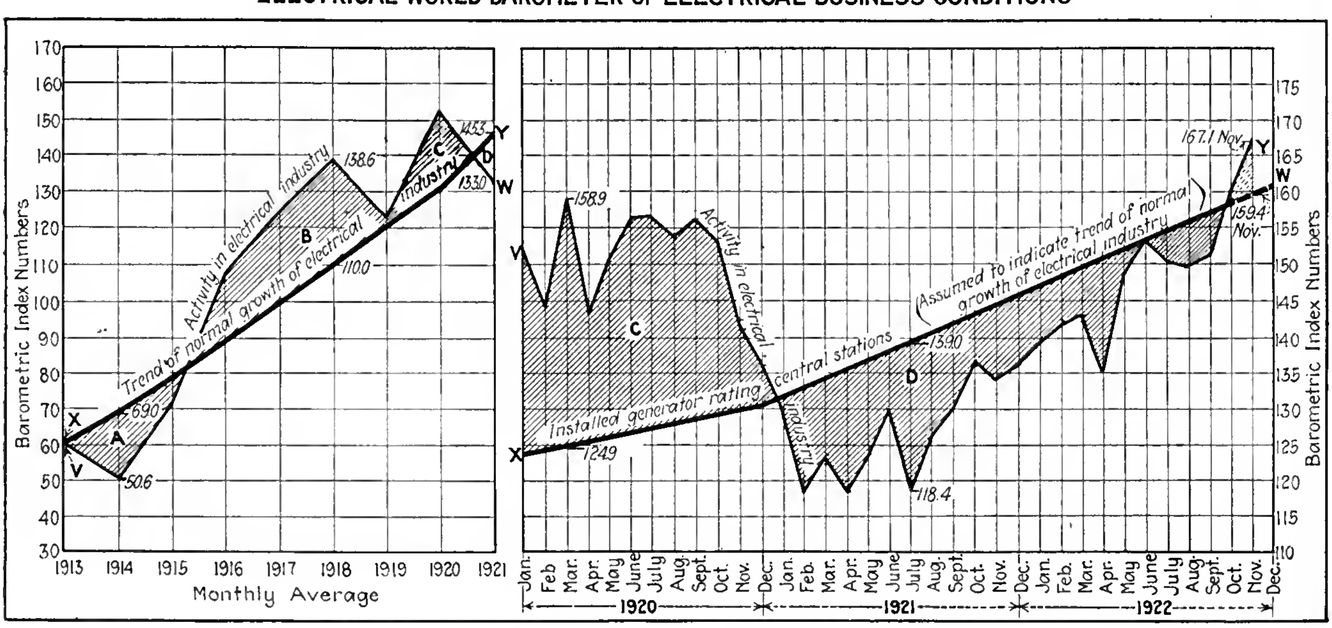
## Further Progress in Production

INDEX figures upon which the "ELECTRICAL WORLD Barometer of Business Conditions in the Electrical Industry" is based indicate that November activity within the industry was materially in excess of that experienced during October. The largest consumption of cotton since 1917 and further high records since 1920 in the output of pig iron, steel ingots, coke, zinc, locomotives and leather emphasized the sustained and basic character of industrial production during November. The usual seasonal decline of building construction in that month failed to materialize.

The "ELECTRICAL WORLD Barometer" indicates that in the month of November business conditions in the electrical industry, taken as a whole, continued to show the monthly improvement which started in September. The basic data indicate an increase of 6.7 points on the Barometer scale as compared with October. The electrical industry as a whole was operating at 7.7 points or per cent above what would have been the point of seasonal demand if growth in the industry had been normal. In October it was operating at 2.4 points or per cent above the point of normal demand.

The returns for November continued to point clearly to the probability that a long season of unusual activity is just opening up for the electrical industry. In many sections collections are reported still generally slow, and other retarding influences from the recent depression are holding back much of the possible progress. But the business is undoubtedly to be had, and its development awaits only the toning down of these retarding influences.

ELECTRICAL WORLD BAROMETER OF ELECTRICAL BUSINESS CONDITIONS



### THE BASIS FOR THE "ELECTRICAL WORLD BAROMETER"

By the "electrical industry" is meant the electric light and power branch, the electrical manufacturing branch and the electrical merchandising branch, taken as a group. The chart is not believed to be barometric for these branches as units.

By reason of their large influence on activity within the electrical industry the following nine primary industries have been adopted as a basis for the "activity curve" of the electrical industry: Active cotton spindles, pig-iron production, bituminous-coal production, copper production, news-print-paper production, passenger automobile production, truck automobile production, yellow-pine lumber production and Portland cement production.

Activity in each of these basic industries referred to its own normal growth curve is found, and then this index of activity is applied to the electrical industry in proportion to the influence of the particular basic industry on the electrical industry. The estimated horsepower of the motors installed in the plants of the various basic industries has been taken as a basis for weighting the industries in their influence on the electrical industry. In weighting the lumber and Portland cement industries the large domestic load of the electric light and power branch and the sale of domestic apparatus have been taken into consideration. Applying these weights to the activity in each basic industry, adding the totals and dividing by the total of the weights gives the activity in the electrical industry referred to as the "trend of normal growth of the electrical industry."

The line showing the "trend of normal growth of the electrical industry" is based upon the rating of the active installed generators of the central stations of the country. Further details concerning the development of the "Barometer" will be gladly furnished upon request.

# Power Factor as It Affects the Consumer

## Causes of Poor Power Factor—Remedial Measures, Including Rearrangement of Motors and Use of Synchronous Apparatus, Phase Advancers and Condensers—Economic Factors Which Should Be Considered

By L. J. MURPHY

*General Engineer Westinghouse Electric & Manufacturing Company*

INDUCTION motors, particularly when underloaded, cause a poor power factor on a system, and when a large part of the load of a central station consists of induction motors naturally the power factor will not be very high. For a long time a poor power factor was considered a necessary evil and little or nothing was done toward correcting it.

During the recent war, when production was at its highest, the central stations began to realize that their generators were being worked above their rated capacity while their prime movers were considerably underloaded, naturally resulting in poor economy of operation. As their load increased they also began to realize that it would be necessary to take action to overcome this evil, particularly since it meant the installation of additional costly electrical equipment on their part, which would be unnecessary if their customers had maintained a reasonable power factor. To the central stations poor power factor meant increased generating capacity, increased excitation losses, larger line losses and a more expensive distribution system than was really necessary. Obviously, a poor power factor was something about which there was cause for worry and concerning which there was justification in the contention that the consumer should bear some portion of the expense.

To accomplish this end the central stations, as a rule, imposed a penalty upon plants for their poor power factor. This penalty in the majority of cases was based upon the maximum demand and a power factor of 80 per cent. For all power factors below 80 per cent the demand charge was increased in inverse proportion to the power factor; that is, if the power factor were 60 per cent and the maximum demand was 1,000 kw., then the maximum demand upon which the demand charge would be based would be $80 \div 60 \times 1{,}000$, or 1,333 kw. In some cases a bonus was allowed the customer for power factors above 80 per cent, and the same general scheme of calculating the demand was used in this case.

With this system of charging the burden of the expense caused by a poor power factor rightfully fell upon the shoulders of the consumer whose power factor was low. In very few cases the energy rates were decreased if the consumer's power factor was good, but in most cases only the demand charge was affected.

The first question naturally asked by the consumer of power is: What are the causes of a poor power factor and how can it be corrected? The chief causes of poor power factor where induction motors are used are, first, overmotoring the machine; second, the use of low-speed induction motors, and, third, the use of individual motors on machines where the motors run continuously but the load on the machine is of an intermittent nature, as, for instance, punch presses or shears.

Overmotoring is by far the worst offender. It is a well-known fact that induction motors when operating at light loads, as is the case with an overmotored machine, have poor power factors, and in order that the plant may have the highest power factor obtainable, it is essential that the motors be operated as near to full load as possible. When a new plant is installed it is quite often the case that very little is known regarding the horsepower requirements of the various machines, and it is left to the manufacturer of the machine or to the power company's solicitor to determine the proper size and type of induction motor to be used. The machine manufacturer knows the horsepower requirements of his product, but feels that in order to play safe and to take care of any emergencies he should specify a motor with a horsepower rating perhaps 10 or 20 per cent in excess of that actually required. His estimated figure usually is high enough to take care of the most unfavorable condition to be found, and therefore will easily suffice for plants where the operation is not so severe. The power company's solicitor and the motor salesman, in order to insure that the motor will not be overloaded, usually figure on a reasonable factor of safety, and if the power requirements of the machine are less than expected, owing to conditions in the process of manufacture, then the natural result is overmotoring. Where a motor is to replace one already installed overmotoring seldom occurs as the actual power requirements of the machine can be measured. Both the power companies and the electrical manufacturers have done good work in aiding the power consumer in the proper selection of motors.

### Low Speed Induction Motors Draw Large Magnetizing Current

An induction motor having a large number of poles—i.e., a low-speed motor—requires considerably more magnetizing current than an induction motor having a small number of poles. The magnetizing current determines to a large extent the power factor of the motor, and if it can be kept low, the power factor will naturally be increased. Obviously, then, it should be the desire of the power consumer to utilize high-speed motors in all cases where possible in order to keep this magnetizing current down to a minimum.

There has been much discussion as to whether individual motor drive or group drive is the better method for operating a number of similar machines. Both methods have their advantages, but as far as power factor is concerned the group drive generally gives the better results, inasmuch as a higher load factor is maintained on the motor. Individual drive, however, reduces the losses caused by belting and line shafting, giving a lower energy consumption.

Cases can be cited where by rearranging the motors in the plant the power factor has been increased from

5 to 10 per cent. This procedure, however, usually entails the elimination of several larger-size motors and the purchase of a few smaller motors to take their places. Before installing any power-factor-correcting features this procedure for bettering power-factor conditions should be thoroughly investigated.

Aside from rearranging the motors in a plant, power-factor correction can be obtained by the use of synchronous motors, phase advancers, static condensers and synchronous condensers. Some of the relative merits of each will be given below.

The design and construction of the synchronous motor is such that it is possible for it to be built for very low speeds with good performance at a lower cost than an induction motor of the same rating and speed. It is applicable as a directly connected machine to air compressors, ammonia compressors, fans and centrifugal pumps, and can be used with clutches on any other form of drive on which induction motors are now supplied. The synchronous motor can be designed to operate at a leading power factor, thereby supplying a considerable corrective effect to the rest of the plant, but in cases where the synchronous motor load is almost the entire load a motor designed for 100 per cent power factor only is required.

While a synchronous motor has larger losses than some other forms of power-factor-correcting devices, yet the greater portion of its losses can be charged to the losses which would be found in the induction motor ordinarily used on the application. This feature is illustrated in the accompanying table where the losses which could really be attributed to power-factor correction amounted to only 1 kw. In some cases, particularly with very low-speed machines, it might work out that the losses in the synchronous motor will be less than in the induction motor. If a synchronous motor is replacing an induction motor the investment charges against power-factor correction can be reduced by the value of the induction motor which the synchronous machine is replacing. Moreover, no extra operating charges are incurred, since the same man who previously operated the induction motor can now take care of the synchronous motor.

A phase advancer can be applied only to wound-rotor motors of suitable characteristics. It is connected in the secondary circuit of the wound-rotor motor and operates to supply the magnetizing current for that particular motor, thereby making the motor practically a 100 per cent power-factor machine over the usual operating range of load. In so doing it increases the current in the rotor of the motor, and if the rotor has not been liberally designed, the phase advancer cannot be applied. An examination of the accompanying curve shows the action of a phase advancer on the performance of a 150-hp. slip-ring-type motor.

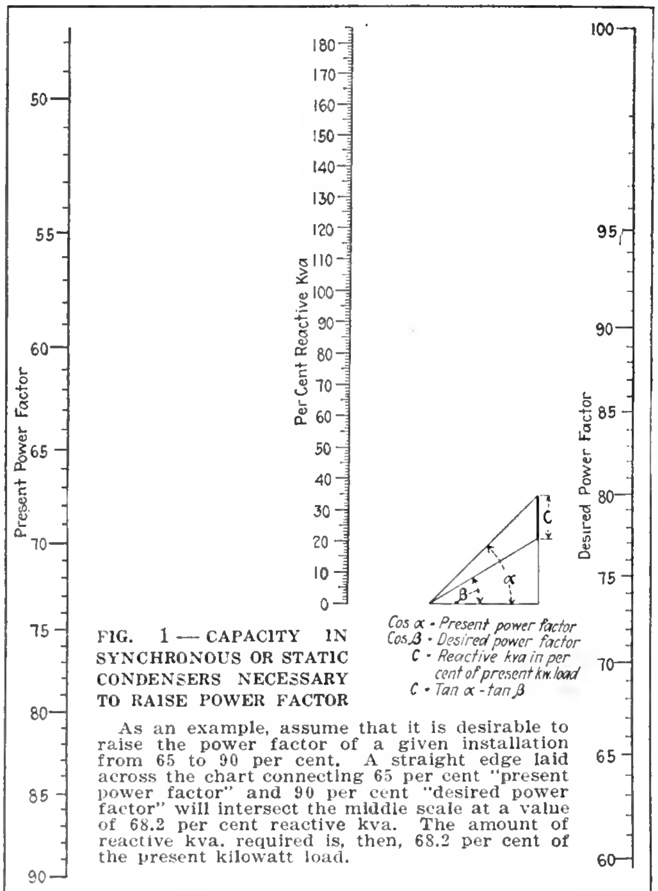


FIG. 1 — CAPACITY IN SYNCHRONOUS OR STATIC CONDENSERS NECESSARY TO RAISE POWER FACTOR

As an example, assume that it is desirable to raise the power factor of a given installation from 65 to 90 per cent. A straight edge laid across the chart connecting 65 per cent "present power factor" and 90 per cent "desired power factor" will intersect the middle scale at a value of 68.2 per cent reactive kva. The amount of reactive kva. required is, then, 68.2 per cent of the present kilowatt load.

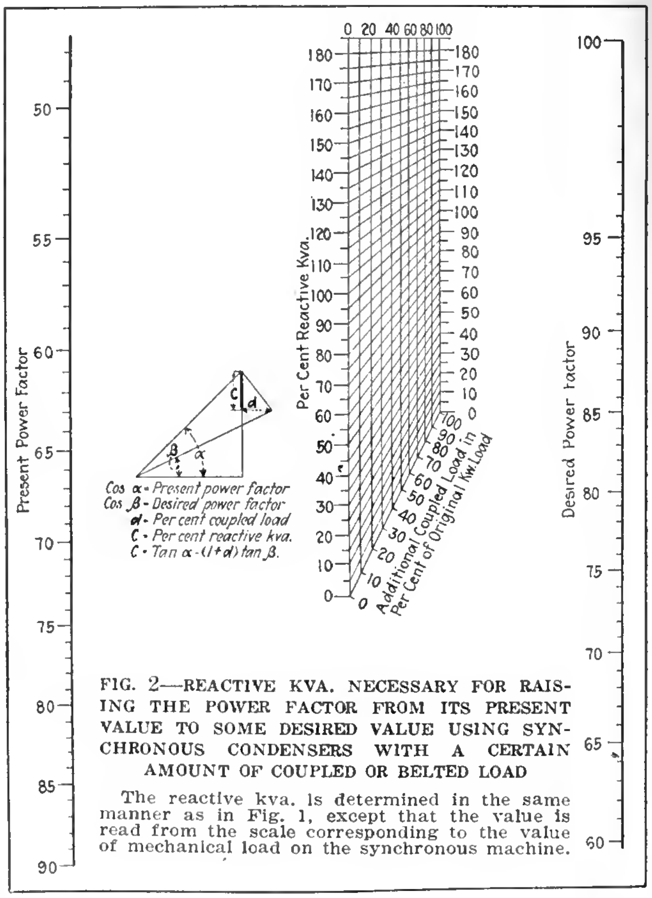

FIG. 2—REACTIVE KVA. NECESSARY FOR RAISING THE POWER FACTOR FROM ITS PRESENT VALUE TO SOME DESIRED VALUE USING SYNCHRONOUS CONDENSERS WITH A CERTAIN AMOUNT OF COUPLED OR BELTED LOAD

The reactive kva. is determined in the same manner as in Fig. 1, except that the value is read from the scale corresponding to the value of mechanical load on the synchronous machine.

During the last few years a number of electrical manufacturers have made considerable progress in developing a static condenser for power-factor correction. This type of corrective device requires no special foundation and little or no attendance, and where the service voltage is such that no transformer is required to furnish the proper voltage to the condenser the losses in it are negligible, being less than one-half of 1 per cent. It cannot, however, be readily adjusted to meet various conditions of loading in the plant, since the condenser effect is constant.

Its initial cost is somewhat higher than other forms of power-factor-correcting devices. The losses in static

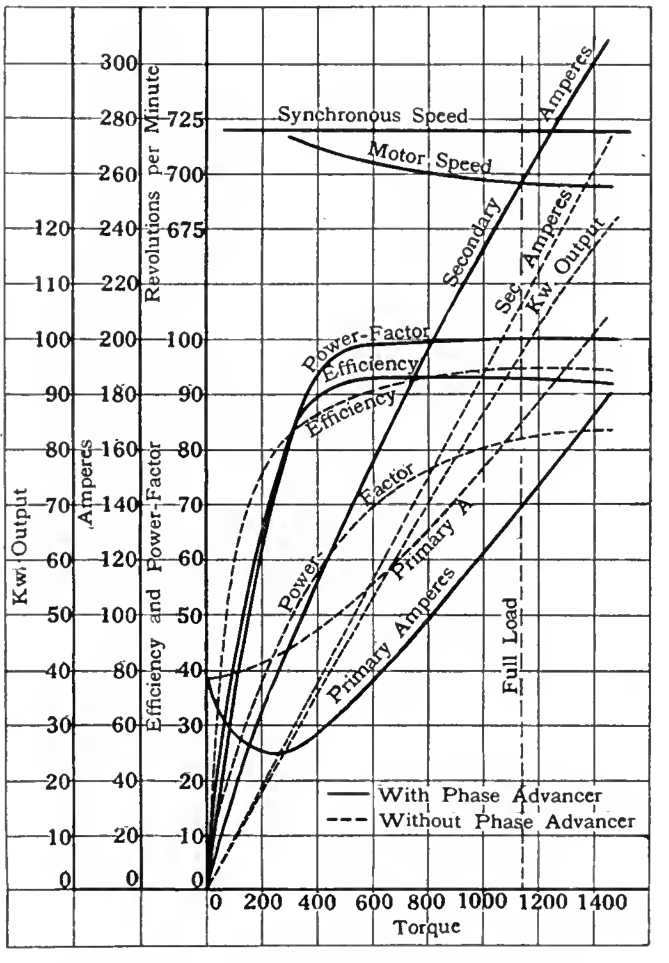
condenser equipments complete with transformers where required vary from $2\frac{1}{2}$ to 3 per cent. Owing to the fact that static condensers consist of a large number of small units, the price is naturally a direct function of the kva. required, and for this reason a static condenser does not compare favorably with other forms of power-factor correction where large corrective effects are involved.

The synchronous condenser is practically the same in construction as the synchronous motor, except that its mechanical parts are not designed to transmit any mechanical load. Its losses vary from about 11 per cent for the small commercial size, namely, 100 kva., down to 4 per cent for the larger sizes, namely, 1,500 kva. The price per kva. is not constant as is the case with static condensers, but decreases with the size, so that in the larger sizes the synchronous condenser is really the more desirable.

### ALL ANGLES SHOULD BE INVESTIGATED

The power consumer, in determining whether power-factor-corrective devices should be installed, should investigate the situation from all angles, particularly in regard to the aspect of economy. If it happens that he is being penalized several hundred dollars a month on account of his poor power factor, he is invariably under the impression that if he corrects his power factor he can save the greater portion of this penalty. Such, however, is not always the case, for the power-factor-correcting devices require a certain amount of power and the cost of this power is liable to be as great as or even much greater than the penalty. The cost of this additional power is not readily discernible in the power bill, and the consumer is under the impression that the amount saved on his maximum-demand charge is clear profit. However, the power companies have usually investigated this feature and offer a premium for good power factor which is sufficient to make the installation profitable to all concerned. Investigation of the power rates and the cost of power-factor correction by the consumer may disclose the fact that while a saving could be accomplished by correcting this power factor to unity, yet a still greater saving could be obtained by correcting only up to 90 per cent.

In comparing the economy of the different forms of power-factor correction, suppose, as an example, that a plant is taken which has an average load of 300 kw. at 70 per cent power factor and it is desired to increase the power factor to 85 per cent. To bring about this increase will require 120 reactive kva. Suppose also that in the above plant there is operating a 200-hp. low-speed slip-ring-type motor driving an ammonia compressor which operating at three-quarters load has a power factor of 70 per cent. With these conditions any of the various means for correcting power factor could be employed, and it remains to determine which one will work out to the maximum benefit of the purchaser. Providing the characteristics of the slip-ring motor are satisfactory a phase advancer can be applied. A synchronous motor designed for 100 per cent power factor operation, if used to replace the induction motor, will eliminate the 120 reactive kva drawn by the induction motor, and bring the power factor of the plant up to the desired figure. The other corrective devices can be used in any plant.



PERFORMANCE CURVES OF MACHINE WITH AND WITHOUT USE OF PHASE ADVANCER

An examination of the accompanying table shows that under the conditions assumed the phase advancer is the most desirable proposition, with the static condenser without transformer showing up almost as well. However, it quite often happens that the slip-ring motor is not adaptable to the application of a phase advancer and the voltage of the plant is such that a static condenser cannot be applied without the use of transformers. If such were the case, the synchronous motor replacing the slip-ring motor would undoubtedly be the best proposition to consider. Obviously, then, a power-factor-correcting device which would be satisfactory in one plant would not work out advantageously in another plant. The impression might be obtained from the table that a synchronous condenser could never be applied as a means of correcting power factor, but if a plant which requires a rather large cor-

PRINCIPAL ITEMS OF EXPENSE IF A STATIC CONDENSER, PHASE ADVANCER, SYNCHRONOUS MOTOR OR SYNCHRONOUS CONDENSER IS EMPLOYED

| Item | Static Condenser — With Trans. | Static Condenser — Without Trans. | Phase Advancer | Synch. Motor | Synch. Condenser |
|---|---|---|---|---|---|
| Initial cost | $3,600 | $2,600 | $800 | $3,500 | $2,600 |
| Cost of installation | 200 | 200 | 200 | 800 | 800 |
| Value of equipment replaced | ...... | ...... | ...... | 800 | ...... |
| Investment chargeable to power-factor correction | 3,800 | 2,800 | 1,000 | 3,500 | 3,400 |
| Losses in kw | 3.6 | .6 | 2.0 | 12.0 | 11.0 |
| Losses in equipment replaced | ...... | ...... | ...... | 11 | ...... |
| Losses chargeable to power factor correction | 3.6 | .6 | 2.0 | 1.0 | 11.0 |
| Cost of power per year (7,200 hr.) at $1\frac{1}{2}$ c./kw.-hr | 388 | 65 | 216 | 108 | 1,188 |
| Interest and depreciation 12 per cent | 456 | 336 | 120 | 420 | 408 |
| Attendance and upkeep chargeable to power-factor correction | ...... | ...... | 20 | ...... | 150 |
| Total cost per year | $844 | $401 | $356 | $528 | $1,746 |

rective effect, say 1,000 kva., is taken as an example and all the machines are small so that synchronous motors could not be used economically, then the synchronous condenser would compare favorably with the static.

The three main points then to be considered in selecting the proper power-factor-correcting device are as follows: First, the power losses in the corrective device; second, the interest and depreciation of the investment; third, increased operating expense.

In order to assist the consumer of power who is not thoroughly acquainted with vector diagrams in determining the proper size of corrective apparatus, two charts are presented.

The power consumer will quite often find that where previous to correcting his power factor he was unable to install any additional load on account of the fact that his power transformers were overloaded he can now make a considerable increase in his load without exceeding the carrying capacity of his transformer.

The charts (Figs. 1 and 2) were prepared by W. E. Douglass of the Westinghouse Electric & Manufacturing Company.

# Keep Public Contacts from Sparking—II

## Further Suggestions for Avoiding Possible Points of Friction in the Daily Contact of the Employees of the Utility with the Community

By E. L. MILLIKEN
*Stone & Webster Management Division*
*Assistant Manager Blackstone Valley Gas & Electric Company*
*Woonsocket, R. I.*

IN A recent article in the ELECTRICAL WORLD on improving public relations H. A. Lemmon said:

"The secret of the whole thing, if it be a secret, is to be found in taking care of the little things, the minor points of contact with people. Very small keys will open very large doors both in an organization and in a community."

It is equally true that small keys will lock shut large doors. Through some doors can come consumer faith and trust. We should have on our rings the keys to open these. From other doors, if they are allowed to remain open, may issue influences that breed distrust and antagonism. We should have and know the keys to these doors in order that we may close them and keep them closed securely. The locking or the unlocking of these doors lies within the power of the executive, through the setting, in little ways like those suggested below, of thoughtful policies that please the public.

*Operation of Company Trucks and Automobiles.*—It may seem far-fetched to connect the operation of cars and trucks with public relations. The fact remains that there is an opportunity, through proper education of those driving such company vehicles, to lock one door of complaint and criticism.

If you have ever driven your own car behind a large oil company's tank truck, which had the owner's name emblazoned on it in large letters, and the truck hogged the road and forced you to the ditch or prevented your passing it, you must admit that you did not feel particularly like patronizing one of that company's filling stations when you ran out of gas on the road. Neither is your wife partial to a grocer whose truck, driven without regard to pedestrians, splashes her clothes at some street crossing. Again, you cannot be too favorably impressed with the management of a company whose trucks, recklessly driven by your house, endanger the lives of your children. Suffice it to say that cars and trucks of central stations should be driven with due regard to traffic laws and the rights of pedestrians.

*Moving Poles.*—Some city franchises practically enable the central-station company always to charge for moving poles if it sees fit to do so. To exercise this right is probably unwise. It emphasizes first the existence of poles on the streets, which may cause an agitation for underground service. Secondly, it places the company in a position of insisting on its rights in matters of small importance. Rights are nice things to possess, but it is not always wise to enforce them.

*Extension of Service.*—A liberal and equitable policy in extending service, particularly within and adjacent to city limits, makes friends for a central-station company. Frequently political considerations require unusual expenditures of this nature. If possible, it is better to meet them gracefully and quickly, because usually they must be made eventually.

Where a particular extension is to be refused, a close study should be made before it is refused, for sometimes dollars seemingly unwisely spent may be returned tenfold. People today have so many affiliations socially and in a business way that the pigeons may come home to roost any time. The management should keep a close check on extensions from the psychological side as well as the economic side.

This may seem too liberal a policy to pursue and is not to be taken as always applying to what are known as rural extensions. When, as stated, it applies to the policy prevailing in and around a city or town, there is not much to be lost, because cities and towns are growing so rapidly that what today may be an unwise investment may a week or a month or a year from now prove decidedly profitable.

*Cut-outs for Non-Payment.*—The uncollectible accounts of lighting companies have usually been held at a low figure, because in each case there has always been hanging over the customer, like the sword of Damocles, the possibility of being cut out for nonpayment. It has been perfectly proper and just that the company should have this privilege. At the same time it is a power which should be exercised judiciously, and in general it has so been exercised. On the other hand, the routine and manner of making cut-outs for non-payment is worthy of considerable study.

In the first place, regardless of how the collection department may look upon a customer who is affected

with chronic delay in payment of his bills, the fact is that once he does pay up in any given instance he is then a customer of good standing and entitled to every consideration—at least until his next offense.

A rather usual routine in handling such cut-outs is for the collection department to notify the order clerk to issue a cut-out, which cut-out order is then either sent to the operating department or to certain employees who are charged with collecting from customers. They either collect the bill or disconnect the service.

There is always the possibility that between the time when the order is issued and the time when the employee arrives on the customer's premises prepared to execute it the customer may have called at the office and made either a full payment or a partial payment satisfactory to the collection department. The cashier taking this payment may be the only person having full knowledge that the payment has been made. It therefore becomes necessary that before any employee actually disconnects service to any customer he should first communicate with the collection department by telephone and ascertain whether the account has been paid. This also requires that the cashier keep a record of such payments so that the information may be given promptly.

This co-operative effort will obviate the very disconcerting situation of a customer's service being disconnected after he has actually paid up. Usually such a customer is in a rather disgruntled frame of mind at being prodded to pay his bill, and if after finally paying he then finds that his service after all has been disconnected, his perturbation is naturally much increased. If this situation arises out of the company's routine methods, the customer is somewhat justified in his attitude.

### Interruptions Cause Good Will

*Good Will from Emergencies and Interruptions to Service.*—It sometimes seems a paradox that out of serious interruptions to service can come good will. Nevertheless, such is the case, and this will be attested by no mean number of public service companies which have come through trying times as the result of severe storms or fire. When these emergencies arise and service is cut off either completely or to a large portion of the customers, there immediately comes the opportunity to do favors for individuals or for large sections of the public. During such periods the "contact" employees of any company should be led to feel that their duties are no less important than those of the operating men, who are charged with the specific duty of effecting repairs, rehabilitating parts of plants which are destroyed, and in general performing those functions which appeal to the layman as more spectacular than sitting by a telephone and receiving requests for service and endeavoring to have them executed.

The public in general either understands the forces beyond the control of a public service company which bring about catastrophes and service interruptions or it can be easily made to understand the situation by proper publicity during or immediately after the interruptions occur. It is surprising to note what allowances the public seems to make in such cases once it realizes the facts. When the entire organization affected bends its energies day and night to resume service there is no question that the customers appreciate and are grateful for what is done for them. There may be some who take the efforts of the company's employees as a matter of course and feel that it is no more than they should expect. These, however, will be found to be in the minority.

Therefore, "contact" employees, and all of those in an organization charged with improving public relations, should look upon every catastrophe affecting service as an opportunity to improve good will. When this is done rarely will the company come out of such a period of stress without an increased number of friends.

*Supervision.*—Lack of proper supervision, resulting in men loafing on outside jobs, naturally costs a company good money. It is then paying for something it does not get. The dollars and cents loss, however, may be small compared to the loss in prestige the company suffers through the public getting the idea that in handling work its officials are inefficient.

For example, picture the effect on a prospective customer who, on account of his remote location, is obliged to pay a portion of the cost of running an electric line or laying a gas main to his premises if the construction crew sent is too large or if the foreman goes away and the men "take it easy" during his absence. The prospective customer naturally feels that he is being called upon to pay for some or all of this waste time. His opinion of the company will not be of the best.

### Labor Affects Public Relations

Just so, the manner in which the ground man digs holes or the laborer ditches has a bearing on public sentiment by no means unimportant. No company can afford to stand before the public as inefficient. When we contend that we must receive a fair return on our investment, the public in turn may well insist that the work of creating that investment be done as efficiently as possible.

It is to be noted that not only our customers of today are our critics, but in the future as the ownership of our securities is spread more thinly among the public, including our customers, these owners of securities will naturally become more critical of our work, because in their minds they will feel that it is their funds we are spending.

*The Effect of Method of Compensation for Salesmen.*—There are today probably two schools of thought as regards the most effective method of paying salesmen. One believes in a straight salary basis, the other in a salary plus commission basis. The former policy may not produce so large a volume of sales measured in dollars and cents, or in any other unit, but it does tend toward better satisfied consumers.

It is easier to imbue a straight-salaried salesman with the spirit of service. The introduction of a commission or bonus puts sales upon a competitive basis, where the consumer's viewpoint is too frequently ignored. Two satisfied consumers are better assets than three dissatisfied consumers, or even than two who are content plus one who has cause for complaint due to misrepresentations made at time of sale. Grouchiness and the spirit of complaint are just as contagious as happiness. Misery not only likes company, but many times company courts misery.

Particularly liable to strain public relations are appliance campaigns by outside organizations. The salesmen employed are generally guided solely by their desire to make the biggest day's income. They have no constant interest in the local company. They are not a

part of its organization and frequently are only temporary employees of the outside organization handling the campaign. If such organizations are to sell in any territory, it is better that they do it under their own name. The electric company may well steer clear of such entangling alliances.

*Team Work in the Organization.*—One manager of a large central-station company stated to the writer recently that in fully 75 per cent of all of the cases where the consumer complained the company was in some way at fault. The importance of this statement is increased when it is realized that the company in question has a most liberal service policy and that all down through the organization there exists to a high degree the "spirit of service."

Undoubtedly fault on the part of the company may be due to two things, the personal equation of the individual employee or lack of team work and even friction within the organization. Errors due to the personal equation can be largely reduced by the proper choice and training of personnel.

Lack of team work is more difficult to remedy. Good men individually may not work well as a team. In our dealings with our consumers there are so many interdepartmental relations that opportunities for slips are many. Then, too, the aims of certain departments naturally tend toward friction with other departments unless constant care and supervision are exercised. The sales department chafes at the restraint of the collection department, which many times is called upon to place its "N.G." on certain new business which the sales department may have developed only after strenuous effort. The operating departments are frequently taken to task by the sales department because the former fail to make connections and set meters quickly enough to satisfy the new consumers which the latter has secured.

These are but two of many possible causes of internal friction. The remedy lies in educating the respective departments to a reality of the trials and tribulations of the other departments. "Get-together" meetings help to iron out these difficulties. The interchanging of employees between departments for a short period, as, for example, the putting of salesmen into the meter and service departments, and vice versa, helps the employees of each department to understand the viewpoint of the other departments with which they have relations.

This clearer understanding reached, then the organization is better able to function as a whole and by the better service rendered lock the door against a great mass of justified complaints from consumers. A general prescription for the difficulty may perhaps be contained in the motto, "Don't sell—serve." The commitment of all departments, and particularly the sales department, to this policy will give rise to a different viewpoint all down through the organization and among the various divisions.

*Local Purchasing by Central Stations.*—Local purchasing has been discussed from certain angles from time to time. Its value is further enhanced by the central-station company being thus better able to enlist the aid of local dealers and manufacturers in furthering legitimate company policies in times of stress as well as improving conditions in times of peace. Local merchants and manufacturers have really a greater incentive to support the company than many consumers who own company securities. Many of the former usually get more dollars in profits on merchandise sold than the latter receive in dividends. Where a man's or a business firm's dollars come from, there lies his or its interests.

*Donations and Contributions.*—The tendency is for the demands of charity to increase. Where commission regulation prohibits the company from making such contributions, except for certain purposes, the number of disbursements is naturally less. However, such donations and contributions are prominent more because of their number than because of any actual large percentage of gross income so disbursed.

To be sure, the central station is in a way the trustee of funds intrusted to it by the public for use in rendering a certain public service. But this trusteeship many times may best be exercised by being liberal in contributing to local activities, because the favorable sentiment created reacts to the company's benefit and hence to the good of all in the community. Whatever benefits the company does actually benefit the community, and hence its consumers, and the converse is equally true about injuries.

## Opposition Test of Polyphase Meters

*To the Editors of the* ELECTRICAL WORLD:

In the article appearing on page 1394 of the Dec. 23 issue of ELECTRICAL WORLD entitled "Testing of Polyphase-Type Watt-hour Meters" D. C. Hoffman refers to the "opposition" test for balance in a polyphase meter. Personally, I have not favored this method for the reason that with potential applied in the normal way on both elements (one current reversed to give the opposition) the friction compensation still acts in the same forward direction for both elements. If the torque adjustment is then made, it will result in one element being slower than the other by twice the amount of the friction compensation per element. This perhaps is not enough to condemn the practice for ordinary field tests.

In another part of the article Mr. Hoffman makes no reference to the phase relation between potential of one phase and current from another phase for the purpose of making the registration correct at 50 per cent power factor. If the lag resistance is precisely adjusted, the meter then will be correct for both lead and lag. If not, the error for the other condition will be twice as much as the error remaining for the condition (lead or lag) used in making the adjustment.

I am not in agreement with the proposed use of a phantom load. Resistance in the primary may regulate current magnitude well enough, but it will throw the resultant power factor wholly into doubt. The proper place for resistance to regulate current magnitude and preserve some semblance of unity power factor is in the low-voltage secondary circuit of the phantom load. Apart from the regulation of current magnitude, there should be enough voltage on the secondary circuit to permit the insertion in that circuit of enough resistance, even at maximum rating of the load box, to insure that the secondary current is approximately in phase with

the primary voltage; otherwise the power factor will be appreciably less than unity at times when unity is desired and seriously less than 50 per cent when that figure is desired. A. E. KNOWLTON,

Assistant Professor of Electrical Engineering.
Sheffield Scientific School, Yale University,
New Haven, Conn.

### Testing of Polyphase-Type Watt-Hour Meters

*To the Editors of the* ELECTRICAL WORLD:

In the ELECTRICAL WORLD for Dec. 23, page 1394, Dan C. Hoffman has an enlightening article on the practical testing of polyphase meters. However, there is a slight error in his "hook-up" which I would like to correct.

When the two elements of the meter are connected in series, whether for balance or regular test, the lower shunt coil should be grounded to the upper series coil instead of to the lower. In Mr. Hoffman's diagram the losses of the lower shunt coil will register on the upper series element, and, although the error is slight on full load, it is very noticeable on light load, especially with the smaller sizes of meters. METER TESTER.

Central Illinois Public Service Company,
Beardstown, Ill.

### Electric Drive for Paper Machines

*To the Editors of the* ELECTRICAL WORLD:

In your issue of Nov. 11 there is an article on sectional electric drive for paper machines in which the following statement is made: "The war gave impetus to this development so that three distinct systems are now available—Westinghouse and General Electric in this country and the Harland system in Canada." This statement may lead to a misconception.

We wish to say that the Harland drive is available in the United States as well as in Canada. Arrangements have been made for its manufacture in the United States, and the sales representation is in the hands of Thomas H. Savery, 1718 Republic Building, Chicago, who is well known in the paper trade.

It may also be of interest to your readers to know that the first Harland Electric Drive was installed and put into operation in the year 1913 and has been running satisfactorily ever since. The war delayed its development owing to the fact that the works of the Harland Engineering Company were fully occupied with war service. Immediately after the war, however, the development of this drive was actively prosecuted, and the apparatus has met with a very large degree of success and given complete satisfaction to all who have installed it. R. N. NORRIS,

Managing Director.
Harland Engineering Company of Canada, Ltd.,
Montreal, Que.

### New Zealand Leads in Proportion of Savings-Bank Depositors

*To the Editors of the* ELECTRICAL WORLD:

I noticed in a recent issue of your paper that you quite rightly asserted that the number of savings-bank depositors is a measure of the industrial stability of a country. You followed this by pointing out that the number of accounts in the United States is 100 per 1,000 persons, in France 346 per 1,000 and in England 302 per 1,000. May I point out that the proportion of post office savings bank depositors in New Zealand is 518 in every thousand? H. A. HUGGINS,

Controller of Savings Banks and Accounts.
Wellington, New Zealand.

### Laminated-Frame Arc-Welding Generator

*To the Editors of the* ELECTRICAL WORLD:

In the Oct. 1 issue of the ELECTRICAL WORLD there appeared a discussion by Pliny P. Pipes under the caption "Laminated-Frame Arc-Welding Generators." While we agree with many of the points brought out in Mr. Pipes' discussion, we do not believe that the advantages set forth for the laminated-frame construction really warrant this type of machine in preference to solid-frame types of welding generators.

In the design of arc-welding generators the question of arc stability is of great importance, and many different schemes are used for obtaining it. The use of inductance properly disposed is commonly resorted to in obtaining this essential characteristic. In all types of welding generators inductance is placed in the external circuit, regardless of the type of frame construction used.

With laminated-frame construction it is true that the generator is more responsive to arc changes, but it is impossible to make these responses rapid enough to eliminate entirely the use of an external reactance, and for this reason the extra cost of manufacturing a machine of this design is not warranted when the same results can be obtained by using generators of less costly construction simply by using external reactance in the arc circuit.

If Mr. Pipes' inference that the damping effect in the generator frame is equivalent to placing a reactance in series with the arc circuit were correct, a laminated-frame generator would require more reactance in the arc circuit than would a solid-frame construction, because so-called damping effects are less in the laminated-frame construction. Actually, the greater the damping effect of the generator frame the larger is the reactance required in the arc circuit. However, this is such a minor point in the proper performance of a welding generator that it can be neglected.

The laminated frame has no practical advantages over the solid frame as regards the efficiency of machine operation. It is recognized that both hysteresis and eddy-current losses are less in a given volume of laminated sheet metal than for the same volume of rolled steel. However, the total iron loss in the frame of a machine is negligible compared with the iron loss in the armature. This is due to the fact that the flux changes in the frame of a generator through a range of certain positive values at a very low frequency, whereas in the armature of a machine the flux reverses from a maximum in one direction to a maximum in the other direction as often as an armature tooth traverses the distance between poles of opposite polarity. In fact, the iron losses in the frame of a machine will not be greater than one-fourth of 1 per cent of the total output of a machine, and for this reason can be neglected when establishing fundamental designs for arc-welding generators. Incidentally, iron losses in the frame of a machine are never considered in calculating machine designs.

Since, then, the efficiency of a machine is not appreciably affected by the type of frame construction, and since it is necessary to use an external reactance for either type of frame—that is, whether laminated or rolled—the solid-frame arc-welding generator should have preference over the laminated frame on account of its less expensive construction. **Installation, Operation, Maintenance, Test and Repair of Generation and Distribution Equipment, and Methods of Economically Utilizing Electric Service in Large Industrial Plants**

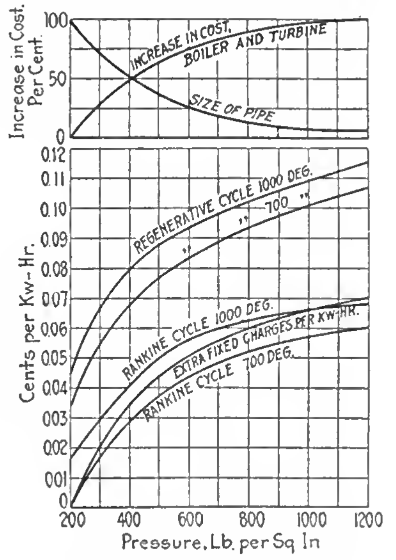
## Higher Steam Pressures and Temperatures

IN COMMENTING on the paper presented at the annual meeting of the A. S. M. E. by George A. Orrok and W. S. Morrison (published in considerable detail in the Dec. 8 issue of the ELECTRICAL WORLD) Peter Junkersfeld brought out the vital question whether higher steam pressures and temperatures pay. He also called attention to the use factor of a number of turbine installations running from twenty to thirty hours per year up to 6,000 to 7,000 hours per year. Mr. Junkersfeld's discussion is given in part below:

Mr. Orrok shows that temperatures of from 700 deg. F. to 750 deg. F. should not be exceeded for the present, and in the accompanying illustration [reproduced from the paper] he shows that extra fixed charges are always greater than the saving of coal at $6 per ton for the Rankine cycle (ordinary operation) of 700 deg. F. maximum temperature. It is a comparatively simple matter to derive all but one of the curves for coal of a different price and quality. The exception is the curve of "extra fixed charges per kilowatt-hour." The determination of fixed charges is one thing, but fixing charges per kilowatt-hour is quite another matter. This curve will be high with some companies and low with others, being based on three items, namely, (a) extra construction cost, (b) percentage of interest, depreciation, etc., and (c) kilowatt-hours per year over which the number of dollars per year resulting from (a) and (b) may be spread. The effect of kilowatt-hours per year or annual output is so much greater on extra fixed charges per kilowatt-hour that for the purpose of discussion it may be assumed that the extra construction costs and the percentage of interest, depreciation, etc., are both constant for a number of central stations whose extra fixed charges per kilowatt-hour are to be determined. Only one factor has to be dealt with, namely, output or, as specifically defined, "generator capacity factor."

This factor, which is the ratio of the actual output t the possible output of a steam turbine as rated with all its accessories, when averaged over a period of years, is much less than usually supposed, especially among central stations that have a substantial annual average increase in output.

An examination of the experience of seven companies with fourteen power stations and ninety-two steam turbines, aggregating 1,730,000 kw. rating, shows that in substantially the same twelve-month period one had an average generator capacity factor on all its turbine units of 44 per cent and another had one of 25 per cent. The extra fixed charges per kilowatt-hour for the latter would be almost double that for the former. It was also noted that only two out of seven companies had an annual capacity factor of 60 per cent or better on any one turbine. The company whose successive installations apparently gave improved economy and reliability and which made good use of its equipment had the average capacity factors during a twelve-month period shown in the accompanying table. Only one company had turbines still available for use, two in number, that had been in service eighteen years, and only three companies had such turbines, nineteen in number, that had been in service fourteen years or more.



COST OF INSTALLING AND ECONOMY IN USING PRESSURES ABOVE 200 LB.

Saving afforded in cents per kilowatt-hour, based on the Rankine cycle at 200 lb. and 700 deg. maximum temperature and coal at $6 per ton. At the top of the figure are two curves showing the increase in cost of boiler and turbine and the decrease in size of pipe required for a given quantity of steam. The extra fixed charges are always greater than the coal saving for the Rankine cycle (ordinary operation) at 700 deg. F. maximum temperature, and the additional gain for 1,000 deg. F. maximum temperature barely exceeds the additional fixed charges.

AVERAGE CAPACITY FACTORS OF ONE COMPANY'S TURBINES FROM ONE TO ELEVEN YEARS IN SERVICE

| Years of Turbine Service | Per Cent | Years of Turbine Service | Per Cent |
|---|---|---|---|
| 1 | 77 | 9 | 3 |
| 3 | 55 | 10 | 4 |
| 4 | 38 | 11 | 2 |
| 5 | 32 | | |
| 8 | 23 | Average | 37 |

An average experience curve for these seven companies, all in large and growing cities, indicated a capacity factor of about 58 per cent on turbines one year old and 30 per cent or less on turbines ten years old. The actual average of five turbines that were eleven years old was only 20 per cent, but this point was below the average curve.

The falling off with age of the capacity factor of turbines reflects good operating procedure with improved equipment in the successive installations. The fact that only one company operated its one-year-old turbines at 77 per cent, another at 52 per cent, and the third at only 23 per cent, and that the average of ten turbines two years old operated by six companies was only 50 per cent, indicates that there is still very great room for improvement in construction and operation of equipment with what might today be called moderate pressures and superheat.

### DATA ON HIGHER PRESSURE TURBINES INCOMPLETE

The turbines considered above were all operated at pressures from 150 lb. per square inch to 250 lb. per square inch at the throttle and total temperatures from 475 deg. F. to 600 deg. F. Some of the companies have turbines with 300 lb. pressure, but are not included because a full year's service had not been completed at the end of the year 1921, the period from which most of this experience record was taken.

In the foregoing wherever reference is made to turbine experience it means not only the turbine proper, but also includes the condensing equipment, piping and other mechanical accessories, the generator, excitation, switching equipment and other electric accessories.

The development toward higher steam pressure and superheat has been under way for many years and will inevitably continue. It should be given every reasonable encouragement consistent with established scientific facts and sound economic possibilities. It should be remembered however that this development in the past in a broad and over-all aspect has tended toward lower construction as well as lower operating costs of the station.

The development now seems to tend toward higher costs of construction and of operation with the exception of fuel. It thus becomes even more necessary than heretofore to determine proper balances between fuel saving and what Mr. Orrok has called "extra fixed charges per kilowatt-hour." The latter is, therefore, particularly important, and especially because experience has shown that it varies so widely from turbine to turbine, from station to station, from company to company and from year to year.

## Relative Merits of Three Methods of Charging Batteries

AS IS generally understood, the constant-current method of charging both lead and nickel-iron batteries consists in connecting a variable resistance in series with the battery and connecting it to a charging circuit having any voltage higher than the full-charge voltage of the battery. The charging current is maintained virtually constant throughout the charge at the normal charging rate. This is accomplished by varying the resistance in series with the battery, adjusting it to give a current value slightly higher than the normal charging rate and, after the current has fallen off to a value below the normal rate, again adjusting it to a slightly higher value, thus maintaining an average equal to the normal charging current.

With a nickel-iron alkaline battery the charge is terminated when the voltage reaches approximately 1.85 volts per cell. In the case of a lead battery the charge is continued at the normal rate until free gassing begins, accompanied by a comparatively rapid rise of voltage, when the charging current is reduced to the finishing rate, which is somewhere between 25 per cent and 40 per cent of normal, depending on the make of the battery. This results in simultaneous reduction of the battery voltage, and the charge is then continued at the finishing rate until the battery voltage reaches a one-hour maximum as indicated by three half-hourly readings of equal values, the current being held constant, after which the charge is terminated.

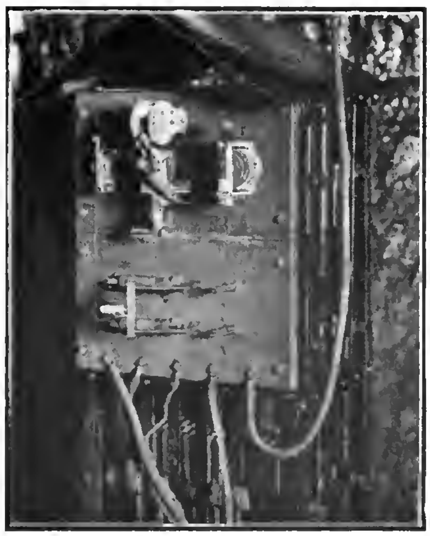
In order to keep the charging current practically constant it is necessary to adjust the resistance at more or less frequent intervals, these intervals being dependent on the difference between the battery and the line voltages. With a battery having a voltage slightly lower than the line voltage, as, for instance, a battery of forty cells being charged from a 110-volt circuit, it will probably be necessary to adjust the rheostat at half-hour intervals; but for a similar battery being charged from a 220-volt circuit adjustments may be made at very much longer intervals. Observations of gassing and readings of battery voltage must be taken at suitable intervals to determine the points at which to reduce the rate and terminate the charge.

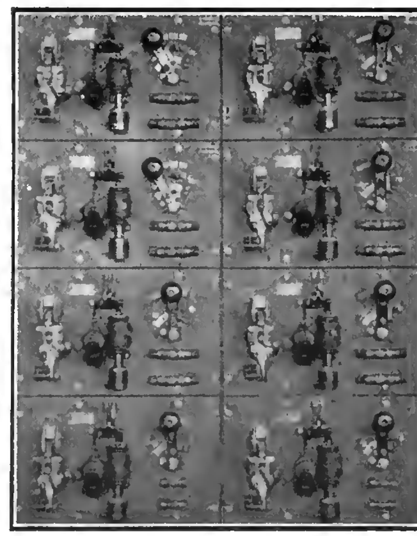
The chief objection to the constant-current method is the necessity for keeping a competent attendant to regulate the current from time to time and take voltage readings. If he is not attentive to his work, the batteries under his care will probably be either overcharged or undercharged, and in either case their useful life will be shortened.

This objection to the constant-current method is not inherent in the constant-potential method of charging, the basis of which lies in the fact that a proper charge for any lead battery can be obtained by applying a fixed charging voltage of approximately 2.3 volts per cell.

In charging batteries by the constant-potential method the battery, without series resistance, is connected directly to a circuit, the voltage of which is maintained constant throughout the charge at a value determined by the number of cells in the battery. For lead batteries this voltage is ordinarily about 2.3 volts per cell and for nickel-iron batteries 1.7 volts per cell. In cold weather a somewhat higher voltage may be required. Under these conditions the time required for charging a battery which has previously delivered its rated output can be reduced to five or six hours in the case of a lead battery. Seven hours, however, is required for a total charge for a nickel-iron battery. This time is not changed regardless of the method of charging used, as the average rate of charge is equivalent to the normal rate. Owing to the fact that the battery voltage is low at the start of the charge, the charging current tapers, starting at a high value and falling off as the charge progresses. In the case of the lead battery the initial inrush current is about four times normal, and it is about twice normal for the nickel-iron battery.

The constant-potential method of charging requires a definite constant charging voltage for each battery, which voltage seldom, if ever, corresponds to that of a power circuit. It is therefore necessary to install a separate power supply or provide some special means of obtaining the proper charging voltage. Where batteries of different numbers of cells are used, the problem is more complicated as a different charging voltage may be required for each battery.





FIXED RESISTOR METHOD OF CHARGING BATTERIES ELIMINATES KEEPING ATTENDANT ON DUTY DURING CHARGE

Left — Charging panel installed underground in mine for charging locomotives by this method. Right—Frame of eight resistor charging sections, each section controlling a charging circuit and having a remote control relay which automatically establishes the charging circuit upon plugging into the battery.

In the case of lead batteries an objection to this method of charging is the fact that the capacity of all the conductors must necessarily be increased about 300 per cent in order to provide capacity for the inrush current, which lasts only a few minutes. All fuses or other overload devices must also have a capacity for the maximum current and thus be useless as a protection throughout the remainder of the charge.

By inserting a resistor in the battery circuit, this heavy initial inrush is cut down to the point where heavy leads, switching equipment and fuses

are not necessary. This is known as the fixed resistor method of charging, and retains the chief advantages of the constant potential method.

The chief advantage of fixed-resistor charging is that the expense of keeping a responsible attendant on duty is saved since no attention is required during the charge; and, as the battery automatically receives the proper amount of current at every stage of the charge, it receives better treatment than when charged by any method which depends upon the operator to adjust frequently the charging current at the proper value and to terminate the charge. This elimination of the human element is a strong argument for fixed-resistor charging with automatic amperehour meter cut-off, as the useful life of the batteries is probably shortened more often by improper charging than by any other cause.

# Concrete Poles Used on 132,000-Volt Line

### Minimum Hazard of Contact and Maximum Adaptability at Low Cost Offered by "Pi" Construction—Puzzling Transportation Problem Solved

THE 132,000-volt cross-country trunk line recently built in Sweden between Trollhättan and Västeras is carried out for a stretch of about 80 miles on poles of steel-reinforced concrete. Though concrete poles have been used rather extensively in Switzerland and Germany for lines of moderate voltages, this line is believed to be the first extra high-tension development employing such poles.

The type of pole adapted for the line may be characterized as the Π type. Each pole consists of two masts, carrying a horizontal cross-beam 57 ft. from the ground, and the conductors are arranged horizontally 20 ft. apart. About 400 suspension poles on the line are built of concrete, some with steel, some with concrete cross-beams, the remaining 1,200 poles being made of structural steel, as are all the strain towers.

The concrete masts were manufactured by the so-called Schleuderbeton process. The reinforcement consists of steel rods placed around the circumference and interwoven by heavy steel wire. The steel skeleton is placed in a large hollow mold, which by special machinery is set in rapid rotation around its axis while the concrete mixture is poured

SMOOTH AND DENSE CONCRETE POLES SHOW SURPRISING STRENGTH AND ELASTICITY

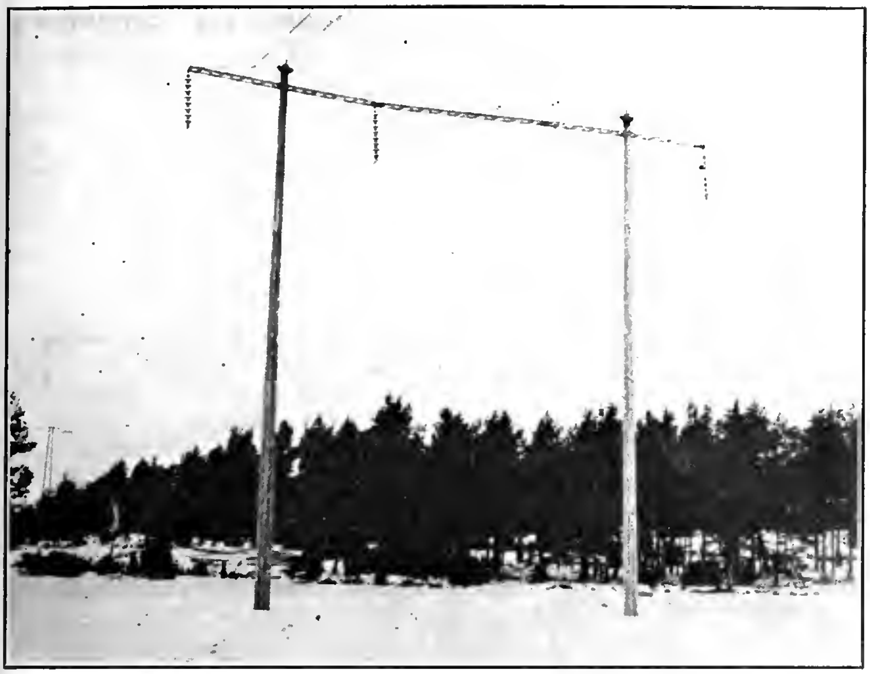
in. Owing to the centrifugal action the surface layer of the concrete comes out extremely smooth and dense, and the poles exhibit a surprising strength and elasticity.

Each mast weighs about 8,000 lb., is 61 ft. long and has a diameter at the base of 19.7 in., tapering to about 9 in. at the top. The cross-beam weighs 4,400 lb. and is 59 ft. long, with a diameter of 11 in. The masts are guaranteed to withstand a cross-pull of 1,320 lb. at the top with a factor of safety of four. One of the accompanying illustrations shows a mast being tested at 6,750 lb. As indicated in the photograph, the top deflection at this pull was about 4.6 ft. After this exaggerated test the pole showed neither cracks nor permanent deflection. Later the same mast was tested up to 7,600 lb. and it then gave a deflection of fully 10 per cent of the pole height without breaking.

At first some doubt was felt as to the feasibility of transporting these large masts from the factories in Germany to their sites in Sweden without so great a degree of breakage as to make the expense prohibitive. The masts, however, proved to be much easier to handle than was anticipated, and not a single piece had to be discarded. The majority of the 800 masts were taken by rail and ferry, on special cars, nine to the cars, but some were reloaded on seagoing barges and towed to Gothenburg. The transport from the nearest rail station and out to the sites presented some puzzling problems but was managed satisfactorily in the following way: The base of the mast was anchored to a motor truck, and somewhat below the middle the mast was supported by a special trailer. When the truck could get no further the masts were rolled over the fields by two horses, each attached to a sling of wire rope around either end of the mast.

The other illustrations show how the masts were raised and the cross-beam being hoisted into place. With both masts in place concrete foundations were cast around the butts. From a practical point of view the poles proved successful, the simple method of pole erection cutting down field work considerably. Although the first cost—all transportation damages, etc., included—came out about as high as for the steel poles used on the line, the concrete poles probably will be cheaper in the long run, since concrete needs no

CONCRETE POLES CARRIED FROM GERMANY TO SWEDEN BY TRAIN, BARGE AND MOTOR TRUCK WITH NO BREAKAGE



A SECOND CIRCUIT MAY BE ADDED BY SIMPLY ADDING ONE POLE AND EXTENDING CROSSARM

painting and requires practically no upkeep.

The Π-type pole is not a special feature of this line. This type of construction with wooden poles was used to a great extent on 77,000-volt lines built in Sweden during the war, when structural steel was scarce. The poles have proved that they have several advantages besides that of being very cheap where considerations of right-of-way do not enter. Theory as well as practice show that the horizontal arrangement of the wires offers a minimum of hazard of wire contact due to sleet storms, frost, etc. Furthermore, the Π-pole can be easily adapted to meet a growing power demand. On the Trollhättan-Västeras line only three 200,000-circ.mil copper wires were pulled, although the poles are designed for conductors of three times that size. The line is operated at 132,000 volts, but the clearances in the poles will permit the voltage to be raised to 220,000. By simply adding one mast to each pole and extending the cross-beam space may be provided for six conductors, and even as the poles stand now there is room for a fourth (reserve) cable.

Stockholm, Sweden.

## Fire-Extinguishing Liquid Specifications

SPECIFICATIONS for fire-extinguishing liquid, with carbon tetrachloride base, issued by the Federal Specification Board of the Bureau of Standards state that carbon tetrachloride is the only suitable liquid known which is a non-conductor of electricity for use in hand fire extinguishers in fighting incipient fires in connection with electrical apparatus. The board points out, however, that the fumes generated in extinguishing fires with carbon tetrachloride are intensely irritating and poisonous and that the liquid is unsafe for use in confined spaces. The specifications as officially adopted by the Federal Specification Board on July 3, 1922, are given in part below:

The liquid shall be capable of extinguishing fires caused by the burning of inflammable liquids and solids, shall be a non-conductor of electricity and shall consist of carbon-tetrachloride containing other suitable products necessary to produce a liquid conforming to the following requirements when tested according to the methods outlined in circular No. 134 of the Bureau of Standards:

*Appearance* — It shall be a clear, homogeneous, mobile liquid.

*Specific Gravity*—The specific gravity at 15.5 deg. C. shall not be less than 1.500.

*Cold Test*—The liquid must have a cold test not higher than minus 45.5 deg. C.

*Distillation* — Not over 2 per cent shall distill below 60 deg. C. At least 90 per cent shall distill between 70 deg. C. and 80 deg. C. At least 99 per cent shall distill below 100 deg. C.

*Impurities*—The liquid shall be free from nitrobenzine, water, acid or alkali and free halogens, and shall not contain more than 1 per cent by weight of carbon disulphide. It shall not corrode metals used in fire extinguishers.

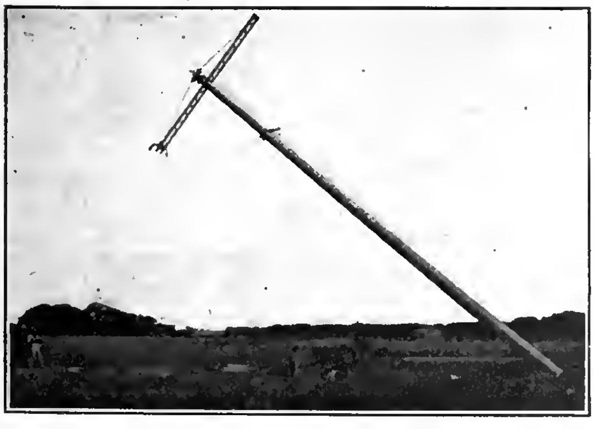
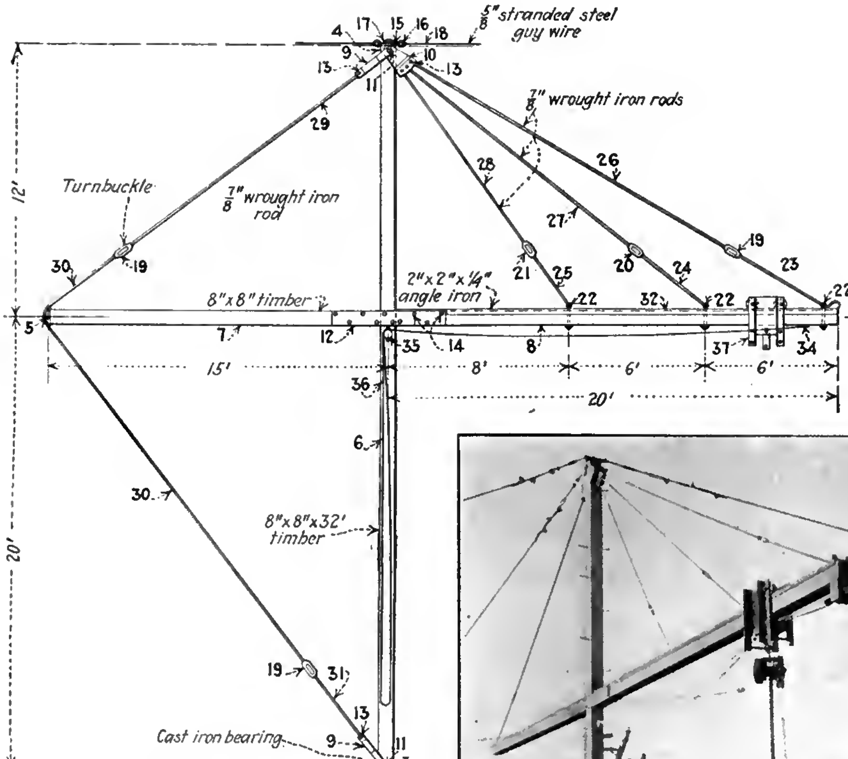
## Rotary Crane for Handling Transformers

FOR handling transformers and heavy wire reels in its main storeyard the Northwestern Electric Company of Portland, Ore., has installed a simple jib crane, shown in the accompanying illustration. Previous to this time a small rotary crane without jib traveler was used. This crane could be used only to swing heavy loads on and off trucks as it had no traveler on the



THE 8,000-LB. CONCRETE MASTS WERE RAISED AS ORDINARY POLES, WHILE CONCRETE CROSSARM WAS HOISTED BY SPIRAL DERRICKS



CRANE USED BY NORTHWESTERN ELECTRIC COMPANY REDUCES TIME AND EXPENSE OF HANDLING TRANSFORMERS

The construction details of the handling crane are shown in the drawing. The numbers indicate the order in which the parts were assembled. The insert shows the completed crane in operation.

jib. Transformers and other heavy articles had to be moved some little distance by hand to storage space. On this account the cost of handling several transformers and other material each day was quite an item. In addition, the time lost during the manual operation became of prime importance when it was necessary to take out transformers in case of emergency. Transformer bushings were quite often broken while the transformer was being shifted by hand.

The new crane has a capacity of 3 tons, has a travel of 20 ft. along the jib arm and can be swung around in a complete circle. A differential block is suspended from the traveler of the jib, permitting the traveler to be moved the full length of the jib arm by means of a block and endless rope operated from the foot of the mast. The mast is set in a cast-iron thrust bearing mounted on concrete foundation. A steel pin is set at the top of the mast, and by means of a loose collar on the pin the mast is guyed in three different directions to anchored stubs.

This equipment enables one man easily to handle transformers to and from the truck and storage space. The cost of the crane complete was approximately $425. It was designed and erected by the company.

E. F. Pearson,
Electrical Engineer.
Northwestern Electric Company,
Portland, Ore.

## Periodic-Test Schedules

A NUMBER of the more important rules and regulations relating to meters issued or revised during the past year by state and municipal authorities are given herewith.

The principal changes in the Illinois rulings are that induction-type meters not exceeding 25-amp. rated capacity, which meet the requirements of the Meter Code, are to be tested every forty-eight months instead, as under the previous rule, every thirty months. With respect to installation tests the period within which the test is to be made has been extended from sixty days up to one year, provided that the meter is inspected for connections and mechanical condition within sixty days.

The Michigan Public Utilities Commission has issued an order that includes some regulations governing metering and service methods. Definite rules on meter switches and trims have been issued by Detroit for that city.

The rules and regulations of the Public Service Commission of New York governing the testing of watt-hour meters and the reporting of such tests to the commission have been made to apply to the entire state, whereas the former rules applied to only part of the state.

The Public Service Commission of Montana has adopted rules and regulations prescribing standards for electric service. The rules relative to meters and meter testing are incorporated in this order.

A comparative tabulation of periodic test schedules as prescribed by four commissions is given below.

# Central Station Business

Advertising, Selling and Service Methods
Commercial Organization and Management, Customer and Trade Relations, Public and Financial Policies, and Reports of Company Plans and Experiences

## Electrical League Co-operation

**Better Business Methods Have Resulted from the Organization of Local Leagues in Eleven Districts Served by the Public Service Company of Northern Illinois**

BASED on the theory that the better business man the contractor-dealer is the better it will be for the central station, the Public Service Company of Northern Illinois during 1922 was instrumental in the organization of electrical leagues comprising the contractor-dealers in the territory served by the company. Each local league, of which there are eleven, is under the direction of officers elected by the members and the contractor-dealers are represented 100 per cent. The Public Service Company of Northern Illinois also is a member and an active force in the work of each league.

Meetings of the leagues are held monthly, and among the important subjects which have been studied at these meetings has been that of cost keeping. Methods of handling cost records, the costs of material, overhead and profit, the effect of cut-throat competition without considering the cost of doing business, the organization of working forces, shop forces, analysis of actual costs on the job and the proper methods of estimating and bidding on jobs have been under consideration in the meetings.

Efforts have been directed toward better advertising and better window displays. Special work to improve the appearance of show-window cards has been done, and signs for the use of the contractors on their wagons or cars are also being prepared.

Methods of carrying deferred payments on appliances have been considered and financing plans provided. The installation of adequate electrical equipment, including convenience outlets, to take care of the future needs of the home owners and to pave the way for future merchandise sales, has been studied.

In the early days of the organization of the leagues it was discovered at the dinners held that many of the contractor-dealers did not know each other and that the central-station men and the contractor-dealers were in many cases unacquainted with each other. The leagues have remedied this, and in addition it has been possible to bring about a better understanding on the part of both the central station and the contractor-dealer of each other's difficulties.

A most gratifying accomplishment has been to give the contractor a true conception of the work that must be done by the central station in connecting up customers. This has brought about a co-operation between the contractor and the central station that has avoided many of the delays and troubles encountered in making new connections and has developed better service to the customer from both the contractor and the utility. Another subject has been the education of employees of the members of the league to appreciate that they have a vital interest in the business—in other words, they have been convinced that they are more than wage drawers.

### Electrical Shows and Exhibits

One activity of the past few months is the construction of electrical homes. These projects have been handled by a building committee of the electrical league. The homes have been widely advertised, the names of the contractors responsible for the project being connected with the advertising. Electrical shows have been held under the direction of the leagues, and during this winter at least one of these shows will be held in each district.

For organization purposes the territory has been divided into arbitrary districts, usually by counties, though in the territory immediately adjacent to Chicago smaller divisions have been used. This has been a case of fitting the district to the organization desired by arranging it so that the men who would naturally be grouped together are brought into the same body.

Not only have the members of the leagues been provided with valuable educational material, but the central station has benefited from the co-operation. Among other things a substantial number of new stockholders have been obtained, and the better understanding brought about in the league association has made friends for the Public Service Company of Northern Illinois. In some cases where it has not been possible for the company to maintain convenient trouble organizations the contractors handle trouble calls.

While the work of the leagues has been under way only a year, the results in better service and better business relations make the members very enthusiastic over future possibilities. The work has been carried out as far as the Public Service Company of Northern Illinois is concerned by the company's district superintendents, who are: Theo. Blech, Waukegan; J. S. Reesman, Evanston; H. L. Judd, Oak Park; G. E. McCollum, Crystal Lake; O. L. Hyatt, Chicago Heights; L. C. Stephens, Joliet; B. G. Smith, Kankakee; J. A. Schabeck, Lacon; W. J. Brown, Ottawa; V. V. Parshall, Pontiac; W. C. Dowdy, Streator, and T. J. Mulvey of the contract department, under the direction of John C. Learned, assistant to vice-president.

## New York Edison Schedules Seven Special Exhibits

THE recently organized Bureau of Exhibitions of the New York Edison Company, under whose auspices all future specialized electrical exhibits by the company are to be held, has announced a schedule of seven shows to be held between January and June. These seven shows will cover electric signs, electric heating, household equipment, electro-therapeutics, ventilation and refrigeration and electric trucks. All the

displays will be in the Irving Place showroom of the New York Edison Company and will be free to the public. As with previous shows of this sort, the exhibits will be by invitation and there will be no sale of space to exhibitors.

The electric sign show will be the first of the series. It will be held during the week of Jan. 29 to Feb. 3. The other shows scheduled are as follows: Heating, Feb. 19 to 24; washing machines, ironing machines, and dishwashers, March 12 to 17; power, ventilation, and refrigeration, April 2 to 7; electro-therapeutics, April 23 to 28; vacuum cleaners and floor machines, May 14 to 19; electric trucks, cars and accessories, June 4 to 9.

The general management of all the shows will be under the direction of Lincoln Bancroft, manager of the bureau of exhibitions, but in each show he will be associated with the manager of the department of the Eidison company specializing in that particular field.

## Comparison of Utility Rates with Commodity Prices

THE relation of gas and electric rates to commodity prices and the cost of oil is shown graphically in the accompanying chart prepared by the Railroad Commission of California. It includes the years 1914 to 1922, covering the pre-war, war, reconstruction and "return-to-normalcy" periods. In its annual report the commission states that there was a downward trend in the cost of several important classes of public utility service in the fiscal year ended June 30, 1922, and that a corresponding reduction was concurrently reflected in public utility rates. Regulation, the commission adds, has demonstrated its flexibility and its responsiveness to general economic conditions. It is shown that the maximum increase in electric rates over 1914 levels was 36 per cent and the present excess is approximately 16 per cent, while commodity prices soared to 173 per cent over normal at the 1920 peak and are still between 60 and 70 per cent above pre-war prices.

The information compiled by the United States Department of Labor showing the variation of the wholesale price index over the period from 1914 to April 1922, has been used to plot the curve of commodity prices in the chart. A study of this index curve will show that the average price has increased from a basis of 100 per cent in 1914 to a peak of 273 per cent during the early part of 1920. Just after this peak was reached there was a very sudden decrease to 150 per cent during June of 1921. From that time to the present the index price has slightly increased.

In comparison with the variation of this wholesale index price it is interesting to compare the variation of electric rates of utilities operating in California. Considering the rates of the Pacific Gas & Electric Company, it will be noted that the maximum increase in electric rates of this utility occurred during the middle of 1920, and on the basis of the rates during 1914, assuming them to be 100 per cent, the maximum increase amounted to 34 per cent. This maximum increase remained in effect for a period somewhat less than a year, when during the early part of 1921 rates were lowered to the present charges, which are approximately 23 per cent above those in effect in 1914. In the same way the increase in the rates of the Southern California Edison Company made these 43 per cent in excess of 1914 rates. The maximum increase lasted for only nine months, and on Jan. 1, 1921, rates were reduced by about 6 per cent and again in April by 5 per cent. A further reduction in May, 1922, of 10 per cent brought about the present rates, which are now approximately 16 per cent above the rates in effect during 1914.

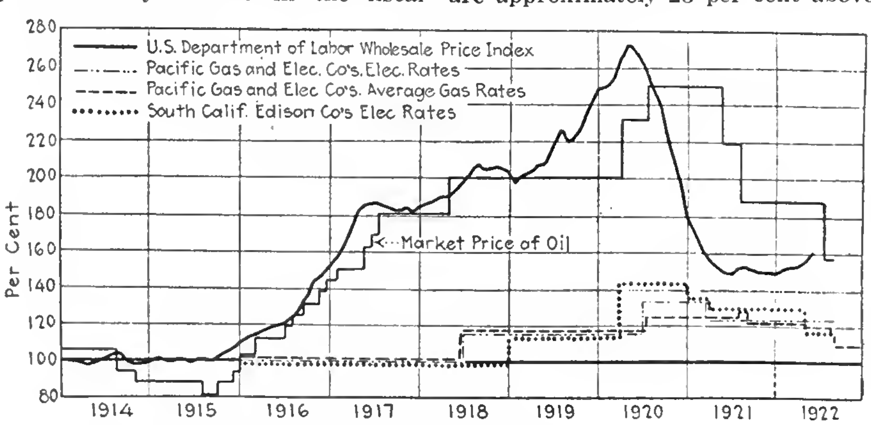

CHART SHOWING COMPARATIVE FLUCTUATIONS OF UTILITY RATES AND COMMODITY PRICES

The rates of other utilities varied in a similar manner to those of these two companies. The average maximum increase of rates for all electric utilities in the state did not exceed 35 per cent over the 1914 rates. The increase of 173 per cent in the price of commodities was over five times the increase in electric rates during this period.

## Electric Ranges Serviced by Dealers

BY W. M. CRAWFORD
General Agent California-Oregon Power Company, Medford, Ore.

AFTER trying out and discarding a number of plans for servicing electric ranges, the California-Oregon Power Company has adopted a very satisfactory arrangement whereby the electrical dealers service the electric ranges they sell. The company replaces fuses and renders only such service as it would to a power customer or any other consumer on its lines.

This company actively entered the range field in 1912, when the electric range was not so reliable a piece of electrical apparatus as it is today. At that time it was necessary for the power company not only to adopt a very liberal servicing policy but to sell and in many cases install the range as well.

About 1916, at the request of the dealers in this territory, the company increased the prices of ranges to a point where the dealers could make a legitimate profit on their sales, and the company maintained prices so that the dealers could go after the business. Before that time the company had been selling ranges at only a small percentage above cost. The company still continued to sell ranges and also to service them, making charges for the servicing at prices which the dealers maintained were unprofitable.

The contractor-dealers also serviced ranges and the company used its influence to throw this business of maintenance to the dealers where it could be done without losing the good will of the customers. In 1918 the company discontinued the sale of ranges, throwing this business

entirely to the dealers, who by this time had become quite active. It also discontinued servicing ranges at the same time, and this practice has been continued ever since. The company's activity in connection with range sales since that date has been confined to efforts through the dealers. All sales are made through the dealer — the dealer installing the range and thereafter servicing it.

We believe that we have been reasonably successful in this procedure, inasmuch as 23 per cent of all of our residential customers in this district have electric ranges installed and we have eliminated a great deal of work and expense.

# "The Public Servant"*

## Application of Some Ancient Laws Which Give a Refreshing Slant to Present-Day Public Relations Problems of the Utility

BY DONALD MCDONALD
Vice-President and General Manager
Louisville Gas & Electric Company

WHOEVER coined the expression "public servant" to describe the utilities performed a real service both to the companies and to the public. No relation of life is older or better understood than that of master and servant. The oldest code of written law is that of Hammurapi, an ancient king of Babylon, which provides among other things for the relation between master and servant. The law of Moses enjoins on the servant diligence, honesty and efficiency; it enjoins on the master justice, kindness and intelligence.

Among the other wise statements contained in the Bible is the one which says "No man can serve two masters." People are prone to forget this. National laws commanded the railroads to obey the Interstate Commerce Commission, whose jurisdiction covered the whole of the United States. State laws commanded the same railroads, within the limit of the state, to obey the rulings of the State Railroad Commission. In some cases these rulings conflicted, and endless confusion resulted.

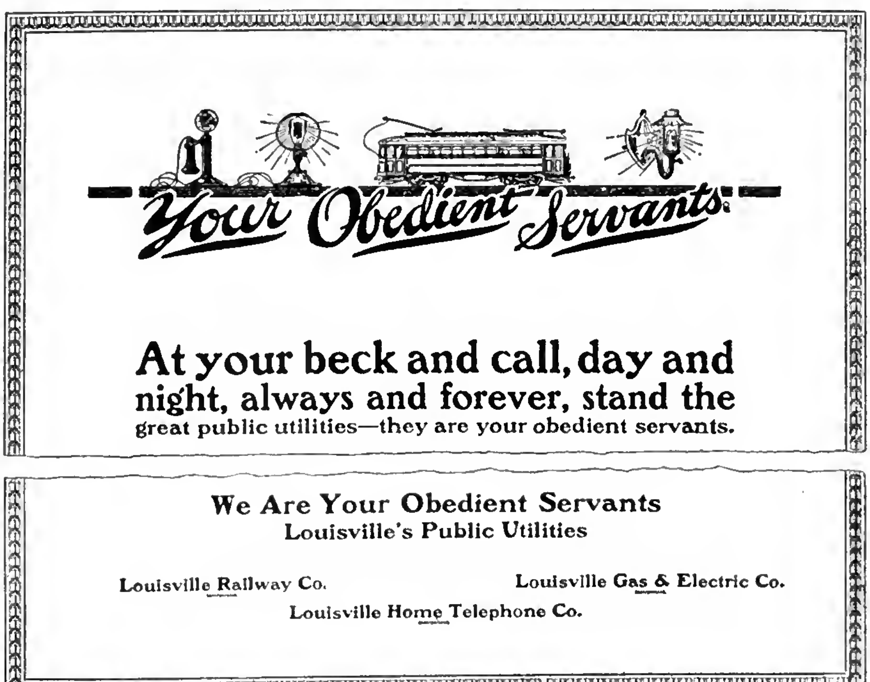
### CONFLICT OF AUTHORITY OVER SERVANTS

Other public utilities were placed under state commissions, while at the same time certain cities claimed and exercised the right to regulate these same utilities. Recent enactments have wiped out most of these conflicts, but the fact is just as true as it was four thousand years ago that no servant can serve two masters.

The relation of master and servant imposes on the servant the exercise of a certain deference to the wishes of the master, even when the master is somewhat unreasonable. A wise public servant will remember this. People will neglect to apply for gas until the weather is actually cold, and then forget that a hundred others have done the same thing and each one feels that he should be served first. A certain amount of good temper in picking out the hardest cases and a large amount of hustling, so that two days' work may be done in one, in this way relieving people from the consequences of their own carelessness, will help the company.

We also learn from Holy Writ that "the laborer is worthy of his hire," and no man promotes his own comfort or interest by beating down that hire to a point which is below the cost of decent living. People are proud of the fact that their servants are well housed, well fed, well paid and contented. I have heard them boast of how cheaply they bought goods, but I never heard a man boast of the fact that his servants were underpaid or underfed. I have, however, heard men boast that in their city the street-car fare was five cents, although they knew that the actual cost of carrying them was more than that. On the whole, communities have reached a saner and more just attitude toward the public utilities.

The relation of master and servant implies not only diligence and respect on the one hand and justice and consideration on the other, but it also implies mutual knowledge of the difficulties and perplexities which each side is compelled to face. Service that would be adequate on ordinary days becomes inadequate when sickness or death invade the house, or when a wedding or a funeral brings a large number of people to the master's house and to his table. At such times the servant must make unusual effort and do his very best to see that the emergency is adequately met. Fires and floods and fairs impose similar duties upon the public utilities. The demand upon them increases suddenly and the importance of their service to their pa-



PREACHING THE GOSPEL OF SERVICE

Mr. McDonald's paper has been very favorably commented on by the press throughout Kentucky, and, following up the public-servant idea, three of the Louisville utilities combined to issue the accompanying advertisement on New Year's Day.

*From an address at the annual meeting of the Kentucky Association of Public Utilities at Lexington, Ky., Dec. 12, 1922.

trons becomes even greater than usual.

The wise manager is prepared for such emergencies, but in order to be prepared he must have such a revenue as will enable him to pay all of his bills promptly and to pay a fair return upon the investment which has been made by his stockholders. Without this he cannot enlist the additional capital which is necessary to provide far in advance the machinery which will be needed to meet the emergencies when they come.

### The Dignity of Service

The rôle of public servant is an honorable rôle. Again we can quote scripture in saying, "He that would be greatest among you, let him be your servant." Every man who is neither a thief nor an idler nor a beggar serves some one. He has at least one master. If he is highly placed, he is apt to have many masters. The President of the United States serves more people than any other man I know. The head of a great corporation appears at a glance to be almost an autocrat. "He sayeth unto this man, 'Come,' and he cometh, and to another, 'Go,' and he goeth," but he cannot with impunity violate the sense of fairness which is in the minds of all those that look to him for orders, he cannot be arbitrary and he cannot be unreasonable. More than this, he must himself take orders from his stockholders and from the representatives of the public.

All that the public utilities have a right to ask is that in public matters the public speak with one voice, that they speak through an authority which is recognized by both sides, and that that authority informs itself of the facts before it issues orders.

### Consideration of the Master for the Servant

The most momentous event in human history came through the failure of a master to inform himself as to the needs of his servants and to adopt a sympathetic attitude toward those needs. Pharaoh said to the children of Israel, "Make bricks without straw, and the tale of the bricks shall not be diminished." In other words, these overburdened slaves must go into the fields and gather stubble, and in spite of the time lost in this way they must make as many brick as they made before, when the straw was delivered to them. Of course, there was great discontent and great wailing. There followed hail and storm, plague and pestilence, and eventually Pharaoh yielded and allowed them to go. He not only allowed them to go, but he speeded their parting in every way—in fact, he thrust them out.

It frequently happens that "the wrath of man is made to praise God"; that the mistakes and stupidities and stubbornness of a utility on the one side or of a municipality on the other finally result in a better day for both sides. But the better day comes after plagues and storms. It is much better that each side should recognize the rights and the interest of the other. It is much better that the utility take care to be a good servant and that the municipality take care that it shall be a good master.

## Oklahoma's Municipal-Plant Shutdowns

In 1922 a large number of individual electric light plants were sold or abandoned in Oklahoma. Ten of these were municipally owned. These towns decided to dispose of their plants and take energy from the high-tension lines of privately owned companies.

Among the towns are: Okemah, which has signed a contract with the Oklahoma Power Company; Heavener, which sold its plant to the Oklahoma Gas & Electric Company; Hunter, Billings, Watonga, and Geary, which gave up municipal plants to take service from the Oklahoma Gas & Electric Company; Boswell and Soper, which signed a contract with the Public Service Company of Oklahoma; Ramona, which voted to abandon its municipal plant to receive service from the Sand Springs Power, Light & Water Company; Wapanuck, which sold its plant to the Public Service Company of Oklahoma; Pawhuska, which was connected with the high-tension line of the Sand Springs Power, Light & Water Company. Norman and Lawton abandoned their municipal electric lighting projects and are buying energy from the Oklahoma Gas & Electric Company. Eldorado a few weeks ago completed a high-tension line to the plant of the Quana Light & Ice Company at Quana, Tex., and Purcell is now negotiating for electricity over a line which is to be extended south from the town of Norman and through Noble to Purcell.

## What Other Companies Are Doing

**Boston, Mass.**—Seventy-one percolators were sold in one day recently by the Edison Electric Illuminating Company of Boston in the Davis Square district of Somerville in a co-operative movement with the local Chamber of Commerce designed to encourage popular buying in particular neighborhoods.

**Illinois.**—Electrical homes built in the Chicago territory during 1922 have not fallen behind the pace set in other districts. In River Forest, a Chicago suburb, a twelve-room house costing $60,000 was constructed during the summer. It contained a total of 200 outlets connected to thirty-two standard appliances and drew an attendance of 30,000 with an average daily number of visitors of 1,200. This house was planned by an organization of electrical contractors and the Public Service Company of Northern Illinois. During the fall a smaller house was built in Wilmette which combined the use of gas and electricity. Then in December, at Hammond, Ind., a house costing $20,000 was opened, also built through the efforts of the local contractors and the utility company.

**Altoona, Pa.**—Thirty new electric display and advertising signs were erected in Altoona during the twelve months of 1922, according to the annual report of Building Inspector M. W. Craine. The total is the largest for any year in the city's history and followed the adoption by the city of a favorable ordinance regulating the use of overhanging electric designs.

**Berlin, Wis.**—To create interest in water-power development the employees of the Wisconsin Power, Light & Heat Company have constructed a miniature hydro-electric plant which is being displayed in the various cities which the company furnishes with power. The model is an exact reproduction of the power plant at Prairie du Sac and represents the dam and power house on the Wisconsin River there.

**Worcester, Mass.**—The New England Power Company plans to erect a new 110,000-volt transmission line from Davis Bridge, Vt., to Millbury, Mass., enabling energy to be obtained from the new development on the Deerfield River now under construction to be utilized in the central Massachusetts district.

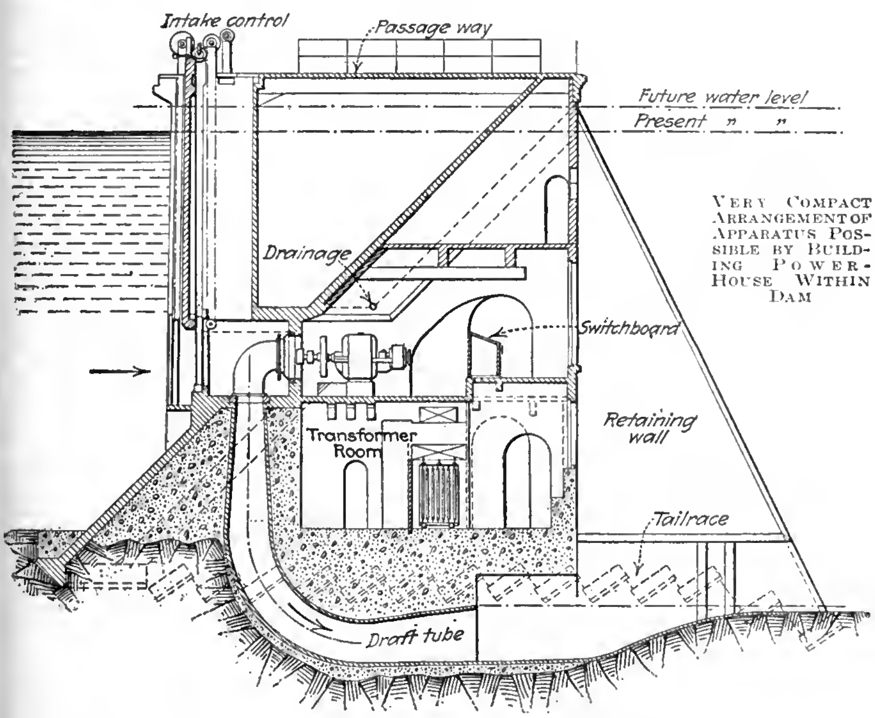
## Hydro-Electric Development and Steam Equipment

*Hydro-Electric Station Built Into a Dam.*—A power house built compactly into a dam is described in this paper, the first of its kind in France and probably in Europe. Across the river Léguer, near the British Channel, at Belle-Isle-en-Terre, a reinforced-concrete dam inclined at 45 deg. and consisting of fourteen semi-circular vaults has been erected. The three middle compartments serve as engine room and have each three stories. On the lowest level are placed the transformers, the middle tier carries the turbines, alternators and bench-type switchboards, and the upper story contains the buses and protective apparatus. The three turbine sets, each of which is inclosed in an individual vault, are of different sizes, 175 hp., 300 hp. and 600 hp. The third unit has not as yet been installed. A hydraulic head of 10.8 m. is available for these horizontal-shaft Francis turbines, to which the generators are directly connected. About one-third of the head is utilized in draft tubes from the turbines. The transformers transform the machine voltage of 220 to the transmission voltage of 15,000, supplying a paper mill 4 km. away. The limited height of the power-house vaults did not permit the installation of a crane. The hydraulic part of this station is of a design very unusual in France, and the bulk of the article is devoted to detailed description of this, including also a general description of the entire plant.—*Génie Civil*, Dec. 9, 1922.



VERY COMPACT ARRANGEMENT OF APPARATUS POSSIBLE BY BUILDING POWER-HOUSE WITHIN DAM

*Economic Design of Power Plants.*—H. MIDGLEY.—The author presents certain elementary facts which are rarely put before young engineers in training and gives such information on cost as affects design and concerns the preparation of estimates. In the comparison of plants an attempt should be made to estimate the relative cost of repairs. Even though the estimate may not be quite accurate, such a procedure will lead to a much closer comparison of the relative importance of various factors than would otherwise be obtained. For power producers on a high load factor using fuel at an average price it is worth while paying the extra sum required by highly economical plants. For power producers on a low load factor and for standby plants the cheapest possible plant should be installed consistent with reliability, but almost regardless of fuel consumption. —*Beama*, December, 1922.

## Transmission, Substations and Distribution

*Experiences with Aluminum Wires.* —A. G. ERFTWERK.—The data contained in this short article, describing a practically copperless substation for smelting works, are of interest. The station receives its power over four three-phase lines of steel-aluminum, each with a total cross-section of 105 sq.mm., of which 25 sq.mm. is steel, at a voltage of 110,000. Joints in these cables, which were manufactured in 2,000-m. lengths, are made with galvanized-iron clamps with inlaid sheets of aluminum. These lines have been in operation for four and one-half years. The three main transformers, each rated at 30,000 kva., 110,000/5,000 volts, have aluminum windings and have given uninterrupted service. Fifteen rotaries of 4,000 kva. each have aluminum high-voltage windings with welded joints. Between these rotaries and the switchboards aluminum cables of the underground type are used. All buses and connecting lines of the 5,000-volt system are of aluminum. Owing to the high expansion coefficient of aluminum some of these connections on the disconnecting switches worked loose, heated and finally melted off. This was found to be due to too small a contact surface, and after enlarging the contacts 100 per cent no further trouble was experienced. All bars between the rotaries and the smelting furnaces, carrying 12,000 amp. at a density of 0.7 amp. per sq.mm., have given satisfactory service. A large number of rubber-insulated aluminum wires are used for the distribution of light, all joints being made on brass terminals in the junction boxes. Up to the present no electrolytic trouble of any kind has arisen.—*Elektrotechnische Zeitschrift*, Dec. 7, 1922.

## Units, Measurements and Instruments

*Use of Condenser Bushings for Measuring Purposes.*—G. KEINATH.—Bushings built upon the condenser principle, such as are used extensively on high-voltage oil switches, transformers or wall-entrance leads, may be easily arranged to measure voltage, frequency, charging current or insulation, or to synchronize machines, whenever a moderate accuracy is sufficient. Atmospheric conditions may introduce an error of up to 5 per cent. Between the last and next to last condenser layers of such a bushing a static voltmeter may be connected to measure, after proper calibration, the voltage against ground. To measure the insulation against ground of very high-voltage lines during their operation, the author suggests connecting the two last condenser layers to the primary of a specially designed but inexpensive current transformer, insulated for only about 6,000 volts, with a winding ratio of 1 to 170, transforming the primary current of 3 milliamperes to 510 milliamperes, and energizing with the latter current a standard soft-iron instrument calibrated in volts. In a similar way, frequency meters of the resonating comb-type system, or synchronizing meters, may be connected over a small transformer to a condenser bushing. A considerable saving may further be realized in watt measurements by combining an ordinary current transformer with the above transformer connected in "V" to two con-

denser bushings. The charging current of these two bushings for a three-phase line is in phase with the Y-voltage and is fed over the small transformer to the moving coil of the watt-meter, while the stationary current coil is energized from the secondary of the standard current transformer. All of the new high-voltage condenser bushings of one German concern are now equipped with bands connected to the last two metallic layers to enable the customer to take advantage of the simple measuring methods mentioned in the description above.—*Siemens Zeitschrift*, November, 1922.

## Illumination

*Development, Present Status and Problems of Electrical Illuminants.*—H. LUX.—The author outlines the historic development of arc and incandescent lamps. It is shown that it is economically wrong to try to increase the amount of light from a filament by an increase of its temperature, because a visual efficiency of only 14½ per cent can be reached theoretically. With increasing temperature the maximum of radiation is gradually shifted from the long-wave end of the spectrum into the short-wave end. At 3,600 deg. the radiation enters into the just visible red end at 800$\mu\mu$ and leaves the visible end at 7,200 deg. at the violet end, at 400$\mu\mu$. The highest visible efficiency is reached at 5,200 deg. at a wave length of 556$\mu\mu$. If we should succeed in developing a radiator emitting only visible rays, the highest possible light energy would be reached at 4,250 deg. with 248 lumens per watt. A light source with 100 per cent efficiency could be obtained from a radiator giving off rays near the 556$\mu\mu$ maximum. Such a light would give the highest possible output—about 650 lumens for each watt input. But we are far from having reached the ideal light emission of 247.5 lumens per watt. The flaming arc gives 40 lumens per watt, and the mercury vapor lamp in a quartz tube 54 lumens per watt, but their light is quite disagreeable. Another matter of great importance is the light density. It rises enormously with the temperature. With a black body radiating at 6,500 deg. a density of 73,000 cp. to 150,000 cp. per square centimeter is obtained for a bright body or other selective radiator. Such a terrific density would cause instant blinding. A flaming arc gives a density up to 1,000 cp. per square centimeter, which is so high that artificial means have to be employed to lessen the glare. New and more promising ways of obtaining the ideal source of light are shown by the modern electronic theories. If electrons are emitted from a hot cathode and allowed to hit the atoms of a vapor or gas at low pressure, they will be reflected until the reflection potential is reached, when the entire energy of the impulse is absorbed and the radiation of a spectral line is generated without ionization. If now the pressure is increased to the ionization value, all electrons will be driven out of the atom and will unite to form a new atom, forming a complete spectrum. Assuming, for example, a tungsten cathode heated to 2,800 deg., an electron stream of 8.4 amp. per square centimeter is available, producing in the ideal gas a light at 2.2 volts, resulting in 12,300 lumens. To heat the cathode 126 watts will be required, resulting in 2,300 lumens, which would give a total of 12,300 + 2,300 ÷ (18.5 + 126), or 101 lumens per watt. — *Elektrotechnische Zeitschrift*, Nov. 23 and Dec. 7, 1922.

## Motors and Control

*Selection of Electrical Systems for Iron and Steel Works.*—J. MACSHEEHY.—The author describes the demands that iron and steel works make on the electricity supply and discusses the system which he considers most suitable for meeting these demands. Stress is laid on the necessity for thermal efficiency, reliability, adaptability and standardization. The three possible systems of generation, transmission and distribution are considered. The direct-current motor is shown to be the most efficient for intermittent duties.—*Electrician*, Nov. 24, 1922.

*Use and Maintenance of Safety Switches.* — R. B. ANDERSON. — The author takes up typical safety-switch applications and discusses some of the factors that enable this type of switch best to carry out the fundamental purposes of its construction and use in the operation of industrial motors. Because a safety switch is inclosed and made as nearly accident-proof as possible, many men responsible for maintenance forget that it is an operating mechanism and should have inspection and attention of the same nature that is paid to the vital parts of any other system.—*Industrial Engineer*, November, 1922.

## Traction

*Methods Used to Lessen the Corrosive Effect of Stray Currents from Street Railways.*—H. F. ZANGGER.—The author assumes an imaginary street-railway network with given currents at all feeding points and calculates the return currents through the rails and the ground for all sections of the system. It is shown how the dangerous stray currents through the ground which corrode metallic pipe lines of gas and water systems can be reduced to an almost negligible amount by a judicious location of feeding points and the use of additional return-current cables of proper cross-section. A graphical representation of the stray currents along the sections shows in a striking way the large improvements which can be realized by such a reconstruction of any existing rail system having excessive stray currents. The author enlarges further upon his example by adding new extension lines to the improved system, and shows that to keep stray losses down additional return cables would have to be installed in the previously perfect system to take care of unbalancing of network introduced by added lines.—*Bulletin de l'Association Suisse des Electriciens*, November, 1922.

## Heat Applications and Material Handling

*Possibilities of Electrical Precipitation in the Chloride Volatilization Process.*—THOMAS VARLEY and H. W. CLARK.—The Cottrell process of electrical precipitation was described in the November, 1921, issue and a number of its applications have been dealt with, particularly those with reference to the precipitation of fumes from furnaces for treating tin drosses (December, 1921), dust from cement mills (February, 1922) and the cleaning of blast furnaces (July, 1922). In this article the authors describe the possibilities of electrical precipitation in the chloride volatilization process. In the event that the electrical precipitator for this service proves a commercial success—and from the tests described this seems probable—the results will be far-reaching and extensive changes from what is now considered standard practice may be looked for within a comparatively short time. — *General Electric Review*, December, 1922.

## Telegraphy, Telephony, Radio and Signals

*Sensitivity and Precision of the Electrostatic Transmitter for Measuring Sound Intensities.*—E. C. WENTE.—By means of a "pistonphone" and a thermophone, for which corrected formulas are available, both the absolute sensitivity and the phase lag were determined for frequencies of from 10 cycles to 12,000 cycles. Eight transmitters similarly constructed give the same curves within 20 per cent. Combined with an amplifier of ordinary design, the instrument has an over-all sensitivity which is practically uniform from 25 cycles to 8,000 cycles. It is therefore remarkably well adapted for the measurement of the intensities of complex tones and tones of changing pitch and for use with an oscillograph for recording sound waves. If sounds of a definite pitch are to be measured, the apparatus can be made highly selective and almost any desired sensitivity can be obtained by using a tuned amplifier in connection with a vibration galvonometer.—*Bulletin B-7-1 of the Engineering Department, Western Electric Company.*

*Secondary Standardizations of Radio Wave Meters.*—A method of standardizing wave meters for both the transmitting and receiving type is described. In the receiving type the standardizing consists in measuring by means of a standard wave meter the frequencies emitted by a generator of continuous waves which is tuned to resonance with the wave meter under test at various settings of the scale of the latter. In the transmitting type the process utilizes the make and break of a buzzer which excites the wave meter by impact and emits waves the frequency of which is regulated by the wave-meter setting. (A limited supply of this letter circular is available to persons who have use for such information.) *Letter Circular No. 75, Bureau of Standards.*

# New Books

Reviews of the Latest Contributions to Technical, Industrial and Commercial Literature of Particular Interest to Members of the Electrical Industry

## Year Book of Wireless Telegraphy and Telephony, 1922

London: The Wireless Press, Ltd. 1,472 pages.

In this, the tenth successive issue of the "Year Book of Wireless Telegraphy and Telephony," no change of importance has been made in arrangement or subject matter; in fact, much of the material was taken from the 1921 volume. The standard sections have, however, been revised and brought up to date. If the material included in the sections on "Wireless Developments (1827-1921)," "The Birth and History of Long-Distance Telegraphy" and "Biographical Notices" were expanded and published in a separate volume, a service would be rendered. There appears to be no reason why this historical matter should be included in a year book already overgrown. Approximately one-third of the book is devoted to the radio laws and regulations of all countries of the world and one-third to a directory of land and ship stations. With a few exceptions, private and experimental stations are not included in the book.

The year book fulfills its function of giving information regarding developments of the preceding twelve months in the sections on "National Résumés of Technical Progress in Radio Communication," "Patents," "New Radio Books" and a résumé of articles published during 1921 which are of particular value. Interesting technical articles on the "Progress of Wireless Telephony in Aircraft," "The Recording of Wireless Signals," "The Rectification Effect in the Reaction to the Composition and Structure of Crystals" and "The Earthing Resistance of Antennæ" are included. The section on standard wireless publications is convenient for reference purposes. In view of the phenomenal growth of interest in amateur activities in this country during the past year, it is rather surprising to find no mention of the development of radio broadcasting or the influence it is exerting upon the general public. H. M. TURNER.

## The Electrometallurgy of Steel

By C. C. Gow. New York: D. Van Nostrand Company. 351 pages.

This book recounts the historical development of the electric furnace and gives considerable information on the electrical characteristics of the various types of furnace. A part of the volume is given up to highly theoretical electrical features of various furnaces. This possibly represents the author's chief interest. The matter relating to the metallurgical side of the problem is a summary of what has been covered in previous literature. The book presents no very striking advance in known facts, but if one wishes an elementary survey of the general field it will be found in this volume in very readable style. E. E. THUM.

## Machines Electriques: Theorie, Essais et Construction

By A. Mauduit, professor in the faculty of sciences at Nancy, France. Third edition. 1,180 pp., illustrated. Paris: Dunod.

In an analytical preface to this work, Prof. A. Blondel gives an estimate of its value which is so comprehensive that an abstract will serve better than anything else to show just where it fits in. Professor Blondel says that he has a high opinion of the achievements of Professor Mauduit, whose career he has followed with a lively interest.

Referring to the book, Professor Blondel says that, avoiding general or theoretical electrotechnique, the author has devoted attention to detailed study of practical means of applying theory in actual machines. He has produced a personal work in which he has presented clearly and directly the essential elements of each theory, that which is directly applicable. In many cases he is the first to combine in a new arrangement elements which thus associated have double value for those who wish to apply them. He has added many remarks and counsels inspired by his own experience.

Among the new subjects treated in the present edition, Professor Blondel draws attention to the important advances in the theory of continuous-current dynamos, in which Professor Mauduit is an expert on commutation. There is no work where the study of commutation is treated so exactly and on such a solid experimental foundation. Noteworthy are the treatment of non-sinusoidal currents, magnetic fields in alternating-current machinery, three-phase transformers and practical calculations of induction motors.

The author has also made a new development in the study of synchronous machines in giving a place to the theory of double reaction. He introduces also questions relative to the short-circuiting of alternators and the coupling of alternators with dampening circuits.

In the study of alternating-current motors with collectors he has unified the theory of the different types, notably in that which concerns the study of resultant flux, commutation and saturation. Space has also been given to mercury-vapor converters, dynamos with three brushes, and so forth.

One sees, says Professor Blondel, that the new edition is almost a new work. Like its predecessors, it constitutes for the electrician-engineer a veritable encyclopedic manual on the construction and utilization of machines in which the reader, young or old, will find the necessary elements for making quick application of recent progress, at the same time that numerous subjects for reflection and study are suggested to him. H. H. NORRIS.

## The Dynamo—Its Theory, Design and Manufacture

By C. C. Hawkins, Vol. I, sixth edition, rewritten and enlarged. Bath, England: Sir Isaac Pitman & Sons, Ltd. 505 pp., illustrated.

The English type of text differs largely from the American and is chiefly meritorious for the accuracy and thoroughness of its treatment. While English books are not making serious encroachments in the schools as classroom textbooks, they are universally respected and consulted by teachers and students.

The present revised volume is an admirable work on the fundamentals of direct-current and alternating-current generators. It discusses these machines from the design viewpoint very largely, but also gives valuable pointers on manufacture and operation. The author uses mathematics and vectors to determine quantitative results and bases his design analysis on the mechanical-force equation instead of the familiar induced-voltage relations. The book is particularly noteworthy in its consideration of mechanical forces associated with machine operation. It is a welcome revision to a well-known text and its technical treatment is greatly improved over past editions.

## Fire Causes Half-Million Loss at Eagle Rock

The Eagle Rock substation of the Southern California Edison Company was partly destroyed by fire on Monday last, Jan. 8, entailing a loss unofficially estimated at $500,000. The fire, which burned for nearly eight hours, is said to have been caused by the explosion of a 60,000-volt lightning arrester, the flames quickly spreading to a quantity of oil stored in the substation.

## Big Mining Contract Signed in Illinois

To the Central Illinois Public Service Company has just been awarded what is said to be one of the largest, if not the largest, coal-mine electric power contracts in the history of the industry. This took place when a contract was signed between this company and the Old Ben Coal Company, operating several large mines in Franklin and Williamson Counties, Ill. The Old Ben Coal Company mines and ships 6,000,000 tons of coal a year. The contract with the coal company is for a period of ten years and its bill for electrical energy will be $500,000 a year. The Central Illinois Public Service Company will begin to serve the mines on Feb. 1. The coal company plans to electrify the remainder of its properties gradually over the next two years, so that by Jan. 1, 1925, the electricity required will aggregate 750,000 kw. When the mines of the Old Ben Coal Company are connected to the Central Illinois Public Service Company's lines there will be an aggregate of seventy-three mines operated by electricity supplied by this company.

## New York State Commission Pleads Its Case

The annual report of the Public Service Commission of New York State to the Legislature, just made, declares it of great importance to the public welfare and comfort of the people that the public utilities over which the commission has jurisdiction should remain under the close observation of the state government and that ample power of regulation should at all times be vested in some adequate governmental agency, thus taking direct issue with Governor Smith's views.

"The establishment of a single regulatory commission by the Legislature of 1921, in place of two commissions, centered responsibility for regulation of utility operations," says the report. "The centering of responsibility for the regulation of all utilities of a like character was an act of wisdom and has been amply justified by the results of the work of the commission during the year just closed."

The eighty-one Republican Assemblymen, in a secret conference, agreed, to a man, according to Speaker Machold, their leader, to stand together in their action on measures proposed by Governor Smith and the Democrats, who control the Senate and have sixty-nine votes in the Assembly. This pledge is reported to include opposition to the Governor's program of "home rule" and municipal control or ownership of utilities.

## San Francisco Cable Laid at Rate of 3 Miles an Hour

The Great Western Power Company's submarine power cable across San Francisco Bay referred to in last week's ELECTRICAL WORLD, page 56, as one of the largest and longest ever installed, was successfully laid last Monday, Jan. 8. The cable, which is more than 7 miles in length, was laid in one piece and in one continuous operation in the remarkable time of two hours and thirty-seven minutes, or an average speed of more than 3 miles an hour.

## Power to Order Extensions Denied Commission

A decision denying the power of the Wisconsin Railroad Commission to order extensions of water mains has been handed down by Judge George Thompson of the Dane County Circuit Court in a suit growing out of an action of the state against the Washburn Water Works Company. The decision, far-reaching in effect, is thought virtually to nullify the right of the commission to order public utilities of other kinds to make extensions, as has been its custom during a long period of years.

"The jurisdiction of extension of water mains in cities rests with the municipality," Judge Thompson said, and he expressed the opinion that, though the Railroad Commission can review the action, the grant of original jurisdiction to the municipality in such cases is clear and specific under the law.

The court's opinion, it is contended, will have state-wide effect. Heretofore it has been though obligatory for utilities to do the bidding of the commission when extensions of such nature were ordered.

## Bacharach Utilities Bill to Come Up Again

Representative Isaac Bacharach of New Jersey intends to continue to support in Congress his bill to prevent public utility corporations from appealing to the United States courts from rate decisions of state public utility commissions until after they have exhausted all their right of appeal to the courts of the state.

That is the crux of a letter Congressman Bacharach sent this week to Governor-elect George S. Silzer of New Jersey in reply to a letter from the latter urging him to drop his own bill in favor of one prepared by the Governor-elect which is described as "not so broad." Mr. Bacharach intimated that if his own bill is rejected on the claim that it is unconstitutional he will then urge the adoption of the Silzer measure.

## Mergers of Wisconsin Utilities Continue

Control by the Wisconsin Public Service Corporation of Milwaukee of all power plants and service in the northern section of Manitowoc County has resulted from its acquisition of the Oslo Light & Power Company. This purchase followed another under which the Public Service Corporation came into possession of the lighting plant at Mishicot and the plant at Denmark, Brown County, just over the Manitowoc County line. The Reedsville property was acquired some time ago. The Oslo company, with 80 miles of line, serves the city of Kiel and nine villages.

With the acquirement of these plants the Public Service Corporation gains virtual control of the entire northern section of the state, it having also taken over a plant at Oconto, while it is serving the Lake Shore district north from Manitowoc. It maintains a steam plant in Manitowoc as an auxiliary to its High Falls hydro-electric plant and also operates a station at Green Bay.

Coincident with the confirmation of these purchases by the Public Service Corporation came announcement of the sale of the Cleveland (Wis.) municipal electric plant to the Badger Public Service Company, which was later taken over by the Milwaukee Electric Railway & Light Company.

That control of public utilities of the state may soon be vested in one or two big companies is indicated by the reports of transfers and mergers which have taken place in all sections in the past year.

## Wired Radio Broadcasting

### Practicability Is Shown by Recent Tests at New York City and Washington

TESTS of wired radio broadcasting have for several months past been conducted by the North American Company—in New York City in co-operation with the United Electric Light & Power Company, and in Washington, D. C., in co-operation with the Potomac Electric Power Company. The tests formed a practical demonstration of the feasibility of the "wired wireless" method.

In New York communication was established between the Sherman Creek and Hell Gate power stations over the 13,000-volt underground cables. The transmitting apparatus was connected to the high-voltage bus at Sherman Creek through the distributed capacity of a 30-ft. length of lead-covered cable. The receiving apparatus at Hell Gate was connected through the capacity between the primary and secondary windings of a potential transformer, one terminal of each being disconnected, the remaining terminals connected to the high-voltage bus and the receiving apparatus respectively. The wave lengths employed were in the neighborhood of 5,000 m., or 60,000 cycles per second.

In Washington broadcasting was conducted as such over the 2,400-volt, three-phase distribution system from the Georgetown and Tennallytown substations to the Bureau of Standards and to different points in Chevy Chase, D. C., and Maryland. Transmitter connection was effected through mica condensers, and the receiving apparatus was plugged into any convenient light socket. Wave lengths from 3,000 m., 100,000 cycles, to 30,000 m., 10,000 cycles, were employed. On every test reception from an antenna was compared to that over the light wires, and it was consistently found that unless the antenna was in very close proximity to the power lines, the limited radiation which was present at 3,000 m. decreased very rapidly with increasing wave length until it became unobservable at the lower frequencies. At the same time, owing to the decreasing attenuation from other causes with increasing wave length, for the same energy input considerably more energy was available at the receiving terminals.

#### CONDITIONS OF EXPERIMENTS

R. D. Duncan, Jr., radio engineer with the North American Company, was in charge of the tests. Mr. Duncan in the issue of the ELECTRICAL WORLD for Aug. 19 last described certain experiments which had been performed in Cleveland with a view to investigating the practical utility of broadcasting by wired radio over electric lighting and power lines, the results of those experiments indicating, in his opinion, that, though requiring development, this new method of broadcasting not only offered a decided advantage over radio broadcasting but as a means of commercial use—as, for example, communicating over the high-voltage mains between substations and with repair crews, remote control of substations and similar functions—could be made of important service to electric lighting companies in general.

It is to be noted, Mr. Duncan said recently in describing the later experiments in New York and Washington, that the problem of wired radio broadcasting over an interconnected distribution network of a city differs considerably from similar operation over a long-distance, high-voltage transmission line. In the latter case there is a directly connecting, unobstructed path, constituted by the high-voltage conductors, between the transmitting and receiving stations. In the former the distribution network, constituting innumerable paths and to which are connected hundreds of transformers and other forms of power apparatus, besides a multiplicity of receiving sets, forms the interconnecting medium. It is obvious that the attenuating effect of such a network on the high-frequency currents is many times greater than with a high-voltage transmission line.

Furthermore, Mr. Duncan continued, since one of the fundamental objects of this new type of transmission is to suppress or eliminate entirely radiation from the lines, with the consequent interference with radio broadcasting—already in a chaotic condition—the construction of a large outdoor aërial in close proximity to the high-voltage lines and for coupling thereto is, where the latter are overhead, precluded from the start, and of necessity direct connection to the system must be effected in the power house or substation. This is especially true when the distribution system is underground, as is the case in most cities. Connection to the buses in the substation immediately brings up a multitude of problems, such as the effect of attached apparatus, induction voltage regulators and so forth, all of which, it has been found, vitally affect the high-frequency transmission.

#### RESULTS ASCERTAINED

The effect of connecting transformers across the lines has been investigated, and their characteristics at high frequencies have been determined. The same is being done with induction voltage regulators which contain both a shunting and series winding.

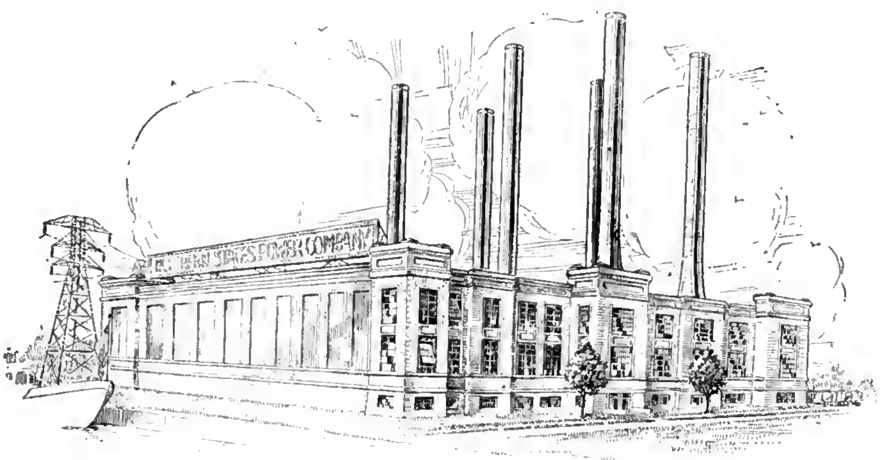
Another interesting line of investigation has been that of relay operation at high frequencies. Remote control of relays has been obtained by voice modulation and whistling at the transmitter, the relay being adjusted to respond to voices at different pitch and to different types of modulation.

Mr. Duncan acknowledges the co-operation of H. R. Searing of the United Electric Light & Power Company and J. H. Ferry of the Potomac Electric Power Company.

## St. Paul's New Power House

### Further Details of the Eighty-Million-Dollar Program for the Twin Cities

AS ALREADY stated in the ELECTRICAL WORLD, the H. M. Byllesby Engineering & Management Corporation has announced a hydro-electric and steam-power construction and development program for the cities of Minneapolis and St. Paul which will involve the expenditure of $80,000,000 in the next ten years. This new construction will increase the generating capacity of the Northern States Power Company is 303,000 hp.



PROPOSED 100,000-HP. ST. PAUL PLANT OF THE NORTHERN STATES POWER COMPANY

Construction work on a 100,000-hp. steam-turbine generating station in St. Paul on the Mississippi River near High Bridge will start immediately. The first generating unit to be installed will have 40,000-hp. capacity, and it is planned to install additional capacity of 60,000 hp. after this unit is completed. During the remainder of the ten-year period an additional steam generating capacity of about 100,000 hp. will be added, divided between the Riverside station in Minneapolis and the new power plant at St. Paul. The present capacity of the Riverside station is 103,000 hp., of which about 28,000 hp. is generated by water power and the rest by steam.

Hydro-electric development on the St. Croix and the Upper Mississippi Rivers has been authorized by the Federal Power Commission. Construction plans call for an increased capacity of 106,000

hp., which will be divided between the existing plant and new construction. A water-storage dam will also be built in the St. Croix River, 8 miles above the Kettle River Rapids.

To facilitate the distribution of this additional power, a new transmission loop will be built around the Twin Cities, with the necessary additions in substations and other equipment. The financing plans contemplate the continuance of customer-ownership methods which have created a shareholders' list of about twenty-five thousand persons, most of whom are customers of the company.

## North Americans Elected to Brazil Technical Club

One of the results most hoped for from the International Engineering Congress in Rio de Janeiro was the establishment of closer relations between the engineers of the Americas. A tangible proof that this has resulted is seen in the election of the following North American engineers to membership in the Club de Engenharia, an organization which would correspond to an amalgamation of the four national societies here in the United States of North America:

Elected corresponding members: Josiah E. Spurr (A. I. M. and M. E.), editor *Engineering and Mining Journal-Press;* Louis J. Hirt (A. S. M. E.), engineer Pearson Engineering Corporation.

Elected honorary members: Verne L. Havens (A. S. C. E.), director *Ingenieria Internacional;* A. W. K. Billings (A. S. C. E.), Canadian & General Finance Company, Ltd. (Toronto); Edward Wegmann (A. S. C. E.), consulting engineer; Samuel M. Vauclain. (A. S. C. E.), president Baldwin Locomotive Works; Calvin W. Rice (A. S. M. E.), secretary A. S. M. E.

## Puget Sound Company Gets Coast Utilities

The Puget Sound Power & Light Company, Seattle, Wash., has purchased the Washington Coast Utilities, furnishing lighting and power service in Wenatchee, Edmonds, Arlington, Stanwood, Vashon Island, Port Townsend and Montesano. The combined properties will be under the management of Stone & Webster, Boston, who have managed the Puget Sound company for more than twenty years. An adequate source of energy for the development of the fruit-raising districts of central and western Washington will result from the completion of a 120-mile transmission line now being built by Stone & Webster, from the White River hydro-electric plant over the Cascades to Wenatchee.

The gross revenue of the acquired company reaches approximately $700,000. The capitalization is about $3,000,000, of which one-third is in common and preferred stock. The Puget Sound company is purchasing $500,000 par value of common stock for cash and securities, offering to exchange its 6 per cent preferred stock share for share for the preferred stock of the Washington Coast Utilities, of which about five thousand shares are outstanding.

## Kentucky Utility Favors Mouth-of-Mine Plants

Officials of the Kentucky Utilities Company are much pleased with the rapid development of the company's high-tension transmission lines in western Kentucky, where it now has nearly 200 miles of lines. The company had a contract whereby it gets the surplus power of two 6,000-kw. coal-mine plants at Greenville and Earlington, amounting to from 5,000 kw. to 5,500 kw. These plants are at the mouth of the mines and furnish power from coal chuted to or directly dumped on the stokers.

In fourteen months the company has developed a total transmission system of 92 miles in western Kentucky and it now furnishes service to a large number of towns, mines and farms in that part of the state. In eastern Kentucky the company has 215 miles of interconnected transmission lines and close to 500 miles in all. In the Harlan County field alone there is about 21,000 kw. connected load.

The company is to a considerable extent following out the plan of producing power at the mouth of the mine. Just how big the development of this method will be is uncertain, but the utility is steadily enlarging its system and there is rapid growth of demand, especially in the eastern Kentucky coal fields.

## Alabama Power Company Completes Mitchell Dam

On the first day of January the Alabama Power Company plugged Mitchell Dam, and the ceremony marked the completion of the eight-million-dollar water-power project. As the impounded waters flow down from Lock 12 they will create a lake 14 miles in length, the entire distance between the two dams.

The first unit of this new project, carrying 25,000 hp., will be placed in operation in February. By April two more units of 25,000 hp. each are expected to be placed in operation, and the total harnessed power of the dam at that time will be 75,000 hp. When the last unit is placed in operation the total horsepower produced will be 120,000.

The Alabama Power Company will begin the construction of its next large water-power project, on the Tallapoosa River, early this year. Four dams will be constructed, and the potential development of power is about 140,000 hp. The project, it is said, will cost between twelve million dollars and twenty million dollars.

## Henry Ford's Water-Power Project at High Dam

According to a press dispatch from St. Paul, representatives of Henry Ford, who, as told in the ELECTRICAL WORLD of Dec. 30, page 1465, is endeavoring to obtain from the Federal Power Commission the right to the power produced by the High Dam erected by the government in the Mississippi River between St. Paul and Minneapolis, have announced the purchase of a site for the proposed factory of the Ford Motor Company immediately adjacent to the dam and have given out the statement that if the water-power rights are granted a ten-million-dollar plant, to employ ultimately between fourteen and fifteen thousand men, will be built; otherwise a plant on a smaller scale to be operated entirely by steam is projected.

Senator Nelson of Minnesota has, it is reported from Washington, aligned himself with those opposed to granting these power rights to the Ford company.

Information from political circles in Minnesota is to the effect that the Legislature will not grant the Municipal Electric Corporation the authority necessary to carry out its plan for the utilization of the High Dam. There is a very general opinion, however, that the Legislature will extend the authority of the Warehouse and Railroad Commission so as to give it regulatory supervision over power matters.

## Competitor Allowed to Enter Indianapolis Field

A certificate of convenience and necessity has been granted by the Indiana Public Service Commission to the Terre Haute, Indianapolis & Eastern Traction Company, which has made plans for an eventual expenditure estimated at between $6,000,000 and $7,000,000 in the development of the West Tenth Street power plant in Indianapolis and in the construction of transmission and distribution lines inside and outside of Indianapolis. As previously reported in the ELECTRICAL WORLD, the application of the railway company was contested by both Indianapolis power companies, the fight being called one of the most bitter in the history of the commission.

The opinion handed down with the order challenges the idea that regulated utility monopoly is best under all contions and asserts that there are situations in which the public will be best served by a certain amount of competition. It denies that a public utility has any vested right in a monopoly and affirms that the basis for regulated monopoly is the public welfare and not the welfare of a utility company.

Although the certificate gives the company authority to supply electrical energy for all purposes authorized by law, a representative of the railway company said that the intention for the present is to sell power in bulk and not to distribute power to small Indianapolis consumers.

## Federal Engineer on Power in Southeast

After a trip along the Coosa and Tallapoosa Rivers and a visit to Muscle Shoals and to the Gorgas steam plant, Col. William Kelly, the chief engineer of the Federal Power Commission, has returned to Washington much impressed with the rapidly growing market for power in the Southeast. Colonel Kelly is interested in the possibility of utilizing storage on the Tallapoosa to advantage. There are several sites on that stream where large storage can be provided at low cost. This would prove an important supplement to the Coosa River plants since it would help the Alabama Power Company to carry its base load on water power.

Further relief could be had, Colonel Kelly reports, if the Alabama Power Company could secure a long lease on the Sheffield plant. As it is, 30,000 kw. of that plant's capacity cannot be used because of transmission-line limitation. It would cost $750,000 to provide the additional transmission line, an expense which the Alabama Power Company naturally would not incur when the contract for the use of the plant is subject to termination on thirty days' notice. Colonel Kelly says that two thousand yards of concrete are going in every day at Muscle Shoals. Construction work has reached the point, he believes, where no slackening of the work will be caused by high water.

## New Rates for Great Western Power Company

Rates reflecting a reduction of approximately 10 per cent on the system as a whole have just been established for the Great Western Power Company by the California Railroad Commission. The rates are almost identical with the new rates of the Pacific Gas & Electric Company, referred to in the ELECTRICAL WORLD for Jan. 6, page 56, and as in the case of the latter are entirely new, taking the place of existing rates and surcharges. The rate structure eliminates various discriminatory rates, and for that reason the percentage reduction is not uniformly applicable to all present charges. Flat rates are effective Feb. 1, meter rates Feb. 20.

Lighting rates in San Francisco and contiguous places will be 90 cents per meter a month for the first 10 kw.-hr., 6 cents for the next 40 kw.-hr., 5 cents for the next 150 kw.-hr., with proportionate reductions as consumption increases. In other incorporated places the rate schedule starts at $1 a month, and outside of incorporated limits it begins at $1.25.

In general the same principles of valuation and rate making were applied to the Great Western as to the Pacific Gas & Electric. The application of these principles eliminated the company's claim of $15,000,000 for water diversion rights and $8,047,185 for development costs. Other reductions were: Intangible capital from $277,359 to $189,500, lands from $4,540,229 to $1,353,022, structures from $40,713,903 to $36,740,957, working capital from $938,049 to $590,000. For additions and betterments operative in 1922 $1,271,000 was allowed.

The rate base found reasonable is $40,144,479. Including items eliminated, the company claimed a rate base of $69,516,725.

## Valuation of Idaho Power Company Cut in Half

After a hard-fought battle of more than two years' duration, the Public Utilities Commission of Idaho has placed a value for rate-making purposes of $11,638,495 upon the property of the Idaho Power Company. The original valuation arrived at by the company's representatives was $22,567,890, but the commission's elimination from the inventory of eighteen Idaho items and one Oregon item on the ground that they are "non-co-operative," the omission of cost involved in borrowing money for development, the discarding of "capitalized deficits," the reduction of alleged inflation in purchase prices, with other "slashes" made by the regulating body, brought the sum total down to the figure already named. Even of this greatly reduced total the commission decided that $1,542,095 is not entitled to full return.

The formal order of the commission which accompanies the opinion sets Monday, Jan. 22, as the date for the opening of the hearing concerning the rates to be based upon the new valuation just arrived at.

# New York Utility Offers Stock to Customers

### Consumers and Employees of Consolidated Gas Company and Its Affiliated Companies May Buy 6 per Cent Preferred Issue at Par, with Privilege of Resale at Premium

DETAILS of the special offer of 6 per cent cumulative participating preferred stock of the Consolidated Gas Company offered at par ($50 a share) to its employees and those of its affiliated companies and to all consumers of gas or electricity distributed by it and its subsidiaries have just been published over the signature of George B. Cortelyou, the president. The authorization of this issue was referred to in the ELECTRICAL WORLD for Dec. 2, but full particulars were not then available. The New York Edison Company, the United Electric Light & Power Company and the New York & Queens Electric Light & Power Company are among the affiliated companies of the Consolidated Gas, and their employees and customers share in the invitation.

This stock will be entitled to receive additional dividends at the rate of 1 per cent for each dollar a share paid on the common stock in excess of the rate of $4 a share per annum. It is designed for those consumers and employees who are seeking an opportunity to invest their savings safely, with the further advantage that it may be acquired by installment payments.

One of the purposes of this issue is to obtain the widest possible range of ownership of this company's stock by consumers and employees, the hope being that eventually every consumer and every employee will become a stockholder, thus assuring a sympathetic relationship between the company and its affiliated companies and the public which they serve. For the purpose of assuring the permanency of this plan of widely distributed ownership, the company has established a means through which any holder desiring to sell his shares may find a constantly available market at a premium above the price paid. This redemption provision is in part as follows:

"In case any holder of preferred stock shall at any time desire to sell or otherwise dispose of any of such preferred stock, he shall give written notice thereof to the company at its main office; and the company shall have the right, within thirty days after the receipt by it of such written notice, to purchase the preferred stock described in such notice upon the payment of an amount equivalent to the par value thereof and the amount of any unpaid dividends accumulated thereon to the date of purchase, plus a premium equivalent to 5 per cent of such par value if dividends of not exceeding 6 per cent in the aggregate shall have been paid on the preferred stock during the period of twelve consecutive calendar months next preceding the purchase thereof; a premium equivalent to 10 per cent of such par value if dividends exceeding 6 per cent but less than 8 per cent in the aggregate shall have been paid thereon during such period, or a premium equivalent to 15 per cent of such par value if dividends of 8 per cent or more in the aggregate shall have been paid thereon during such period. . . . No preferred stock shall at any time be transferable by any stockholder unless he shall first have given the said written notice to the company nor unless the company shall have either consented in writing to such transfer or shall have failed to exercise its right to purchase the said stock within thirty days after the receipt by it of the said written notice."

The new issue may either be paid for in full upon allotment or payments may be spread over a period of ten months, interest being credited on the payments at the rate of 5 per cent. Consumers so desiring may make such payments with their monthly bills.

An over-subscription is anticipated, and the company therefore reserves the right to decline subscriptions in whole or in part and to make individual allotments in such manner as may seem best.

# Engineering Education Is a Fruitful Theme in Many Quarters

## Prof. C. F. Scott Pleads for Fuller Comprehension and Support

A BETTER understanding of the purposes of engineering schools, financial support for their work, more intelligent guiding of potential engineering students in secondary schools and a clear recognition of the complex tasks of technical education were urged by President Charles F. Scott of the Society for the Promotion of Engineering Education in a paper upon "Engineering Training and Modern Life" presented at the recent Boston meeting of that society and of the American Association for the Advancement of Science. Reviewing the development of applied science in the past century, Professor Scott pointed out that the engineering type of mind is destined to assume general leadership in governmental and public affairs as well as in private industry. The stability of our civilization depends on our ability to produce the man power for successful and technical leadership. In concluding his address Professor Scott, who holds the chair of electrical engineering at Yale University, said:

"Broader fields of service call for broader training. Suggestions come to the schools from all quarters proposing supplemental subjects which would make the college curriculum cover a lifetime. What is the best training for the young engineer which will best fit him for leadership? Are the present facilities in our engineering schools, their curricula, their equipment, their faculties, their environment, those which will best train young men for the needs of the future? Are boys in sufficient number and of the right type entering those courses?

### THE COMMON FACTOR

"If engineering education is to provide men for such divergent activities as technical research and design, construction, salesmanship, finance, management and advertising, one may well question what is the common factor in all these things which constitutes the real engineer. Is the product of the engineering school to be a definite, simple thing, or is there to be an indefinite list of engineering courses varying from sanitary and automobile engineering to commercial and human engineering? Is the engineering course to be one thing or an indefinite number? Is there some class or type of boys who will make good engineers or is the engineer himself so varied that any sort of a boy ought to make some sort of an engineer?

"In general we recognize that the common factor in the varied type of engineer is a common method; this may be applied to different kinds of problems in accord with personal tastes and abilities and with opportunities and needs.

"Broadly the purpose of the engineering schools is to produce men who will do their part in the world's work. But in order to produce a definite product there should be a definite ideal. Should these matters lie only with the engineering school, with the authorities who select the faculties and with the faculties who make schedules of studies and impart ideas?

### CLEAR OBJECTIVE NEEDED

"Surely we need to know more clearly the ideals and objective in engineering education. The prime task will presumably fall to the engineering school. It must survey the situation and take counsel from others as to the real needs of the future and then set about to determine what training and what learning and what influences will best contribute to the desired results. But as the problem in its larger sense is one which vitally concerns the industries and the public utilities and, broadly speaking, the public welfare it is fitting that there should be a wider interest in the problem. There are other things besides advice which the schools need. There should be a better understanding of what engineering means. High schools and preparatory schools now have teachers with a decidedly academic influence. These should take a new attitude toward the engineering school and the selection and direction of boys of better quality to it. Financial support should be forthcoming. A better understanding is needed of what the graduate is and what he can do. He has potential ability, he has fundamental training, he is a good beginner, but he must have opportunity for experience and training and growth in the particular fields which he enters. These are matters in which those outside the engineering school can contribute directly toward the production of the engineer of the future."

## Stratton Tells of Need of Trained Men

Informally addressing the student body of the Massachusetts Institute of Technology in taking office as president at Cambridge last week, Dr. S. W. Stratton declared that there never was a greater shortage of well-trained men than today and emphasized the growing bond between American manufacturers and institutions of learning, saying that it marks a trend toward closer co-operation in future on behalf of scientific and commercial progress. Dr. Elihu Thomson, acting president, occupied the chair. Prof. H. P. Talbot greeted the new president on behalf of the faculty and Robert Payne Shaw spoke on behalf of the undergraduates. Dr. Stratton said that a few years ago an ordinary manufacturer would not come near a university, but that that time has fortunately passed away and the universities are now besought to aid in solving the problems of industry.

## President Butler Says High Standard at Columbia Will Be Kept

PRESIDENT NICHOLAS M. BUTLER of Columbia University, New York, in his annual report to the trustees, says that opinion is moving in the direction of a policy of higher standards of admission and instruction in engineering schools. The time has come, in Dr. Butler's opinion, to give more special and concentrated attention to the advanced and research work of the university in the whole field of engineering. "The line of separation between pure and applied science is increasingly difficult to discern and maintain." Dr. Butler says, "The real distinction would appear to lie not so much in the subject matter as in the spirit with which the work of research is carried on."

The policy of Columbia University in accepting eight years ago the recommendation of the faculty of applied science to elevate the standard of admission to the Schools of Mines, Engineering and Chemistry, and to turn those schools definitely to the task of training leaders of the engineering profession and research workers, has resulted, Dr. Butler asserts, in greatly reducing the enrollment of students and has left several departments of instruction overequipped for the work which they have to do, at least during the period when the new policy is establishing itself; but he thinks that no one would counsel going back to the former policy of accepting students for the Schools of Mines, Engineering and Chemistry direct from the secondary schools.

### PRINCIPLES ARE DETERMINED

"That," he says, "would be to abandon a fixed principle of our university organization and development and to turn aside from a task which but few institutions, among them Columbia, can do at all, to resume the task which almost any institution of higher learning can accomplish if it chooses. The real question under discussion would appear to relate to the details of the existing plan of admission and instruction, and not to the principles upon which that plan is based. There are signs that opinion is moving in the direction of the policy that was adopted eight years ago."

Pointing out that a group of representatives of the most important engineering schools in the Middle Western States have unanimously approved a five-year program of study for engineering students, with a view to giving the time gained to the study of the humanities and fundamental scientific subjects, Dr. Butler says that whether the program of engineering study be one of five years or six years is probably of less importance than its content and the possibility of the funda-

mental instruction being given by a large number of colleges and scientific schools.

## Industrial Lectureship at Princeton Succeeds

An attempt to bring students into direct contact with the activities of the engineering world and to acquaint them with the leading personalities in industry has been very successful at Princeton University.

In 1921 the Princeton Engineering Association established the Cyrus Brackett Fogg lectureship in memory of Dr. Fogg, formerly professor of physics and electrical engineering at Princeton. A series of lectures is given during the college year by eminent engineers and scientists. These lectures are chosen by an alumni committee in co-operation with Dean Arthur M. Greene, Jr.

Last year the speakers were Samuel Insull, Joseph B. McCall, John W. Liéb, Charles L. Edgar, John A. Britton, Dr. N. E. Loomis and Col. William C. Spruance. Lecturers for this year are Charles E. Adams, Dr. Ralph Modjeski, Henry I. Harriman, Dana D. Barnum, R. G. Porter, Henry O. Loebell, Alexander S. Lyman, August Belmont and General J. J. Carty.

Dean Greene reports that large numbers have attended the lectures and that the students have shown great interest. The plan marks a trend in development which should, it is held, have a marked influence upon educational co-operation with industry.

## No Successor Found for Dr. Stratton at Washington

No progress has been made in the search for a director for the Bureau of Standards to succeed Dr. S. W. Stratton, who retired from the government service to accept the presidency of the Massachusetts Institute of Technology. Because industry is making much more extensive use of research laboratories, physicists are, according to Commerce Secretary Hoover, very scarce and as a result the level of salaries has risen greatly. This, he declares, makes it very difficult for the government to find an ideal man for this place, when it requires a physicist in the front rank of his profession who will be willing to work for $6.000 a year.

## Wiring Committee Makes Recommendations

In an interim report the wiring committee of the Joint Committee on Business Development has made the following recommendations as a "standard or measure at which commercial departments, wiring contractors, etc., should aim." The committee labels its recommendations "the minimum American house-wiring standard of wiring outlets." They are:

"An average of three outlets (lighting and convenience) per room [that is, parlor, sitting room, dining room, kitchen, bedroom, etc., as based on the ordinary real estate rating], computed as follows:

"There should be at least one lighting outlet and one convenience outlet in any one room, and the outlets (whether lighting or convenience outlets) in the bathrooms, hallways, stairways, closets, unfinished attics, cellars, etc., and any additional outlets in the main rooms (over and above the minimum of one lighting and one convenience outlet) should be enough to bring the average per room up to three as a minimum.

"For the purpose of this standard a switch is not an outlet. An outlet (omitting switches) is considered the point where the wires come to an end at the wall. A convenience outlet is considered as one outlet. A twin convenience outlet permanently connected to the wall is considered as two outlets. A bracket light is considered as one outlet even if there are two or more sockets in the bracket. A chandelier is considered as one outlet even if there are two or more sockets in the chandelier."

## Interstate Merger Approved

The application of the Interstate Public Service Company of Indianapolis for permission to absorb seven public utilities owned by it or under the same control has been approved by the Indiana Public Service Commission. The consolidation is based on a $6,071,029 valuation, and the commission has authorized the company to issue $2,000,000 common stock, $600,000 of 7 per cent preferred stock and $500,000 of 5 per cent bonds to finance the deal and to assume $2,119,600 of debts against the absorbed properties. The seven companies are the Hydro-Electric Light & Power Company, Connersville; Hawks Electric Company, Goshen; Middlebury Electric Company, Winona Electric Light & Water Company, Electrical Transmission Company of Northern Indiana, Southern Indiana Power Company and Indianapolis & Louisville Railway Company.

The enlarged Interstate Public Service Company serves more than 46,000 customers with electricity and has an annual gross revenue from all sources of approximately $6,000,000.

## December Financing Less Active

ALTHOUGH the demand for bonds during the month of December was not so heavy as it had been for several months previously, bond dealers report that the issues offered were well absorbed by investors. New issues of electric light and power public utility securities equaled $18,048,000. The issues were small in number and also in volume. Only nine issues of this type of security were offered in the month, and the largest single offering was the five-million-dollar stock issue of the Electric Bond & Share Company. The average rate of return yielded the investor advanced to 6.59 from 5.82 in November and 5.85 in October. The fact that most investment bankers decided to stand aloof from the market until the first week of the new year tended to slow up business, but the outlook for new issues is now pending.

SECURITY ISSUES OF ELECTRIC SERVICE COMPANIES IN DECEMBER

| Name of Company | Amount of Issue | Period | Class of Security | Purpose of Issue | Rate of Interest | Offered at | Per Cent Yield |
|---|---|---|---|---|---|---|---|
| Central Indiana Power Co. | $4,248,000 | Twenty-five-year | First mortgage collateral and refunding gold bonds, series A. | To acquire securities of subsidiary companies and for other purposes | 6 | 95 | 6.40 |
| Central Arizona Light & Power Co. | 500,000 | Twenty-year | First and refunding mortgage gold bonds, series B. | To retire outstanding bonds | 6 | 97 | 6.25 |
| Great Northern Power Co., Ltd. (Ontario) | 850,000 | Fifteen-year | First mortgage sinking-fund gold bonds. | To construct plant | 7 | 95* | 7.50 |
| Adirondack Power & Light Corp. | 2,500,000 | Twenty-eight-year | First and refunding gold bonds | | 5½ | 96⅝ | 5.75 |
| | 3,800,000 | | Cumulative preferred stock | For acquisitions and construction | 7 | 90 | 7.78 |
| Detroit Edison Co. | | Ten-year | Convertible gold debenture bonds. | | 6 | 102 | 5.73 |
| Northern Ohio Traction & Light Co. | 1,000,000 | Twenty-five-year | General and refunding mortgage gold bonds, series A | To retire underlying bonds and reimburse for construction expenditures. | 6 | 94 | 6.50 |
| Coast Power Co. (Oregon) | 150,000 | Twenty-year | First mortgage bonds, series A | To retire outstanding bonds and for additions | 6 | 98 | 6.20 |
| Electric Bond & Share Co. | 5,000,000 | | Cumulative preferred stock | General corporate purposes | 6 | 97 | 6.20 |
| Total | $18,048,000 | | | | | | |

* With a bonus of 50 per cent in common stock.

## Farm Engineers Form Rural Lines Committee

The use of electrical energy on the farm was discussed at the annual meeting of the American Society of Agricultural Engineers at St. Louis at a session of the college section on Dec. 27. The matter was presented by J. C. Martin of the ELECTRICAL WORLD as one in which the electrical and agricultural industries must co-operate. Methods and equipment through which the farmer can employ electrical energy profitably to reduce the cost of production must be developed, Mr. Martin said.

Men engaged in farm engineering work at the agricultural experiment stations and who make up the college section of the society discussed the problem, dwelling on the important part these stations should take in its solution. A committee to study rural electric service from central stations was formed to supplement the work already under way by a committee studying the individual-plant problem. C. A. Atherton, National Lamp Works, Cleveland, is the chairman of the new committee.

## Coal Commission May Take Hand in Wage Dispute

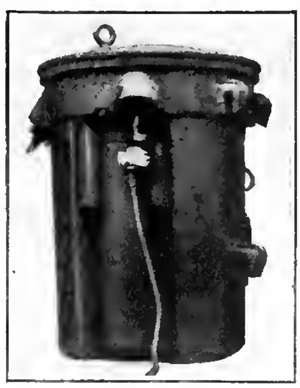
The action of the President's fact-finding coal commission last week in telegraphing the officials of the coal operators' and miners' joint wage conference at Chicago asking for a continuance of the present wage scales for one year in case efforts to reach an agreement should fail is thought by some to indicate a disposition on the part of the commission to mediate in the wage dispute. The commissioners have asserted the probability of an agreement of some kind that will prevent a strike on April 1. The replies from Chicago afford basis for a moderate degree of optimism, both sides, while maintaining that the agreement proposed could not be made at the conference then in session, expressing the opinion that a subsequent conference would be held at which it could be acted upon.

## Accounting Service Given by Wisconsin Association

The Wisconsin Utilities Association has instituted an accounting service bureau for the purpose of assisting the smaller member companies in the association to keep better accounts. Karl F. McMurry will head the bureau. By going to Madison to have reports made out, errors in accounting detected or general instruction given to new bookkeepers, companies can obtain this service without extra charge. The smaller companies can send in their records and federal and state income tax reports will be made out. In cases where more extensive services are required the member companies are expected to pay the actual cost.

## Brief News Notes

**A New Experiment in Electrical Homes.**—Just as the electrical interests in Cleveland were opening their fifth "electrical home" with the latest electrical fixtures and appliances, a sixth electrical home, not quite so modern, but in the class of experiments, was discovered by linemen working on a 55-ft. pole in one of the districts where trees are not plentiful. A bushing in a transformer case, which insulated the primary tap from the casing, had in some way been ejected, leaving a 1½-in. opening through which the birds entered the case. Within it, over the coils,



five nests, built one on top of the other, were found, possibly used by the same birds for as many years. There was one egg in the top nest. The transformer had been in service for eleven years and was being replaced by a larger one. It was rated at 7½ kw. and was connected to a 4,600-volt primary line. This plan of partial electrical incubation seemed to have been successful, as there were no signs of fatalities to birds in the transformer case. The photograph was taken by W. C. Saker of Cleveland.

**Cheboygan (Mich.) Company Sold.**—The General Engineering & Management Corporation, New York City, has recently taken over the Cheboygan (Mich.) Electric Light & Power Company, serving twelve communities, and is completing negotiations for the acquisition of some properties in New Jersey.

**A Consolidation in Maryland.**—The plant of the Havre de Grace Electric Company has been purchased by the Northern Maryland Electric Company, and connections will be made at Perryville with the latter company's transmission line, which will be extended from Port Deposit, the end of its present line. Steel poles will be used.

**Maine Companies May Unite.**—The Cumberland County Power & Light Company, Portland, Me., has petitioned the Maine Public Utilities Commission for authority to purchase the properties of the York County Power Company and the Westbrook Electric Company. The Cumberland County company owns the common stock of these utilities, which form with it a single interconnected system.

**New Turbine for Iowa Utility.**—The Tri-City Railway & Light Company is contemplating the addition of a 26,000-kw. turbo-generator to its Moline station, at a cost of about $1,250,000. The present capacity of the station is adequate to take care of existing needs, but a careful survey has shown that the proposed new unit will be required in the next few years. The Moline station serves Davenport, Rock Island, Moline and Muscatine.

**Permanent Electric Exhibit at San Diego.**—In connection with a permanent materials exhibit now being installed in the basement of the Spreckels Building in San Diego, Cal., electrical men plan to take part of the space and make a co-operative display. Building permits for San Diego totaled $10,000,000 in 1922, and the prospects are for a still more active program in 1923. The exhibit will bring builders into contact with those who manufacture, job and retail materials and appliances.

**Fort Smith Transmission Line Completed.**—The transmission line of the Oklahoma Gas & Electric Company from Muskogee, Okla, to Forth Smith, Ark., has been completed. This line furnishes power to Fallis, Gore, Vian, Sallisaw, Hanson and other towns along the line which heretofore have been dependent upon small individual plants. The construction of this 60-mile transmission line through a wooded and mountainous country was completed in sixty-two days. A distribution system at Gore and Webbers Falls is now being constructed. The main construction force has been transferred to the southern extension, which will run south from Sallisaw through Cowlington, Poteau and Heavener. This line will extend into the coal fields of eastern Oklahoma.

**Nevada Valleys to Lease Lahontan Plant.**—It is reported that the Secretary of the Interior and the Director of the Reclamation Service have approved the contract entered into by the Nevada Valleys Power Company and the United States government for a lease on the Lahontan power plant. The lease is to extend from 1924 to 1934, and in return the company abandons all claims to power rights on the Truckee River near Vista. The contract provides for certain improvements to the Lahontan power plant, increased power efficiency and broadening of the power service. Approval of the contract settles for ten years the friction that has

developed over power rights on the Truckee River, involving as participants the Reclamation Service, the Nevada Valleys Power Company and promoters of the Newlands Project.

**Electrification of Railroads in France.**—Electrification of the section of the Midi Railroad from Pau to Tardes in France has been about completed. The Midi Railroad is committed to the electrification of 1,864 miles of track at an early date, and the Orléans and Paris-Lyons-Mediterranean lines have similar progress in view. The director of the Midi Railroad says that the electrified system will be extended to Montrejeau by March and that during the summer of 1923 the Dax-Toulouse line will be electrified.

**Springfield (Ohio) Company to Serve Five Electrically Abandoned Towns.**—Five Ohio communities that lost electric power and light service when the Springfield, Troy & Piqua traction line was abandoned will receive service in the future from the Springfield Light, Heat & Power Company, negotiations having been about completed. These communities are North Hampton, Dialton, Bushnell, Lawrenceville and Thackery. Under the tentative plan, the Springfield company will take over the transmission lines of the abandoned traction line, transmitting energy at 66,000 volts, to be reduced to 110 volts for consumption. The Springfield company is also supplying Urbana with light and power and contemplates extension to other communities in the vicinity.

**Wakefield to Save Money by Buying High-Tension Central-Station Service.**—By expending $50,000 for a new substation and for an underground line about 6,000 ft. long to connect with the system of the Edison Electric Illuminating Company of Boston, the town of Wakefield, Mass., will save about $7,000 a year over the present costs of operation. The town has a municipal distribution system and already purchases energy from the Edison company, but by the new arrangement electricity will be supplied to the town at the regular high-tension rate. The Edison company will expend $135,000 to build an underground line from its Woburn substation to the Wakefield town line, the distance being about 5 miles. The introduction of the high-tension service will also enable the town to expand its local service. The citizens have appropriated $50,000 for the foregoing purpose.

**Court to Decide Utility Basis.**—An order issued by the Corporation Commission of Oklahoma holding that the Southern Oklahoma Power Company, which manufactures electricity at Byng, is a public utility under the laws of Oklahoma is to be tested in the State Supreme Court. The question involved is whether or not the company is required to report to the Corporation Commission and file all the reports required under the commission's orders. The commission holds that the ownership of the Southern Oklahoma Power Company is the same as that of the Oklahoma Light & Power Company, which distributes electricity from the Byng plant in several cities and towns of southern Oklahoma, and that in order to fix rates for the latter company intelligently it is necessary to have possession of monthly reports of the Southern Oklahoma Power Company.

**United States Navy Airplane Carriers to Have Electric Drive.**—Two airplane carriers now under way for the United States Navy under plans altered from others originally drawn for battle cruisers which, under the limitation program, will not be built are to be electrically equipped throughout by the General Electric Company. Powerful turbo-generators will drive the propellers through huge electric motors, two for each of the four propeller shafts. Rear Admiral Griffin, former chief of the Bureau of Engineering, says that these boats will represent "the greatest horsepower per shaft that has ever been projected in any marine installation, irrespective of the type of motive power." The propulsion apparatus is the same, barring minor alterations, as was planned for the original battle cruisers. The generators will be operated by steam from sixteen oil-fired boilers and each will have a rating of 40,000 kva., 5,000 volts, three-phase, 1,770 r.p.m.

# Associations and Societies

**Rocky Mountain Electrical Co-operative League.** — The second annual meeting of this association was held at Salt Lake City on Dec. 4, when the sixteen members of the board of trustees were chosen, four each from the central-station industry, the manufacturers, the jobbers and the contractor-dealers. W. A. Moser was made chairman of the league for the ensuing year, A. J. Calloway vice-chairman and R. M. Bleak secretary and treasurer.

**Southwestern Electrical and Gas Association.**—Announcement is made of change of name of the Southwestern Electrical and Gas Association to the Southwestern Public Service Association. There will be no change in the purposes or activities of the association, and the office will be as heretofore at 403-4 Slaughter Building, Dallas, Tex. The spring convention will be held at Fort Worth, Tex., May 15 to May 17. E. N. Willis is secretary.

**American Society of Civil Engineers.**—Engineering education and engineering research figure prominently in the program of the civil engineers' seventieth annual meeting, to be held in the Engineering Societies Building, New York City, on Wednesday, Thursday and Friday next, Jan. 17 to 19. On Wednesday afternoon there will be a joint session with the Society for the Promotion of Engineering Education, when Prof. Charles F. Scott of Yale, president of the latter society; Dean William G. Raymond of the College of Applied Sciences, Iowa State University; Magnus W. Alexander, consulting engineer, General Electric Company, and John L. Harrington, president A. S. M. E., will speak. Research activities will be discussed on Friday morning by prominent engineers.

**Empire State Gas and Electric Association.**—The electric meter section of this association will meet at the Onondaga Hotel, Syracuse, N. Y., on Monday and Tuesday, Jan. 22 and 23. On Monday "Demand-Meter Maintenance" will be discussed by E. A. Le Fever, Buffalo General Electric Company; "Electric Demand Rates" by W. M. Carpenter; "Metering Problems in Changing Distribution" by W. Davies, Public Service Corporation of New Jersey; "Instrument Transformers" by J. B. Gibbs, Westinghouse Electric & Manufacturing Company, and "Potentiometers" by I. Melville, Stein, Leeds & Northrup Company. On Tuesday C. L. Casler, Syracuse Lighting Company, will discuss "Maintaining Meters Under Public Service Commission Order"; F. C. Holtz, Sangamo Electric Manufactur-Company, "Measurement of Electric Energy and Power," and B. W. St. Clair, General Electric Company, "Jewels and Pivots."

## Coming Meetings of Electrical and Other Technical Societies

[A complete directory of electrical associations is published in the first issue of each volume. See Jan. 6 issue, page 78, for latest list.]

National Council Lighting Fixture Manufacturers—Cleveland, Jan. 15-20. C. H. Hofrichter, 231 Gordon Square Bldg., Cleveland.

Lighting Fixture Dealers' Society of America—Cleveland, Jan. 15-20. J. L. Wolf, Electrical League, Hotel Statler, Cleveland.

Western Association of Electrical Inspectors—Chicago, Jan. 23-25. W. S. Boyd, 175 W. Jackson Blvd., Chicago.

Iowa Engineering Society — Des Moines, Jan. 23-26.

Wisconsin State Association of Electragists—Milwaukee, Jan. 24-26. H. M. Northrup, 23 Erie St., Milwaukee.

Association Municipal Electrical Utilities of Ontario—Toronto, Jan. 25-26. S. R. A. Clement, 190 University Ave., Toronto.

Electrical Supply Jobbers' Association—Central Division, Chicago, Feb. 13-14; Atlantic Division, New York, Feb. 14; executive committee, Atlantic City, Feb. 15-16. Franklin Overbagh, 411 S. Clinton St., Chicago.

American Institute of Electrical Engineers—New York, Feb. 14-16. F. L. Hutchinson, 33 West 39th St., New York.

American Institute of Mining and Metallurgical Engineers — New York, Feb. 19-21.

American Physical Society—New York, Feb. 24; Washington, April 21. D. C. Miller, Case School of Applied Science, Cleveland.

Oklahoma Utilities Association—Oklahoma City, March 12-14. O. D. Hall, 1106 First National Bank Bldg., Oklahoma City.

Southwestern Division, N. E. L. A.—Oklahoma City, March 14-16. S. J. Ballinger, San Antonio Public Service Co., San Antonio, Tex.

Illinois State Electric Association—Chicago, March 16-17. R. V. Prather, 305 Mine Workers' Bldg., Springfield, Ill.

Wisconsin Utilities Association—Milwaukee, March 22-23. John N. Cadby, 445 Washington Bldg., Madison.

American Electrochemical Society — New York, May 3-5. Colin G. Fink, Columbia University, New York.

National Electric Light Association—New York, June 4-8. M. H. Aylesworth, 29 West 39th St., New York.

# Recent Court Decisions

**Nebraska Commission Sustained.**—Affirming a decision of the Nebraska Railway Commission in Rawlings vs. Chicago, Burlington & Quincy Railroad Company, the Supreme Court of Nebraska declared that on any appeal from a commission order the finding of the commission would receive the same weight as the verdict of a jury and would not be reversed unless clearly wrong. (190 N. W. 569.)*

**Six Thousand Dollars for Death of Electric Helper Not Excessive.**—The Supreme Court of Appeals of West Virginia, in Halley vs. Ohio Valley Electric Railway Company, has declared not excessive a verdict for $6,000 for the death of an electric helper from injuries received while installing a transformer in an electric substation. He was put to work on a ladder which stood only a few inches from an exposed and energized bushing, the dangerous character of which was unknown to the youth, who was inexperienced. (114 S. E. 572.)

**United States May Maintain Storage Pond at Maximum Height for Power Purposes.**—Suits brought by Phillips et al. against Waters et al. and Wheeler et al., and in which the Sterling Hydraulic Company and the Rock River Light & Power Company sought to intervene as defendants, asked for an injunction against the agent of the United States having charge of a federal dam in the Rock River to compel him to open the sluicegates in the winter months, thus stopping the operation of the power plant to which the government's hydraulic system was leased. A decree granted by the lower court has been reversed by the United States Circuit Court in Illinois, which holds as follows: (1) When the United States in lawful exercise of its authority builds a dam for purposes of navigation, the water power thus developed may be lawfully used by it or leased to any concern engaged in the development and distribution of power or electrical energy. (2) Where the United States government acquires the right to erect a dam to a certain height for the purpose of improving navigation, it also acquires as an incident thereto the right to use the pond for power purposes. (3) Injunction is not a proper remedy when the damage caused by the thing sought to be enjoined is relatively very slight compared with that which would be caused by its issuance. (4) Where the United States at large expense built a dam in aid of navigation and for seven years maintained it at a certain height without objection from owners of the land which was overflowed, and in the meantime a power company had built a plant at large cost to use the water from the pond made, such landowners are not entitled to an injunction which would stop operation of the power plant, but will be held to their remedy at law, especially in absence of showing that they would suffer substantial injury. (5) Condemnation decrees giving the United States the right to maintain a dam in aid of navigation at a stated height, on which basis landowners were compensated for flowage, entitles the government in its discretion to maintain the dam at such height during all times of the year. (284 Fed. 237.)

**Electric Truck Not Attractive Nuisance.**—An electric delivery truck by which a child was injured after he and other children had started it going was held not to have been an attractive nuisance by the Supreme Court of Michigan, in Jackson vs. Mills-Fox Baking Company. In this case the driver of the truck shut off the power and set the brakes while he carried purchases to a private house, but did not remove the switch plug. The court, reversing the lower tribunal, found no negligence and said that the starting of the car by the trespassing children was the proximate cause of the accident. (190 N. W. 740.)

*The left-hand numbers refer to the volume and the right-hand numbers to the page of the National Reporter System.

# Commission Rulings

**Capitalizing Non-Utility Property.**—A public utility may capitalize all the property it owns although it may not include property not devoted to public service in its rate base, according to a decision of the New Hampshire Public Service Commission *in re* Exeter & Hampton Electric Company. The commission therefore included in a valuation for the purpose of issuing securities an office building a part of which was rented for other than utility purposes, stating that rates and capitalization rested upon different bases.

**Capitalization of Savings.**—The annual savings of the Kootenai Power Company under a favorable contract were capitalized at the rate of 8 per cent, and half of this amount was added to the rate base by the Idaho Public Utilities Commission. The question, the commission said, was "whether or not the Kootenai Power Company is entitled to receive any of the benefits which may accrue by reason of its diligence in taking advantages of opportunities which make for economy in the furnishing of electrical energy to its consumers. This utility is one which is and has been managed efficiently and economically. . . . A public utility should be encouraged to practice economy in its management, and the utility that practices economy should not be placed on a par with the utility which is extravagant in its operation. A utility should not have the full benefit accruing by reason of such arrangements, but it is entitled to a portion thereof. . . . In case the present conditions change from any cause whatever, the amount herein allowed shall be deducted from the valuation hereinafter determined."

**Rural Service Charges.**—In authorizing the Leopolis Electric Light & Power Company to make adequate charges to meet the additional expense from excessive transformer losses in supplying rural consumers the Wisconsin Railroad Commission said: "Data furnished by the company indicate that over one-half of the energy purchased is dissipated before reaching the customer. In order that those consumers who cause the unusual expenditures shall contribute more materially to the revenues, the commission has in nearly all cases involving rural rates authorized a line or transformer charge in addition to the regular rates. This charge is dependent partly on the size of the transformer required by the customer. In this particular case we believe that a transformer charge is necessary for all consumers not located in groups having the saturation density of villages."

**Revenue Derived from Other States May Be Considered in Fixing Rates.**—Although a state commission has no jurisdiction over rates in a neighboring state, it may, according to a decision of the North Dakota Board of Railroad Commissioners in fixing rates for the Pembina Light & Power Company, take into consideration the total revenues and expenses of the utility and the amount of the utility's product sold in towns out of the state. The commission said it would expect the utility to look to other towns than the one in question for a portion of the increased revenue necessary to meet operating expenses, depreciation and return. The commission added: "If the utility, in view of the facts disclosed by this investigation, desires to furnish electricity to towns outside our jurisdiction at cost or less, it cannot expect to make up losses by excessive rates elsewhere."

**Adjusting Expense of Inductive Co-ordination.**—The Public Service Commission of Missouri has ordered the Clifton Hill Light & Power Company, which, it was alleged, had made the service of a telephone company of no effect on the two possible routes between two towns, to stand the first cost of one additional telephone wire so as to provide a metallic circuit, and it was required to build its stub lines according to standard specifications, and where the stub lines overbuilt or paralleled in close proximity the rural grounded lines of the telephone company the electric company was required to stand the expense of separating the grounded telephone lines from the transmission line for a distance equal to the width of the country roads in that territory. In view of the fact that better telephone service would be obtained by the metallicized lines, the telephone company was required to pay for the maintenance, depreciation and pole rental of the lines.

# Men of the Industry

Changes in Personnel
Accomplishments, Responsibilities, Honors, Appointments and Activities of Men Engaged in all Branches of the Electrical Industry

**Worth Bates**, treasurer of the Missouri Gas & Electric Service Company, has been appointed a member of the city advisory committee of Lexington, Mo.

**Francis C. Shenehon** has been appointed vice-president and general manager of construction and engineering of the Byllesby Engineering & Management Corporation, with headquarters at Chicago.

**Major-General George W. Goethals** was appointed State Fuel Administrator on Tuesday, Jan. 9, by Governor Smith, to succeed William H. Woodin, who resigned because of the pressure of private business.

**Charles H. Brown** assumed the duties of superintendent of the North Birmingham (Ala.) light and water plant last week, succeeding Henry S. Hill, who tendered his resignation about a month ago to become chief clerk in the office of Sheriff T. J. Shirley.

**Douglas Betts**, chief engineer of Messrs. Debenhams, Ltd., electrical engineers of London, England, recently visited the Pacific Coast. Mr. Betts, who is a member of the American Institute of Electrical Engineers, is touring the United States for the purpose of investigating recent hydro-electric developments.

**John J. Hubbard**, assistant secretary of the Public Service Commission of New York, resigned last month to enter private practice as an expert accountant and financial adviser to public utilities. He will maintain an office in New York City. Mr. Hubbard has been connected with the Public Service Commission for ten years in various positions, including examiner of accounts, expert accountant and chief of the division of capitalization.

**Edward J. Nally**, who was elected to the new office of managing director of international relations of the Radio Corporation of America, as was announced in the Nov. 25 issue of the ELECTRICAL WORLD, assumed his duties on Jan. 1, when he was succeeded in the presidency of the corporation by Major-General James G. Harbord, who retired from the army.

**August H. Meyer** has been elected president of the Langstadt-Meyer Company, Appleton, Wis., replacing A. C. Langstadt, who is no longer connected with the organization. R. S. Saxton, formerly manager of the Milwaukee branch of the Westinghouse Lamp Company, will be associated with the company as vice-president and sales manager, and **J. G. Harvey**, formerly sales manager of the Luxam Electric Company, Fort Wayne, Ind., will be manager of the company's Oshkosh (Wis.) branch.

### W. A. Moser Elected Chairman of Rocky Mountain League

Walter A. Moser, manager of the Westinghouse Electric & Manufacturing Company at Salt Lake City, was elected chairman of the Rocky Mountain Electrical Co-operative League at the second annual meeting of the league, held in December. Mr. Moser completed two years' apprenticeship with the Westinghouse company at East Pittsburgh, Pa., in 1911. He entered the sales department of the Salt Lake City office of that company in August, 1911, and was made manager in 1920, which position he now holds. Mr. Moser was born in Union Hill, N. J., in 1886 and was graduated from the University of Nebraska with the degree of bachelor of science in electrical engineering in 1907.

W. A. MOSER

**Verne L. Havens**, director of the *Ingeniería Internacional*, has been made permanent secretary of the International Engineering Congress, composed of engineers of North America and the Latin-American republics.

**John M. C. Horn**, who was comptroller of the Illinois Traction System, Peoria, Ill., with headquarters at Champaign, Ill., resigned that position on Jan. 1. Mr. Horn had been with the Illinois Traction System and its component companies for fourteen years, having served in the general offices at Champaign during that time. He has made no plans for the immediate future. The position vacated by Mr. Horn will be filled by T. A. Smith, supervisor of capital expenditures for the same company, who for the present will conduct the work of both offices.

**F. S. Mills** has been appointed representative of the Illuminating Engineering Society in Los Angeles. Mr. Mills has recently been made director of the activities of the National X-Ray Reflector Company in the territory from Denver west, including the Hawaiian Islands.

**W. C. Chappell**, noted English hydro-electric engineer, recently visited San Francisco en route from Australia. Mr. Chappell is known in Australasia as the man who gave Tasmania its first electric lights and street cars. He supervised the construction of a 57,000-hp. hydro-electric plant near Hobart, Tasmania, and later, as chief electrical engineer of the State Electrical Commission of Victoria, was in charge of the erection of a steam plant at Melbourne.

**Harry L. Brown**, who was for some time Western editor of the *Electric Railway Journal* at Chicago and has more recently been managing editor at New York, has been appointed co-editor of the paper with Henry W. Blake. Mr. Brown joined the *Electric Railway Journal* staff at the Chicago office in 1916, having become connected with the McGraw-Hill Company a year before as assistant editor of the ELECTRICAL WORLD. He is a graduate of the University of Michigan and is well known in the railway field, particularly in the central territory.

**J. E. Yorkston** has recently been promoted from the position of engineer in charge of the drafting department of the General Electric Company to that of consulting mechanical engineer. In his new capacity Mr. Yorkston will assist the designing engineers of the company in connection with important mechanical problems and will also serve as a consulting authority in all matters pertaining to drafting practice. He was first employed by the General Electric Company in 1894 as a designing draftsman. Three months later he was put in charge of the alternating-current drafting department, and in 1902 he was made assistant engineer of the works drafting department. In 1907 he was again promoted to be engineer in charge of drafting, which position he held continuously until his present promotion. He is also chairman of the committee on drafting practice and a member of the committee on mechanical design.

# Obituary

**Mabel Hubbard Bell**, widow of Alexander Graham Bell, inventor of the telephone, died on Tuesday evening, Jan. 2, in Chevy Chase, Md., at the home of her daughter. Mrs. Bell never recovered fully from the shock of her husband's death last summer. Mrs. Bell lived under an affliction of total deafness that followed a severe attack of scarlet fever in her childhood. It is said that Dr. Bell's hope that he might find a means of enabling her to hear led to experiments in the realm of phonetics which resulted in his great discovery.

## Waste in Advertising

**The Bad Influence of "Free Literature"—The Dealer Should Share in the Cost to Make Him Careful—Manufacturer and Seller Should Unite for Efficient Publicity**

By J. C. McQuiston

Manager Department of Publicity, Westinghouse Electric & Manufacturing Company

NO ONE can deny that there is waste—much waste, large waste—in advertising. Somehow we have come to accept it as a condition, much like that of waste in fuel. Take a ton of coal and burn it in your furnace. Will you get all of the heat units out of it? Even if your furnace is the most efficient you know, you will lose far more than you will get. That is why the battle is ever on for more efficient grates and burners, boilers, etc. And so it is in advertising. Our fight to reduce waste in advertising must be courageously continued.

Let us consider the advertising that we ourselves control—our direct mail and our literature for consumers. Do we know what our waste is? No doubt all of us sleep better because we do not know the facts in the case. Enough is known, however, about this waste to stir every user of direct advertising to eliminate much of it.

J. C. MC QUISTON

### "Free Literature" an Evil

One of the causes of flagrant waste is "free literature." This is a disease in advertising. It is cancerous, because it draws the very lifeblood from this kind of advertising. We all know how much a "free" thing is appreciated. Make a concert free and you prepare the way for either an empty house or a "cheap crowd." The manufacturer who gives without charge all advertising "helps," including folders, "trims," cards and so on, will get rid of large quantities. That is just what he will do, but no more—he will "get rid of them." But, of course, he intended to do more; he expected the "helps" to be mailed to prospective customers. He desired every copy to find a lodgment in the home or business of such a person. But the "life" of the scheme was lost when the plan was cheapened by being "free." The dealer thought he was interested, and you, the manufacturer, thought the dealer was interested, but the facts are that the interest was only on the surface.

When the manufacturer offers the dealer all of some three-color folders he wants, and the dealer says, "Better let me have two thousand," does the dealer say to himself, "I can make good use of two thousand by addressing eighteen hundred from my up-to-date mailing list and two hundred can be used on my counter. I will use them very carefully because two thousand copies of this beautiful folder must be worth $200." On the contrary, you know he knows little, and cares less as a rule, what they cost. Any manufacturer who does not know this to be so can find out by following up some of those free and easy requisitions that come in from his dealers. He might even visit some of those dealers and ask where their last folders went. Is it not his duty to inquire into this?

Printed sales helps represent so much money. When you send them to your dealer you are sending just so much cash, for you have paid cash for writing, planning, printing and shipping them to the dealer. The dealer should be made to appreciate this, so that when he sees a pile of printed folders in his stockroom, out of date, dust-covered and obsolete, he will realize that it represents waste—waste in advertising, which represents waste of real American money.

### Dealer Should Share Costs

I recall returning from an advertising conference at Bedford Springs, Pa., where waste in advertising had been made one of the chief topics. Our party of five were motoring along the Lincoln Highway at Stoyestown, when immediately in front of a garage at this place a tire blew out. While repairs were under way the party, strolling about the garage, beheld stacks of automobile and accessory folders which had, conservatively speaking, a value of $1,000. Think of it! How many manufacturers in good faith had sent this man supplies of literature, and here it was ready to be burned. I would regard it as a safe guess that one-half of the auto literature given to the dealer "free" is wasted.

For economical and other reasons it would not be practical for the dealer to prepare and print his selling "helps." In many ways, if he could do it, however, the work would be better done. For if the dealer *did* do it, you could rely on his knowing the cost and realizing the value of it, and he would therefore, with certainty, see to it that such matter was properly used—not wasted.

Even as things are, with manufacturers for the most part printing and paying for the dealer helps, the dealer would be in a more sound position if he paid a portion—say one-half of the cost of all dealer helps requisitioned by him. If he realized in every case that when he asks his manufacturer for helps he is obli-

gating himself to pay some of the cost of producing such helps, he would be prompted to consider ways and means of using the literature. His demands would be tempered by consideration of investment, and thus this costly waste would be greatly reduced.

Free literature, advertising "helps," etc., are conducive to careless practices and waste. The sooner this problem of the efficient promotion of advertising as between the one who makes and the one who sells is brought to a point where the cost is shared by both, the sooner will millions of dollars be saved to many industries, to say nothing of greater effectiveness resulting from such joint efforts.

# Our Largest Potential Foreign Customer

**Importance of Great Britain as a Market and as a Source of Education in Foreign Trade—Some of the Difficulties Encountered in Promoting Business with Her**

BY CAXTON BROWN

Secretary Weston Electrical Instrument Company, Newark, N. J.

A RATHER careful reading of numerous articles dealing with foreign trade opportunities that have appeared recently reveals the fact that it is very seldom that writers give any attention to our potential market in the British Isles. Yet Great Britain is this country's largest foreign customer.

I do not minimize the trade possibilities that exist in the Latin-American countries, the Far East or other export markets. They are all worthy of close attention, but sometimes it seems to me that there is more theory and less common sense applied to the development of foreign markets than should be the case.

### OFFERS FAVORABLE CONDITIONS

Great Britain has shown the most powerful recuperative possibilities of all markets. It is an English-speaking country. Its methods of doing business are most similar to our own, and, generally speaking, its electrical products do not equal our own either in design or workmanship. Surely these are conditions that warrant a careful study of the best method of securing a fair share of that market. For were we considering the matter from a domestic viewpoint, I believe that any intelligent manufacturer would lay most stress on an effort to secure the good will and trade of his largest potential customer.

All foreign trade is beset with difficulties at the present time. There are troubles of exchange and finance and tariff difficulties which are largely reciprocal; there are passport visas with ridiculous fees, also of a reciprocal nature, and depression in business, all to combat. But these obstacles will not endure forever, and those who endeavor to overcome them in a sane manner can establish connections that will yield attractive returns later on. It is worth consideration that it is easier to obtain a firm foothold now than it will be later on when business is better and more American companies make the effort.

But the intending American exporter should by all means go after this market in an earnest, determined manner and be ready to back his opinions. Haphazard efforts will produce no satisfactory results. His first step should be to analyze all available data, including our own consular reports and British statistics, upon the amount of imports of his particular article. He should secure catalogs of all British competitors and, if feasible, samples of their product. With such information available it will be possible to establish laid-down costs in England for his own product, and should these costs be higher than the price of British-made articles, he may determine whether the price disadvantage may be offset by superior quality or superior serviceability. If neither of these latter advantages exist, the market had better be left alone.

However, should it be deemed possible to export advantageously, then the best procedure would be to make a trip to England to obtain exact information as to the preferable methods of sale—whether through dealers, jobbers or through an exclusive agency. Likewise, careful study should be made of the volume or extent of the sale of the British-made articles which are offered in competition and of the best advertising mediums.

The American Chamber of Commerce in London and our own consular force and commercial attachés will cheerfully assist in such research work and indeed will, I am sure, be glad to furnish much valuable information by mail.

It is difficult for me to try to say specifically just which type of electrical products at this time will be apt to find the greatest opportunity in the British market. I have not investigated or studied the problem from this point of view, our attention being pretty fully occupied with our own line and the affairs of our own British company. In general, I may say that I do not believe that lamps or large motors or generators could profitably be exploited in England; but were I manufacturing any other electrical contrivances or devices and were I interested in exporting them, I would at once start my research work in this market as previously indicated.

### TARIFF DIFFICULTIES

Of course, the prospective importer to the British Isles must not overlook the fact that Great Britain is no longer a strictly free-trade country, for within the past two years laws have been passed which impose an import duty of 33⅓ per cent on many articles and commodities. However, we in this country are hardly in a position to throw stones on that score, because it is a well-known fact that many of the tariffs encountered in conducting foreign trade are to a great extent of a retaliatory nature. Indeed, one of the greatest impediments to world trade today is the vicious circle of retaliatory tariff barriers.

Notwithstanding that it is largely in our own power to reduce these barriers, we seem to make very little, if any, progress in that direction, and by many our latest tariff law is believed to increase these difficulties rather than diminish them. So that if one is inclined to demur at Britain's change from a free-trade to an import-tariff country, he should first study the question from all angles.

Another obstacle that appears somewhat insignificant at first glance and yet which has its importance for United States companies employing foreign travelers is the ridiculous charge made for visas of passports. Visa charges were quite moderate until the United States decided to charge citizens of other countries a ten-dollar fee for a passport visa. It naturally required very little time for other nations to reciprocate in kind, and now the citizen of the United States pays a ten-dollar

equivalent every time he obtains a visa to visit another country, while a citizen of any other country pays only a moderate sum for the same kind of visa. This visa expense is not at all insignificant when viewed in the light of a commercial traveler from the United States, as many American companies will cheerfully testify, and the matter is referred to merely to indicate that import duties and visas should not be neglected as factors to be considered.

Dr. Julius Klein, chief of the Bureau of Foreign and Domestic Commerce of the United States, recently said in an address: "We must be familiar with the situation in Great Britain for two reasons, that we may be able to appraise possible foreign competition and that we may be able to appraise foreign buying power. England has long been and will for years probably continue to be our best foreign customer and our best rival in foreign trade. She can also be our best teacher, and we need education and need it badly."

Great Britain should, therefore, not be disregarded as a market by the American manufacturer who wishes to sell his goods abroad. Yet it must be expected that real success can be accomplished only by building slowly, sanely and surely. That sort of business endures, whereas it is true of export business as of money that that which is easily obtained is easily lost.

Finally, it should be understood by those intending to enter into the exporting field for the first time that European business has been at its lowest ebb for approximately two years. There are now quite distinct signs of improvement, yet one must be a prophet of extraordinary foresight to attempt to forecast how soon and how rapidly business will approach normal. That matter is largely in the hands of the politicians and bankers, and they have yet to solve many problems essential to permanent business stability.

# Business Conditions

A Survey of Important Developments in the Electrical Market Including Data on Production, the Sales Outlook, Credits, Exports, the Metals and Other Conditions Affecting Cost, Supply and Demand

## Battery Stocks Spotty in New England

Stocks of dry cells in New England reflect uneven delivery conditions as the year gets under way. Prices are holding firm, and the demand is active for radio uses as the public becomes better informed about the possibilities of operating certain tube sets with this sort of equipment. Fairly good buying of dry cells is reported by jobbers on the part of contractor-dealers, and flashlamp business is always reasonably active at this season.

A healthy absorption of such batteries into new residences for bell-ringing service is also in progress. In the storage-battery field some sales are being made for automobile service, notwithstanding the heavy winter weather and great reduction in car usage. Stocks are none too large, but are meeting current requirements well. Prices are firm. The outlook for better battery sales for industrial and road truck service in this territory this year is excellent.

## Heater Sales Quieter

The demand for radiant heaters since the holidays has shown a considerable recession, and unless scarcity of coal for domestic use makes itself felt more seriously, it is not expected that any immediate marked increase in sales will be recorded. Stocks in the hands of distributors and retailers were substantially lowered before Cristmas, but buying since 1923 began has been on a hand-to-mouth scale. While prices are firm, difficulties in obtaining steel are a factor in production which is causing no little consideration, and anticipation of requirements has to be very carefully planned in order to insure an even flow of sheets for cutting and assembly.

Factory stocks are of moderate size, and these are relied upon by a good many distributors within fairly easy reach of the manufacturers to meet current demands outside of local stock facilities. It is the opinion in some circles that intensive sales effort combined with fair local stocks would improve trade materially in this apparatus, which in many communities has almost reached the staple class in the public mind.

## Raw-Material Advances Push Tape Prices Upward

Recent advances in the cost of rubber and sheeting, amounting to about 100 per cent since the last schedule of a representative manufacturer went into effect, have forced the price of tape upward lately, and the outlook seems to be for a so-called "high market" for the coming half year. This advance in tape was not unexpected in the trade, but in many quarters the disposition to look upon it as a temporary condition resulted in the placing of relatively few orders by distributors.

The moderate supply on hand has led to a flood of orders upon manufacturers, and in some instances production is under way for full-time days and also for part of the nights. So far there seems to be little shortage of labor in this branch of the industry. Manufacturers are buying material on a short-term basis in view of the price situation, which has some uncertainties that well-informed opinion heeds in refusing to make large commitments.

## Generator Figures in Error

The 1922 production figures for generators, both waterwheel and turbo, were: Waterwheel, 1,200,000 kw., and turbo, 1,575,000. These figures erroneously appeared in the ELECTRICAL WORLD for Jan. 6, page 70, as 200,000 kw. for waterwheel, 575,000 kw. for turbo.

## Estimates 1923 Construction at $6,000,000,000

Based upon a survey which it has just completed, the Copper and Brass Research Association estimates the total building construction for the year 1923 at $6,000,000,000. The potential market for copper in building construction in this country next year (including sheet copper for roofing, leaders and gutters, etc., as well as the copper content of the brass used in plumbing pipe, hardware and lighting fixtures) is approximately 780,000,000 lb.

In 1922, statistics for eleven months of which are now available, the total expenditure for building construction is placed at $4,910,000,000. In addition, there were projected, but not built, other buildings of a total estimated cost of $2,480,000,000.

In estimating the amount of building construction in 1923, the carry-over from 1922 has been reduced to $1,240,000,000, because experience indicates that in making preliminary estimates the cost is usually placed on the safe side, and allowance is also necessary for the percentage of such projects that has been indefinitely postponed or will not come up in 1923.

Taking the known accumulated shortage as a basis, after deducting work completed during 1922, and adding the normal increment of building for the year 1923, the actual building requirements of the nation are estimated at $7,830,000,000. Details of the 1923 estimates and the expenditures for the same classes in 1922, follow:

| | 1923 Estimates | 1922 Expenditures |
|---|---|---|
| Apartment houses | $1,253,000,000 | $950,000,000 |
| Churches | 530,000,000 | 205,000,000 |
| Dwellings | 940,000,000 | 680,000,000 |
| Hospitals | 595,000,000 | 230,000,000 |
| Hotels | 851,000,000 | 640,000,000 |
| Industrial buildings | 827,000,000 | 655,000,000 |
| Office buildings | 804,000,000 | 645,000,000 |
| Public buildings | 328,000,000 | 260,000,000 |
| Public garages | 162,000,000 | 125,000,000 |
| Schools | 1,540,000,000 | 610,000,000 |
| Total | $7,830,000,000 | $5,000,000,000 |

To predict such a vast amount of building during the year 1923 presupposes that the entire shortage plus the normal increment for the year will be carried out in 1923 and that we shall enter 1924 with a clean building slate. It is believed by the association, however, that neither the financial nor the material and labor resources of the country are in a position to carry out this program in twelve months.

The association's reports indicate that there still exists over the major part of the country a housing shortage of considerable proportions, despite the huge construction of 1922.

There are, of course, no definite data to go on in estimating how far the present resources of the country and the labor and materials situation will enable it to go in the 1923 building program, but careful consideration of the various factors involved leads to the estimate of $6,000,000,000 as the amount which can be completed in 1923.

Of this amount about $3,030,000,000 will be devoted to housing, about $2,025,000,000 to office, business and industrial buildings, and $2,675,000,000 to churches, hospitals and schools.

ENGLISH ELECTRICAL EXPORTS, IMPORTS AND RE-EXPORTS FOR NOVEMBER, 1922

| | Exports | Imports | Re-exports |
|---|---|---|---|
| Electrical goods and apparatus | £123,273 | £52,794 | £2,612 |
| Insulated wires and cables | 179,447 | 17,182 | ...... |
| Glow lamps | 28,235 | 28,690 | 416 |
| Arc lamps and parts | 1,320 | 1,255 | ...... |
| Batteries and accumulators | 32,950 | 17,799 | 2,070 |
| Meters and instruments | 32,937 | 6,337 | 107 |
| Carbons | 2,967 | 7,030 | 205 |

| Other motors and generators | 144,232 | ...... | ...... |
| Switchboards (not telegraph or telephone) | 10,690 | 4 | ...... |
| Electrical machinery, unenumerated | 137,596 | 72,539 | 6,183 |
| Telegraph and telephone cable and material: | | | |
| Telegraph and telephone wires and cable (not submarine) | 27,325 | 4,673 | ...... |
| Submarine telegraph and telephone cable | 51,255 | ...... | ...... |
| Telegraph and telephone instruments and apparatus | 157,254 | 41,879 | 762 |
| Totals | £944,074 | £250,182 | £12,355 |

## November Electrical Exports Show Gain of $939,646

Total exports of electrical machinery, apparatus and appurtenances for the month of November were $5,817,349, a gain of $939,646 over November, 1921, when the total amounted to $4,877,703, and of $693,878 over October, 1922, when they were $5,123,471. The following figures are supplied by the Bureau of Foreign and Domestic Commerce:

ELECTRICAL EXPORTS FOR NOVEMBER, 1922, COMPARED WITH CORRESPONDING PERIOD A YEAR AGO

| Articles | Value November, 1921 | Value November, 1922 |
|---|---|---|
| Turbines | | $245,596 |
| Generators | $437,057 | ........ |
| Direct-current— | | |
| Under 500 kw. | ........ | 41,633 |
| Over 500 kw. | ........ | 6,096 |

| Other electric lamps | ....... | 22,206 |
| Flashlights | ....... | 19,815 |
| Searchlights and projectors | ....... | 19,521 |
| Motor-driven household devices | ....... | 78,756 |
| Domestic heating and cooking apparatus | 70,155 | 73,860 |
| Industrial electric furnaces and ovens | ....... | 6,894 |
| Therapeutic apparatus, x-ray machines, galvanic and faradic batteries | ....... | 64,917 |
| Signal and communication devices: | | |
| Radio and wireless apparatus | ....... | 223,180 |
| Telegraph apparatus | 20,660 | 34,615 |
| Telephone apparatus, including switchboards | 242,603 | 318,336 |
| Police, fire and burglar alarm apparatus | ....... | 1,665 |
| Railway signals, switches and appurtenances | ....... | 129,212 |
| Bells, buzzers and annunciators | ....... | 5,014 |
| Other electrical apparatus: | | |
| Spark plugs, magnetos and other ignition apparatus | 70,384 | 58,388 |
| Insulating material | ....... | 65,149 |
| Metal conduit, outlet and switch boxes | ....... | 18,125 |
| Sockets, outlets and receptacles | ....... | 56,138 |
| Other wiring devices | 85,624 | 127,926 |
| Other electrical apparatus, not elsewhere specified | 1,599,629 | 478,337 |
| Globes and shades for lighting fixtures | ....... | 41,065 |
| Electrical glassware, except for lighting | ....... | 7,828 |
| Electrical porcelain | ....... | 47,346 |
| Carbons for electric lighting, electrodes and batteries | 30,607 | 163,385 |
| Insulated wire and cables (iron and steel) | ..... | 44,750 |
| Other manufactures of aluminum, including wire | 154,672 | 52,799 |
| Copper: | | |
| Bare wire | 66,690 | 265,159 |
| Insulated wire and cable | 411,389 | 177,625 |
| Total electrical machinery, apparatus and appurtenances | $4,877,703 | $5,817,349 |

## English Exports and Imports for November, 1922

The British Board of Trade records of electrical business for the month of November show a decrease in values of £64,207 on last month's totals and £296,736 as compared with November last year. The figures for the month were £944,074; for October, £1,008,281 and for November, 1921, £1,240,810. The principal decreases occurred in the items for batteries, £36,000, and telegraph and telephone exports, £22,000; lower values were also recorded in the sections for electrical goods and apparatus, lamps, carbons and electrical machinery, while slightly increased values are shown in the items for insulated wires and cables and meters. Electrical imports at £250,182 for the month under review show an increase of £30,000 on the total for October, 1922, and £70,000 as compared with November, 1921. An addition of £28,000 in the electrical machinery import section accounts for the enhanced values for the month. The electrical re-export figures for November were £12,355, an increase of £1,300 in October, but a decrease of £2,400 in November, 1921.

## The Metal Market

**Copper Sales Not Heavy—Foreign Demand Quiet—Lead at 7.25—Zinc Active**

Copper sales have not been heavy during the last week, but producers are not concerned, for they did such an excellent business in December that they are well sold up and expect a quiet January. Foreign demand is quiet, with a resumption of Chinese buying an encouraging feature.

A slightly increased activity is noticeable in zinc, but prices show only a small change.

NEW YORK METAL MARKET PRICES

| | Jan. 3, 1923 Cents per Pound | Jan. 10, 1923 Cents per Pound |
|---|---|---|
| Copper | | |
| Electrolytic | 14.75-14.87½ | 14.75 |
| Lead, Am. S. & R. price | 7.25 | 7.25 |
| Antimony | 6.35 | 6.35 |
| Nickel, ingot | 36.00 | 36.00 |
| Zinc, spot | 7.05 | 7.05 |
| Tin Straits | 38.87½ | 38.87½ |
| Aluminum, 98 to 99 per cent | 23.00 | 23.00 |

## Brisk High-Tension Equipment Business in Chicago

Chicago manufacturers of high-tension equipment are unanimous in stating that their business volume in 1922 was above that obtained in 1921. One firm during the week sold three 44,000-volt outdoor substations with capacities of 300 kw. to 900 kw. to a Middle Western utility and six 13,000-volt substations of from 75 kva. to 300 kva. for other Middle West concerns.

Another firm reports that the money value of its 1922 business was 56 per cent greater than that in 1921. This concern received an order during the week for a 33,000-volt, 1,000-kva. substation for a Minnesota utility and shipped a 110,000-volt air-break switch to a utility in Georgia.

Foreign shipments of 25,000-volt fuses were made by another organization.

# The Week in Trade

Prices When Quoted Are Those Reported at the Opening of Business on Monday of This Week for Points West of the Mississippi River and on Tuesday for All Eastern Points

LOWER stocks are reported in most of the market centers of the United States, and the price trend in all parts of the country is upward. In the West there is slightly increased activity in porcelain and hardware for central stations, following recent storms and heavy snows which have seriously damaged some lines. Materials entering into new construction are selling as well as they did in the autumn months, and increased demand by the textile and metal-working industries is noted.

New York.—Business is settling down to a more normal stride, and sales show healthy conditions throughout the industry. Orders for lamps are coming in at an unusual rate, and the outlook for the next three months is most optimistic for this line. Stocks generally are low and prices have an upward tendency.

Chicago.—The aftermath of the holiday trade in heaters was rather slow because few jobbers had any stocks worthy of notice left over from the rush of the preceding two weeks. But by combing the local market a sufficient number of heaters were found to supply the past week's trade. Prices

## Demand, Supply and Price Trend of Eighteen Commodities as Sold in Fourteen Cities

remain firm and jobbers are rapidly replenishing their stocks according to their scheduled contracts.

**Boston.**—Business in New England reflects widespread confidence. Inventories were satisfactorily low on Jan. 1 in many electrical establishments, and buying has set in for current requirements. Lengthening deliveries are causing jobbers to stock up more than for some time. Prices trend upward, with advances in washing machines and tape and firmness in quotations for wire and steel products. The peak of the lamp business seems likely to be reached about Feb. 1, instead of the maximum having been scored in December as usual. Building operations are well sustained and the textile and metal-working industries are very active.

**Atlanta.**—This year has started off according to best expectations. Jobbers report satisfactory orders in all lines, although because of stock taking the majority of dealers have not had an opportunity to place their orders. These orders should be received within the next few days. The prosperity of the year just passed is reflected in the issuing of a 50 per cent stock dividend by the Carter Electric Company. This is in addition to a 12 per cent cash dividend. The cotton-oil industry has been held up by the shortage of cotton, and it has been necessary to close down several mills in this section. Bank clearings are in excess of any previous period, and the credit situation is easier than it has been for a great many months.

**Cleveland.**—Stocks are low, but completed inventories in some instances have allowed substantial orders. Batteries are in fair demand and tape is selling in fair volume. Dealers report heaters active, owing to the colder weather, but have been able to meet the demand without difficulty. Collections show improvement.

**St. Louis.**—Jobbers report business to be increasingly active to an unexpectedly large degree, one of the larger houses stating that January business will be fully 50 per cent better than that of a year ago. Another reported that December was the best month in its history. This condition exists in virtually all lines of goods handled, with the fundamental line of wiring supplies obtaining its share of the progress. The increased demand for radio equipment of the higher grades is producing good markets for batteries and for small battery chargers. The demand for automobile purposes is steadily increasing. The railroads and other regular purchasers of dry batteries are buying in normal quantities, and the sale of flashlight batteries is good. Stocks are conservatively maintained, with liberal turnovers, and business generally is sound.

**St. Paul-Minneapolis.**—Jobbers and dealers declare radio more active than before Christmas. Wire prices are stronger, but consumers are lying low. Power construction is dead. Tape demand is probably a little inclined to be active on account of activity in wiring. The heater trade is steady, compared with a very active market last fall.

**Salt Lake City.**—Central-station companies are buying well for extensions and new development, surplus stocks of copper being rapidly absorbed by the market, and production is steadily increasing. Collections are reported better than for months past. Jobbers are confident of steady improvement in electrical trade.

**Denver.**—Business during the first two weeks of the new year has been unusual. All jobbers report a good volume in excess of the similar period a year previous, while one has equaled the entire month of January last year. New business developing and the number of inquiries received support predictions that the year will be a good one. Collections in outside territory are slow, but few losses are being experienced. Heavy orders are being placed for pole-line hardware, transmission equipment and construction specialties in anticipation of new extensions and overhauling of country lines. One project alone in northern Colorado, not officially announced, will require considerable of this material and extensive generating equipment. High winds during the past week have played havoc with transmission lines and city distribution. Business in heaters has suffered.

**Portland-Seattle.**—Electrical jobbers report business active for the first week in January. There is an optimistic feeling regarding the prospects for the coming year. On the other hand, the retailers in the large cities report little activity on appliances and an appreciable slackness in the demand for fixtures. The falling off, however, does not seem to have been greater than the usual drop following the holidays. The Christmas trade this year was principally on lower-priced articles than formerly, which had the effect of lowering the gross volume of business.

# Activities of the Trade

Devoted to News of the Manufacturer, Jobber, Agent, Contractor and Dealer, Including Important Orders and Contracts for Apparatus and Equipment

## Approves Wagner Refinancing

The Circuit Court has denied the recent application for a receiver made by a small minority of stockholders to prevent the transfer of assets of the Wagner Electric Manufacturing Company to the new company, Wagner Electric Corporation, and has simultaneously refused to cancel the transfer which has been made. The complete refinancing plan will consequently be carried out in the manner authorized by the stockholders. The operations of the company are now being conducted under the name of Wagner Electric Corporation.

## General Insulate Sales Doubled

The General Insulate Company, 1008 Atlantic Avenue, Brooklyn, N. Y., manufacturer of electrical insulating specialties, reports that its volume of business during 1922 was more than 100 per cent over the year 1921. The year 1922 was the second largest year in volume of sales since the company was established nearly twenty years ago.

## Milmow Opens Sales Office

Albert Milmow has opened an office in Charlotte, N. C., where he will conduct a business as a sales engineer in electrical and mechanical lines. At present he is handling the accounts of the Packard Electric Company and the Electrical Engineers' Equipment Company. He will also do some electrical consulting work.

Mr. Milmow is a pioneer in the electrical business in the South. He opened the sales office of the General Electric Company in Charlotte and was with the Southern Power Company as engineer of the mill-power department for some time, later joining the Westingbouse Company. He has been most active in the development of hydro-electric applications to industry.

## Burdick Cabinet Expanding

The Burdick Cabinet Company, Milton, Wis., expects to occupy its new manufacturing plant, with 40,000 sq.ft. of floor space, about Feb. 1 and is now inquiring for additional equipment. Its principal product is a patented electrical bath cabinet and other therapeutic equipment and electric hospital appliances. It is increasing its capital stock by an issue of $100,000 preferred stock to cover the expansion.

## Connecticut Electric Completes Warehouse

The Connecticut Electric Manufacturing Company, Bridgeport, Conn., has just completed the erection of a warehouse, 50 ft. x 140 ft., in which stocks of raw materials will be stored. This new building will allow a great deal of additional space in the main factory building for manufacturing operations. The amount of business booked by this company during the last few months has necessitated larger manufacturing operations than it has heretofore conducted, and every effort is being exerted to increase production to take care of this larger business.

## Betts & Betts Announces Changes in Sales Organization

The Betts & Betts Corporation, 645 West Forty-third Street, New York City, manufacturer of refillable fuse plugs, bell-ringing transformers, radio apparatus and motor-driven controllers, announces the following changes in its sales organization: H. O. Klug has taken over the territory formerly covered by F. Maples, consisting of western Pennsylvania, Ohio, Michigan, eastern Indiana, northern Kentucky and West Virginia. Mr. Klug will probably make his headquarters in Cleveland. John Gilmore, formerly with the Barber Manufacturing Company, replaces J. E. Eldredge. His territory will consist of the New England States, the Hudson River towns and New York State.

## E. W. Ham Electric Company Moves Into New Quarters

The E. W. Ham Electric Company, Worcester, Mass., has moved into a three-story newly constructed reinforced-concrete warehouse and office at 3 Burnside Court, Worcester. The new quarters have a total floor area of about 17,000 sq.ft. and are designed to facilitate rapid service, convenient handling of supplies and improved control of stock volume.

The business of this jobbing house has grown so rapidly of late that a lease for five more years has been signed for the old quarters of the company on Barton Place, covering about 18,000 sq.ft., which will be utilized for storage purposes. The company has recently taken the New England agency for the Aerobell washer, manufactured by the Foote-Burt Company, Cleveland.

## Fairbanks, Morse & Company to Expand Indianapolis Plant

Plans are being made by Fairbanks, Morse & Company, manufacturers of generators and other electrical equipment, for the expansion of the Indianapolis plant, according to Linton A. Cox, Indianapolis, attorney for the company. The attorney is asking that the county commissioners of Marion county call a special meeting at an early date and that a public auction sale of county property be conducted by the commissioners.

The company, an Illinois corporation, has operated in Indianapolis several years. The present factory site has 500 ft. frontage at Northwestern Avenue and Twenty-first Street. The property sought is directly across the street from the present plant. A. W. Thompson, general manager of the Indianapolis plant, says it may require a year to complete surveys and plans before actual construction can be started. Engineers for the company say the electrical business has grown in the last five or six years to such a point that the present plant of the company is inadequate.

It has been suggested that the electrical plant of the company be moved and consolidated with either the factory at Beloit, Wis., or that at Three Rivers, Mich. However, Mr. Thompson and others connected with the Indianapolis branch have been assured that the electrical business will be continued in Indianapolis if the additional space for new buildings can be acquired. The Hoosier plant now is valued at slightly below $1,000,000 and employs nearly 800 persons. If the company's expansion project is carried through, more than 3,000 persons will be employed.

## To Make and Sell Appliances

The Electrical Utilities Company, Jeffersonville, Ind., recently organized with capital stock of $25,000, announces that it will manufacture and sell electrical devices and appliances. The company is located at 332 Missouri Avenue. Officials of the company are Charles F. Schnatterer, C. J. Fackler, M. D. Phillips, George Reiss, R. L. McGinnis and E. A. Drake.

## Kuhlman Sales Appointment

E. N. Hyde, Philadelphia, Eastern district representative of the Kuhlman Electric Company, reports the appointment of Harry W. Motter of York, Pa., as distributor for Kuhlman transformers in several counties of central and southeastern Pennsylvania.

With the addition of Mr. Motter to the field force, prospective buyers will no doubt be able more promptly to get detailed information regarding Kuhlman products, covering as they do high-tension transmission and power distribution transformers for general central-station service and street-lighting transformers which operate without moving coils and without low-power-factor disturbances.

Transformers fit in with the other representations assigned to Mr. Motter by the Howell Electric Motor Company, Marble-Card Electric Company, Electric Machinery Manufacturing Company, Cutler-Hammer Manufacturing Company, Westinghouse Lamp Company and Automatic Fuel Saving Company.

## Ledox Storage Battery Firm Opens Brooklyn Branch

The Ledox Storage Company, Inc., 314 Bergen Street, Brooklyn, N. Y., which was recently incorporated with capital stock of $25,000, is manufacturing two makes of storage batteries. This company makes its own plates and castings, but the remainder of the work is let out through contracts. A new place has been opened at 76 Fourth Avenue, Brooklyn, as the main office, salesroom and repair department. Further expansion is contemplated by the company. The officers of the company are: J. Donald Moulton, president; R. B. Stackpole, vice-president, and O. W. Larson, secretary and treasurer.

## Elliott-Lewis Company Adds to Sales Force

The Elliott-Lewis Electrical Company, Inc., 1017 Race Street, Philadelphia, distributor for the Trumbull Electric Manufacturing Company, Ansonia Electrical Company and Landers, Frary & Clark, has recently added several new salesmen to take care of its increasing number of orders and to assure better distribution. The company has recently leased 15,000 sq.ft. of additional warehouse space to provide for enlargement in its stock. Frank R. Elliott is president of the firm.

## Kubec Electric in New Location

By moving from 506 West Van Buren Street to 628-30 West Jackson Boulevard, Chicago, the Kubec Electric Company has increased its floor capacity 250 per cent. This change went into effect Jan. 1. August Kubec, president, says this expansion affords him better facilities to improve his jobbing lines, especially in the electric industrial tool, industrial fixtures and radio field. He also states that his total business for 1922 was 30 per cent greater than that obtained in 1921. Plans for the incorporation of the company for $75,000 have been made.

## Hurley Company Manufacturing 12,000 Washing Machines Monthly

The decrease in the number of domestic servants, as shown by the last census, is not due to the shortage of persons willing to accept this sort of employment, according to Edward N. Hurley, Jr., vice-president of the Hurley Machine Company, Chicago.

"While the census shows that there has been a decrease in the number of persons listing themselves in the domestic service classification," said Mr. Hurley, "a recent survey by the field force of our company shows that more women than ever before are doing their own household work by preference. This is largely due to the increased use of electrical conveniences.

"There are now approximately 2,500,000 washing machines of all makes and types in use in the United States. While the washing machine has been on the market for many years, the full appreciation of this labor-saving device did not come until the period of the war, when thousands of women left domestic employment to go into munition factories.

"Back in 1909 there were only about three thousand electrical washing machines in the United States. Today the Hurley Machine Company alone is manufacturing twelve thousand a month.

"The future possibilities of the industry are shown by the fact that there will be at the end of this year nine and a half million wired homes in the United States."

## Bright Outlook for Bosch Firm

The 1923 business outlook for the American Bosch Magneto Corporation is exceedingly bright, announcement having just been made that the Rickenbacker car will hereafter be equipped with Bosch starting, lighting and battery ignition and that Hudson and Essex cars will continue during 1923 to use electrical equipment of the same make.

The Rickenbacker will be equipped with the standard 4-in. Bosch generator, the 4-in. Bosch starting motor and the compensating battery ignition system, which has automatic spark control. Compensating ignition is also used on both Hudson and Essex cars, and each is equipped with the standard Bosch 5-in. generator and 4-in. starting motor.

The supplying of electrical equipment for Hudson and Essex cars during 1922 helped greatly to increase the Bosch corporation's business, and the prospects of a substantial increase in production of these two cars during 1923 holds a promise of still greater business for the American Bosch Magneto Corporation.

The Rickenbacker corporation is also rapidly enlarging its selling organization, and its requirements of Bosch equipment during 1923 will undoubtedly assume substantial proportions.

## Pettingell-Andrews Sales Meeting Has Optimistic Tone

Anticipations of an excellent business during 1923 based upon hard work and a growing demand for electrical products on the part of the general public was the feature of the annual sales convention of the Pettingell-Andrews Company, Boston, which was held Jan. 8-10 inclusive. At the opening session Monday the program included addresses by H. S. Schott,, National Carbon Company, Long Island City, N. Y., on "Columbia Batteries," and A. H. Jaeger, Edison Electric Appliance Company, Chicago, on "Appliances." J. E. Livor, sales manager, then threw the meeting open to a general discussion of co-operation by department heads and assistants, and this was continued during the evening.

On Tuesday Messrs. Kennedy and Bowe of the General Electric Company were scheduled to speak on "Insulating Material" and "Tungar Rectifiers," respectively, followed by a talk by J. E. Livor on "Possibilities of G. E. Co-operation." E. N. Hurley, Jr., vice-president, and Messrs. Blye and Root of the Hurley Machine Company, Chicago, were scheduled for addresses upon "Hurley Products." H. F. Wallace, New England manager Edison Lamp Works, and R. B. Parker, assistant sales manager, Edison Lamp Works, Harrison, N. J., on "Lamps." R. S. Yates, Bridgeport, Conn., was scheduled to speak on "Wiring Devices;" R. P. Heaney, Schenectady, on "Fans," and A. L. Atkinson, Bridgeport, was also to speak.

The closing event scheduled was a dinner at the Exchange Club, Boston, on Wednesday evening, the program including talks by F. S. Price, president of the company; George Baldwin, merchandising manager General Electric Company, and David Saranoff of the Radio Corporation of America. A feature was a "radio sketch" of the Pettingell-Andrews and General Electric company a decade ago and today.

## Worcester Sales Agency Opened by McGrail Interests

Interests identified with the McGrail Electric Company, Worcester, Mass., have opened a new fixture and supply house at 442 Main Street, Worcester, under the name of the Sunset Light & Power Company. The establishment is under the management of John E. McGrail. The company plans to retail and to distribute Hotpoint appliances, Hamilton-Beach vacuum cleaners, "Easy" washers, "American Beauty" irons, Simplex heaters and pads, Riddle fixtures and "Lightoliers."

**The Re-New Lamp Company**, Malden, Mass., manufacturer of carbon and tungsten lamps, has changed its corporate name to the Economic Lamp Company. Officials state there has been no change in the management or policy of this company, and that the change seemed desirable to them because, as manufacturers of new lamps, the name Re-New Lamp Company gave a wrong impression as to their product.

**N. A. Strand & Company**, manufacturers of electric vibrators and other machinery, 631 West Jackson Boulevard, Chicago, are taking bids on a two-story factory, 79 ft. x 80 ft., at Argyle and Lincoln Streets, to cost $50,000.

**The Battery Products Company**, 5425 South State Street, Chicago, recently incorporated with $100,000 capital stock, is a continuation of the former Battery Parts Company, same address. It manufactures storage-battery-charging clips, battery terminals, connections and cable leads, and recently completed an addition which is being used as a foundry.

**Electric Appliances, Inc.**, Muncie, Ind., an outgrowth of a purchase recently made of the Sterolectric Company, through a receiver, has been incorporated with a capital stock of $50,000, to manufacture electrical heating and cooking devices.

**The Standard Underground Cable Company**, Westinghouse Building, Pittsburgh, Pa., announces that it moved the Boston sales office of the company from its former location in the Delta Building to 609 Unity Building, 185 Devonshire Street, Boston, on Jan. 1.

**The Mueller Electric Company**, Cleveland, manufacturer of electric specialties, has recently moved into its new building at 1583 East Thirty-first Street, where production will be carried on in greater volume.

**The Federal Lighting Fixture Manufacturing Corporation**, 35 North Ninth Street, Philadelphia, has leased property at 33 North Eleventh Street, Comprising two complete floors, for expansion.

**The National Electric Service Corporation**, organized in Denver, Colo., in the spring of 1922 and manufacturing the Nesco radio equipment, has declared a 5 per cent cash dividend, payable Dec. 20 to stockholders of record of Dec. 15.

**The Wisconsin Cabinet & Panel Company**, a subsidiary of Thomas A Edison, Inc., West Orange, N. J., has plans for a two-story addition to its plant at New London, Wis., to be 72 ft. x 100 ft. and estimated to cost $60,000.

**The Safety Car Heating & Lighting Company**, Dixwell Avenue, New Haven, Conn., manufacturer of electric heating and lighting equipment for railroad cars, will build a one-story addition, 106 ft. x 115 ft.

**Wood & Weber**, Denver, Col., engineers, have recently moved their office to 507 Tramway Building, where additional space is provided for their activities.

**The Bead Chain Manufacturing Company**, Bridgeport, Conn., manufacturer of brass chain for electric lighting service, has announced that it has increased its capital stock from $50,000 to $300,000.

**The Western Electric Company** branch at Portland, Ore., is now occupying its new three-story office and warehouse building at West Park and Flanders Streets, Portland.

**A. B. Faulkner**, 720 Fifth Avenue, Williamsport, Pa., is planning for the establishment of a factory to manufacture electric outdoor operating displays.

**O. H. Sebring**, who recently began the erection of a plant in Sebring, Ohio, for the manufacture of aluminum ware, has decided to make instead a line of electrical supplies. A building 70 ft. x 140 ft. will be occupied by this business.

**The Electrical Dealers' Supply Company**, 162 West Randolph Street, Chicago, will erect a three-story factory, to contain 45,000 sq.ft. of floor space, in Diversey Boulevard near Oakley Avenue. This building, it is estimated, will cost $150,000.

**Guy Dillon**, Indianapolis, has arranged for the establishment of a one-story factory for the manufacture of wireless and equipment at 150 Virginia Avenue.

**The Electric Machinery Manufacturing Company**, Thirteenth and Tyler Streets, N. E., Minneapolis, Minn., will soon take new bids on revised plans for the construction of a two-story plant. Bids recently received have been rejected. Silas McClure is president.

**The Modern Electric & Machine Company**, Indianapolis, Ind., has arranged for an increase in capital from $35,000 to $110,000 for proposed expansion.

**The B-R Electric Company**, Fifteenth and Walnut Streets, Kansas City, Mo., has commenced the erection of a new five-story and basement building at 1411 Walnut Street for general distributing and operating service. It is expected to be ready for occupancy early in the Spring.

## Foreign Trade Notes

FUNDS PROVIDED FOR AN ELECTRIC PLANT IN JAMAICA.—Under a law which became effective on Aug. 11, 1922, *Commerce Reports* states, public improvements, including an electric plant to supply electricity for power purposes and for lighting streets, roads, government buildings and institutions in the cities of Kingston and St. Andrew, Jamaica, were authorized. A loan of £428,000, to be raised by the Kingston General Commissioners, will cover the cost of these improvements.

PROPOSED RADIO SYSTEM IN ARABIA.—Plans are under consideration by local promoters, according to *Commerce Reports*, for connecting Aden, Khokha, Mocha and Hodeidah by wireless. The maximum distance is about 250 miles, and the promoters desire to secure estimates of cost of construction and other information. The same parties desire catalogs covering lighting sets using kerosene engines.

ASH AND DUST EXTRACTION PLANT FOR MORWELL (AUSTRALIA) POWER SCHEME.—Tenders will be received by the State Electricity Commission of Victoria, Melbourne, Australia, until March 7 for an ash and dust extraction plant for the Morwell power scheme (Specification No. 23/6). R. Liddelow is secretary of the commission.

## Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number.

Purchase is desired in Cuba (No. 4,926) of ornamental interior electric lighting fixtures.

Purchase is desired in Chile (No. 4,934) of transmitting and receiving radiophone apparatus. Descriptive literature and prices of apparatus easy to install and operate are required.

Purchase and agency is desired in Australia (No. 4,953) for refrigerating machines for household and hotels.

Purchase is desired in Cuba (No. 4,961) of storage batteries, parts and accessories, and machinery and apparatus for the manufacture of storage batteries.

Purchase is desired in Switzerland (No. 4,965) of electric machine to solder fine silver wires onto tinplated brass heads of fusible lamelles.

Purchase is desired in Italy (No. 4,970) of both hand-driven and motor-driven knitting machines for the manufacture of hosiery.

THE EASTERN ELECTRIC & TRADING COMPANY, P. O. Box 459, Hornby Road, Fort Bombay, India, is in the market for individual radio transmitting and receiving sets, also commercial duplex wireless telephone sets, capable of working from 26 miles to about 300 miles, and also for automatic telephone switchboards.

## New Apparatus and Publications

LAMP-MAKING MACHINE. — A unit lamp-making machine for producing miniature, vacuum and nitrogen lamps, tipped or tipless, has been brought out by the General Engineering & Supply Company, 160 Fifth Avenue, New York City.

AUTOMATIC ELECTRIC STOVE.—The Toledo Cooker Company, Toledo, Ohio, has placed on the market an automatic electric stove, known as the "To-Lectric."

ELECTRIC TEST UNIT.—An improved model of testing unit for making tests on starting, lighting and ignition systems has been developed by the Service Products Company, Springfield, Ohio.

ELECTRIC LAUNDRY STOVES.—The George D. Roper Construction Company, Rockford, Ill., has brought out a line of electric laundry stoves with two or three burners.

PORTABLE DESK LAMP.—A portable desk or table lamp of solid brass ("Verdelite") furnished with a pen rack and inkwell has been brought out by the Faries Manufacturing Company, Decatur, Ill.

OUTDOOR LIGHTING CONTROL.—The South Bend Current Controller Company, South Bend, Ind., has issued a new and revised edition of its "Engineer's Reference Book," which deals with the remote control of all phases of outdoor lighting from a power house by means of the "R-C-O-C" system of remote control. It contains typical plans, data for solving problems connected with control of constant-current transformers, multiple or series ornamental lighting systems, etc.

TELEPHONICS.—The Western Electric Company, Inc., Engineering Department, New York City, is distributing reprints B-13-1, B-15-1, B-19-1 and B-20-1, entitled "Voltage-Current Relation in Central Anode Photo-Electric Cells," "The Crystal Structures of Potassium and Beryllium," "The Relative Sensitivity of the Ear" and "Thermionic Work Function of Tungsten" respectively.

STEAM TURBINES, PUMPS, BLOWERS, ETC.—"Plant and Products" is the title of a twenty-four-page booklet issued by the De Laval Steam Turbine Company, Trenton, N. J., covering its single-stage and multi-stage turbines, centrifugal pumps, blowers and other products.

SAWMILL EQUIPMENT.—"Electrically Driven Sawmills" is the title of bulletin No. 140 issued by the Allis-Chalmers Manufacturing Company, Milwaukee, covering its equipment for electrically driven machinery for sawmills. Illustrations are also given of various sawmills equipped with "Allis-Chalmers" machinery.

PORTABLE AMMETERS AND VOLTMETERS. — The Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., is distributing a folder entitled "Handy Instruments for Everyday Use," giving information for instrument users about its line of portable ammeters and voltmeters.

FEED-WATER HEATERS.—"Feed Water Heaters in Their Relation to Steam-Plant Efficiency" is the title of a sixty-page booklet distributed by the H. S. B. W. Cochrane Corporation, Philadelphia, which is a presentation of the theory and practice of heating boiler-feed water.

OIL ENGINE.—The Ingersoll-Rand Drill Company, 11 Broadway, New York City, has recently placed on the market a horizontal direct-injection oil engine.

FLEXIBLE SHAFTING.—The Stow Manufacturing Company, Binghamton, N. Y., is manufacturing a flexible shafting which can be used with any portable electric drill.

PORTABLE CORD.—"Okocord" is the name of a new flexible, unbraided, portable cord, recently placed on the market by the Okonite Company, Passaic, N. J.

RADIO APPARATUS. — The Coto-Coil Company, 87 Willard Avenue, Providence, R. I., has recently developed a new vacuum-tube socket, known as type 7,000.

SOLDERING MACHINE. — The P. E. Chapman Electric Works, Tenth and Walnut Streets, Philadelphia, have recently developed the "Allatonce" commutator soldering machine, which is described in bulletin No. 120.

WATER HEATER.—The Automatic Electric Heater Company, Warren, Pa., has brought out an improved-type "Sepco" automatic circulation water heater. This heater differs from previous models in that the heating units are inserted from the top. Another feature is the use of separate 1,000-watt units instead of placing 3,000 watts all on one unit-head assembly, and still another is the telltale of glow fuse.

RADIO APPARATUS.—The Dayton Fan & Motor Company, Dayton, Ohio, has brought out a line of molded variometers and vario-couplers.

VARIABLE CONDENSER.—The Mignon Electric Manufacturing Corporation, 25 South Water Street, Rochester, N. Y., has developed a variable condenser.

## New Incorporations

THE WEST TEXAS UTILITIES COMPANY, Abilene, Tex., has been chartered with a capital stock of $1,500,000 to furnish gas and electricity in thirty-four counties in western Texas. The incorporators are G. W. Fry, Taylor County; E. W. Campbell, Eastland County, and M. J. Insull, Chicago.

THE GREAT NORTHERN UTILITIES COMPANY, Great Falls, Mont., has been incorporated with a capital stock of $3,000,000 to supply electricity for lamps and motors in this part of the state. The directors are F. D. Fletcher, J. F. Mooney and O. C. Allan, all of Great Falls.

# Construction News

**Projects, Plans, Bids and Contracts, Contemplated or Under Way**

## New England States

PORTLAND, ME.—The Maine Central Railway Company contemplates powerhouse extensions in connection with its proposed car and locomotive shops at its South Portland terminal, to cost about $1,200,000.

WATERVILLE, ME. — The industrial concerns and water-power companies which utilize the waters of the Kennebec River are reported to have united on a project to double the available water power of that stream by establishing storage basins. The proposed plan contemplates the establishment of a large basin along the Dead River in the Flagstaff district. Should the Dead River project be delayed, the other site which is contiguous to Brassau Lake in the Moosehead region, would be devoloped first.

NEW HAVEN, CONN.—Plans are being prepared by Day & Klauder, Architects, 416 Chestnut Street, Philadelphia, for a one-story power house at the building now in course of erection at 19 Rose Street.

STAMFORD, CONN.—Contract has been awarded by the Stamford Gas & Electric Company for the construction of a switch house, to cost about $50,000.

## Middle Atlantic States

AMSTERDAM, N. Y.—The Adirondack Power & Light Corporation, it is reported, will build a new plant on East Canada Creek, below Canada Lake, to cost about $750,000. This plant will be connected with the present transmission system near St. Johnsville.

BINGHAMTON, N. Y.—Extensive improvements are contemplated by the Binghamton Light, Heat & Power Company, involving an expenditure of about $1,000,000, during the coming year. The work will include the installation of a 10,000-kw. turbine and three 600-hp. boilers with auxiliary equipment at the main power station at Johnson City, to cost about $850,000. The power station will be doubled in size, and another brick stack, 150 ft. high, will be erected.

BROOKLYN, N. Y.—The Rubel Coal & Ice Corporation, Glenmore Avenue, will install electric power equipment at its proposed ice-manufacturing plant on Eighteenth Avenue, to cost about $500,000. Edward M. Adelsohn, 1778 Pitkin Avenue, is architect.

BUFFALO, N. Y. — The International Railway Company contemplates rebuilding its Cold Spring car shops and barns, recently destroyed by fire.

BUFFALO, N. Y.—Bids will be received by the Board of Education until Jan. 18 for electrical and machine equipment for the vocational and technical schools. D. J. Sweeney is deputy superintendent of business and accounts.

CALCIUM, N. Y.—Steps have been taken by the Citizens' Protective Association to secure electrical service in Calcium from the Northern New York Utilities, Inc., Watertown. Madison Cooper is president of the association.

DUNKIRK, N. Y.—Plans are under consideration for the installation of electrically operated pumping machinery at the waterworks station.

GENEVA, N. Y.—The Empire Gas & Electric Company has acquired the right-of-way for a new high-tension electric transmission line between this city and Lyons, where it will connect with the system of the Niagara, Lockport & Ontario Power Company. The new line will also supply electricity to communities and farms along the route, including Junius, Alloway, Thompson's and other towns.

MAPLETON, N. Y.—Arrangements have been made with the Tonawanda Power Company, North Tonawanda, to furnish electricity in Mapleton. The transmission line will be extended a distance of 4 miles in the spring to furnish the service.

NEW YORK, N. Y.—The Arctic Hygeia Ice Manufacturing Company, 300 East One Hundred and Thirty-third Street, will

install electric power equipment in connection with extensions to its plant, to cost about $450,000. Ophuls & Hill, 112 West Forty-second Street, New York, are engineers.

NEW YORK, N. Y. — Electric power equipment will be installed at the confectionary plant to be erected by Henry Heide, 313 Greenwich Street, on Van Dam Street, to cost about $500,000. Maynicke & Frank, 25 East Twenty-sixth Street, are architects.

UTICA, N. Y.—The Utica Gas & Electric Company contemplates placing its wires on Bleecker Street underground.

GLOUCESTER CITY, N. J.—Electrically operated pumping machinery will be installed in connection with proposed waterworks extensions, to cost about $250,000.

NEWARK, N. J.—The Board of Education contemplates the installation of additional equipment in the electrical department and shop at the Seymour vocational school.

ALTOONA, PA.—Officials of the Penn Central Power Company have organized the Central Transmission Company, to take over eleven of its subsidiary companies operating in central Pennsylvania. The new company will build a transmission system from the power plant of the Penn Central Company at Saxton, now in course of construction.

COATESVILLE, PA.—Improvements are contemplated by the Chester Valley Electric Company, including the erection of a new boiler house and installation of new boilers, to cost about $125,000. The erection of additional high-tension lines is also under consideration by the company.

MOUNT HOLLY SPRINGS, PA. — The Cumberland Valley Light & Power Company has secured contracts for light and power service in York Springs, East Berlin, Abbottstown and Bendersville.

PHILADELPHIA, PA.—Electric power equipment will be installed at the proposed paper manufacturing plant to be erected on South Street, by S. Kardon, Second and Vine Streets, to cost $500,000. Clarence E. Wunder, 1415 Locust Street, is architect.

PHILADELPHIA, PA. — The Schlorer Delicatessen Company, 1909 South Front Street, will install electric equipment at its proposed factory at Water and Mifflin Streets, to cost about $200,000. Clarence E. Wunder, 1415 Locust Street, is architect.

SHENANDOAH, PA.—The Pennsylvania Power & Light Company is making surveys for a transmission line to Shenandoah via Hometown and Delano. Service will be furnished from the Hauto power plant.

STRASBURG, PA.—The Edison Electric Company, Lancaster, has acquired the Strasburg Electric Light Company and will merge the property with its system. Extensions and improvements are planned.

BALTIMORE, MD. — The Washington, Baltimore & Annapolis Railway plan to extend its transmission line to Laurel for light and power service. A distributing system will also be installed at Harmans.

BALTIMORE, MD. — Electric power equipment will be installed in the printing plant to be erected by the Baltimore American, Courtland and Centre Streets, to cost about $450,000. McKim, Mead & White, 101 Park Avenue, New York, are architects.

BLUEFIELD, W. VA.—The Coal River Collieries Company plans to install electrically operated machinery and power equipment at its properties.

BLACKSBURG, VA.—Bids will be called early in February for an addition to the power house at the Virginia Polytechnic Institute, to cost about $55,000. Wiley & Wiley, People's Bank Building, Lynchburg, are engineers.

MARTINSVILLE, VA. — The Lester Lumber Company plans to build a power house in connection with the rebuilding of its local plant, recently destroyed by fire, causing a loss of about $250,000.

WASHINGTON, D. C. — Bids will be received by the Chief Signal Officer, United States Army, until Jan. 22, for telephone supplies. (Circular PR 13360-43 CP.)

## North Central States

CHEBOYGAN, MICH.—The property of the Cheboygan Light & Power Company has been acquired by the Commonwealth Light & Power Company, 141 Broadway, New York. Extensions and improvements are planned.

DETROIT, MICH.—The Board of Education contemplates the construction of a central power house on the Roosevelt Field for service at a number of schools, to cost $150,000.

DETROIT, MICH.—Plans are being prepared by Edward Gray, engineer, foot of Continental Avenue, for the construction of a central power plant, in Detroit.

BELLAIRE, OHIO — The Central Coal Mining Company, Charleston, W. Va., plans to equip its local properties for electrical operation.

DAYTON, OHIO—Plans are being prepared by the A. C. Bishop Company, architect and engineer, Guardian Building, Cleveland, for a plant for the Miami Ice & Fuel Company, Ludlow Building, to cost about $250,000.

DOVER, OHIO.—The American Gas & Electric Company has acquired the plant and property of the Ohio Service Company and plans extensions and improvements.

LIMA, OHIO—An agreement has been reached between the City Council and the Ohio Power Company, which has recently acquired the local system, whereby 200 additional street lamps will be installed in various parts of the city.

GEORGETOWN, KY.—The power house of the Georgetown Water, Gas, Electric & Power Company was recently damaged by fire, causing a loss of about $50,000.

LAWTON, KY.—The Enterprise Chemical Company, P. O. box 545, Huntington, W. Va., recently organized, will build a power plant in connection with its proposed local lime-manufacturing plant. William Lewis is construction engineer.

EVANSVILLE, IND. — The Southern Indiana Gas & Electric Company plans extensions and improvements during the present year, to cost about $500,000.

CHICAGO, ILL. — Extensions will be made to the power house at the Michael Reese Hospital, Twenty-ninth Street and Ellis Avenue, in connection with a new nurses' home. Schmidt, Garden & Martin, 104 South Michigan Avenue, are architects.

JOLIET, ILL.—The Public Service Company of Northern Illinois will begin work at once on the proposed addition to its power plant.

OTTAWA, ILL.—Plans are being prepared by the Waterway Division, of the State of Illinois, 304 South Wabash Avenue, Chicago, for a new power house at Ottawa in connection with locks and dam on the state waterway. W. L. Sashett is superintendent.

HARTFORD, WIS.—The Westphal Milk Products Company has purchased the Denison millpond which it proposes to utilize for the development of hydro-electric power.

HUDSON, WIS. — The Stanton-Star Prairie Power Company, recently organized, plans to erect a transmission line to furnish electricity for lamps and motors to the farming sections north and east of the city. Energy for distribution will be purchased from the New Richmond Roller Mills Company of Hudson.

PORT EDWARDS, WIS.—The Nekoosa-Edwards Paper Company is planning to install a new 1200-hp. hydro-electric unit at the Nekoosa mill to furnish power for the new paper mill now under construction. Two steam turbines of about 3,000 hp. capacity, will also be installed by the company, one at Nekoosa and the other at Port Edwards, as auxiliaries. Other electrical equipment will also be required at the Nekoosa mill.

PORT WASHINGTON, WIS.—The town officials have applied to the Railroad Commissioners for permission to extend the municipal electric light and power lines to the town of Holland to supply electricity in the latter place.

RACINE, WIS.—The Board of Aldermen has decided to replace the arc lamps (416) now in use with 600-cp. nitrogen electric lamps. The Wisconsin Gas & Electric Company furnishes the street-lighting service.

SHEBOYGAN, WIS.—The Eastern Wisconsin Electric Company has applied to the State Railroad Commission for permission to issue $239,000 in capital stock and $3,099,000 in bonds, the proceeds to be used for retiring underlying bonds and proposed extensions and improvements.

MAPLETON, IOWA.—Bonds for $50,000 have been approved for improvements to the municipal electric plant.

MOUNT VERNON, IOWA. — Electric equipment will be installed in connection with improvements at the municipal waterworks pumping plant.

GALENA, MO. — Application has been made to the Federal Power Commission by B. J. Diemer and John Meyer, Springfield, and John A. Williams, Aurora, for permission to construct a hydro-electric plant, in Galena, to cost about $100,000.

LAMAR, MO.—Bids will be received at the office of the Lamar water and electric plant until Jan. 15 for furnishing additional power equipment, consisting of an engine or engines with direct-connected generators, for the municipal electric light plant. J. M. Earp, is Mayor and chairman of utilities committee.

PURDY, MO.—Bonds to the amount of $12,000 have been voted for extensions and improvements to the municipal electric plant and system.

SPICKARD, MO.—Bonds to the amount of $15,000 have been sold for the erection of a transmission line from Trenton to supply electricity in Spickard.

McLAUGHLIN, S. D.—Application has been made to the Council by E. M. Young for the installation of an electric light plant in McLaughlin.

PICKRELL, NEB.—Plans are under way for the erection of a transmission line to Beatrice to supply electricity in Pickrell.

BONNER SPRINGS, KAN.—The International Cement Corporation, 342 Madison Avenue, New York, contemplates an addition to the power plant at its local mills, in connection with extensions, to cost about $500,000.

WICHITA, KAN. — Electric equipment will be installed in the printing plant to be erected by the McCormick-Armstrong Press on Ellis Street, to cost about $100,000. Lorentz Schmidt & Company, Fourth National Bank Building, are architects.

## Southern States

BOSTIC, N. C.—Bonds to the amount of $4,000 have been authorized for the installation of an electric lighting and power system. A transmission line will be erected to Forest City to connect with the lines of the Southern Power Company at that place.

DENMARK, S. C.—The Edisto Public Service Company plans to double the capacity of its electric and ice plants.

HARBOR POINT (P. O. ALLANDALE), FLA.—The Harbor Point Development Company has acquired three partially developed tracts of land about 5 miles south of Daytona, comprising Norwood, Allandale and Rose Bay, aggregating 1,400 acres, which it will develop for homesites. Lighting, water and sewer systems will be installed. Charles D. Thompson is local manager in charge with offices in Nelson Building, Daytona.

TAMPA, FLA.—R. W. Pillsbury, president, Woodmont Orchards Company, New Hampshire has purchased the holdings of the Anna Maria Beach, including pier, dance hall and equipment for maintenance of an amusement resort, and contemplates improvements including an electric lighting system, etc. Bouton & Cermak, St. Petersburg, are representing agents.

MEMPHIS, TENN.—The Memphis Light & Power Company is negotiating for the purchase of the properties of the Memphis Street Railway Company. As soon as the receivership is cleared up it will enlarge the power house of the street railway and make other extensive improvements.

UNION, TENN.—The proposal to issue $125,000 in bonds will be submitted to the voters on Jan. 27. Of the proceeds $75,000 will be used for extensions to the municipal light and water plant and sewer system.

CHICKASHA, OKLA. — The Chichasha Gas & Electric Company has submitted proposals and has asked for franchises to serve electricity to the towns of Cement, Cyril, Tuttle, Minco, Pocasset, Ambler and Alex.

PAWNEE, OKLA.—The Oklahoma Gas & Electric Company plans to extend its 22,000-volt transmission line to Pawnee for commercial service. A line will also be erected to Cushing.

WEST TULSA, OKLA.—The Oklahoma Power Company, Tulsa, will soon break ground for the construction of a new 10,000-kw. unit at its local power plant, duplicating the unit now in course of erection.

DALLAS, TEX. — The Dallas Railway Company will construct two substations in connection with the electrification of the line of the Missouri, Kansas & Texas Railway Company from Dallas to Denton.

ELECTRA, TEX. — The Griswold Oil Company, Henrietta, contemplates the construction of a substation at its proposed oil refinery here, to cost about $500,000.

JACKSONVILLE, TEX.—The Jacksonville Electric & Ice Company has increased its capital stock to $135,000.

PORT ARTHUR, TEX.—The Gulf Refining Company, Dallas, contemplates the installation of additional power equipment in connection with extensions to its local refinery, to cost about $500,000.

## Pacific and Mountain States

CENTRALIA, WASH.—The H. H. Martin Lumber Company will install a substation in connection with a new mill, to cost about $100,000.

COLVILLE, WASH.—The Stevens County Power & Light Company contemplates extending its transmission lines 3 miles south of Kettle Falls.

SEATTLE, WASH.—A preliminary permit has been granted by the Federal Power Commission to Maurice D. Leehy, Seattle, involving a power development at Lake Mahoney and Beaver Lake, 10 miles northeast of Katchikan, Alaska.

FRESNO, CAL.—The installation of a 6,000-hp. generator in power house No. 3 of the Crane Valley system is under consideration by the San Joaquin Light & Power Corporation. An extension, 36 ft. x 85 ft., will be erected at the power house to provide space for the proposed new unit.

HAYWARD, CAL.—Plans are being prepared for the installation of an ornamental lighting system on Castro, B and Main Streets, to be maintained by an underground wire.

LIVERMORE, CAL.—Bids for the construction of twenty-nine buildings at Livermore, including electrical work, refrigerating machinery, etc., for the United States Veterans' Bureau, Arlington Building, Washington, D. C., have been rejected. The work will be readvertised.

LOS ANGELES, CAL.—Ordinances have been approved for the installation of a street-lighting system on North Main Street and on Vermont Avenue.

OAKLAND, CAL.—Steps have been taken by property owners on Webster Street from Fourteenth to Twenty-second Street to secure the installation of electroliers on that thoroughfare.

REDLANDS, CAL. — An ordinance is being prepared for the installation of an ornamental lighting system on Eureka and Grant Streets and Brookside Avenue.

RIVERSIDE, CAL. — Steps have been taken by the officials of the Gage Canal Company for the incorporation of a mutual company for the purchase of power used in pumping water from the Gage Canal to the foothill citrus orchards.

SACRAMENTO, CAL.—The installation of an ornamental lighting system on I Street, to include octagonal electroliers, is under consideration by the City Council.

SAN RAFAEL, CAL.—Negotiations are under way with the Pacific Gas & Electric Company for the installation of an ornamental lighting system in the residential districts.

WATSONVILLE, CAL. — The Watsonville Water & Light Company has petitioned the State Railroad Commission for permission to sell its property to the city of Watsonville, at $200,000. Bonds have been voted to acquire the plant.

PEACH SPRINGS, ARIZ.—A permit has been granted to James B. Girard, engineer, Phœnix, by the State Water Commissioner to build a hydro-electric plant on the Colorado River, at the mouth of Diamond Creek, about 25 miles from Peach Springs. The plans call for a total development of 200,000 hp. Authority from the Federal Power Commission will be necessary before the plant can be erected.

## Canada

ANYOX, B. C.—The Granby Consolidated Mining, Smelting & Power Company is building an addition to its local power plant and will install a 5,000-hp. vertical reaction turbine, for which orders have been placed.

VANCOUVER, B. C.—The British Columbia Electric Company is planning to erect a new 34,000-volt transmission line from its Lake Buntzen plant to Port Moody, tying in with an existing line at that point. This line and the reconstruction of other lines will cost about $170,000.

CAMPBELLVILLE, ONT.—The question of issuing $35,000 in bonds for the installation of an electric lighting and power distribution system is under consideration.

LANSING, ONT.—Surveys are being made for the installation of a street-lighting system in North York Township. A. Stocking, Hydro Building, University Avenue, Toronto, is engineer.

# Electrical Patents

Announced by U. S. Patent Office

(Issued Dec. 19, 1922)

1,439,524. ELECTRIC HEATER; T. A. Lewis and A. L. Dunham, New York, N. Y. App. filed March 20, 1920. Radiant room heater with element inclosed in glass bulb.

1,439,525. EXCITATION OF ELECTROLYTIC CONDENSERS; R. D. Mershon, New York, N. Y. App. filed Sept. 14, 1920. Excitation of condensers that are to be employed in polyphase circuits.

1,439,526. EXCITATION OF ELECTROLYTIC CONDENSERS; R. D. Mershon, New York, N. Y. App. filed July 18, 1917. Single source of excitation current.

1,439,543. ELECTROMAGNETIC DEVICE; H. E. Frost, Cleveland, Ohio. App. filed July 9, 1920. Switch for alternating current.

1,439,562. AMPLIFYING SYSTEM; P. F. Lowell, Washington, D. C. App. filed Sept. 9, 1921. Radio-frequency amplifier transformer.

1,439,563. RADIO-FREQUENCY TRANSFORMER; P. D. Lowell, Washington, D. C. App. filed Sept. 9, 1921. Amplifies efficiently at short wave lengths.

1,439,577. ELECTRIC WATER HEATER; G. Pominville, St. Hyacinthe, Quebec, Can. App. filed Sept. 1, 1920. Adaptable to any type of domestic water tanks.

1,439,633. METHOD OF AND APPARATUS FOR TELEGRAPHIC TRANSMISSION; J. W. Milnor, New York, N. Y. App. filed Sept. 17, 1918. Duplex telegraphic transmission through long submarine cables.

1,439,639. ELECTRIC REGULATOR; T. M. Pusey, Kennett Square, Pa. App. filed Nov. 4, 1920. Voltage regulator for generators.

1,439,648. TROLLEY-WHEEL GUARD; W. Stasiak, Detroit, Mich. App. filed April 12, 1922. Star-shaped guard at each side of wheel.

1,439,657. CONNECTION TERMINAL; R. Zollner, Dresden, Germany. App. filed April 6, 1921.

(Issued Dec. 26, 1922)

1,439,686. MAGNETIC FISHING TOOL FOR WELLS; A. H. Brandon, Toledo, Ohio. App. filed May 10, 1919. Relates to electromagnetic fishing operations.

1,439,687. FISHING TOOL; A. H. Brandon, Self-energizing unit attached to drilling stem.

1,439,723. NUMBERING SYSTEM FOR AUTOMATIC TELEPHONE EXCHANGES; W. G. Blauvelt, New York, N. Y. App. filed Sept. 17, 1918. Automatic switching machinery.

1,439,729. TELEPHONE HAND SET; G. Deakin, Antwerp, Belgium. App. filed Sept. 7, 1922. Impulse sender easily attached or removed.

1,439,735. TELEPHONE EXCHANGE SYSTEM; E. W. Hancock, New York, N. Y. App. filed Oct. 20, 1920. Automatic switching.

1,439,740. TROLLEY-POLE BASE; E. S. Lincoln and Ernest Larsson, Mansfield, Ohio. App. filed March 25, 1922.

1,439,761. SIGNAL AND ALARM SYSTEM; C. J. Rohland, Worcester, Mass., and J. H. Wheelock, Fitzwilliam, N. H. App. filed Feb. 5, 1915. Fire-alarm system.

1,439,771. SIGNAL-CONTROLLING SYSTEM; C. A. Sprague, East Orange, N. J. App. filed Feb. 27, 1920. Correcting defective or false response of receiver systems.

1,439,772. SIGNALING APPARATUS AND CIRCUITS; J. F. Toomey, New York, N. Y. App. filed April 24, 1919. Indicates that portion of long telephone line is in use.

1,439,785. TELEPHONE RECEIVER OF THE WATCHCASE TYPE; F. W. Andrew, Brooklyn, N. Y. App. filed April 20, 1922.

1,439,797. GENERATOR DRIVING; W. L. Conwell, Montclair, and W. I. Thomson, Newark, N. J. App. filed Dec. 5, 1918. Railway car-lighting generator belt supplied with sand to prevent slipping.

1,439,817. ANNUNCIATOR DROP; C. Herrmann, New York, N. Y. App. field Oct. 24, 1919.

1,439,871. MOTOR CONTROLLER; L. P. Coulter, Milwaukee, Wis. App. filed Feb. 13, 1922. For machines having several tool-operating motors and a motor-operated feeding mechanism.

1,439,892. MOTOR CONTROLLER; A. J. Horton, White Plains, N. Y. App. filed Nov. 24, 1917. Automatically accelerates to a number of predetermined speeds.

1,439,893. BATTERY-CHARGING APPARATUS; A. J. Horton, White Plains, N. Y. App. filed Jan. 17, 1920. Prevents improper connection to charging circuit.

1,439,947. ELECTRICAL SIGNALING; L. Cohen, Washington, D. C. App. filed June 29, 1921. Static in radio receiving balanced out by Wheatstone bridge.

1,439,955. CATHODE; M. E. Fuld, Baltimore, Md. App. filed Sept. 21, 1920. Dry-cell cathode of wire with depolarizing material.

1,439,956. BATTERY CELL; M. E. Fuld, Baltimore, Md. App. filed June 23, 1919. Cap-shaped anode for dry cell.

1,439,962. TUBE-WELDING MACHINE; E. Kamper, Toledo, Ohio. App. filed June 21, 1917. Preheating the parts of tube to be welded.

1,439,965. ELECTRICALLY HEATED UTENSIL; J. F. Lamb, New Britain, Conn. App. filed July 20, 1917. Waffle iron.

1,439,972. ELECTRIC ARC WELDING; P. O. Noble, Schenectady, N. Y. App. filed Dec. 20, 1920. Flux-covered electrode welding performed with automatic machine.

1,439,979. ELECTRICALLY HEATED DEVICE; E. H. Richardson, Ontario, Cal. App. filed Feb. 21, 1921. Automatic cut-out for flatirons.

1,439,990. VENTILATION FOR DYNAMO-ELECTRIC MACHINES; H. S. Baldwin, Lynn, Mass. App. filed March 5, 1921. Fan attached to one end of machine forces air through windings.

1,439,994. PROCESS OF STABILIZING STORAGE-BATTERY ELECTRODES; R. C. Benner, Bayside, N. Y. App. filed April 29, 1922. Method for washing and drying formed negative plates.

1,439,995. INDUCTANCE; L. F. Bird, Seattle, Wash. App. filed Jan. 5, 1921. For radio circuits.

1,439,997. INSULATION MOUNTING; L. F. Bird, Seattle, Wash. App. filed Feb. 25, 1921. For low-capacity and low-inductance resistances.

1,440,005. PORTABLE BURGLAR ALARM; F. Crossman, San Francisco, Cal. App. filed Aug. 16, 1921.

1,440,021. ELECTRIC POCKET LAMP; A. Luzy, Paris, France. App. filed July 29, 1920. Self-contained generator.

1,440,023. STORAGE BATTERY; S. M. Meyer and W. James, Brooklyn, N. Y. App. filed Oct. 29, 1921. Positive electrode in form of box with perforated sides.

1,440,024. STORAGE BATTERY; S. M. Meyer and W. James, Brooklyn, N. Y. App. filed April 7, 1922. Cylindrical container inclosing cylindrical electrodes.

1,440,036. METHOD OF RECEIVING TELEGRAPH SIGNALS; C. H. Teegarden, Washington, D. C. App. filed Sept. 19, 1918. Supplementary receiving set which may be attached to duplex telegraph system without interference.

1,440,044. COIL-WINDING MACHINE; S. R. Wright, Rawdon, England. App. filed Aug. 22, 1921. Used for winding conical coils.

1,440,051. STARTING GENERATOR FOR INTERNAL-COMBUSTION ENGINES; S. G. Baits, Detroit, Mich. App. filed Nov. 12, 1920.

1,440,078. TELEPHONE LOCK; W. F. Hemstreet, Brooklyn, N. Y. App. filed Feb. 16, 1921. Prevents unauthorized use of automatic telephone.

1,440,091. ELECTRODE; R. A. Long, Tamaqua, Pa. App. filed March 1, 1922. Platinum faced on lead for electrolytic solution.

1,440,093. TROLLEY SHOE; J. Miller, Amesbury, Mass. App. filed Nov. 13, 1915. Self-adjusting, spring-held trolley harp.

1,440,106. PROCESS AND APPARATUS FOR ELECTRIC SMELTING OF ORES; E. H. Rothert, Seattle, Wash. App. filed June 14, 1921. Refining done in same furnace in which ore has been reduced.

1,440,110. TRUNK CIRCUITS; C. Sparks, Chicago, Ill. App. filed April 4, 1918. Provided with double supervision.

1,440,111. TELEPHONE SYSTEM; C. Sparks, Oak Park, Ill. App. filed May 23, 1918. Balanced operator's telephone circuit reduces side tone in the operator's head receiver.

1,440,112. TELEPHONE SYSTEM; C. Sparks, Oak Park, Ill. App. filed July 1, 1918. Multiple-line lamp system in which instantaneous "disconnect" and recall are provided.

1,440,113. TELEPHONE SYSTEM; C. Sparks, Chicago, Ill. App. filed May 15, 1916. Busy test for multiple-line jack and line lamp system.

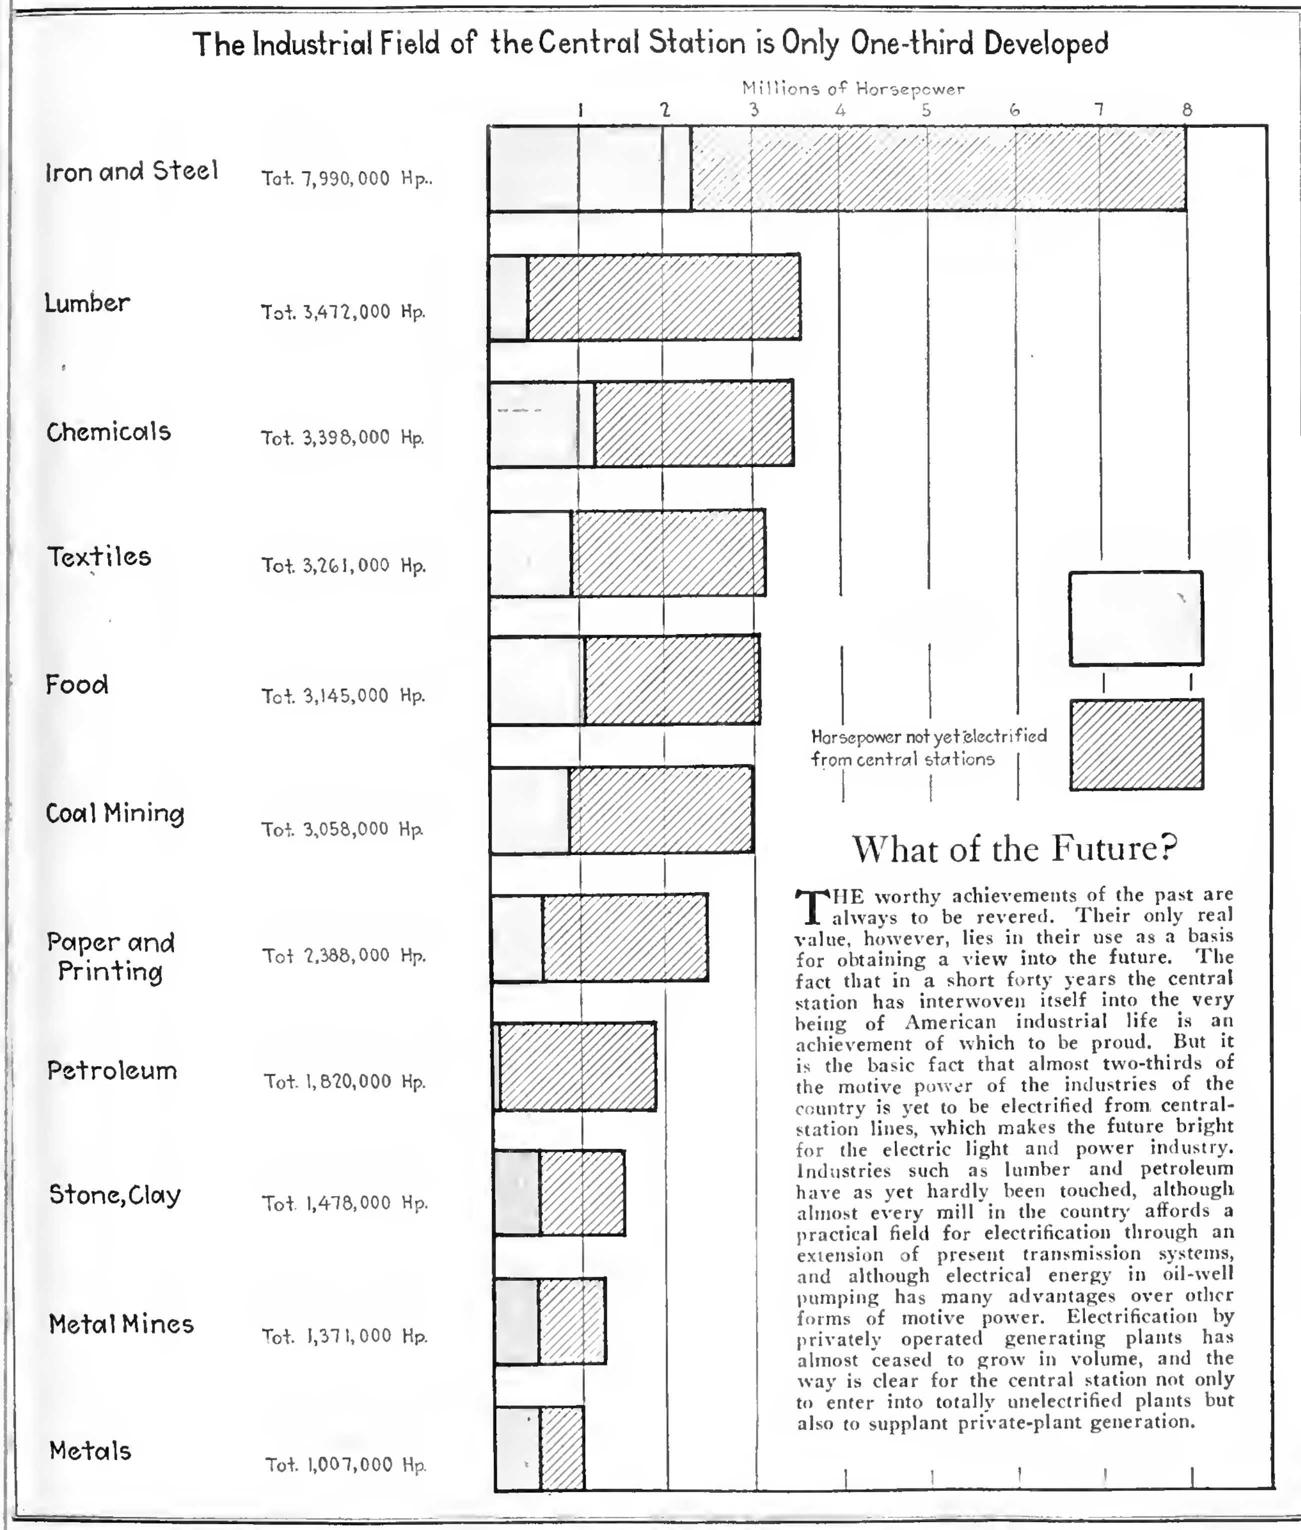
1,440,114. TELEPHONE SYSTEM; C. Sparks, Oak Park, Ill. App. filed Aug. 5, 1918. Interconnection of common-battery and local-battery lines.

1,440,171. ELECTRIC HEATER; A. Papini, Philadelphia, Pa. App. filed April 21, 1920. Expansion and contraction of thermostatic element employed to oscillate reflector.

1,440,202. ELECTRICAL HEATING UNIT; J. S. Yoast, Cincinnati, Ohio. App. filed April 21, 1921. Loosely packed resistance-element refractory container.

# Business Facts for Electrical Men

Selected Statistics Presented Graphically for the Use of All Interested in Analyzing the Trend of the Electrical Business



## What of the Future?

THE worthy achievements of the past are always to be revered. Their only real value, however, lies in their use as a basis for obtaining a view into the future. The fact that in a short forty years the central station has interwoven itself into the very being of American industrial life is an achievement of which to be proud. But it is the basic fact that almost two-thirds of the motive power of the industries of the country is yet to be electrified from central-station lines, which makes the future bright for the electric light and power industry. Industries such as lumber and petroleum have as yet hardly been touched, although almost every mill in the country affords a practical field for electrification through an extension of present transmission systems, and although electrical energy in oil-well pumping has many advantages over other forms of motive power. Electrification by privately operated generating plants has almost ceased to grow in volume, and the way is clear for the central station not only to enter into totally unelectrified plants but also to supplant private-plant generation.

## A Year of Inconsistencies

THE year which has just closed has witnessed many extremely encouraging tendencies and a few extremely discouraging tendencies. The cost of construction during the first half of the year was materially under that of 1920 and 1921, but in September, prices of construction materials exhibited an upward swing which carried them above the prices of 1921 during the last quarter of the year, though they remained still many points below the prices of 1920. Actual construction, however, was far above that during 1921 with the exception of November. The rapid rise in the price of coal with the opening of the coal strike in the middle of spring applied the brakes to industrial development and the rapid return to normal. The year closed with coal prices about 90 per cent above those of 1921.

# Stop the Negative Guesswork

WEST of the Rockies a new drive is on to extend and intensify the use of electrical appliances in the home. There are a million and a half electrically connected residences in that region. Already certain central-station companies—notably the California Oregon Power Company, the Idaho Power Company and the Washington Water Power Company—have succeeded in introducing electric ranges and water heaters to the extent of one to every five of their residential consumers. The forward movement, which looks to building up electrical household appliance loads to the same degree of saturation in every district, is worthy of the electrical industry, and it should receive similar impetus in every nook and corner of the country.

But there is one great obstacle. As a prominent manufacturer recently expressed it in a line: "Our most difficult and persistent enemies are the electrical men themselves."

An "old fogy," according to William James, is a man who has ceased to accept new thoughts, and he confessed having known some men who showed symptoms of old-fogyism at the age of twenty-five. The question is important, because the disease is a prevalent one and the old fogy is a menace to any industry in which he engages. He is the man who ties his industry down to inefficient methods and hampering limitations.

In the electrical field he is not sufficiently convinced of the value of electricity for cooking, dishwashing, water heating and refrigerating to use it for these purposes himself. He will doubtless put up a very good sales argument if confronted with a prospective customer, but he will tell his friends, as his private opinion, that, aside from electric flat-irons and perhaps vacuum cleaners and possibly clothes washers, there is not one electric appliance which has really proved itself.

This man, and he is surprisingly common in the ranks of the electrical industry, is the greatest hindrance to the advancement of the electrical idea today. It is a common statement among electrical men that they must "sell themselves" before they sell the public. But apparently most of them mean by this that they must somehow acquire an inpouring of enthusiasm on things electrical which will descend from heaven in the form of religious inspiration.

This skepticism and apathy are a tremendous handicap under which our pioneers must struggle. The public naturally considers all members of the electrical industry experts in this field and takes their word, especially if it be derogatory, as final. The man who by snap judgment condemns any new device or method therefore does a tremendous injustice and he is hampering his own work.

# Frederick Gardner Cottrell

*A notable contributor to electrochemical progress through the development of the electrical precipitation process.*

ONE of the leaders in the field of electrochemical research is F. G. Cottrell, research chemist and chairman of the division of chemistry and chemical technology of the National Research Council. The Cottrell process which bears his name and by which he is best known is a simple electrical process by which foreign substances in an admixture with gases or liquid are deflected when made to pass through an electrical field and caused to be deposited in chambers especially prepared for that purpose. So simple is the system that it has usually paid for itself within the first few months of operation by the value of the by-products saved, and so important is it that it may be said to have saved more than one smelting and cement industry from being put out of business as a public nuisance.

Mr. Cottrell is a native of California and a graduate of the University of California, class of 1896. Following graduation, for three years he served as a teacher of chemistry in the Oakland High School. He then went to Europe for further study, receiving a degree from the University of Berlin in 1901 and a Ph.D. from the University of Leipzig in 1902. On his return to California in the latter year he became associated with the chemical department of his Alma Mater, rising to the rank of assistant professor in 1906. About this time he conducted numerous experiments in electrical precipitation on the principles laid down by Walker and Lodge. He was more successful than they in establishing the commercial feasibility of the system, and as early as 1906 an installation was made at the Hercules works of the E. I. du Pont de Nemours Powder Company at Pinole, Cal. Since that time the principle has been applied to the removal of fumes from smelter stacks, the recovery of potash from cement plants, the dehydration of oil and numerous other processes.

In 1911 Mr. Cottrell's services were asked for by the Bureau of Mines and he became consulting chemist with that organization, rising to be director of the bureau in 1920. His interest has always, however, lain primarily with research, and in 1921 he resigned to accept his present post with the National Research Council.

Mr. Cottrell is deeply interested in public service in the broadest sense of the word. Typical of the man is his action, while still dependent on the modest income of an assistant professor, in transferring to the Smithsonian Institution substantially all his rights to his inventions and patents in the field of electrical precipitation, in order that the profits might be applied to the advancement of scientific research.

Electrical World, January 20, 1923

Volume 81 Number 3

### Do Our Associations Function?

THIS question has often been asked by those who contribute as well as by those who have been asked to contribute to the support of the various societies of the electrical industry. Needless to say, organizations which measure up to expectations seldom have to worry greatly about the wherewithal to "carry on." Nevertheless none is ever immune from the necessity of hustling for funds. Though they be as chaste as ice and as pure as snow, they shall not escape calumny, and though the benefits they confer on those who support them be as manifest as the nasal organ of a Roman senator, yet for one who gladly proffers his assistance there are three who wait to be coaxed or who demand superfluous proof.

In the case of the National Electric Light Association at least this necessary work of supererogation has been done well enough to convince even him "who complies against his will." President Frank W. Smith has prepared a report reviewing the affairs of that organization for the first half of the year. In reading his narrative no one can help being impressed with the tremendous scope of the work in which the association is engaged. Mr. Smith and his staff are to be congratulated on such an excellent account of their stewardship. It should silence the carpers and cynics as well as the honestly doubting Thomases, if such there be, and will deprive the reluctant contributor even of the chance to pose as a benefactor, so clearly is he shown to be an investor for his private good as well as for the good of the industry on which he depends.

### Notable Achievement in Radio Telephony

THE speeches delivered in New York last Sunday night and transmitted by radio telephone to New Southgate, England, unquestionably establish a record of development noteworthy in the art. As long ago as 1915 successful radio telephony had been carried on between the naval radio station at Arlington and such distant points as San Francisco, Honolulu and Paris; but these were mere demonstrations indicating the practicability of wireless speech over long distance as soon as improvements in transmitting and receiving apparatus, particularly the former, could be brought about. With the development of continuous-oscillation systems, detectors and amplifiers, and more especially water-cooled vacuum tubes, long-distance radio telephony became a commercial possibility. Although still imperfect, it is nearer perfection than either the telegraph or the telephone was twenty years after its introduction. Ever since Marconi's first experiment scientific interest all over the world has been aroused in radio communication, and that interest has continued unabated until this day.

Meanwhile the aspect of mystery which covers the working of radio grips the mind of the general public, and countless persons, not understanding the physics of what they are attempting, nevertheless, thanks to a great variety of commercial apparatus, have been able to gratify a passion for wireless experimentation. Amateur interest was increased a thousandfold when broadcasting stations were established in every section of the country. It is interesting to observe that telegraphy and telephony, wired or wireless, are not competitors, but co-operators. Each has its particular field and function, and it is particularly gratifying to note the vigorous development of radio despite the limitations imposed on it. It is a matter for congratulation that the art has reached such a point that transatlantic radio telephony is now virtually assured.

### An Engineer Ambassador

WITH a sincerity and an unassuming convincingness that captured his audience, Prince Caetani, the recently appointed Ambassador from "the new Italy" to the United States, established a high standard for future engineer ambassadors to maintain in his address at the dinner given in his honor by the Federated American Engineering Societies at Washington. It is not too much to say that the dinner marked an epoch in visualizing the opportunity for bringing about through the engineer a new basis for international relations. Preceded by Calvin Rice, who presented the opportunity for establishing common purposes between the engineers of North and South America, and by Elmer Sperry, who also was recently an ambassador of engineering good will through his message to the engineers of Japan, the address of Prince Caetani came as a fitting climax to an international evening.

Between the lines of the addresses of all three one common truth was evident, that the engineer who has been and is so definitely responsible for the material advance of our civilization is now viewing himself as one having a responsibility, not alone as an engineer, but also as a citizen, for helping to solve some of the complex problems that this civilization has brought. The Italian Ambassador alluded to this in his address, when he said that he had returned from the war with a great engineering task in view, the draining of the Pontine marshes, but that when the call came to him to serve his country at Washington he felt that the problems of industrial and commercial relations between Italy and the United States could be approached in the spirit of finding the facts and adjusting these international questions on the basis of an understanding of these facts, and in that spirit he had undertaken his new mission.

The addresses of all the speakers emphasized the fact that international relations are not essentially based on mysterious communings between national spokesmen meeting in secret, but on the bringing about

of practical results by discussing with intelligent understanding and in the spirit of mutual respect the industrial and commercial problems between the nations. To this sort of diplomacy the engineer brings an intimate knowledge of the industrial life of his country and the special ability needed in deciding whether a solution proposed will work in practice. With facts expressed for facts' sake in the new diplomacy, is it too much to hope that there will come a mutual respect and tolerance for national motives and ideals that will bring order out of chaos in our world? Certainly this is not a vain hope if truth, common sense, purpose and vision shine in our diplomatic interchanges as they will if men like Caetani are chosen for ambassadors.

### Electrification Proves Economical Factor in Port Development

THE revival of shipping following the post-war depression has turned the attention of port engineers to a consideration of those factors which make for increased speed and economy in port operations and are demanded by the keen competition for water-borne commerce between rival ports and terminals. The most restricted step in the cycle of a ship's operations is the handling of the cargo at the port. It is therefore important that human ingenuity devise ways to facilitate cargo handling, and as a result much study is being given to the electrification of port terminals. Electrical material-handling equipment not only speeds up operations and reduces the unit handling costs, but permits a degree of flexibility in handling large volumes of commerce in commodities of all varieties, both in bulk and in package, not obtainable in any other way.

In an article appearing elsewhere in this issue O. P. Seim, mechanical engineer of the port of Seattle, discusses the factors which have entered into the electrification of the Port of Seattle's terminals, the selection and application of motive-power equipment and control, and the layout of the lighting and power circuits. An interesting point which the author brings out is that if the cargo must be moved more than 120 ft. from the side of the ship, then it is more economical to handle it by conveyors, tractors with trailers or other forms of material-handling equipment. There is a vast field of development in the application of electricity to material handling at ports, and a more complete knowledge of the economies derived from the use of electricity would doubtless encourage those concerned with such work.

### Talk Plainly to the Stockholder in This Year's Statement

THE season of financial reports has again arrived and the annual statements of the public utilities will be laid before their stockholders for inspection. We wonder how many of these public service corporations will follow the lead of the Commonwealth Edison Company's "Year Book" of 1922 (see ELECTRICAL WORLD, July 1, 1922, pages 1 and 29, and put its story in terms of popular understanding. How many will follow the ancient form of the traditional balance sheet?

The average investor regards an annual report as a sort of mathematical puzzle which he has neither the time nor the energy to solve. He reads the president's message, notes its optimism and its statement of growth, looks at a few totals in the columns of assets and liabilities, and lets it go at that. And yet it is of the greatest importance that the stockholder of any corporation shall understand his company's business and feel not a passive but an active confidence in it.

As a matter of fact, the annual report of the average American corporation is, as a rule, a singularly frank statement of the results of the year's activities. The trouble lies in that the form in which this statement is expressed is highly technical. It is couched in financial jargon, adequate and full of meaning to the trained financial mind, but ambiguous, abstruse and almost unintelligible to the ordinary men and women whose money is invested in the enterprise and who are expected to read it and approve. The steward of their property writes to tell them what he has been doing, but he uses a language that is not clearly understood.

It is a simple matter, as the Commonwealth Edison Company demonstrated so cleverly last year, to make the financial statement of a public utility corporation "talk United States." It is to be hoped that many of the other companies who read this year book saw the point and have remembered, and that this season will see a new type of statement that will speak plainly to the stockholder.

### "In Language Understanded of the People"

IN TECHNICAL and scientific circles there is often lamentation over the lack of popular interest in research and of general appreciation of scientific work and attainment. It is in fact true that unless a discovery can be directly coined into dollars, which the most illiterate can fully comprehend, it passes almost unnoticed. Yet this does not really indicate that the man on the street is dull-witted or uninterested in the achievements that lead to a closer knowledge of the mysteries of life and the universe. On the contrary, he is by no means void of intellectual curiosity or unmindful of how far the torch has been borne within a few brief generations. It is chiefly the fault of the highbrow that his works are so often taken at a paper-ruble value. For the highbrow speaks and writes dialects that to the common man are as meaningless as is the superscription on that same worthless spawn of the printing press; and if he looks for real enlightenment, it is generally not to be found unless through translation into another tongue scarcely more intelligible.

At the recent meeting of the American Association for the Advancement of Science, a cub reporter was sent to the scene of action with instructions to summarize what might be of general interest. He was probably, like most of his profession, far above the average in education and intelligence, but all that he brought back was his sense of humor and a collection of titles of papers which looked like printer's "pi" reassembled by a plain drunk. The fact is that technical and scientific men have fallen into the use of language which their fellow mortals can ill comprehend. The jargon of the physicist, the patois of the psychologist, the polysyllabic lingo of the chemist, the pseudo-Hellenic patter of the biologist and the curious argot of the radio fan make a mixture that is enough to drive the common citizen into the arms of the nearest bootlegger. In all seriousness there never was greater need for men who can think straight science and talk straight English. Such there have been in the past —Michael Faraday and John Tyndall, Huxley and Lub-

bock, Sir Robert Ball and the lamented Kingdon Clifford—who in their generation made clear the way. Such interpreters are keenly needed now, for the confusion of tongues has grown steadily worse. Unmasked by fame is the professor who has not, from sheer laziness, devised a new and needless name for an old thing or idea to save himself a casual touch of chalk to blackboard, and lucky is the world if he has not foisted it upon some society to standardize. Our English tongue has thus been cursed by enrichment as Midas by the golden touch, and it has come about that to intricacies of fact have been added those of expression until science repels those who would gladly learn and profit. The situation is a grave one and without good excuse. No modern language surpasses the French in the clarity of its scientific expression, and none is less burdened with the verbiage of the specialist. An ancient English statute prescribed the reading of the Scriptures "in language understanded of the people." We greatly need today the same rational precept applied to the growing body of human learning, so that by many interpreters the truth may be brought to all who are willing to receive it.

## Engineering Necessary in Design of Wooden-Pole Lines

TOO little engineering and an excess of rule-of-thumb methods are still applied in the construction of wooden-pole transmission lines in the United States. Starting with the low-voltage distribution line more than twenty-five years ago, when there was little knowledge of the structural features available and attention was concentrated on more vital development problems, wooden-pole construction was developed largely by the cut-and-try method, and eventually the job of designing new lines was left to the line foreman. As the cross-country transmission line developed the wooden-pole line construction in this field followed the distribution methods. If some one guessed wrong, the error could be corrected without much expense. The nature of the steel-tower line precluded going at the problem in this way, with the result that better engineering methods have been developed for use with this type of construction. These methods ought to be extended as a matter of course to the wooden-pole line.

Climatic, topographical and right-of-way conditions are the three principal factors governing the physical features of a cross-country line. The first largely determines the loading to which the structures will be subjected and warrants a careful study of sags and a careful control of the sags determined on during construction. Topographical conditions must be determined by a survey, including in addition to the transit line a carefully run level line. Stadia methods will not suffice for this. Moreover, where the line is erected on side slopes these slopes must be taken to a point beyond the location of the outside conductor on the high side so that conductor clearances can be maintained by proper design. A careful location of all obstructions, lines of other companies and similar factors should be made in the survey. Using these data, a careful pole layout should be made on the drafting board, particular attention being paid to the location of structures to insure the least possible strain under maximum loading conditions. Particular attention should be paid to the elimination of unbalanced strains of any sort. Frequently when lines are constructed on steep slopes a careful study of different pole locations on the slopes will make for a much more desirable loading on the structures. Particular attention should be paid to the elimination of dead ends and the modification of angles to reduce strains. Such studies mean a better line with longer life, less maintenance expense and in the end much better service.

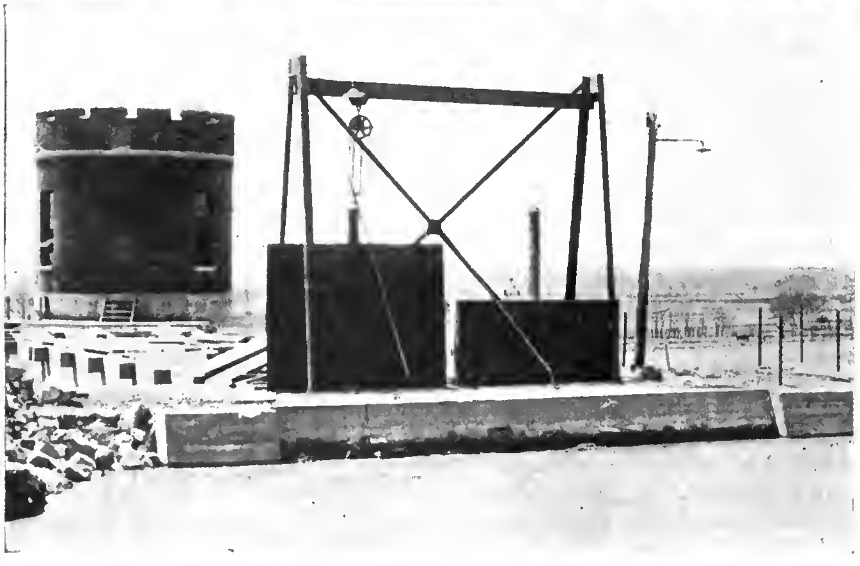
In acquiring a right-of-way it is usually necessary to steer a course founded by economical considerations on one side and by public policy on the other, but the vital effect of the right-of-way on the physical character of the line must not be overlooked. A right-of-way that is easy to obtain may make it almost impossible to construct a physically good line and in many cases may raise the cost of the line itself to a high figure because of the special construction required. No right-of-way should be purchased until the engineers have been called upon to determine its feasibility and its effect on the physical characteristics of the line.

Elsewhere in this issue H. P. Crawford tells of a wooden-pole transmission line constructed in Oregon in which this character of careful engineering has been applied. The stubbing of poles to reduce the cost of construction and to solve a future problem received careful study, and the course indicated to meet a special condition was intelligently carried out. The use of semi-tension insulators in place of dead-end assemblies to reduce strains and meet the demands of service is another piece of intelligent application of engineering facts. The consideration given right-of-way in this instance is well worth the study of engineers who must deal with wooden-pole line design and construction.

## Stray Magnetic Fields and Lead Cable Sheaths

A RELATIVELY inconspicuous, though often serious enough, result of the stray magnetic field is the setting up of circulating currents in neighboring conductors. This case obviously is confined to alternating-current circuits. In generators, and especially in transformers, these currents, unless prevented, lead to greatly increased losses and therefore entail expensive modifications in design. A neglect of suitable precautions in these cases immediately leads to trouble, but there is still a third instance in which, in most cases, the disturbance is too small to notice, namely, the losses in the lead sheath of the three-phase cable caused by the rotating stray magnetic field. This phenomenon has never led to serious trouble either in the heating or the limiting of the capacity of the cable. The exact analysis of the problem and the predetermination of the losses is a matter of some difficulty owing to the unsymmetrical geometry of the cable cross-section. However, various approximate computations have been given from time to time, as, for example, that of N. A. Allen in a recent number of the *Electrician*. He concludes that ordinarily the worst result to be expected is equivalent to an increase in the copper loss of about 5 or 6 per cent, which is usually not a serious matter. He points out, however, the importance of even this small increase in extra-high-voltage cables in which the dielectric losses raise the internal temperatures to the neighborhood of the unstable condition of the insulation. It would appear that, outside of such exceptional cases as this, no serious trouble is to be apprehended from the losses caused by the stray fields of linear conductors.

# Unusual Design for Kearney Hydro-electric Station



**Features of the Kearney Station**

A canal conveys the water 16 miles for irrigation and power purposes. The power plant develops 1,500 kw. with a 54-ft. head.

The upper view shows the open concrete flume, concrete standpipe and brick generator house.

The center view shows the combined standpipe and station foundation.

The lower view shows the forebay and headgates.

# Design Reduces Cost of Small Hydro Plant

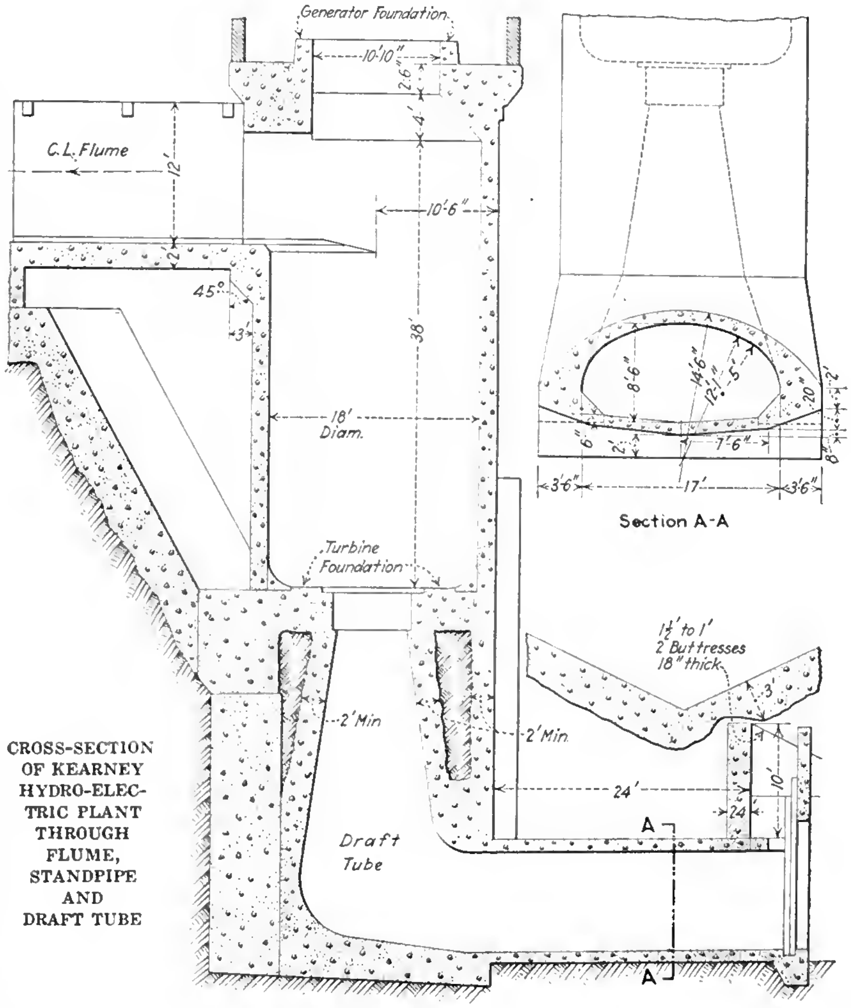
## Unusual Ground Conditions Make Conventional Designs Difficult of Application to Kearney (Neb.) Plant and Hence Unique Plan Is Adopted —Output More than Double that of Old Plant from the Same Canal

A HYDRO-ELECTRIC station with some unique features which were adopted largely to fit unusual local conditions was built by the Central Power Company at Kearney, Neb., a subsidiary of the Middle West Utilities Company, during the summer season of 1921. Water for this project is diverted by a low wing dam across the north channel of the Platte River near Elm Creek, Neb., and is carried by a canal for a distance of 16 miles (25.7 km.) to its terminus at Kearney. Water is used for irrigation along the course of the canal during the irrigation season as well as for power development under 54 ft. (16.5 m.) head at the terminus of the canal. At the power station at Kearney is a spillway, the water from this and the draft tubes returning to the Platte River through a tailrace canal about 2 miles (3.2 km.) long. This canal has been in use for many years for irrigation and for supplying the old Kearney power station. The old station was very inefficient and its situation and type of structures did not permit of substantial improvement in economy by reconstruction. It could develop only 600 kw. from the full capacity of the canal.

The new station was completed and put in operation on Jan. 15, 1922, when the flow of water in the canal was restricted by freezing, and yet the new unit yielded somewhat over 1,000 kw. continuously under these conditions. Moreover this increased capacity was obtained at low gate opening since the new unit is rated as a 2,350-hp., 1,875-kva. unit. The plant is now developing 1,500 kw. with virtually the same canal.

The canal at the site of the development is on ground sloping gently southward toward the Platte River and the 54-ft. (16.5-m.) fall is realized, not by the height of the dam or by the height of the canal above surrounding territory, but by a depressed tailrace channel flowing in a deep cut some 50 ft. (15 m.) below the elevation of the surrounding ground surface at the power station. This tailrace cut has been formed by erosion in clay, and the banks stand nearly vertical to the full height except for a small talus accumulation at the bottom—a type of stream channel familiar in the semi-arid districts of the West, where the flow of a stream rapidly deepens the channel but where the rainfall is insufficient to wear the banks back on a flat slope as in older streams and in more humid regions.

As a result, the problem was to design a power plant which would be adapted to the most effective utilization of a canal only 6 ft. (1.8 m.) deep at ground level and carrying 460 cu.ft. (17 cu.m.) per second, the head being obtained by the depth of the tailrace. The tailrace begins about 100 ft. (30.5 m.) away from the foot



CROSS-SECTION OF KEARNEY HYDRO-ELECTRIC PLANT THROUGH FLUME, STANDPIPE AND DRAFT TUBE

of the spillway, which is only a sloping surface of the native clay deeply paved to resist the scouring action and absorb the energy of the surplus water in its fall.

The conventional type of station now being built most extensively would call for an intake structure in the bank of the canal and a wood-stave or steel-pipe line about 100 ft. (30.5 m.) long leading to a vertical turbine installed in a steel plate or concrete scroll case about 16 ft. (5 m.) above the tailwater level. The amount of water to be carried would have required a pipe about 10 ft. 6 in. (3.2 m.) in diameter and would have necessitated a somewhat large and elaborate intake structure of sufficient depth to depress the top of the pipe at least 2 ft. (0.6 m.) below canal level, or a total depth of the bottom of the pipe of some 13 ft. (4 m.) below water level; still, this would be required to draw water from a canal only 6 ft. (1.8 m.) deep. A deep

cut in the clay bench would have been required to carry the pipe line down to the elevation of the scroll case at the tailrace, 100 ft. away, and this pipe line would have involved considerable maintenance and depreciation. The scroll case itself would occupy a considerable ground area which would need to be provided by excavating back into the nearly vertical wall of the tailrace channel as no space existed in this narrow, deep channel for any structures. With this arrangement it would have been necessary to slope the clay banks outward in three directions from the power house below to avoid possible caving of banks onto the power house in the deep, narrow cut. Furthermore, the generator would have required a flywheel effect adapted to the 100-ft. inclosed column of water in the penstock and scroll case. In addition the power station at the foot of the spillway would have required sheet piling to protect it from scour, and possibly bearing piles.

### Unusual Design Selected

For these reasons, and also because of smaller estimated cost, a unique type of development was decided upon, consisting of an open rectangular flume 12 ft. (3.7 m.) deep by 18 ft. (5.5 m.) wide inside, built of reinforced concrete, carrying 9 ft. (2.7 m.) of water, normally, widening at the intake to 33 ft. 4 in. (10 m.) with the same depth. This concrete flume was carried along the ground surface to the edge of the bench, overlooking the deep tailrace cut, where it enters a concrete standpipe, 18 ft. (5.5 m.) in internal diameter, at the bottom of which is a single-runner, vertical-shaft, open-flume turbine. This discharges downward into a concrete draft tube formed in a downward continuation of the standpipe structure of the same external diameter. The draft tube discharges through a short passage under the talus material to the tailrace canal.

The standpipe extends 3 ft. 6 in. (1 m.) above the top of the flume, expanding in diameter to about 25 ft. (7.6 m.). On top of this is a brick superstructure housing the generator. The floor of the flume is monolithic from the intake to the standpipe, this construction being adapted on the assumption that it will have sufficient flexibility to adjust itself to any unequal settlements. However, the side walls are provided with expansion joints at the standpipe and at the pier at the top of the clay slope, between which points the ground slopes off abruptly. The purpose of the joints is to accommodate any unequal settlement of the flume and of the concrete standpipe, which has a total height from foundation to generator floor of 78 ft. (23.7 m.) in addition to the height of the superstructure of 22 ft. (6.7 m.).

The excavation in which the combined standpipe and station foundation was built was carried 4 ft. (1.2 m.) below the bottom of the discharge tunnel, and a test was made to determine the bearing resistance of the clay bottom at this point. A load of 8 tons per square foot produced a compression of the soil of only 0.16 in. (4 mm.). This clay had been subjected to a compression load of 3 tons per square foot (0.25 t. per sq.m.) in its natural state because of the height of the clay bank in which the pit was dug. The load imposed by the standpipe structures was about 4 tons per square foot (0.33 t. per sq.m.), and no measurable movement whatever of the expansion joints has occurred since completion to indicate any settlement in this structure.

The turbine deck in the standpipe is 41 ft. (12.5 m.) below the top of the flume, 38 ft. (11.6 m.) below normal water level in the flume, and 44 ft. 6 in. (13.5 m.) below the generator-floor level. As mentioned before, the turbine is a single-runner, vertical-shaft, open-flume unit rated at 2,350 hp. at 54-ft. (16.5-m.) head. Two sections of extension shaft connect it with the generator above. In view of the unusually large head for an open-flume turbine, the crown plate is especially well braced against distortion by two tangential struts to the standpipe walls. All bearings are separately lubricated by a grease compressor on the generator floor. The unit is controlled by a governor on the same floor.

The generator is a 1,875-kva. machine, operating at 225 r.p.m., 60 cycles, three-phase, with a direct-connected exciter. All leads from the generator are carried through conduit to the existing steam station of the company about 200 ft. (61 m.) to the eastward, from which point the unit is controlled.

The installation of the turbine in the standpipe structure serves to reduce the required flywheel effect of the generator and allows the turbine to be assembled or dismantled through the flume entrance without disturbing the generator. The velocities through the trash racks, in the flume and in the standpipe are very low. The draft tube is designed as a straight diverging cone of the maximum possible length permissible without danger of vacuum and is provided with an elbow which spreads the water from a circle of 11 ft. (3.4 m.) diameter at the upper end of the elbow to a width of 17 ft. (5.2 m.) and height of 8 ft. 6 in. (2.4 m.) in the discharge tunnel. From the results obtained and from analysis of hydraulic losses it is believed that the efficiency is higher than could have been obtained with the relatively high velocities in the intake, pipe line and scroll case had the conventional setting been adopted.

The total cost of the installation was about $119,000, amounting to about $50.60 per horsepower of turbine installation, or about $63.50 per kilovolt-ampere of generator capacity.

This project was engineered by L. F. Harza, consulting engineer of Chicago, with the approval of George W. Hamilton, engineer of the Middle West Utilities Company of Chicago, the holding company, and was executed by D. D. McNabb as construction superintendent.

## Curious Case of Electrocution

In the *Revue Générale de l'Electricité* A. Turpain tells of an unusual fatal accident from electric shock. Wires used for radio-telephonic communication between two stations on a distribution network ran parallel to the high-tension lines at a distance of 1.80 m. from the latter. On cutting one of these wires a workman received a fatal shock notwithstanding the fact that the wire was isolated from any source of current and did not touch the high-tension line either before or after being cut. The author attributes the mishap to a capacity effect, current being induced in the circuit (containing the capacity and including the workman) by the 15,000-volt current in the adjacent lines. He maintained that workmen should not be allowed on structures carrying high-tension lines until the latter have been disconnected, even though work is not to be done on those lines themselves. This precaution is particularly necessary when work is to be done on lines running parallel to the high-tension lines for some distance.

# Ash Handling for Central Stations*

## High Maintenance Costs of Mechanical Carrier Systems Outbalance Charges on Hopper Car and Air Systems—Practice in Some Stations Tending Toward Water Sluicing of Ashes

THE primary object of a modern central-station system of ash handling is to reduce both labor and depreciation charges to a minimum. To accomplish this any method adopted for a given plant will be governed by the way the ashes are delivered from the fire and also by the facilities for final disposition. With the development of large power boilers yielding ashes at a rate of over a ton per hour, modern ash-handling equipment has been required to keep pace with the boiler development rate. As a result four distinct types of ash-handling equipment have appeared, namely, hopper ash pits dumping direct into freight cars, mechanical conveyors, air conveyors, and conveyors using water as a means of motion.

The design of hopper ash pits, which are used most extensively in modern plants, depends upon the method of ash removal and the draft system. With underfeed and chain-grate stokers dumping ashes at the rear of the furnace, the top of the hopper will be the width of the fire but of small dimension from front to rear. This reduces the capacity for storage. In some instances very little capacity may be sufficient owing to storage facilities outside the ash pit, but twenty-four-hour capacity should usually be provided for in case of breakdown in the conveyors. The largest ash-pit capacity will be required with conveying systems which are operated intermittently; for example, where ashes are dumped into standard railway cars or into conveyors which might be choked by the direct dumping of an accumulation containing large clinkers and therefore need manual attention.

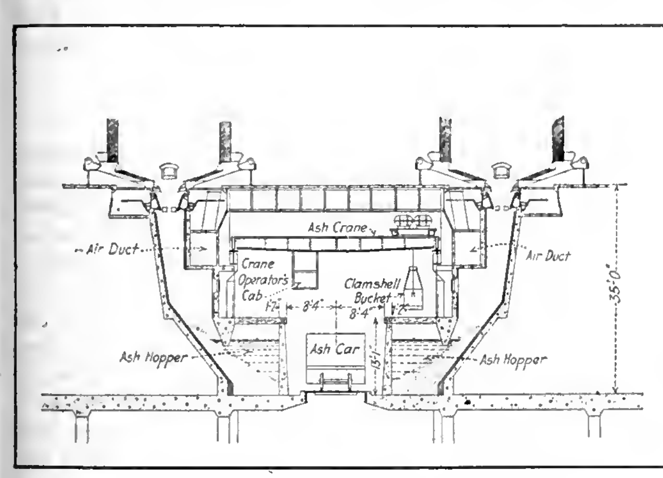


FIG. 1—WATER-SEALED ASH PIT FOR THE SPRINGDALE STATION OF THE WEST PENN POWER COMPANY

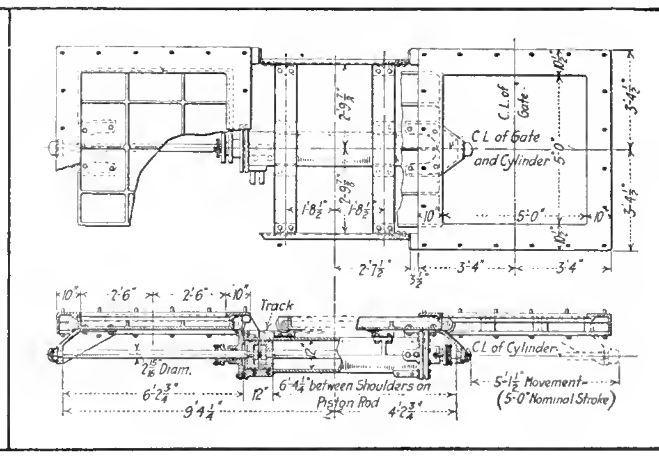

FIG. 2—THIS POWER-OPERATED ASH DOOR HAS A WATER SEAL WHEN CLOSED

Installation of the type shown in Fig. 1 requires a head room of 35 ft. (10.66 m.), but has a capacity of three days' operation at 200 per cent continuous rating of the boilers. Removal of ashes from the ash pits is by traveling crane and clamshell bucket. One crane operator handles the ash output of the station in two hours per day. A further advantage of this method is that no combustible or corrosive gas escapes into the basement to cause trouble to the operating force.

In the design of the hopper ash pit the sides should slope not less than 45 deg. in any case, but if one side is vertical, the opposite side may have the minimum slope. If the slope is too small, arching of the ash is likely to occur. This will increase operating costs owing to the frequent necessity of poking bars up through the discharge doors to start a flow of ash. Where the width of the hopper would necessitate too great a height to get these required slopes, the ash pit may be divided into a number of discharge openings. Modern practice requires discharge openings of about 30 in. to 36 in. (76.2 cm. to 91.4 cm.) as a minimum, although their size depends upon the method of firing. When small anthracite is burned with sufficient steam in the combustion air, no clinkers are formed; but modern intensive firing of bituminous coal tends to cause the formation of large clinkers. Therefore the discharge opening should be large enough to pass these without having to break them into smaller pieces.

The height of the bottom of the hopper above the basement floor depends upon the system of conveyors adopted. With a locomotive and standard railway cars about 17 ft. to 18 ft. (5.18 m. to 5.48 m.) is required; but with industrial cars 5 ft. to 6 ft. (1.52 m. to 1.82 m.) is sufficient, although a clear head room of 7 ft. (2.13 m.) is preferable. Many designers prefer to make the hopper sufficiently large to allow the ashes to remain long enough to cool naturally. By allowing some ash to remain (when dumping) for the new hot ash to fall on the doors and linings are protected.

Although shells with reinforced concrete about 6 in. (15.2 cm.) thick have been found satisfactory, the most modern construction is to use a structural steel skeleton and a shell of substantial cast-iron flanged plates bolted together. Corrosion is not troublesome because cast

*An abstract of the paper presented before the American Society of Mechanical Engineers, Dec. 4, 1922, by John Hunter and Alfred Cotton, St. Louis.

iron suffers much less than steel. By properly quenching the hot ashes with water sprays a lining of well-burned hard paving brick proves satisfactory.

Hopper ash pits will usually be provided with doors to retain the ash, to prevent the passage of air and also to allow the ashes to be dumped. With chain grates and with closed-ash-pit forced draft the doors should be tight to avoid a loss of air pressure and waste of blower power. There are several ways in which dump openings may be sealed. Doors and faces may be machined, flanges may be provided around the edge to maintain a water seal, or the frame may be provided with a groove packed with asbestos rope, while the door has a rib or tongue which is squeezed into the asbestos packing by a cross bar and screw spanning the door. One type of dumping gate which retains a water seal when closed is shown in Fig. 2.

The method of conveying ash by emptying ash pits into small dumping cars has a great deal to recommend it since the cars are usually so inexpensive that one or two spare idle cars are not objectionable; also because the cars can be repaired without interrupting the ash conveyance. The cars can be moved by men, animals, tractors or locomotives; they can be run about the premises and dumped to fill depressions, lifted on elevators to dump into an elevated ash bunker, or they can be dumped into the bucket of a whip hoist.

A hopper ash pit arranged for dumping directly into standard gondola railway cars is shown in Fig. 3. The coal consumption of the particular station in which this system is used is 413,000 tons (374,665 t.) per year, yielding 52,800 tons (47,800 t.) of ashes. Careful time studies have shown that, using the electric locomotive and crane (also in service for coal handling), only 25 per cent of the total time of operation is devoted to ash handling.

The estimated cost of the increased height of the building necessitated by this method of ash handling is liable to arouse comparison with other systems. About 45 lb. (20.4 kg.) of compressed air is required daily to operate the hopper ash-pit dumping doors. From recent tests it was found that 1,030 gal. (3,398.4 l.) of water is used in spraying one ton of ashes. This amounts to about 4 per cent of the total general service water used by the station.

### Mechanical Conveyors

By installing a skip-hoist system at the Ashley Street station of the Union Electric Light & Power Company, St. Louis, in 1916, operation and maintenance expenditures were appreciably reduced. This system is shown in Fig. 4. The old installation, built in 1905, required sixteen men to operate the ash-removal system. This was mainly due to the fact that the men were not allowed to travel on the elevators, which were inspected for freight only. In the old system two men were required to load the cars and drive the mules, two men to run the full cars onto the elevators and to remove the empties, and two men were needed at the top to run the cars off the elevator and dump them into the ash bunker—making a total of six men for each of the two day shifts and four men during the midnight shaft.

The new installation consists of a bucket worked by a skip hoist and a storage-battery locomotive to haul the ash cars. Operation of this system is satisfactory and has given good service. It has reduced the ash-handling labor cost one-third and the cost of maintenance one-half. Experience with storage-battery locomotives shows, however, that in the heat of the basement the electrolyte evaporates rapidly, resulting in battery trouble. A gasoline locomotive is now employed and gives entire satisfaction.

With the chain and bucket forming a ring system (illustrated in Fig. 5) a conveyor may be used for coal in the daytime and for ash at night. The coal is received from crushers at one end of the building and elevated to a point above the bunkers into which the buckets are discharged. The ashes are dumped into buckets during the lower run under the ash pits, elevated and dumped into an ash bin which can be discharged into railway cars or motor trucks. The building of this installation occupies the entire site and no projections of any kind were possible. Since the basement floor was 12 ft. (3.65 m.) below the alley level and as the alley was only 15 ft. (4.75 m.) wide, it was found necessary to build a recess into which the trucks could drive, dump coal and then load up with ashes. Since the ash-bunker discharge is directly above this recess, a truck can be filled with ashes as soon as it has delivered the coal to the receiving bunkers. This makes for quick unloading and reloading, which materially increases the road time of the trucks.

### Conveyor Maintenance

Owing to the abrasive nature of ash, the maintenance cost of mechanical conveyors is high. The ashes grind away the connecting pins, and even with regular renewals the pins sometimes wear excessively and cause breakdowns. With a ring-bucket system breakdowns are sometimes quite serious as the ashes may have to remain in the basement for some days before the conveyor can be placed in operation again. When handling coal and ashes in the same conveyor there is difficulty from the fine coal and wet ashes packing in the buckets, so that there is a needless continuous load on the equipment and a corresponding reduction in the carrying capacity. The water which leaches from the ashes is exceedingly corrosive and helps to carry the fine abrasive ash into the wearing parts.

The life of these conveyors is considered to be about seven or eight years, with extensive repairs necessary every two or three years. The excessive cost of maintenance of ash conveyors of this kind has led to their replacement in some installations with electrically operated cars carrying the ashes to outside pits from which they are loaded into railway cars with a bridge crane. This has resulted in lowering handling costs about 50 per cent.

Both the Fisk Street and the Quarry Street stations of the Commonwealth Edison Company, Chicago, are equipped with bucket conveyors which handle both coal and ashes. It was the intention to install four such conveyors at the Fisk Street station, but only three were installed since the cost of operation and maintenance proved too high. The parts of the fourth were used to repair the three others. An electrically operated ash car is now used in place of the fourth conveyor, and the three other conveyors are being replaced with similar ash cars. These cars are dumped into a pit outside of the building and a bridge crane takes the ashes from the pit with a grab bucket and loads them into railway cars. The cost of maintenance is almost negligible compared with that for the apron conveyors.

At the Northwest and Calumet stations, Chicago, the ash is dumped from hopper ash pits directly into rail-

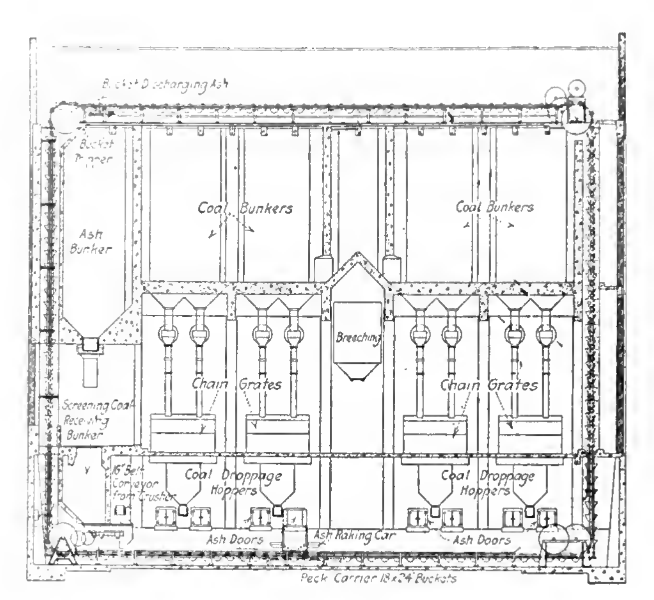

FIG. 5

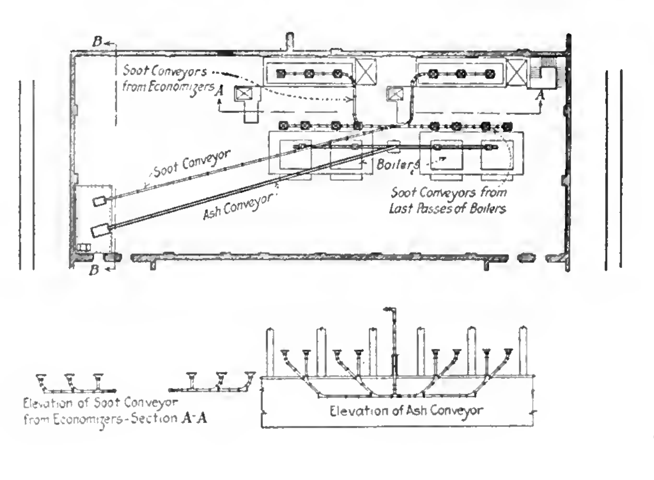

FIG. 6

ASH-HANDLING EQUIPMENT IN USE IN MODERN CENTRAL STATION PLANTS

**Fig. 3**—Hopper ash pit for dumping into standard gondola railroad cars. The hoppers are lined with brick (not shown) and have a capacity of 2,500 lb. (1,134 kg.) of ash. The stokers are equipped with clinker grinders and the ash gates are of the sliding type and are operated by compressed-air cylinders.

**Fig. 4**—Automatic skip hoist at Ashley Street Station of Union company, St. Louis. When an ash car has been dumped into the bucket a switch is pressed which starts the hoisting motor raising the bucket to the top of the travel, where it turns over and discharges into the elevator bucket. A trip switch at this point reverses the motor, thus lowering the bucket to the starting point, where another trip switch stops the motor. One pressure of the button therefore results in hoisting and dumping the bucket and returning it to the starting point, ready for another load.

**Fig. 5**—Typical example of the continuous conveying systems which can be used for both coal and ash handling.

**Fig. 6**—Air conveyor at Milwaukee Power plant conveys a minimum of 12 tons (10.88 t.) per hour at a steam consumption not exceeding 325 lb. (147.4 kg.) of steam per ton of ashes. Feed pipes with a bore of 9 in. (22.8 cm.) are run from the four 734-hp. boilers equipped with underfeed stokers to the storage bunkers inside the boiler house. This storage bunker has a single slope bottom and is emptied through a movable chute into railway cars below. The conveyor for soot and fly ash is connected to the ash conveyor and has a bore of 6 in. (15.2 cm.).

way cars, so that the only maintenance required is the upkeep of ash-pit linings and dumping doors. The cost of the ash-handling equipment at these stations cannot well be estimated since they are recent installations. Owing to the fact that the buildings must necessarily be higher in order to afford head room under the ash pits, the increased cost of the greater height must obviously be chargeable to the ash-handling system.

The salient advantage of fluid conveyors is that there is no mechanism to wear out. The two classes now in common use are the air and water conveyors. As the velocity in air conveyors is high, the abrasive effect is also large and the wear is especially heavy at the elbows.

With the air-conveyor system there are two methods of generating the air current. In one the pipe outlet is connected to the ash-storage tank, in which a vacuum is caused by means of a steam jet, and in the other the air current is induced by a steam jet between the ash intake and the outlet. It is customary to locate the motor jet at an elbow as it is then convenient to aim the jet in the new direction. Ash openings may be arranged in any position desired, such as in the firing floor in front of hand-cleaned ashpits, near the bottom of hopper ash pits, or connected to pipes to draw soot and fly ash from the later boiler passes. They can serve several lines of boilers as easily as one. The maximum capacity of a 6-in. (15.2-cm.) conveyor is about 4 tons

(3.62 t.) of ash per hour; that of the 8-in. (20.3-cm.) conveyor 6 tons to 9 tons (5.44 t. to 8.16 t.), and that of the 9-in. (22.8-cm.) conveyor from 10 tons to 15 tons (9.07 t. to 13.6 t.) per hour. This capacity depends largely upon the size of the pieces. A typical installation is shown in Fig. 6.

The steam consumption of air conveyors depends upon the length of the conveyor, the height to which the ash is lifted, the number of bends and the care used to economize steam during operation. With coal containing 12 per cent ash two tons (1.81 t.) of steam would be used for 100 tons (90.7 t.) of coal. Taking an average evaporation of 9 lb. (4.08 kg.) water per pound of coal, the conveyor will use two tons (1.81 t.) of steam out of every 900 tons (816.46 t.) generated, or approximately 0.2 per cent. To allow for careless operation it

The system of dumping ash directly into an open flume is best illustrated by the installation at the Hell Gate station of the United Electric Light & Power Company, New York, Fig. 8. It has not been sufficiently long in operation to determine the maintenance costs, but the only operating charges are the wages of the ash-crane operator and the cost of energy for driving the pumps, which are running only according to the load and quality of coal.

In the Lacombe station of the Denver Gas & Electric Light Company the same arrangement for ash disposal has been adopted as in the Hell Gate station, with the exception that there are no clinker grinders. Consequently, instead of the ground ash dropping into the flume continuously, the stokers are dumped at intervals, sending down a considerable bulk of ash containing

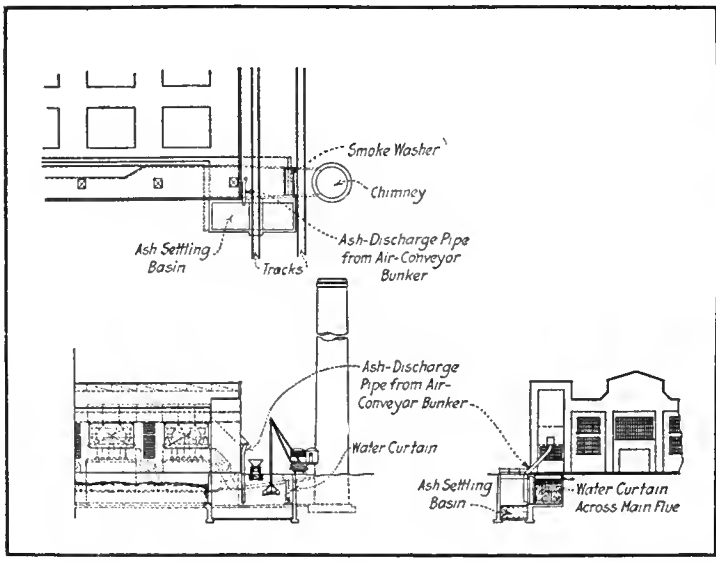

FIG. 7—AIR CONVEYOR AND SMOKE WASHER AT LAKESIDE PLANT, MILWAUKEE

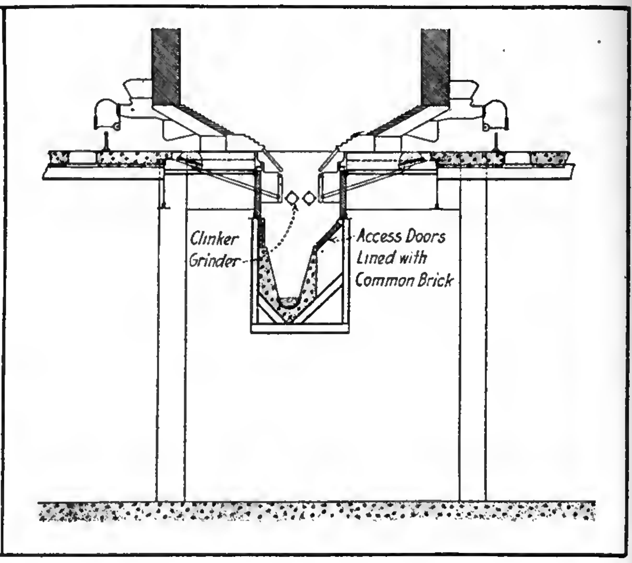

FIG. 8—WATER CONVEYOR AT HELL GATE STATION, NEW YORK

The conveyors discharge into ash bunkers, there being one bunker for each side of the boiler room containing eight boilers arranged in two rows of four each. The ash from one bunker is discharged into cars, while the other is emptied down a closed chute into the ash-settling chamber of the smoke washer. The latter is installed in the main flue about 20 ft. (6 m.) before it enters the base of the stack. The water from the smoke washer runs into a trough formed at the bottom of the flue and then runs off into a concrete settling basin carrying the ashes it collects. This basin is 45 ft. (13.71 m.) long, 16 ft. (4.87 m.) wide and 25 ft. (7.61 m.) deep, which allows the water to settle. When the ash subsides it is removed by a clamshell bucket operated by a locomotive crane.

Open flumes (Fig. 8) run under each row of boilers and connect with a closed cross pipe leading to the ash-settling tank. The ashes are recovered from this settling tank by a grab bucket operated by a locomotive crane and discharged into scows which are towed out to sea. The flumes within the boiler room are of concrete with a bottom lining of vitrified earthen drain tiles or half pipes. There are two nozzles in each flume, one at the head and the other an undercurrent nozzle at the beginning of each succeeding ash pit. These undercurrent nozzles are at the bottom of the flume and are arranged to discharge horizontally downstream to avoid contamination of the circulating water.

is advisable to allow from 0.3 to 0.4 per cent in arranging for extra distillation for make-up water. If the make-up water for the station is 2 per cent, then the distilling capacity should be increased by 20 per cent.

To prevent waste of steam in air-conveyor systems there is on the market an electrically controlled steam valve which consists of a foot-operated switch placed in a convenient position near each ash intake so that steam is actually blowing only when the attendant is actually at work at any particular intake.

The Lakeside plant of the Milwaukee Electric Railway & Light Company in using the air-conveyor system (Fig. 7) has all the conveyor lines constructed of 8-in. (20.3-cm.) cast-iron pipe with a running length of two main lines of approximately 200 ft. (60.96 m.) and a vertical rise of 65 ft. (19.81 m.). In two years of operation the only maintenance required has been the replacement of one nozzle. Since this station uses pulverized fuel, the ash from the combustion chamber is a fine powder which is easily handled by the air conveyor.

large clinkers. The flumes are therefore protected by a "grizzly" composed of heavy bars set 6 in. (15.2 cm.) center to center to withstand breaking up the large clinkers until they can drop between the bars into the flume.

This system handles about 33 tons (29.93 t.) of ashes every twenty-four hours. Stokers are dumped at intervals of two to two and a half hours. The water does not flow continuously, but when the fireman is about to dump ashes the pump is started and when the sluiceway is filled with water, the ashes are dumped from one boiler at a time into the swiftly moving water. A whistle signal is in use between the fireman and the ash tender. The ashes are then recovered from a settling tank by a grab bucket and given to the city for suburban road making. Three combination men, one on each shift, are required to handle the ashes and attend to the feed pumps. Two men, one on each of the two shifts, operate the crane and clamshell bucket to remove the ash from the settling tank.

# Design of Wooden Pole Transmission Line

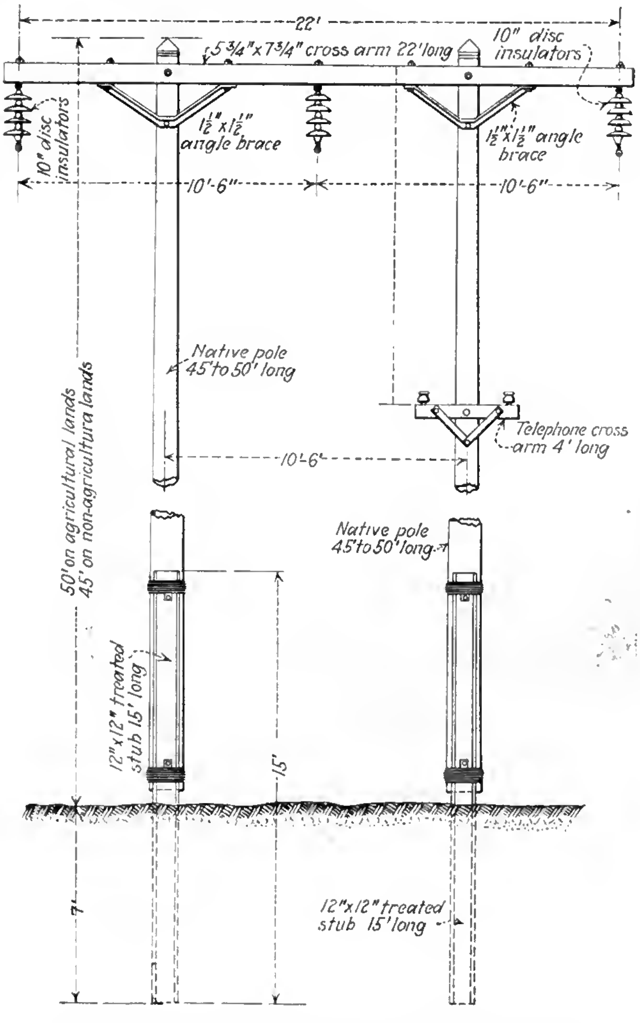
## Tests Made to Determine the Most Suitable Material for Stubs Prove of Much Value—General Features of Design Adopted by Central Station Company in the Pacific Northwest

By PERRY O. CRAWFORD
*Chief Engineer The California Oregon Power Company, Medford, Ore.*

THE construction of a transmission line through rough and mountainous country presents unusual problems in the transportation of materials and in the design of the line to keep down construction costs to the minimum consistent with durability and good engineering practice. The California Oregon Power Company had such a problem in the construction of a 123-mile, 110,000-volt transmission line recently built between its Prospect hydroelectric plant in southern Oregon and the town of Springfield, Ore., in the upper Willamette Valley. A contract was entered into on Dec. 30, 1921, between the Mountain States Power Company and The California Oregon Power Company whereby the latter was to deliver power to the system of the former beginning not later than Jan. 1, 1923, and sooner if the construction of the line should be completed before that date.

The country lying between the systems of these two companies includes two main divides, one between the Rogue River Valley and the Umpqua Valley and the other between the Umpqua and the Willamette River valleys, and in addition a number of steep divides between the minor drainage systems. The southern portion of the intervening territory, particularly on the Umpqua-Rogue divide, is very heavily timbered. In selecting the general route for the line the factors considered were: (1) Accessibility from roads and trails, as affecting construction, patrolling and maintenance, particular attention being given to maintenance; (2) directness of route; (3) avoiding, as far as possible, broken terrain, by following ridges and valleys; (4) avoiding heavy timber as far as practicable; (5) keeping in as low an altitude as possible in order to avoid regions of heavy snowfall. Accessibility and avoidance of heavy clearing were very important from the standpoint of patrolling and maintenance as well as from the standpoint of first cost and time required for construction, as it was essential that the entire line be completed in the one season.

The route as finally selected parallels county roads and highways for a considerable portion of its length, and



IMPORTANT DETAILS OF TWO-POLE WOOD TOWER USED ON TRANSMISSION LINE OF THE CALIFORNIA OREGON POWER COMPANY

no point on the line is more than 7 miles from an existing road. From Springfield south the first 32 miles of the line closely parallels the highway and county roads. South of this there is a timbered ridge not accessible from any road. For the next 50 miles the line is at no place more than 5 or 6 miles from a crossroad, with closely paralleling roads for about 20 miles. Throughout the mountain section, a distance of 27 miles, there is only about 8 miles of paralleling road and only one crossroad, these being rough mountain roads. For the last 14 miles there is practically no road, and the shortest point from the line to the railway is approximately 45 miles. This portion of the line passes through rough mountainous country and crosses the Umpqua-Rogue divide at an elevation of 4,400 ft. Another divide is crossed at an elevation of 3,500 ft

TABLE I—COMPARATIVE COSTS OF TWO KINDS OF CONSTRUCTION FOR MOUNTAIN SECTION

| | |
|---|---|
| Cost of Stubbed Pole at the Hole: | |
| Price of stub, f.o.b., point of railroad delivery | $10.50 |
| Cost of bolts and lashing material | 1.50 |
| Maximum stub haul to line at 25 cents per ton-mile (600 lb., 45 miles) | 3.35 |
| Haul along line, 3 miles, on road | 1.00 |
| Dragging stub with team, 5½ miles to summit | 7.50 |
| Cost of native 45-ft. fir pole at the hole | 5.00 |
| Labor lashing to stub | 1.25 |
| Total | $30.10 |
| Cost of Treated Cedar Pole at the Hole: | |
| Idaho cedar pole, "pentrex"-treated, 50 ft. long, 8-in. top | $21.00 |
| Haul to line, 45 miles | 7.30 |
| Haul along line, 3 miles, on road | 1.95 |
| Dragging 5 miles along line to summit | 15.00 |
| Total | $45.25 |

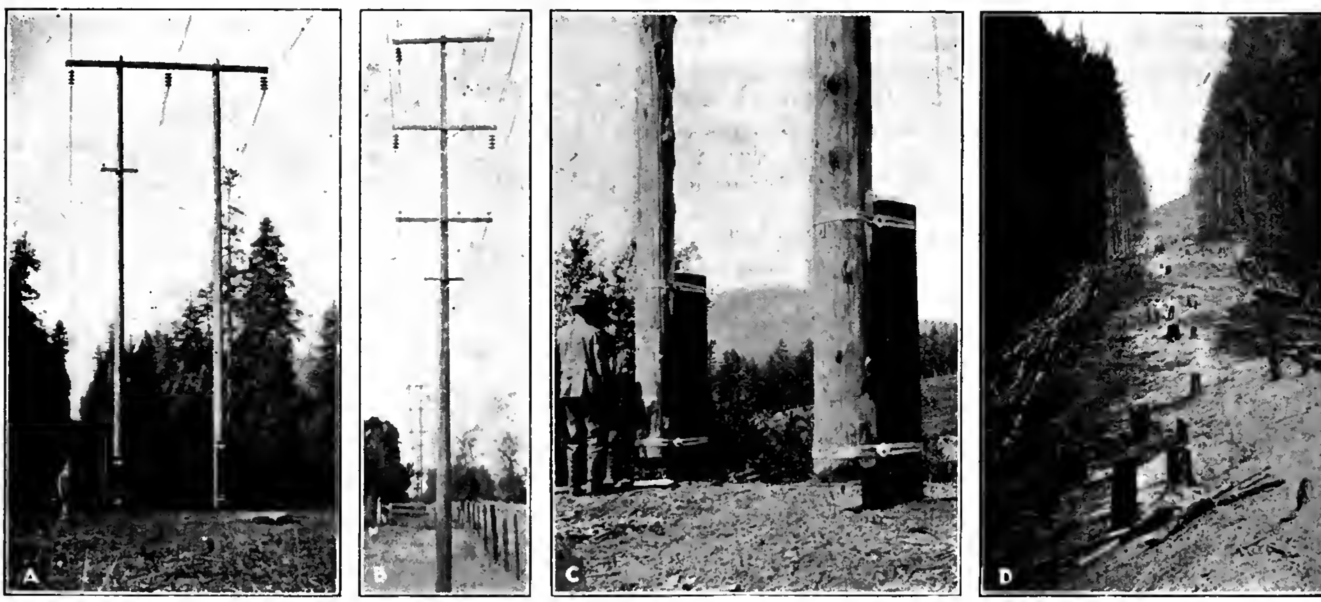
Single-pole construction with 350-ft. spans was used for the first 28 miles because this section of the line lies along roads and highways. For the remaining distance of 95 miles two pole towers were used, the standard span over level ground being 500 ft. The wire throughout is seven-strand, No. 00 medium-hard-drawn copper. Suspension construction was used with 10-in. ball-and-socket disk insulator units. The two-pole tower construction was not used at the north end on account of being too wide to be placed along the highways. On farming and orchard lands a single pole is less objectionable for the reason that there are fewer poles though more structures per mile. The single-pole line averages fifteen and one-half poles per mile and the two-pole line twenty poles, or ten towers per mile. The general specifications for the line were:

*Single-Pole Construction.* — Length of line, 28 miles; standard span, 350 ft.; average span, 342 ft.; standard pole, 8-in. top, 60 ft. long; minimum pole, 55 ft.; maximum pole, 70 ft.; poles, Idaho cedar, "pentrex"-treated; cross-arms, 4½ in. x 6½ in. x 11 ft.; conductor spacing, 10-ft. horizontal and vertical, right-triangle configuration.

*Two-Pole Tower Construction.*—Length of line, 95 miles; standard span, 500 ft.; average span, 550 ft.; longest span, 1,702 ft.; standard pole, 45 ft., lashed and bolted to stub; poles, native fir, native cedar and seasoned fir; stubs, 12 in. x 12 in. x 15 ft., treated fir; spacing of poles, 10 ft. 6 in.; cross-arms, 5¾ in. x 7¾ in. x 22 ft.; conductor spacing, 10 ft. 6 in., flat.

The two-pole construction is unusual in that the poles were attached to stubs at the time the line was built. On account of the high cost and difficulties of transportation and the presence of native timber close to the holes, it was found more economical to haul in a treated stub and bolt the pole to it than to haul in treated cedar poles. The comparative cost of the two types of construction is shown in Table I. It will be seen that the additional cost of a treated cedar pole over that of a native fir pole bolted to a treated fir stub is $15.15. Hence the additional cost per mile for the cedar-pole construction at the summit of the highest divide or the most inaccessible point on the line would be, for twenty poles or ten towers to the mile, $303. In addition, the construction problem was simplified and the labor cost of erecting the towers reduced by the use of stubs, because it was possible to install and line up the stubs with ordinary labor and then for the erecting crew to frame the tower, attach the cross-arm and braces and raise it as a unit. Had cedar poles without stubs been used, it would have been necessary to set the poles separately and frame them and attach the cross-arms after the poles were in place, thus increasing the labor cost.

The native fir which was largely used has such a short life when set in the ground (three to five years) that it was thought preferable to stub the poles at the start rather than later, thus taking advantage of the line organization and equipment to do the work. If the stubs were to be hauled in after a few years instead of at the time of building the line, the cost of transportation would be greater, a new hole would have to be dug, and the rotten butt would still be in the ground to weaken the setting. The creosote-treated stub used is also a better fire risk than the untreated native pole, as has been shown by the tests and experience of many telephone and power companies. In attaching the pole to the stub a clearance of 6 in. to 8 in. was left between the ground and the butt of the pole to prevent butt rot. It is estimated that the life of these stubs will be longer than that of the best treated cedar poles on account of the greater penetration obtained by the closed-tank treating process commonly used for ties and piling. It is conservatively estimated that these stubs will have a life of from thirty to forty years.



GENERAL VIEWS OF POLE-LINE CONSTRUCTION

A—Typical two-pole transmission-line tower used in the mountainous sections.
B—Typical single-pole construction used in the farming sections and along highways.
C—Standard stub structure as finally decided upon for the two-pole towers. Stubs are 12-in.-square fir timbers, 15 ft. long and set in the ground 7 ft. There is a minimum penetration of half an inch and an absorption of 6 lb. of creosote per cubic foot. The estimated life of the stubs is from thirty to forty years.
D—Typical right-of-way.

A series of tests was made to determine the proper size and kind of stub and type of lashing required to develop a strength equivalent to that of the pole. The stubs tested included fir and cedar of various sizes as well as fabricated steel. The results of the several tests are given in Table II. From the results of these tests it was decided to use a sawed Douglas

fir stub 12 in. square and 15 ft. long. These were bought from a lumber company and put through the Rueping tank pressure-vacuum creosoting process, giving a minimum penetration of ½ in. and leaving in the wood 6 lb. or more of creosote per cubic foot. The method of attachment decided upon consisted of bolting the pole to the stub by ¾-in. x 30-in. galvanized bolts, spaced 6 ft. apart, and a lashing near the bolts of ten turns of No. 6 galvanized-iron wire drawn together to form a figure eight by a bolt passing between the stub and the pole, bent washers being used over the wires to prevent them from separating. The bolted and lashed attachment to the pole was found to give a strength equal to that of a treated pole in a direction parallel to the line, and greater than the required strength at right angles to the line for "heavy loading," i.e., wind velocity 57 miles per hour, or a pressure of 8 lb. per square foot on No. 00 conductors loaded with ½ in. of ice.

After the tests on the stubs were made the choice lay between a 12-in. x 12-in. x 15-ft. fir timber, a cedar stub 15 in. in diameter and 15 ft. long, and a fabricated galvanized-steel stub, all being of approximately equal strength. On a comparative cost basis the treated fir stub was found to cost only about one-half as much as the treated cedar stub and only about one-fifth as much as the steel stub. The comparative costs, f.o.b. point of railway delivery, follow:

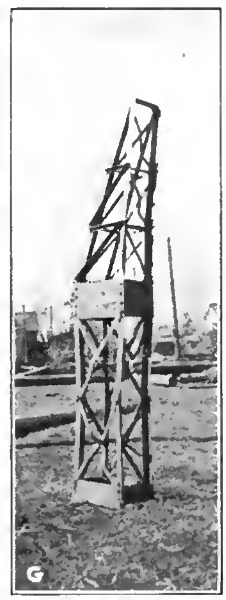
| | |
|---|---|
| 12-in. x 12-in. x 15-ft. tank-treated fir stub | $10.50 |
| 15-in. "pentrex"-treated cedar stub | 19.20 |
| Fabricated steel stub of equal strength (estimated) | 50.00 |

The choice obviously lay between the fir and cedar stubs. The fir stub was chosen for the following reasons: (1) Fir is the stronger of the two timbers, (2) its cost when treated is less than that of a cedar stub of equivalent strength with butt treatment, (3) the pressure-tank treatment gives better penetration than the open-tank pole treatment and hence should give the stub a considerably longer life than that of the best treated cedar pole.

In regard to the probable life, A. F. Robinson, bridge engineer of the Santa Fé system, stated before a meeting of the Western Society of Engineers at Chicago in January, 1922, that "creosoted pine piling was in good condition after sixteen to twenty years of service and was probably good for twenty years more." In deciding on the stub a number of strength tests were made on various sized timbers of fir and cedar and on fabricated-steel stubs. Each was tested individually, and then a two-pole tower structure, the same as used on the line, was set up on stubs and tested to destruction. The steel stubs tested weighed about 400 lb. each and were shown to be much inferior in strength to the wooden stubs under consideration. It was estimated that a steel stub would have to weigh from 550 lb. to 600 lb. to have the required strength.

The line voltage chosen was 110 kv., principally on account of the load requirements. A higher voltage than 110 kv. was not deemed necessary, as it was thought probable that considerable time would elapse before the capacity of the line at this voltage would be exceeded, and when that time came another paralleling line might be built. The line at a voltage lower than 110 kv. would have too short a life in terms of capacity, and the cost per kilowatt would have been greater than for the higher voltage. The line at the present time is being operated at 66 kv., because at this voltage 8,000 kw. can be transmitted, and it is not likely that the demand on the line will exceed this for several years.

Suspension insulators were used for the present line voltage of 66 kv., instead of pin-type insulators, because it was definitely known at the start that a transmission voltage of 110 kv. would be necessary ultimately, and for this voltage pin-type insulators were out of the question. Furthermore, with the use of suspension insulators the additional cost of insulating the line for 110-kv. operation will be a minimum. The increased cost of building a line insulated for 66 kv., with suspension units spaced for 110-kv. oper-



TYPE OF LINE CONSTRUCTION DETERMINED BY TESTS

E—Tower with 2,250 lb. pull on end of cross-arm in test No. 5.
F—Test No. 3 was made on this fir stub, which broke at strain of 1,950 lb. at the top of a 50-ft. pole.
G—Fabricated-steel stub buckled in test No. 7.
H—Steel stub after being subjected to strain of 675 lb. at a radius of 50 ft. in test No. 8.

ation, was estimated to be 7 per cent more for the single construction and 10 per cent more for the two-pole tower construction than for 66-kv. pin-type construction. At the time the line is changed over to 110-kv. operation two more suspension insulator units will be added at the line end and it is estimated that at 110 kv. the line will have a normal capacity of 21,000 kilowatts.

### General Features of Design

The line is sectionalized on an average every 12 miles with a three-pole, 110-kv. sectionalizing switch. The transmission line and the telephone line are transposed throughout the length of the line. Semi-strain anchor towers were placed approximately every mile in level country and oftener in the mountainous sections. Special semi-strain clamps were developed for this purpose, consisting of a standard heavy-body suspension clamp with special features to increase the holding power and 10-in. links to maintain clearance between insulators and conductors.

Semi-strain construction was used to stiffen the line in place of dead-ends for the following principal reasons:

(1) The insulator string is relieved of the continuous strain of the line.

(2) The attachment is much more flexible or elastic in regard to sudden application of longitudinal stresses.

These stresses may be caused by unequal sleet loading, failure of a part of the line, or a tree falling on the wires. Since the structure is head-guyed and back-guyed, dead-ends will allow the full force of the blow to build up suddenly against the tower and guys, while the semi-strain construction greatly relieves the shock by passing a part of it on to the next span and introduces a time element which reduces the peak of the strain. The inclined position of the insulator string also gives better weather protection to the disks.

In the semi-strain construction the same number of disks were used as for dead-ends. Dead-ends were used at the upper end of long steep spans and at both ends of the longest spans. All tower guying was done with ½-in. S. M. galvanized-steel guy wire attached to anchor logs. For the single-pole construction ⅜-in. guys were used. For anchor logs burnt seasoned cedar, yew logs, and in some cases short sections of 12-in. x 12-in. treated stubs, were used. In stringing the wire it first received an initial stretch, then sagged on the single-pole line to medium loading requirements and on the tower line to a tension about 12 per cent in excess of heavy loading requirements. All stringing was done with a dynamometer.

TABLE III—MATERIAL USED ON LINE

| | |
|---|---|
| Length, miles | 123 |
| Wire, No. 00, copper, tons | 410 |
| Telephone wire, No. 6, "copperweld," tons | 50 |
| Insulators, 10-in. disks | 23,000 |
| Number of poles | 2,250 |
| Number of structures | 1,331 |
| Number of stubs | 1,600 |
| Number of dead-ends and semi-strains | 266 |
| Average span, single pole, ft. | 342 |
| Average span, two-pole towers, ft. | 555 |
| Longest span, ft. | 1,702 |
| Shortest span, ft. | 120 |
| Time of active construction, months | 6 |
| Maximum miles per day | 2 |
| Average miles per day | ¾ |
| Total number man-days | 53,220 |
| Man-days, per mile of line | 433 |
| Maximum number of men on the job | 417 |
| Maximum number of camps | 9 |
| Maximum number of survey parties | 6 |
| Number of men clearing, five crews | 177 |
| Number of men digging holes | 48 |
| Number of men stringing wire | 58 |
| Approximate number of ton-miles line material, railroad to line | 40,000 |
| Longest haul, railroad to line, miles | 48 |

TABLE II—RESULTS OF TESTS ON STUBBED POLES

| Test No. | Material and Size | Position of Stub | Fastening | Size and Pole Butt, In. | Distance Between Fastenings, In. | Pull (in Lb.) at Top of 50 Ft. Pole | Deflection Ft. | Deflection In. | Results |
|---|---|---|---|---|---|---|---|---|---|
| 1 | Round cedar, 12 in. dia., 15 ft. long. Single stub tested. | In line with pull | 10 wraps No. 8BB iron wire. | 18 | 41 | 1,000<br>1,300 | 7<br>11 | 7<br>6 | Stub failed at slightly over 1,300 lb. pull by shearing lengthwise through center. |
| 2 | Square fir, 12 in. x 12 in. x 12 ft. Single stub tested. | In line with pull | 12 wraps No. 8BB iron wire. | 18 | 41 | 1,100<br>1,525<br>2,000<br>2,450 | 5<br>6<br>8 | 5<br>0<br>10 | Top lashing broke. |
| 3 | Same as test No. 2. | Right angles to pull. | 10 wraps No. 6BB iron wire. | 18 | 46 | 500<br>1,000<br>1,950 | 10<br>17<br>31 | 10<br>9<br>0 | Stub broke at bottom lashing. |
| 4 | Same as test No. 2, except that complete tower with two stubs was tested. | Pull from end of arm and at right angles to stubs. | 10 wraps No. 6BB iron wire. | 18 | 46 | 500<br>1,000<br>1,250 | 1<br>7<br>11 | 11<br>10<br>7 | Cross-arm was placed on opposite side of poles from stubs and twisting was very noticeable, causing top lashing to loosen. |
| 5 | Same as test No. 4, except that cross-arm was placed on same side of poles as stubs. | Same as test No. 4 | ¾-in. through bolts, and 6 wraps No. 6 BB iron wire. | 18 | 41 | 500<br>1,000<br>1,500<br>2,000<br>2,500 | 0<br>2<br>4<br>6<br>10 | 6<br>2<br>2<br>10<br>5 | Test indicated that a wind pressure less than maximum would move pole tops too far out of line. |
| 6 | Round cedar stub, 15 in. in dia. and 15 ft. long. | Same as test No. 4 | Same as test No. 5 | 17 | 41 | 1,000<br>2,500<br>3,500<br>3,700 | 1<br>6<br>9<br>10 | 5<br>1*<br>7<br>5 | Could not hold 3,700 lb.; pull fell off to 3,100 lb. with increasing deflection. Pull of 3,400 lb. was then applied and one pole and one stub broke. |
| 7 | Single steel stub, 2½ in. x 2 in. x $\frac{3}{16}$ in. corner angles. Horizontal girths, 1 in. x 1 in. angles. Side braces, 1¼ in. x 1¼ in. angles. Flat braces, $\frac{3}{16}$ in. x 1¼ in. Length of stub 11 ft. Set in ground 6 ft. Size base to ground line, 12 in. x 24 in. Weight, 400 lb. | In line with pull | 10 wraps No. 6 BB iron wire. | 15 | 41 | 550<br>625<br>750<br>975 | Stub raked when set<br>Stub plumb<br>5<br>11 | <br><br>10<br>0† | The tests on the two steel stubs indicated that considerably heavier stubs, probably equal to the weight of the wood stubs, or 550 lb. to 600 lb., would be required. |
| 8 | Single steel stub 12 in. square, with bearing plates. Same size material as test No. 7. Weight, 380 lb. | In line with pull | 10 wraps No. 6 BB iron wire. | 15 | 41 | 500<br>640<br>675 | 2‡<br>4<br>7 | <br>5<br>7‖ | |

* No sign of failure. † All angles buckled. ‡ Flat braces bending. ‖ Could not hold over 675 lb., corner angles bending.

Drop-angle cross-arm braces were employed on all construction except where green fir poles were used. The fir in seasoning has a tendency to twist. On this account the braces were omitted wherever green fir poles were used, the arms in these cases being attached to the pole with galvanized U-bolts. On double-arm construction a through bolt was placed on each side of the pole, thus giving the pole freedom to twist.

In all, 44 miles of right-of-way through timbered areas was cleared to a width of 50 ft., and all dangerous trees, including those which were leaning or partly decayed, beyond this width which could reach the line were removed.

The amounts of material given in the following tabulation include spare material left every mile for the greater portion of the line for emergency repairs. This material included 200 ft. No. 00 copper wire, 200 ft. No. 6 telephone wire, one high-tension arm, one telephone arm and one stub.

The survey was started on March 9, 1922, and completed on July 7, 1922. The first holes were dug on April 10, 1922, and the last on Oct. 2, 1922. The first wire was strung on May 9, 1922, and completed on Oct. 12, 1922. The surveying started with two crews, and later others were added until there were six separate surveying parties at different points in the field. Following the surveyors came the clearing gangs, then the hole diggers, then the distributors of material, later the tower erecting crews, and the wire stringing crew last. Powder was used in digging all holes. The towers were framed on the ground and erected with line and shears. Much of the material had to be hauled along the right-of-way, some of it for distances up to 5 miles. During the busiest season nine camps were maintained. There were on the average twenty auto trucks in use on the job. The line was completed on Oct. 15 and placed in operation on Oct. 23; over half a mile of line was completed per day over the entire period of time on an average.

# Electrification of Seattle Port Terminals

## Factors Influencing the Undertaking and Requirements of Electrical Equipment to Meet Port Needs—Essential Features of Lighting and Power Distribution

By O. P. SEIM*

*Superintendent of Distribution Puget Sound Power & Light Company*

THE SMITH'S COVE TERMINAL OF THE PORT OF SEATTLE IS AN EXCELLENT EXAMPLE OF UP-TO-DATE TERMINAL ELECTRIFICATION

ELECTRIFICATION of a port terminal is dependent upon such factors as lower handling charges, flexibility of operation and the speed attained in handling cargoes. The port of Seattle in adopting a policy of electrification of its terminals was primarily actuated by these factors as well as by the necessity for providing facilities for handling great volumes of commerce in commodities of all varieties, both in bulk and in packages. The coordination of railway and marine transportation lines near available industrial sites, in order that these areas might become centers of industry, entering into the original studies of the electrification of the port terminals, exerted a determining influence upon the selection of the terminal sites. Additional factors were the uncertain degree to which the commerce of the port would expand, the character of the cargo-handling equipment of the ships likely to use the terminals, and the nature of the cargo of these ships.

The Smith's Cove Terminal, the most recent and modern in the port of Seattle, has been laid out according to the best practice in port electrification and may be said to be a model terminal of its kind. In designing the electrical installation for this terminal it was found that power requirements fell into two major classifications, as follows:

*Formerly mechanical engineer port of Seattle.

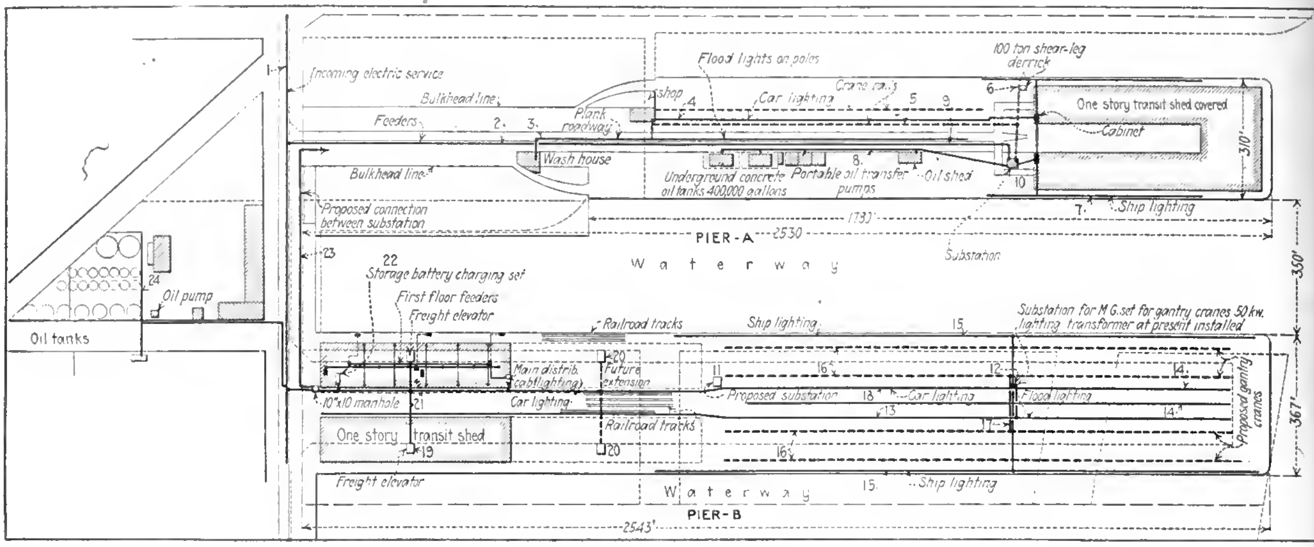


FIG. 1—GENERAL LAYOUT OF PIERS, WITH LOCATION OF EQUIPMENT AND SHEDS

A. Power for driving machines, either in groups or individually, at constant speed. This applies most commonly to conveyors, pumps, elevators and motor-generator sets.

B. Power for driving machinery where it is desirable to obtain speed variation between less than 50 to 100 per cent of maximum. All power in this class is obtained from motor-generator sets. The use of motor-generators instead of rotary converters for this class of service is favored by the port engineers because it is desirable to correct for low power factor on the alternating-current distribution system, and in their judgment a rotary converter, although it has higher efficiency, is not so well suited to this purpose as a motor-generator set. Direct current is used for the gantry crane, the 100-ton shear-leg derrick, the 25-ton stiff-leg derrick, the electric lifting magnets and for charging of tractor storage batteries.

For the requirements of motors under class A, voltages of 440 and 2,200 are used, 440 volts being the most extensively employed. Equipment rated at 220 volts is not desirable owing to the larger size of conductors and conduit required. A 2,200-volt circuit is used only in the case of driving a 300-kw. motor-generator set.

The table gives the electrical and mechanical data for the electrical equipment at the Smith's Cove Terminal, piers A and B. In case it should prove necessary or desirable to generate alternating current, especially for terminal requirements, it is the opinion of the port engineers that load factors ranging from 70 to 75 per cent should be employed, rather from 80 to 85 per cent, which is considered good practice in the design of central stations. This is because of the large proportion of induction-motor load and the consequent low power factor. For equipment operating at constant speed, where conditions would permit, induction motors are used and controlled by standard forms of starting switches, equipped with low-voltage and overload protection. Slip-ring motors with drum-type controllers having sufficient resistance for starting only are used where squirrel-cage induction motors would not supply the necessary starting torque. Where slip-ring motors are used an oil switch is provided in the primary or starter circuit of the motor. If the requirements of a machine are such that motor speeds varying from 50 per cent of maximum to maximum are necessary, a slip-ring induction motor is used with drum-type controller and resistance banks in the secondary or rotor circuit of sufficient capacity to permit of continuous operation at any point of the controller. In those cases where speed variation between less than 50 per cent of maximum and maximum speed are required for driving a machine direct current is used. No standard has been adopted for the control of such

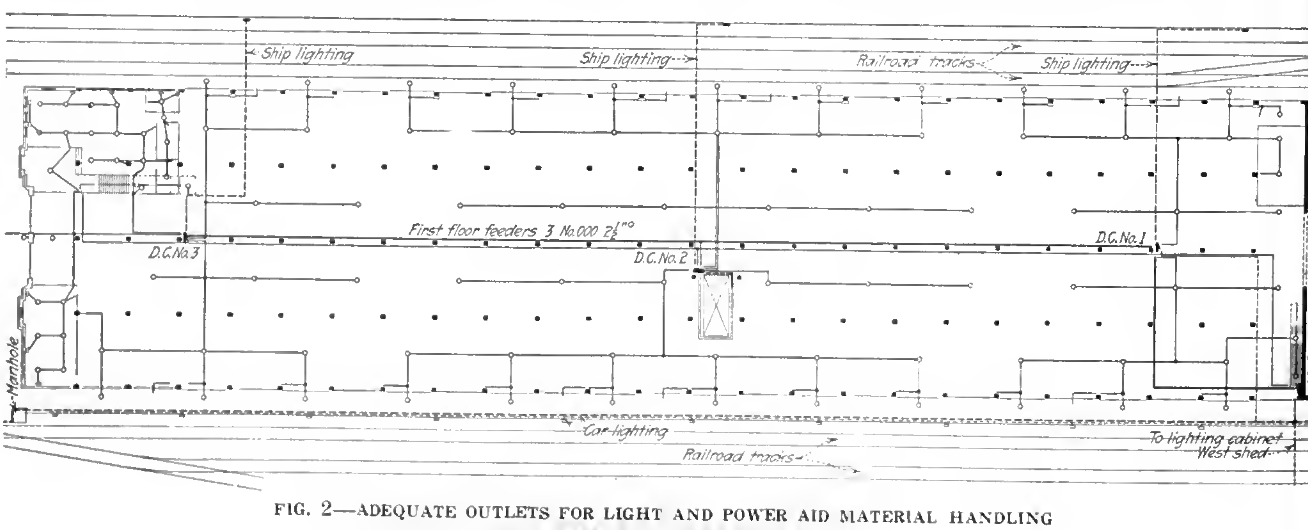

FIG. 2—ADEQUATE OUTLETS FOR LIGHT AND POWER AID MATERIAL HANDLING

motors. Instead, the control is designed to fit the needs of the particular case, and it may vary from a standard plate-field rheostat to the more complex contactor panels.

Service is supplied by the city of Seattle over two circuits, one of 7,500 volts and one of 15,000 volts, to the substations on the terminal property. Fig. 1 shows the location of electrical equipment and substations on piers A and B and the general arrangement of lighting and power circuits. In the case of pier B, which is the latest to be constructed, a 440-volt, three-phase power circuit runs the full length of the pier and is fed from a transformer station situated about the center of the pier. This arrangement has resulted in a more economical installation owing to the reduction in the size of the feeder and conduit made possible in the 2,600-ft. run as compared with that which would have been required had the transformers been installed at one end of the circuit. The three 50-kva. transformers supplying this feeder are operated from a 2,300-volt circuit.

Fig. 2 shows the lighting circuits in the warehouse and transit shed on pier B, as well as the power-plug receptacles for portable motors. The lighting circuits consist of a main and a night circuit. The main circuit is used when cargoes are being handled or when illumination of high intensity is required. The night circuit is used at all times when only enough illumination to allow a clear view of the contents of the warehouse and transit shed is necessary. The tendency toward the use of conveyors, stackers, tractors and other material-handling equipment makes this arrangement of lighting circuits most economical.

Lighting circuits on the open dock consist of a car-lighting circuit, a ship-lighting circuit and a floodlighting circuit. The car-lighting circuit is a plug circuit installed on the side of the transit shed and is used for illuminating box cars or refrigerator cars while they are being loaded or unloaded. The ship-lighting circuit is a plug circuit installed near and parallel to the bull-rail of the dock. The lighting circuit of the ship is connected to this circuit with portable cord, in order that the ship may shut down its boilers and engines for cleaning and repairs. The floodlighting circuit is used to illuminate the dock in the proximity of the ships that are moored there.

CRANES DO THE HEAVY WORK

Owing to the extremely limited field of choice in conveyor equipment applicable to the broad field of use embraced in handling the numerous and varied cargoes that come to the port of Seattle, the design of special equipment has been undertaken to meet the demands

SPECIAL CARE WAS GIVEN TO SECURE RAPID LOADING AND UNLOADING OF VESSELS

imposed by commerce. The equipment developed so far, including that already in use, consists of the following: Derricks, (a) shear leg, (b) stiff leg; cranes, (a) gantry, straight-line and horizontal boom, (b) locomotive; winches, portable conveyors, storage-battery vehicles (tractors with trailers) and piling and tiering machines, (a) inclined, (b) vertical.

As a further step in the development of port facilities the port has under consideration at the present time the installation of an electrically driven air compressor of sufficient capacity to allow certain repairs to be contracted for and executed at the pier while a ship is handling its cargo, rather than having it laid up at a repair yard for several days in addition to the time spent in discharging and loading.

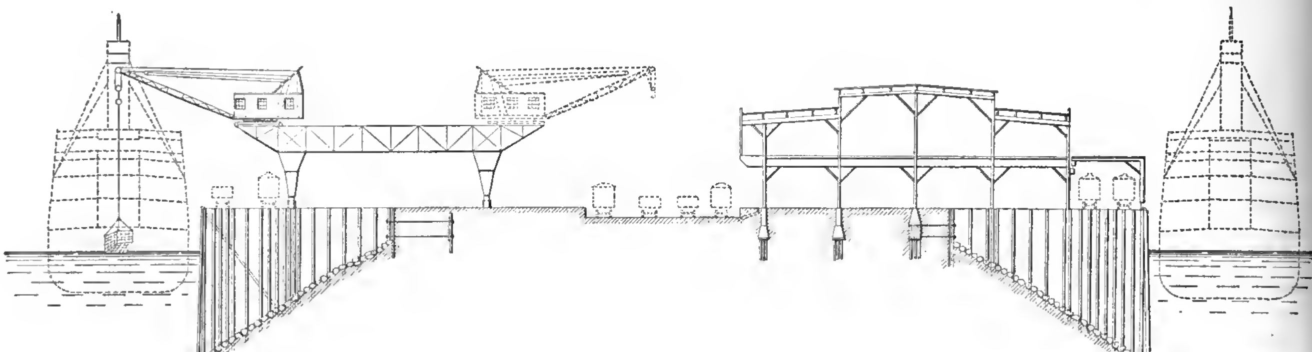
The port of Seattle has three principal industrial terminals, all of which are completely electrified. They are the Hanford Street terminal, at which is constructed and in operation a 1,200,000-bushel grain elevator; the Spokane Street terminal, at which is a 900-carload fruit-storage plant, a 100-ton ice plant, a fish-freezing plant of 300,000 lb. capacity per day, a fish storage plant of 3,000,000 lb. capacity and ice storage for 5,000 tons, and the Bell Street terminal, at which there is a 90-carload miscellaneous cold-storage space.

The grain elevator has 900 hp. connected load, the Spokane Street cold-storage and ice plant 600 hp. and the Bell Street cold-storage plant 250 hp. In the grain elevator and the Bell Street cold-storage plant all the principal driving motors are remotely controlled from the main switchboard. In the case of the Spokane Street plant all motors are controlled at the motor. In the warehouses and transit sheds power circuits are provided as follows:

A. A 440-volt, three-phase plug circuit, usually No. 4 wire. Plugs are placed every 100 ft. along the center line of each floor of the warehouse or transit shed, within reach of the machine operator. This circuit is intended for the use of conveyors, stackers and other portable equipment.

B. Freight-elevator circuit.

C. A 440-volt, three-phase circuit to take care of the motor-generator set for a constant-potential charging set used for charging tractor storage batteries. A typical 30-kw. set consists of a 75-volt, 400 amp. commutating-pole, shunt-wound, direct-current generator, direct connected to a 50-hp., three-phase, 440-volt, 60-cycle, 1,200-r.p.m. induction motor, with starting compensator. On a switchboard are mounted a voltmeter, a shunt ammeter, an overload circuit breaker, a shunt-field rheostat, a voltage regulator and a 600-amp. main switch. This set has capacity for charging at the same time six tractors having twenty-four "Exide" cells each.



VERTICAL SECTION, SHOWING DETAILS OF PIER

On the open dock great care has been taken in making the distribution system flexible. Although the equipment of a pier may be fairly well predetermined and the circuits provided, new business may require alterations or additional equipment, thereby necessitating changes in the distribution system.

The paramount function of a port terminal is to allow a ship to enter, discharge and load cargo and get away with as little confusion and delay as possible. To this end human ingenuity must devise ways to facilitate cargo handling. A ship earns only while it is moving with cargo. Every day it must lie in port means a loss to the operators. The most restricted step in the entire cycle of a ship's operation is the handling of the cargo at the port. If the cargo must be moved over 120 ft. from the side of the ship, then it is more economical to handle it by conveyors, tractors with trailers or other forms of material-handling equipment. This fact establishes the manifold importance of the cargo-handling problem in the development of a port.

ELECTRICAL AND MECHANICAL DATA ON MOTIVE EQUIPMENT AT SMITH'S COVE TERMINAL OF THE PORT OF SEATTLE

| Type of Equipment | Hp. | Voltage | Speed, R.P.M. | A.C. or D.C. | Type of Motor | Type of Drive | Type of Control |
|---|---|---|---|---|---|---|---|
| Gantry crane: | | | | | | | |
| Hoist | 25 | 220 | 510 | D.C. | Series, crane type | ..... | Remote control from cab |
| Travel | 125 | 250 | 490 | D.C. | Series, crane type | ..... | Remote control from cab |
| Crane apron | 40 | 220 | 450 | D.C. | Series, crane type | ..... | Remote control from cab |
| Trolley motor | 18 | 220 | 510 | D.C. | Series, crane type | ..... | Remote control from cab |
| 100-ton Shear-leg derrick | 85 | 230 | 430 | D.C. | Series | Gear coupled to hoist drum | Railway type reversiog drum controller |
| Portable oil transfer pumps | 10 | 440 | 1,200 | A.C. | Induction, constant speed | Gear coupled | Standard control |
| Substation motor generator set | 450 | 2,500 | ..... | A.C. | Synchronous | Direct-connected | Standard control |
| Freight elevators, capacity 20,000 lb.; 60 cycles per minute | 50 | 440 | 720 | A.C. | Wound rotor | Worm-driven gear | Standard elevator control |
| Oil booster pump | 10 | 440 | 1,200 | A.C. | Induction, constant speed | Geared | Standard control |
| Portable motive equipment | 5 | 440 | ..... | A.C. | Induction, constant speed | ..... | Standard control |

# Another Word to Utility Stock Salesmen

## Ancient and Accepted Methods of Investing Money and the Peculiar Advantages of Public Utility Securities, Being Some Reflections and Observations, but Containing, However, No Advice or Recommendation

By WARREN R. VOORHIS

THERE are three orthodox methods of selecting an investment for your money.

Named in the order of their popularity, they are:

1. You may trust your money to a stranger, a gentleman from foreign parts, who has the quick intelligence to recognize at a glance your great capacity to grasp an opportunity before it is too late, and who, also, by reason of your well-known standing and dominating influence in the community, is frequently able to make very attractive promises of really remarkable returns.

2. You may select from your acquaintances that man in whose judgment and financial ability you have the most confidence, give your money to him to invest for you, and thus be done with the whole tiresome business.

3. By observation and study you may acquaint yourself with the simple rules governing the investment of money and then select your investment after such study and observation.

In my time I have employed each of these methods and found that each possesses distinct advantages.

Now, I will here set forth my reflections concerning these three ways of choosing an investment for savings.

The loose, superficial thinker might argue that since 90 per cent of all money invested according to the first method is forever lost to the investor, this method is to be condemned.

A moment of serious reflection exposes the fallacy of this gloomy view.

It is based upon the assumption that the only compensations in life are financial.

One must admit that the rewards to be received from the use of this first method must be expressed other than in terms of money, but it by no means follows that rewards do not exist.

### TRUSTING THE STRANGER

For example: It is always a distinct and gratifying pleasure to me to meet an intelligent stranger, especially one who is able instantly to discern my own intelligence and capacity, particularly in financial matters.

We all feel ourselves to be surrounded by rather dull people, especially relatives, who do not justly appreciate our talents.

To have our true worth appraised by a stranger, who is, of course, wholly disinterested, is one compensation for the use of the first method of investing money.

Then there is a world of romance and imagination in this method, and what sort of a world would this be without romance and imagination?

To feel that you are really a part owner in, say, a cocoanut plantation, located somewhere on an island in the South Seas, where the cocoanuts drop to the ground from the trees, or brushes, or vines, or whatever it is they drop from, and where happy skin-clad natives pitch them into my ships which have anchors and "bo'suns" and "mains'ls" and everything, all this gives an uplift to my spirit and I do not know how to say what it is worth in money.

The picture is always so interesting and attractive to me that it hardly needs the statement of the agent that the stock will be doubled in price within the next thirty days to make me come in.

So that, while I have always lost all the money I ever invested according to this first method of choosing an investment, I am by no means prepared to say that the method possesses no advantages whatever.

I only mean to say that now that I am older and colder I am a little more inclined to separate my romance and imagination from my pocketbook and a little less inclined to estrange myself permanently from my money.

Now, when a fascinating stranger tells me, with his hand on my knee, that I have a great head for finance, I at once admit this and offer it as a reason why I am able to attend to my own financial business, and I point out to him how wrong it would be for me to detain him when so many less able gentlemen are doubtless eager to take his counsel.

### LEANING ON A FRIEND

The second method of choosing an investment has one tremendous advantage.

It makes a minimum demand upon the brain of the investor.

You turn your money over to an honest friend for him to invest according to his judgment, and go your way.

Probably nothing could be more simple than this.

The profound antipathy of the human mind to any form of connected thought is our richest heritage from the arboreal period of civilization.

This method has a further advantage.

Your friend is frequently honest and capable and a good deal of money so invested is well and safely placed.

When it turns out otherwise, you have had the great comfort of having been free from responsibility, and you have also the privilege of calling upon high heaven to witness the perfidy of your friend.

I myself have tried the second method quite often.

Maybe I will again turn over my money to a friend for investment.

But never, never so long as I live, will I take from a friend his money for investment.

When the investment turns out well, my friend proclaims abroad the soundness of his judgment in choosing his investment.

When it turns out badly, my former friend ever afterward regards me with a gloomy and accusing eye.

He wonders what he ever saw in me to warrant his confidence.

This is the reason that I am giving no advice in this article.

I suppose it might be suggested as an objection to this method that one who always relies upon the judgment of others will never become very self-reliant and will never learn to think for himself.

It is only fair to reserve judgment upon this objection until it is demonstrated that the people who think are happier than those who do not think.

I have many friends among both classes, and I am not prepared to give a final opinion.

### A Three-Question Analyses

The third method of choosing an investment is only popular with those persons who have formed a deep attachment for their money and a firm intention not to be separated from it.

I observe that nearly every sound competence and provision for old age has been invested and accumulated according to this method.

Some very able gentlemen make fortunes by keeping alive the hoary tradition that the investment of money is a subject too deep and difficult for people who have only brains enough to make and save money.

But if any man with a little money to invest will first ask three pointed questions, and if he will keep his money in his fist until he gets a satisfactory answer, he will save himself some grief, and the executor of his estate will be required to give a larger bond. These three questions are:

"Will my money be safe?"

"Will my return be as high as is consistent with safety?"

"Can I get my money back when I want it?"

Of course, it would be unsportsmanlike to ask such questions of the picturesque blue-sky salesmen, where, as I have pointed out, romance and adventure rather than stability and safety are the rewards to be expected.

But try these questions upon some of the standard forms of investment and you get interesting results:

### Applying the Test

*Real Estate.*—If you use good judgment in the choice of location, your money ought to be safe. If you can keep the property occupied, if your tenants pay their rent, if taxes and assessments and insurance and repairs don't eat you up, and if you did not pay too much for the property, you ought to make a fair return.

If you can find some one who wishes to invest in real estate, and if he likes your property, and if he will pay you as much as or more than you paid, you should have no trouble in getting back your capital.

It will pay to ask these three questions before you buy any real estate.

*Business.*—You can easily put your money in business. If you select a good business, one which gives a service or makes a product which people want badly enough to be willing to pay more than the cost, your money should be reasonably safe. If you have sense and experience enough to run the business, or if you can find and keep a man with sufficient brains and honesty to do it for you; if times are good; if you are not too much bedeviled by strikes, storm, fire, earthquake or bad debts, you should get a fair return. And when you want to quit, as you may, if you can find some man who wants to go into business, and who likes your line of business and who will pay you as much as or more than you paid for it, you should have no trouble in getting out whole.

These three questions will help you to decide about going into business.

*Government Securities.*—They are safe. The faith and credit of the richest country on earth are behind them. They are safe.

Because they are safe as minted gold held in your hand, the return is low, lower than any other form of investment. The entire absence of risk is paid for by a very low return. The market for these securities always exists. If you want your money, you can get it.

*Public Utility Securities.*—They are very safe. These utility companies furnishing light, water, power, heat, communication, transportation, give to all the people, all the time, a service so necessary that we cannot think of modern life without them. In peace or in war, in good times and bad times, we must have this service.

They earn moderately, but constantly. By the law of the land they are permitted under public regulation to earn a fair, reasonable return upon their fair value.

Because the service of utilities is essential to the very life of the country, because they grow as the country grows in population and wealth, because the return is constant and reasonable, because economy and efficiency are assisted by public observation and supervision, the sound securities of these corporations have become a form of investment favored by an increasing number of investors. This makes a wide market.

The three questions should be of service in selecting a public utility security for investment.

But really there is nothing new about the form or substance of these questions.

They are invariably asked by every investor, no matter what method of selection he employs.

My point is that they will be found to be more useful if they are asked and answered before, rather than after, the investment is made.

### When Winter Comes

Too late, after I have taken the trouble to set down these reflections, it occurs to me that, after all, there are very few people interested in the subject of investment according to any method.

Perhaps it is part of the privilege of the salesman who is endeavoring to sell utility securities to men and women of the community that the company serves to bring these questions to the attention of investors.

For most of us travel gayly through life, considering every dollar saved as so much excess baggage.

We lean heavily on that beautiful Biblical text: "Consider the lilies of the field, how they grow; they toil not, neither do they spin, yet Solomon in all his glory was not arrayed like one of these."

This argument appeals most forcibly to me in June when the lily proudly bends her lovely head to the soft summer wind.

In October, when the early frosts have turned her petals brown, and in December, when she stands stripped and shivering in the bitter winter wind, I am inclined to doubt whether this text was even intended as a guide to thrift and investment.

And as for King Solomon, I think the record is fairly clear that one of his acts of wisdom was to collect and keep enough gold and gear by him to last through the winter of his years.

These are my reflections upon the ancient and accepted methods of investing money.

# Letters from Our Readers

**A Place Set Apart for Suggestions, Comments and Criticisms, to Which All Men of the Electrical Industry Are Cordially Invited to Contribute**

## Compound Migration Inappreciable in Modern Cables

*To the Editors of the* ELECTRICAL WORLD:

Impregnated paper cables were formerly made with thick compounds and loose paper. When the compound melted under the influence of load in the cable it ran down in the large spaces between the paper tapes wherever there was a vertical run. This resulted in leaving voids which ionized at high voltages and caused failures. Modern cables are made with tight paper and comparatively thin compounds. When the compound melts most of it is held between the tapes by surface tension.

Tests which were made in 1922 on a cable of modern type consisted in suspending a 15-in. length at an angle of 45 deg. in an oven, both ends of the cable being open. The oven temperature was 220 deg. F., and the cable was kept at this temperature for ninety-six hours. Upon cooling, the cable was subjected to a high-voltage test. It withstood 150-kv. alternating current for one hour without showing any signs of distress. The cable was of 350,000-circ.mil cross-section and had $\frac{12}{64}$-in. insulation on each conductor and a belt of $\frac{7}{64}$-in. thickness.

Habirshaw Electric Cable Company, Inc., Chief Engineer.
Yonkers, N. Y.

## Meshed Networks for Alternating-Current Distribution

[The editors of the ELECTRICAL WORLD requested Mr. Torchio to submit comments on M. T. Crawford's paper, "Merits of Alternating-Current Underground Distribution," published in the issue of Dec. 23, and he sent in the following.]

*To the Editors of the* ELECTRICAL WORLD:

The low-tension alternating-current systems of distribution are at present generally founded on the fundamental principle of subdividing the territory to be served into separate districts and feeding each district from an independent feeder. Within each feeder district the secondary mains fed by step-down transformers are sometimes connected in a meshed network, but more often they cover only isolated portions of streets in the district, each fed from an individual step-down transformer. Gradually, as the primary feeders become fully loaded, the original districts are subdivided and additional districts created to be fed by corresponding new primary feeders. This fundamental method of growth of low-tension alternating-current systems of distribution, while eminently satisfactory in scattered districts, entails many handicaps when applied in congested and heavily loaded city districts. For such conditions some arrangement of a single meshed network of mains fed from all feeders in the same manner followed in direct-current three-wire systems would afford very great advantages. This has prompted engineers to make efforts to build up low-tension alternating-current meshed networks of distribution.

M. T. Crawford's paper gives a description of one such development. One prominent feature is the fact that Mr. Crawford has solved the difficult problem by the combination of standard apparatus, each unit being already fully developed and obtainable from the standard production of manufacturers. As the district served by the Edison system in Seattle furnishes less than 10 per cent of the total company's service, the advantages that a direct-current system might have would be relatively insignificant as affecting the total business. The adoption of this new system to provide for the growth within the district, still retaining the direct-current system for special customers requiring such service, is probably a compromise prompted by the desire on the one hand to retain the existing investment and on the other hand to obtain a unification of the system, which would offer obvious economical advantages.

PHILIP TORCHIO,
New York Edison Company, Chief Electrical Engineer.
New York.

## Pyro-Electric Theory of Insulation Failure

*To the Editors of the* ELECTRICAL WORLD:

I have read with great interest the discussion by Dr. Whitehead and Mr. Fechheimer in the Nov. 11 issue of the ELECTRICAL WORLD, and by Mr. Del Mar in the Dec. 9 issue. of the article of Oct. 21 contributed by me in collaboration with Dr. Steinmetz on "The Pyro-Electric Theory of the Breakdown of Solid Insulation." We stated in this article that our theory had been gradually developed as the result of our investigation of insulating materials for some years, and we were very much pleased during Dr. Wagner's visit to our country, when comparing notes with him, to find that he had independently come to the same conclusions.

The results of the work since the publication of the article have given further evidence in favor of the theory.

We do not mean to claim that with alternating voltages the pyro-electric effect is caused entirely by the ohmic resistance of the insulation, but the effective resistance of dielectric hysteresis (whatever that may be) may play a large part. Indeed, in a number of our tests the amount of energy loss produced by the ohmic resistance of the dielectric, as measured by high-voltage direct current, was only a very small part of the total energy loss observed under alternating voltage.

In our article we used widely different materials to illustrate the wide extent over which we observed this pyro-electric effect, but no special conclusions can be drawn from the particular nature of the material used in each case, whether Nernst lamp glower or paper, etc. For instance, the black varnished cloth commonly used as machine insulation gave us the same characteristic as the Nernst lamp glower, and mica the same characteristic as unimpregnated paper, so that the described characteristics are not special to the Nernst lamp glower or the paper, but are more general. We are preparing a more extensive paper on the subject for the American Institute of Electrical Engineers.

The difference between our conclusions and those of Dr. Wagner on the variations of the disruptive voltage with the thickness of the insulation is only apparent. Dr. Wagner shows mathematically that if a hot spot in the insulation conducts heat only tangentially into the insulation, then the disruptive voltage should be proportional to the thickness of the dielectric. In his experiment he used wooden blocks as terminals, which were poor heat conductors, and so his assumption was justified. If, however, a sheet of insulation is tested

between metal terminals, which are good heat conductors, then a considerable part of the heat of a hot spot is conducted transversely to the terminals. Indeed, with a thin laminated dielectric practically all the heat may have to be conducted to the metal terminals. It can be shown that in this case the disruptive voltage is not proportional to the thickness of the dielectric, but to the square root of the thickness of the dielectric. In general, therefore, the breakdown voltage of sheet insulation should increase somewhere between proportionality with the thickness and proportionality with the square root of the thickness of the insulation, depending on the proportion of the heat conducted tangentially and radially. The law of variation of breakdown voltage with the thickness, therefore, cannot decide the question whether the effect is pyro-electric or not.

J. L. R. HAYDEN.

Schenectady, N. Y.

### Dielectric Loss and Breakdown

*To the Editors of the* ELECTRICAL WORLD:

In his discussion in the Nov. 11 issue of the ELECTRICAL WORLD of the article by Mr. Hayden and myself in the Oct. 21 issue Dr. Whitehead refers to the characteristic of many insulators, that when a constant voltage is impressed upon them the charging current does not die out rapidly, as required in a circuit with fixed constants, but decreases slowly, sometimes over a period of minutes.

None of the various ingenious explanations given for this characteristic—the motion of water in capillary fibers, progressive ionization, etc.—is satisfactory, when it is remembered that this phenomenon is shown to a marked degree by glass, mica and other materials. I have therefore attacked the question mathematically, in studying the transients in a condenser of non-homogeneous dielectric, such as a cable, but with fixed constants.

Suppose the dielectric of a condenser is laminated—that is, consists of alternating layers of different specific capacities and different resistivities—and a constant voltage $e_0$ is impressed upon it over a supply circuit of resistance and inductance. The charging transient then consists of three terms—not two terms, as in a condenser with homogeneous dielectric.

Two of these terms are of very short duration and may combine to form an oscillation. They are due to the constants of the external or supply circuit and usually have passed in a fraction of a second, leaving the condenser charged to terminal voltage $e_0$, but with the voltage distributed between the two materials in proportion to their elastances (reciprocals of capacity). The third transient, however, is of very long duration, commonly many thousand times slower, and has not yet apparently started when the other two have vanished. By the third transient, which I may call the "internal transient" in distinction from the "external" double transient, the internal voltage distribution between the two materials changes from that corresponding to their respective elastances to that corresponding to their respective resistances. Considerable energy is supplied by the external circuit during this transient—which lasts for minutes—to the interior of the dielectric, and of this energy half is dissipated as heat in the resistance of the dielectric, the other half stored as internal electric charges between the layers.

If, then, the supply voltage is withdrawn and the condenser terminals discharged by a momentary short circuit, the terminal voltage of the condenser gradually builds up again from zero to a maximum value of "residual charge" and then gradually dies down.

In this no variation of constants is assumed, no mechanical changes or local oscillation, but the results are derived for the circuit system of entirely fixed constants.

As illustration, a high-voltage cable of 1,300 ft. of about 0.74 mf. capacity, charged with 20,000 volts direct, over a kenotron rectifier from a 2.5-kw. transformer, gives the charging transient:

$$i = 0.108 \times 10^{-3} + 0.264 \times 10^{-3}\ \epsilon^{-0.0091t} + \epsilon^{-62.5} \cdot (3.2 \sin 196t - 0.372 \times 10^{-3} \cos 196t)$$

One hundred and fifty-four watts is stored as condenser charge during the first quarter second by the external transient, and an additional 288 watts is stored during the next half hour, as internal charge between laminations, by the internal transient.

Discharging the cable by a momentary short circuit, its voltage gradually builds up again from zero to 9,250 volts residual after one and one-half minutes, and then gradually vanishes.

I have specifically considered the case where the lack of homogeneity is due to laminated structure, partly because this is the most important case in cables and condensers, and partly because it is mathematically the simplest. Obviously, similar very slow transients must appear for the same reason, the formation of internal charges between materials of different characteristics in structure with other forms of heterogeneity.

I am preparing an Institute paper on this subject.

CHARLES P. STEINMETZ.

Schenectady, N. Y.

### Proper Methods of Fusing

*To the Editors of the* ELECTRICAL WORLD:

Here are a few suggestions on the much-discussed subject of fusing the grounded side of branch circuits. My judgment is that the neutral or grounded wire should be continuous from transformers to lamp sockets or apparatus, except where provision is made for opening simultaneously every wire of the circuit, as at switches or attachment plugs. The wire should taper in size as it does in wiring where fuses are used, but all fuses on the grounded wire should be eliminated.

The greatest objection to this practice that seems to have been offered is that there would be but one fuse protecting the circuit, while under the present practice there are two. This objection may be simply and completely met by inserting two fuses in series at the branching point in the hot wire. It would be inexpensive compared with the safety gained to add even more than one fuse in series. The fuses, if placed in series on the hot wire, may include only one of the proper size, the others being slightly larger, so that all will not easily blow when ordinary trouble occurs, while at the same time a measure of safety will exist in case the right-sized fuse is bridged.

The most prevalent method of bridging fuses is with coins. This practice can easily be overcome in the design of the block. Overfusing should be prevented by designing the block so that plugs of different sizes are not interchangeable, and there should be fewer sizes made.

FRED CLAYTON,
Chief Electrician.

Gulf Lumber Company,
Fullerton, La.

# Central Station and Industrial Practice

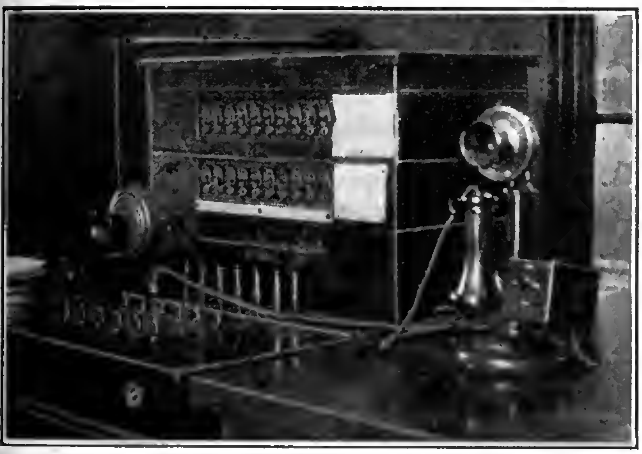
**Installation, Operation, Maintenance, Test and Repair of Generation and Distribution Equipment, and Methods of Economically Utilizing Electric Service in Large Industrial Plants**

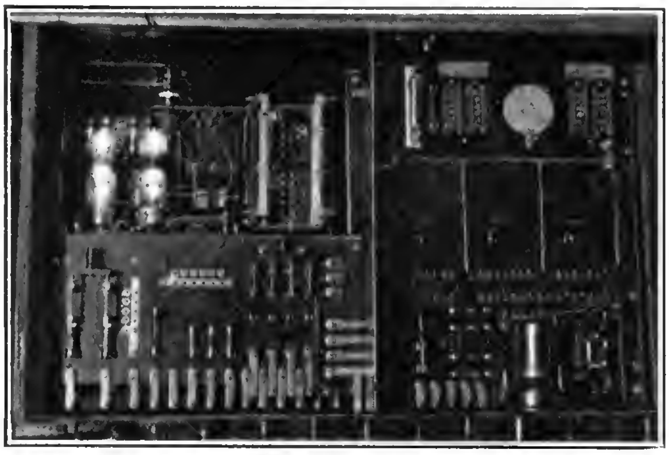
## Carrier Current Being Used Successfully

AS SOON as the development of the carrier-current telephone system had reached the point where apparatus was available the Utica (N. Y.) Gas & Electric Company obtained two sets which were placed in regular service and from which very satisfactory results have been obtained. The apparatus was tuned in, tested out and turned over to this company for regular service on Dec. 8, 1922. During the first two or three days of operation a very few minor troubles were experienced. These were immediately corrected by engineers of the General Electric Company, and since that time the carrier-current telephones have been in regular and continuous use without any further trouble. The two sets now in service are rated at 50 watts and transmit 12½ miles over a 44,000-volt transmission line.

The operation of the sets is almost as simple as with the ordinary telephone. Taking the receiver off the hook starts the motor-generator set and puts the apparatus into condition for either talking or receiving. There is a small key, similar to the key on a telephone switchboard, mounted on the telephone transmitter stand. When this key is pushed up a calling signal is sent to the other station. The key is then released, leaving the telephone in condition for receiving. When the operator desires to talk he pushes the key to the talking position, then releases it for listening.

The voice volume with these sets is at least as good as on the ordinary commercial telephone system. In fact, one of the amplifiers in the receiving circuit is not in operation in our sets, because with the additional amplifier the receiving volume was so great that it was unpleasant to listen to. The quality of the speech received is practically the same as that over the ordinary commercial telephone system.





CARRIER-CURRENT SETS OPERATING SATISFACTORILY OVER 12½-MILE, 44,000-VOLT LINE

One of the very noticeable points in the use of this telephone system to any one who has used the more common dispatching system, in which the telephone lines are run on the same towers with transmission lines, is the very noticeable absence of hum and extraneous noises. There is absolutely no noise discernible from the regular power current in transmission lines, and there has been no interference from any radio signals.

An additional carrier-current telephone set of 250-watt capacity has been ordered to be used in connection with the transmission line now being constructed between the Utica Gas & Electric system and the Northern New York Utilities system. The speech in this case will be transmitted over a 66,000-volt transmission line for a distance of approximately 60 miles, then over a lower-voltage line for a distance of approximately 30 miles, the link between the two transmission lines being closed by means of electrostatic coupling or some equivalent means.

There is one very interesting development being carried out in connection with the new set which has been ordered to provide for talking with several different systems without any system being able to receive conversations or calls directed to another. Where a company is interconnected with two or more companies it is essential that communication between the central company and the various other companies be carried on without interferences with carrier-current systems operating in any of the other companies and without the conversation being receivable by any of the other companies. It appears that this company was the first to call this to the attention of the manufacturers and to ask for sets capable of talking on several different systems without interference between systems. The manufacturers were quick to see the need of this further development, and there is promise of its being carried to a successful conclusion in the near future.

E. P. PECK,
General Superintendent,
Utica Gas & Electric Company,
Utica, N. Y.

## Single-Phase Transformer Ratings Standardized

ADDITIONAL standard ratings for single-phase power transformers have been recently adopted by the Electric Power Club and became effective Jan. 1, 1923. The ratings include transformers to take power from standard circuit voltages, namely, 44,000, 66,000, 88,000, 110,000, 132,400, 154,000 and 220,000, and to supply secondary distribution at voltages above 4,000. The standard sizes, voltage ratings and taps of step-down transformers for supplying lighting and power service as they now stand are given in the accompanying table.

The standard types of transformers are self-cooled oil-immersed, water-cooled oil-immersed and air-blast. The application of air-blast transformers is confined to systems where the voltage does not exceed 25,000. Standard frequencies are 25 cycles and 60 cycles. Standard sizes for oil-immersed self-cooled transformers in kilovolt-amperes continuous rating at 55 deg. C. rise are 250, 333, 400, 500, 667, 833, 1,000 1,250, 1,667, 2,000, 2,500, 3,333, 5,000, 6,667, 8,333 and 10,000. For water-cooled oil-immersed or air-blast transformers the lowest rating is 500 kva., the sizes above this being the same as for the self-cooled type.

Transformers given in the table having a low-voltage rating of 230/115 are arranged for series or three-wire service only. Transformers having low-voltage rating of 230/460 are suitable for series or multiple service only.

Standard single-phase step-down power transformers for supplying secondary distribution and having voltage ratings listed in the table will be designed for successful operation when excited on full winding at 5 per cent above their rated voltage.

Where a standard transformer is suitable for normal application at two voltage ratings, this flexibility will be definitely indicated on the nameplate, on the connection diagram or on a paster inside the transformer cover.

This additional information will be incorporated in the next edition of the handbook of electrical apparatus standards, published by the Electric Power Club.

FIELD EDITOR ELECTRICAL WORLD.
New York, N. Y.

STANDARD RATINGS FOR SINGLE-PHASE POWER TRANSFORMERS FOR SUPPLYING LIGHTING AND POWER SERVICE

Voltage ratings shown in bold type are the normal voltage ratings of these lines and, unless otherwise specifically requested, manufacturers will offer guarantees covering electrical characteristics such as efficiency, regulation, etc., on these normal ratings only.

## Signposts to Economies in Small Stations

BETTERMENT work in the operation of small central-station companies is receiving widespread attention at present, and various lines of attack on waste are being followed with good results in many parts of the country. The following representative "leads" were noted recently in visiting stations which were trying to make the most of existing equipment as well as to install new and economical generating units and auxiliaries:

Substitution of two Klaxon horns and an individual forge blower for an air whistle and compressor service in station forge shop. This secured a marked reduction in the hours of daily operation of an air compressor.

Measurement of the foot-candles of illumination in various parts of the plant, from the coal pocket to the operating gallery, with a tabulation of desirable intensities and lighting unit sizes.

Check-up of station lighting circuits and switching arrangements to permit reduction of energy consumption in maintaining illumination in sections of the plant periodically but not continuously under close operating observation.

Installation of industrial ash car operated by storage battery to reduce labor of ash disposal.

Provision of plane mirror at proper angle outside boiler room to reflect image of chimney top for convenience of boiler-room force in checking smoke

emission and maintaining rules of smoke density laid down by state authorities.

Removal of 6,600-volt knife switches from location within 3 ft. of flow line to height of 12 ft., for safeguarding switchboard operator's work at rear of panels.

Concentration of indicating and recording instruments for boiler-room service in inclosed office at central point in boiler house to facilitate control of boiler units, draft, feed water, etc., and more quickly effect changes in handling when inefficient conditions appear.

Analysis of economical load points or range of efficient service by auxiliaries to insure better handling of such apparatus in connection with fluctuations of station output.

Preparation of special log sheet to record interconnection data, routine and emergency service conditions, to insure more accurate permanent records of operation and provide a basis for deeper economic studies of interplant handling.

Provision of glass-inclosed office in old transformer station serving industrial area to reduce amount of heating required in winter as compared with former practice of steam-heating entire building. Group assembly of all transformer-cooling water-supply valves in recess in switch house, with visual indication of rate of flow and massed thermometric facilities under immediate observation of load dispatchers.

Relocation of transformer bank for city substation next to outer wall facing alleyway and provision of rolling steel doors and screens in place of former brick wall to increase supply of outside air drawn in by motor-driven ventilating fans under peak loads and thereby gain transformer capacity.

# Slotting Improves Commutator Operation

### Operating Conditions Determine Best Method of Undercutting for Any Particular Machine—Proper Selection and Application of Brushes Important

COMMUTATOR slotting, or undercutting, has been fast gaining in popularity among operating engineers during the past few years. Slotting is cutting or grooving the mica lying between the commutator segments below the surface of the copper so as to allow only copper to come into contact with the brushes. Formerly methods were more or less haphazard, and in many cases the results hoped for were negative and troubles that were intended to be eliminated were multiplied. This, in many instances, resulted in turning the operator against the whole idea of slotting, and it is still dwelt upon by some as an indictment against all slotting.

Later experience and practice have proved that the operation of any commutating-type machine can be improved by using a method of undercutting applicable to the type of the individual machine and its operating conditions, together with the selection of the correct grade of brush material and the correct application of the brushes to the commutator. Some of the many benefits to be derived from proper slotting and brush selection may be enumerated as follows:

*Decreased Commutator Wear.* — On slotted commutators brushes with no abrasive characteristics can be used, while on flush mica commutators it is necessary to use a brush material having a degree of abrasive action sufficient to keep the harder mica flush with the copper.

*Increased Brush Life.*—As it is not necessary to use abrasive brushes on undercut commutators, it is possible to obtain a much better polish both on the surface of the commutator and on the face of the brushes.

*Decrease (if Not Elimination of) Glowing of Brushes, Sparking, Ring Fire and Commutator Surface Burns.*—The most common cause of these conditions is high mica, which slotting abolishes.

*Reduction of Frictional Losses.*—Frictional and abrasive characteristics of brush material are closely related, and the use of a brush having no abrasive characteristics means also a material of minimum friction. Reduction of this loss from friction has in many cases amounted to 1½ per cent to 2 per cent of the total output of the machine, and it is directly reflected in the coal bill.

*Decrease in Operating Temperature Under Set Load Conditions.*—All brush friction is transformed into heat energy at the brush face; therefore, by reducing the friction to a minimum the heat due to friction is also reduced to a minimum.

*Increase in Allowable Load.*—Two factors contribute to this result, (1) reduction in heat due to friction, and (2) the fact that non-abrasive brush materials almost always have a lower specific resistance, which reduces the heat due to current flow.

*Decreased Tendency to Develop Flat Spots.*—Sparking and burning are reduced, and these are the most common causes of the development of flat spots.

There are several methods of undercutting in general use, some of which are excellent and others of questionable value. Machines and tools of various kinds for undercutting are on the market, and all have their advantages for certain classes of work. Machine tools for this work are usually circular-milling saws operated by some convenient power method. Hand tools are of various types, including holders for pieces of hack-saw blades, shaped raking cutters, files and other implements. Of the hand tools, the curved file with the offset handle has proved to give best results under average industrial operating conditions.

In all cases where the job of slotting is to be done the following general rules apply:

Be sure that the commutator is round and free from flat spots, that there is no eccentricity, and that there are no grooves around the commutators. If any of these conditions exist, the commutator should first be trued up by grinding or turning.

After the slotting job is completed a careful inspection should be made to make sure that no particle of mica has been left flush with the bars, as this always defeats the purpose of undercutting. After this the commutator surface should be polished. This can best be done by a very fine grit commutator stone. If a commutator stone is not available, very fine sandpaper can be used. Before using sandpaper, the coarser grit should be worn off by drawing over a piece of steel a few times. Best results from sandpaper can be obtained by backing up with a wooden block cut to the curvature of the commutator. A satisfactory method of anchoring sandpaper to such a block is shown in Fig. 1.

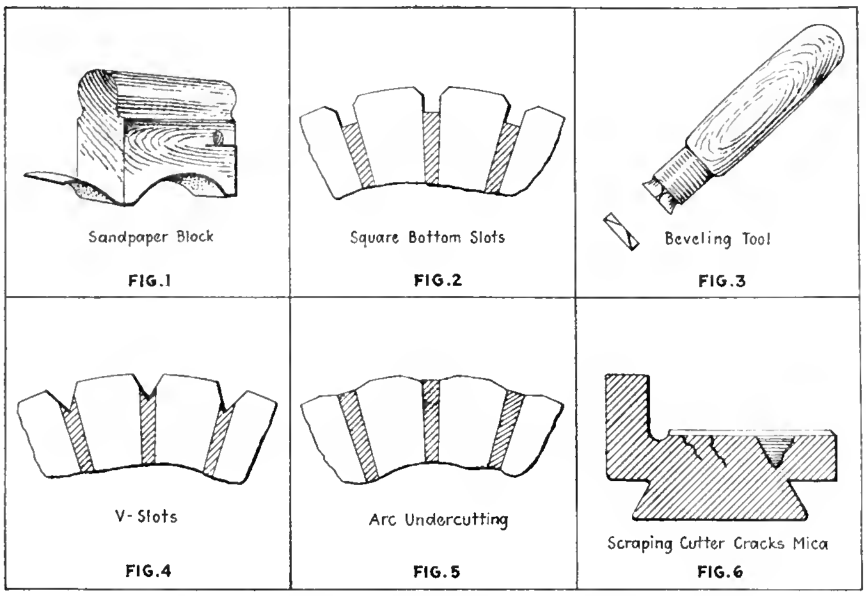
As there are various methods of slotting, conditions of operation determine the best method for any particular job. These methods are divided into three general classifications—square-bottom slotting, "V" slotting and arc slotting, of which the "V" type has the widest range of application.

In the following paragraphs the poorest of operating conditions have been assumed, and under good operating conditions figures for minimum peripheral speeds at which slots will clear will be considerably reduced. Commutator diameters have not been taken into consideration, figures being based on the average diameter of commutators found in the average industrial equipment. Small-diameter commutators will clear at somewhat lower peripheral speeds than those of larger size. However, if figures given are followed in practice, satisfactory results will be obtained, as errors are on the side of safety.

*Square-Bottom Slots.*—The square-bottom type of slot is adapted to high speeds only. This slot is usually put in by the use of power-driven milling saws or hack-saw

blades. It has been found that the maximum depth of this style of slot that will positively clear itself is $\frac{3}{64}$ in., and it is then positive in its action only at peripheral speeds of 5,000 ft. per minute or greater. This practically limits the use of the $\frac{3}{64}$-in.-deep square-bottom slot to turbine-driven commutating machines and some 60-cycle rotary converters. The square-bottom slot of $\frac{1}{32}$-in. depth is positive in its clearing action at peripheral speeds of 3,500 ft. per minute or greater and can be used to advantage on many larger generators and rotary converters having a commutator speed above this figure.

In the machining of the square-bottom slot there are several details which may seem of minor importance, but careful attention to them is absolutely essential if best results are to be obtained, and they cannot be emphasized too much. Where the power-driven milling saw is used it is impossible to prevent it from coming in contact with the sides of the bars, and wherever this occurs some of the copper is cut or dragged off. Usually the dragging or tearing action is pronounced. This has the effect of cold-drawing on the side of the bar, which causes a hardening of the copper at the side of the slot, and no matter how carefully the surface of the commutator may be smoothed or polished after slotting, there is a knife edge of hardened copper at the edges of each bar. This hardened knife edge will not wear down uniformly with the softer center of the bar and after a time will have a tendency to start flat spots in the center of the bars. This causes the bar edges to run high and act as scrapers against the brush face, shortens the brush life and causes an excess of carbon dust which, in the end, may result in flashovers and the breakdown of the machine. With such possibilities it is, therefore, advisable always to bevel the edge of the commutator bars as indicated in Fig. 2. A bevel surface of approximately $\frac{1}{64}$ in. is sufficient for this purpose. Beveling can be accomplished by the use of an ordinary three-corner slim-taper file or with a sharp cutting edge such as a strong pocket knife or a special tool like that shown in Fig. 3.



METHODS OF COMMUTATOR SLOTTING THAT IMPROVE THE OPERATION OF MACHINE

It is a proved fact that the number of car-miles per motor failure obtained on one interurban railway line in the Southwest was increased more than 30 per cent by beveling the edges of the bars where square-bottom slots were used.

*V Slots.*—As has been previously stated, the V slot (Fig. 4.) has a wider range of application than any of the other types and in time is bound to be accepted as the standard method of slotting for all machines operating under average industrial conditions. At the present time there are no power-driven tools on the market for slotting in this manner, and this makes necessary the use of hand tools to get the results desired. Hand tools are comparatively slow, and many operators, while admitting the advisability of using the V slot, continue to use a square-bottom type solely because of the time saving of power machinery. It is, however, a fact that the improvement to be gained in operation will often pay many times over for the difference in labor cost of putting in the V slot. A V slot of 60-deg. angle, the bottom being slightly rounded, cut to a depth that will bevel the copper to about $\frac{1}{64}$ in. at the sides of the slots, will clear itself at peripheral speeds of 1,200 ft. per minute or greater. A careful check of surveys made covering thousands of motors and generators in many industrial and central-station plants shows approximately 76 per cent of the machines operating with a commutator speed in feet per minute greater than 1,200 and less than 3,500, which is the minimum limit for square-bottom slots.

*Arc Undercutting.*—While entirely satisfactory on any machine and under all conditions on account of the cost of properly machining, arc undercutting (Fig. 5) is limited in application to those machines that will not operate satisfactorily when slotted by any other method. When properly machined there is no minimum speed limit at which arc undercutting will not clean, even when the machine is operating under the most adverse of conditions such as engine exhaust, steam, water or oil splash. To get these results, however, it is absolutely necessary that slot machining be held within very close limits. Careful observation of several cases where this method has been used to overcome commutation faults has established 0.010 in. as a maximum depth of undercutting at which cleaning action is positive at very slow speeds. Moreover, the total width of the slot at the top should not be less than two and one-half times nor more than three and one-half times the thickness of the mica.

There is one method of machining slots occasionally used which very often is the primary cause of serious machine trouble. This is the use of raking-type cutters, whether used by hand or in the tool rest of a lathe. Mica is hard and brittle, and the use of any raking or scraping cutter having a single cutting point is almost sure to cause small cracks or checks in the mica at the bottom of the slots, as indicated in Fig 6. Where any oil or moisture is present it finds its way into these small cracks and breaks down the insulation between bars, often causing the mica to char and burn all the way to the spider or shaft, thus bringing about complete machine failure.

The different methods of slotting recommended above will always prove satisfactory when properly applied to machines in continuous operation. Very often, however, on machines used intermittently, where oil creeps from the bearings, or the atmosphere is moist, oily or dirty, or corrosive fumes are present, failures directly traceable to the slotting develop. Where conditions such as those described occur this trouble can be eliminated by coating or filling the slots with a good grade of shellac, certain air-drying insulating varnishes or some of the commutator cements sold for that purpose. Care should be used in the selection of this material. It must have good adhesive properties. It must dry hard and not gum, but it must not become harder than the copper commutator bars. It must not be affected by oil or moisture and it must be free from abrasive qualities.

With a slotting job properly done, the selection of the grade of brush material to be used on the commutator is of the utmost importance. The brush that gave satisfactory service on the machine while operating with flush mica will not operate correctly after undercutting. Brush material on flush mica commutators must have a degree of abrasive action, which on undercut commutators would be expended entirely in cutting out the softer copper, resulting in greater commutator wear than before undercutting. This would mean more copper dust and a correspondingly greater possibility of failure in insulation, with the consequent breakdown of the machine.

With the proper grade of brush material selected, the application of that grade to the machine becomes of prime importance. Brush angle, brush pressure, brush staggering and fitting of brushes to the commutator should all receive consideration. Brushes with low friction should be more nearly radial than those having high abrasive characteristics. Brush pressure on slotted commutators should usually be somewhat less than where abrasive brushes are used on flush mica. Staggering should be by pairs of studs instead of by single studs. New brushes never exactly fit the commutator, and in order to get the proper contact they should be sandpapered in by pulling the sandpaper in the direction of rotation of the commutator.

With correct slotting, the correct brush applied in the proper way, the machine should operate quietly, without chatter, spark, squeal or burn. No lubricant should ever be used on slotted commutators, and if everything is correct it will not be needed.

## Damage from Oxygen in Boiler-Feed Water

WATER containing oxygen in solution actively corrodes the tubes of steel-tube economizers and boilers. The serious harm due to such corrosion can be inferred from Fig. 1, showing the amounts of iron converted into rust in a year by an hourly supply of 1,000 lb. of water containing different amounts of oxygen in solution. Where economizers have been put in without suitable de-aërating means they have in several instances been destroyed by pitting within a year or less.

Open heaters receiving sufficient exhaust steam at all times to bring the water up to 212 deg. F. or above greatly reduce the corrosion, but since the amount of heat recovered by the economizer depends upon the difference between the temperature of the flue gases and the temperature of the water, it is generally desirable in the interests of over-all plant economy to supply water to economizers at the lower temperatures. Ordinarily the flue gases enter the economizer at a temperature between 550 deg. and 650 deg. F. and leave at a temperature between 250 deg. and 350 deg. F., having therefore a mean temperature of about 450 deg. F. If the feed water enters the economizer at 200 deg. F. and leaves at, say, 300 deg. F., giving a mean temperature of 250 deg. F., the average temperature difference will be in the neighborhood of 200 deg. F. If, on the other hand, the water enters at 140 deg. or 150 deg. F., the temperature difference, and therefore the fuel saving and money return upon the economizers, will be increased by about 20 per cent.

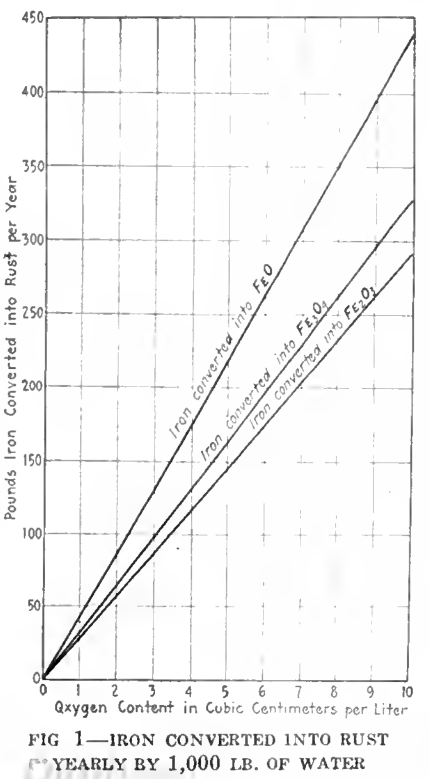

FIG 1—IRON CONVERTED INTO RUST YEARLY BY 1,000 LB. OF WATER PER HOUR

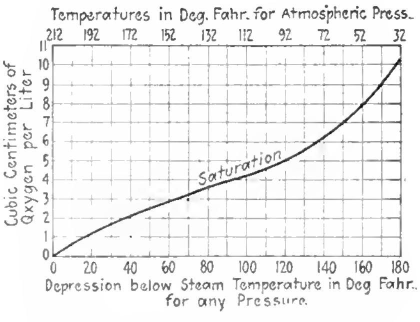

FIG. 2—OXYGEN CONTENT OF WATER HEATED TO VARIOUS TEMPERATURES

The extent to which oxygen can be driven out of solution by heating water to the boiling point under atmospheric pressure is shown in Fig. 2. The problem of heating water to the full temperature of the steam in an open heater resolves itself into that of removing non-condensible gases from the steam space. If the venting is done directly from the steam space, large quantities of steam must be vented in order to keep down the concentration of air.

If the amount of steam supplied is insufficient to heat the water to atmospheric boiling point, the temperature of the feed water will vary according to the relative amounts of steam and water, and in order to secure de-aëration at the lower temperatures, means must be provided for maintaining a vacuum in the heater corresponding to the pressure of water vapor at the temperature to which the water is heated. This condition will be fulfilled if the accumulation of non-condensible gases in the heater is prevented, as by withdrawing a portion of the heater atmosphere continuously by means of a steam-jet air pump or ejector. For operation under vacuum conditions special apparatus has been developed.

## The Present Status of Rural Service*

**Eventual Modification of Agricultural Processes and Equipment Will Increase Use of Energy to a Point Profitable to Both the Central Station and the Farmer**

BY J. C. MARTIN
Western Editor ELECTRICAL WORLD, Chicago

SEEING the advantages of electric service in cities and towns and sensing its economic possibilities in agricultural operations, the farmer has not been able fully to understand why an electric power supply cannot be as readily taken to his door as it has been to that of the city man. He has made attempts, with more or less success, to get his power supply by building lines to the central-station system and buying power on a wholesale basis, doing his own distributing and thereby in many cases entering, legally at least, into the utility business and assuming without realizing it responsibilities that have later proved a severe burden. All sorts of errors, some ludicrous and some tragic, have been committed in such projects.

Some success has been attained, but it is not of the character that indicates the lines along which practice will finally stabilize. After four or five years of work both the seller and the consumer are still groping very much in the dark and the solution seems as far off as ever. As a matter of fact I believe that the difficulty lies largely in the old human failing of refusing to look a problem over and analyze it to see what is involved.

### Nature of the Problem

Two facts are thoroughly proved in economic experience. One is that the seller must make a profit if he is to continue in the business of selling a product. The other is that the buyer must make a profit from the use of the thing he buys. In the case of the buyer the profit does not always come in the form of a money balance. It may come in the form of better living conditions or better health, or in numerous other ways. However, if he is using the things he buys in a producing business from which he derives an income, then he must be able to turn those things into more cash than he pays for them, including the labor and process costs through which he must put his raw materials.

There are two sides to this question, and, to dispose first of the one which seems to be simplest, the seller's problem will be discussed briefly. The central-station man called upon to give service anywhere has certain total cost limits below which he cannot go in establishing the service. The costs per consumer are controlled in certain items by the number of consumers he can serve with a given amount of material in the form of service plant. In certain other items the cost is independent of the number of consumers. When called upon to build a city line he can figure eventually on from approximately twenty to one hundred consumers per mile of line. Probably the general average is around fifty per mile or slightly less. Called upon to serve the same class of consumers in rural territory, he cannot expect in the Middle West and Far West more than three per mile, and the general average in service so far established is less. The expense per consumer which is affected most by the number served by a given line is the biggest expense.

When he has figured out the entire problem he finds that for a line costing a given sum in city service he will serve say forty to fifty consumers and in the country a line costing approximately one-half the amount will serve only about three consumers. This is because there is a minimum amount of material that can be used in building a line that will stand up under the climatic and other physical conditions it must meet. This amount of material has no relation to the number of consumers. It must be used to secure physical strength. He also has to face the fact that in maintaining his rural lines he must arrange to travel miles for service and maintenance purposes where in his city or town service the travel is measured in blocks. Good pavements in city work and poor roads in many country districts serve to widen the difference in expense. The difference in expense is inherent in the method of giving service, and unfortunately it is the only method we know. This is the heart of the central-station side of the problem, and it is a wall which prevents placing the service cost to the individual farmer on the same basis as the city dweller.

### The User's Problem

The user's problem is divided into two parts. The buyer must distinguish between the uses to which he puts the things he buys. We have heard a great deal of the need of improving farm living conditions in the past few years. Much of this has had to do with the farm home. If he can make the other part of his activities pay him a fair return on his investment, the farmer can afford to spend money on improvements in living conditions in the home. In fact, he is doing this in many directions. In using electrical energy the question is how can he make it relieve the home conditions. The way to the solution of this problem is well paved by the developments in city homes, so far as light, the sewing machine, the washing and ironing machine and the ordinary items of home use are concerned. Such items of equipment as the electric range and the refrigerator require educational development. Merely placing them in the farm kitchen will not solve the problem. That they have great possibilities is certain, and a considerable amount of study can be devoted to their use on the farm.

The other and by far the biggest

---

*From a paper presented before a meeting of the American Society of Agricultural Engineers at St. Louis, Dec. 27, 1922.

possibilities, however, lie in the field of farm work that corresponds to the business activities of the city business or industrial man. It seems that the time has come when the farmer must view his producing problems in exactly the same light as the factory owner or executive views his production problems. In other words, the farm as a producing agency is a factory.

The farmer uses power. For centuries that power has been human or animal because such power has been cheap. In America cheapness is no longer a certain feature of human labor unaided by machinery. I think it is fair to question whether animal labor is not also reaching that point in many places. I understand from farm sources that it requires the products from several acres of ground each year to sustain a single horse.

### Possibilities for Increased Production

If by means of machine equipment the products of that ground can be turned to other uses, what is the gain to the farmer? If it is possible to increase the production per man from this acreage and the remaining acreage now devoted to other purposes, what is the value of such a gain to the farmer? If it is possible, for example, to reduce the number of horses used on a 600-acre farm to two, as one English investigator claimed recently could be done, by the use of some form of power other than animal, what is such a gain worth to the farmer in the solution of his production-cost problems?

In a recent discussion it was pointed out that forced curing of hay had been resorted to in an experimental way in England, and the results seemed to show that the food qualities of the product are better than where the hay is cured in the ordinary way. The process is simple, and outside of an ordinary fan and motor the only equipment involved was some sort of a tunnel under the stack into which the air is forced and then allowed to escape through the green hay, carrying the moisture with it and curing the hay before destructive processes can set in. There are other crops on which the same process might make for an improvement in product.

This is but one instance of a saving effected by the application of electric power. There are many other benefits, including water supply, haulage and small power applications in the daily routine of farm work, which will minimize or eliminate hand labor.

Many, including men in both the agricultural and electrical fields, believe that the future development of farm equipment must follow in a general way the broad lines of progress that have been followed in the industrial field in the past twenty-five years, namely, the development of equipment of the highest possible mechanical efficiency which requires the least human labor to keep in operation and which places the production possibilities on a plane that hand labor can never approach. If electric power is to be used profitably on the farm, there will probably be as great modifications in farm processes and equipment as have taken place in the industrial field. The problem is neither wholly electrical nor wholly agricultural in its aspect, but it is an economic problem that must be solved by both industries working together in order that the viewpoint of each may be properly considered. It involves a vast amount of research, and the extensive government experiment stations have the facilities to undertake the work. The nub of the problem in reducing the cost of energy delivered at the farm is to increase the use so that the costs of getting service will be absorbed, and leave the farmer with a profit as the result of his expenditure.

## Power-Factor Table Lessens Billing Computations

By George B. Leland
General Manager Stamford Gas & Electric Company, Stamford, Conn.

Many central stations are using the two-meter method of determining the average power factor of their power customers, one meter registering the kilowatt-hours and the other meter registering the reactive volt-amperes.

Our company started using this method of metering with a few of our larger customers about four

TABLE FOR COMPUTING POWER FACTOR

Divide reading of wattless component meter by reading of kilowatt-hour meter. This gives the ratio of the wattless and the true current. Find in table below nearest constant to the ratio above determined and in the column at the left-hand side of table read power factor. Add to this the decimal shown over the top of the column which contains the constant. This will give the power factor to the nearest tenth.

| Power Factor | 0 | 0.1 | 0.2 | 0.3 | 0.4 | 0.5 | 0.6 | 0.7 | 0.8 | 0.9 |
|---|---|---|---|---|---|---|---|---|---|---|
| 95 | 0.3288 | 0.3252 | 0.3214 | 0.3179 | 0.3143 | 0.3105 | 0.3067 | 0.3032 | 0.2994 | 0.2956 |
| 94 | 0.3630 | 0.3597 | 0.3564 | 0.3528 | 0.3495 | 0.3460 | 0.3427 | 0.3391 | 0.3356 | 0.3323 |
| 93 | 0.3953 | 0.3921 | 0.3889 | 0.3859 | 0.3825 | 0.3792 | 0.3762 | 0.3729 | 0.3696 | 0.3663 |
| 92 | 0.4258 | 0.4231 | 0.4200 | 0.4169 | 0.4139 | 0.4108 | 0.4078 | 0.4047 | 0.4015 | 0.3983 |

years ago, and one of the first problems we had to solve was that the billing department was unable to determine the power factor of the consumer when it received the readings from the indexers. After trying out various methods and "graphs," the accompanying table (cosines and tangents) was worked out. After two years' use it has fully solved the problem and enables any billing clerk accurately to determine the power factor of the consumer and bill him in accordance with our rate.

## Company Garage Has Model Electrical Installation

SOME power companies are prone to devote too little attention to the type of wiring which goes into their own buildings because the men are so familiar with their work that they can be trusted to handle a rough installation. In consequence temporary wires are often used for months or years in positions where a power man would advise the most permanent type of wiring if the installation were being made on a customer's premises.

In the belief that the public will be impressed by the example set by the electric company, the San Joaquin Light & Power Corporation has installed model electrical equipment in its new garage building. Wiring is in conduit throughout and switchboards are well arranged and of the latest design.

More than one hundred of the company's cars are stored in this building, and from 200 to 225 are cared for here for repairs. In addition to the repair work on the cars, which calls for a paint shop and an upholstery repair shop as well as the main machine shop, any heavy machine work in connection with company construction requirements is handled in the garage.

An average of 4,000 kw.-hr. per month is used for power purposes, with a total motor installation of 117.5 hp. as shown below, the figures indicating horsepower:

*Machine Shop.*—Band saw, 7.5; hack saw, 0.5; grinder, 2; drill press, 2; sensitive drill, 1; shaper, 2; grinder, 0.5; milling machine, 3; cylinder driver, 5; universal driver, 3; 14-in. lathe, 2; 18-in. lathe, 5; 18-in. lathe, 3; 12-in. lathe, 2; threading machine, 3; threading machine, 3; drill press, 3; punch, 5; grinder, 3; air compressor, 30.

*Garage.*—Bearing burning-in, 10; bearing burning-in. 20.

*Filling Station.*—Gasoline pump, 2.

All machines are remote-controlled with push-button operation and are protected with approved safety features. In addition to the motor load, there is a 25.9-kw. lighting and fan load with an average monthly consumption of 3,500 kw.-hr. during the summer and 3,000 kw.-hr. during the winter. Heating is accomplished by 1,800-watt heaters, but this installation is too recent to furnish figures for consumption.

Besides serving as an example of good wiring which may be used in selling adequate illumination and modern installations to garage owners and machine shops, this garage has the added advantage to the company of providing for the grouping of all cars at one place, a feature which permits of their being regularly inspected for repairs at frequent intervals.

The paint and upholstery shops located on the premises facilitate keeping up the appearance of the company's cars, a factor which influences the attitude of the community.

## Customers Oversubscribe Holding Company Stock

CUSTOMER ownership of holding-company stock, which was successfully tried out by the United Light & Railways Company of Davenport, Iowa, as described by H. E. Weeks, manager of the company's securities department, in the ELECTRICAL WORLD of March 18, 1922, has further proved its value. Not only was a second block of $1,000,000 of prior preferred stock sold on this plan, but this quota was oversubscribed by $200,000.

During the latter part of March, 922, the directors of the company authorized the sale of another $1,000,000 of prior preferred stock to the customers of the company. The previous block of stock had been sold almost entirely through the employees, the only exception being that in some of the larger localities a few paid salesmen were employed.

When it was decided to sell the $1,000,000 of stock between April 1 and Dec. 31 a definite quota was assigned to each of the sixteen companies operated by the United Light & Railways Company. During the period between April 1 and Aug. 31 the employees were not urged to sell the stock, but approximately $200,000 was sold during that period.

With the opening of fall, however, the effort was intensified, and during

MAIN MACHINE SHOP, SHOWING CONDUIT WIRING, INDIVIDUAL DRIVE AND PUSH-BUTTON CONTROL

MODERN SWITCHBOARD INSTALLATION CONTROLLING POWER SUPPLY FOR THE BUILDING

The illumination is carefully planned and installed to meet the specific needs of the work.

## Purchasing and Employment Value of a Water-Power Development

WHAT hydro-electric construction work means to a city in the employment it gives to labor and the money spent with merchants for various supplies was graphically depicted in a joint exhibit by the Manitoba Power Company and the Winnipeg Electric Railway Company at a recent industrial show in Winnipeg. As will be seen from the accompanying view of the exhibit, the 170,000-hp. water-power project under construction at Great Falls was the feature of the display. How much this will mean in added business for merchants of the city is emphasized by statements of the amount of money and labor necessary to build the plant. For instance, it will require the employment for nearly two years of 1,500 men, who are paid an aggregate of $7,500 in wages, daily. Furthermore, 200,000 lb. of foodstuffs to feed these men is purchased monthly in Winnipeg.

---

the month of September approximately $125,000 of stock was sold, while during October $250,000 in stock was disposed of. The results during the first few days of November were especially gratifying. Announcement had been made about Oct. 15 that the price of the stock would be advanced on Nov. 15 from par to $102 a share. This served as a stimulant to sales and there was sold in the first two weeks of November $625,000 of stock, or at the rate of $16,000,000 a year. The sales for the last six weeks of the campaign totaled $875,000.

The United Light & Railways Company serves 600,000 people, but all of the territory embraced was not opened for sales during the entire period of the campaign. In Chattanooga the sale of stock did not begin until about two weeks before the closing of the campaign. This city was the only one which did not sell its quota. Although the Grand Rapids territory was opened about a month before the close of the campaign the quota was oversold by 140 per cent.

Cadillac, Mich., was also very late in getting started on its sale and had less than a month to sell its quota. Despite this, however, the allotment there was oversold. More than half of the stock was sold in territory known as Tri-City territory, which embraces the cities of Davenport, Rock Island and Moline. It is very significant that the territory where industrial conditions were probably most depressed the greatest sales were made. The Peoples Power Company, which operates in Rock Island and Moline, where the great agricultural implement factories are located, sold approximately $300,000 of stock, although the implement factories are practically closed down. The quota assigned there was exceeded by about 80 per cent.

The splendid work done by the trainmen and other employees of the railway companies owned by the United Light & Railways Company was especially gratifying. During the campaign the percentage of ownership of stock by one railway company's trainmen was increased from 36 to 70. Nearly all of the employees assisted in the sale of the stock. Another of the railway companies included in the system of the United Light & Railways Company had almost 100 per cent of stock ownership.

During the year the company sold stock to 2,100 people, and it has on its books today more than 4,600 stockholders in this issue in the communities in which it operates. These stockholders have all been acquired during the last two years. The figures of the company show an average holding of four and six-tenths shares per stockholder.

The "United Go-Getters' Club," which was organized in the fall of 1921 and was described in the ELECTRICAL WORLD article already referred to as having put on a successful sale of $500,000 of stock, did splendid work in "putting over" this sale. Although the later sale was not handled entirely by the "Go-Getters' Club" on all of the properties, as part of the properties have no organized club, the work of the individual "Go-Getters" was largely responsible for the splendid results which were obtained.

## What Other Companies Are Doing

**Chicago, Ill.**—For the week ended Dec. 23, 1922, the electrical energy output of the Standard Gas & Electric Company increased 12.82 per cent over the corresponding week in 1921. Applications for new electric services totaled 1,623, covering 788 kw. of lighting and 1,125 hp. in motors. New customers' connected load shows a net gain of 579.

**Indianapolis, Ind.**—As Christmas presents to more than nine hundred of his employees, Harry Reid, president of the Interstate Public Service Company, operating interurban and power and light utilities in Indiana, sent life insurance policies ranging in value from $600 to $1,000. A letter of appreciation for services rendered accompanied each policy. The policies are based on the duration of the service of the employees. Those who have been with the company one year and less than two received a policy for $600; two and less than three, $700; three and less than four, $800; four and less than five, $900, and more than five years, $1,000.

**Denver, Col.**—Frank J. McEniry, general field representative of the Electrical Co-operative League of Denver, in going after additional business has chosen for his attack the poor lighting of homes, and particularly the dining table. In Denver, as in every city, there are many houses which have been wired for a number of years, and it is felt that these customers are not aware of the improvement in home illumination which they can have for a very little additional expense.

# Digest of Electrical Literature

Including Brief Abstracts of and References to
Important Articles Appearing in the Scientific and Engineering Press
from All Parts of the World

## Hydro-Electric Development and Steam Equipment

*Surface Condenser.*—C. L. Hubbard.—The choice of a condenser should be based upon a study of individual plant conditions and is governed to a large extent by the degree of vacuum required and the quality and available quantity of cooling water. The author discusses the advantages and types of condensers and the computation of tube and cooling surfaces.—*Southern Engineer*, December, 1922.

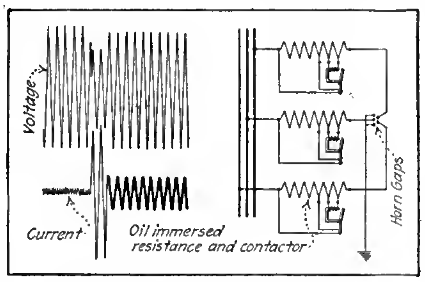
*Aspects of Study and Selection of Water-Power Sites.*—W. T. Taylor.—The author discusses the considerations involved in the selection of power site, stream flow, economical developments, relationship between rainfall and run-off and a survey of natural lakes.—*Canadian Engineer*, Dec. 12, 1922.

*Hydro-Electric Generating Sets for Small Output.*—C. Reindl.—The author has developed a water-turbine-driven generator set which operates at variable speed but maintains constant voltage without a regulator or any manual attention. This has been reached by the use of a specially wound direct-current dynamo the voltage of which will stay constant within a very wide speed range. High-speed water turbines of the Francis, Pelton, Banki or Kaplan type permit direct coupling with the generator. The absence of a turbine regulator, storage battery or electric regulator makes these sets extremely simple and inexpensive, saving as much as 50 per cent on the investment cost as against a non-automatic set. From a few hundred watts up to 25-kw. output these hydraulic generating sets are standardized.—*Elektrotechnische Zeitschrift*, Dec. 7, 1922.

## Generation, Control and Switching

*Neon Glow-Discharge Lamps on Direct-Current Circuits.*—J. T. MacGregor-Morris, M. J. Dowty and B. J. Privett.—The investigation dealt with in this article was carried out to study the behavior and to determine the statical characteristics of two types of neon lamps with a view to further possible applications. The article is illustrated with photographs of the spectra of the two lamps and concludes with a number of suggestions for possible application.—*Electrician*, Dec. 1, 1922.

*Overvoltage Problems.*—F. Schrottke.—The author gives an interesting account of the development of overvoltage protective apparatus. Much thought and energy have been spent on protective apparatus for electric machines, but the author claims that not all of the investigators were qualified for the task and that as a result much so-called protective apparatus was brought on the market which was either of no value or did actual harm. Shortly after the first 100,000-volt lines were put in operation it was realized that an excellent protection against overvoltages could be obtained from a strong internal insulation of generators and transformers. Such reliable results have been obtained in plants with machines of high winding insulation that practically no external protective apparatus is required. Another series of devices has been developed to guard against the dangers of a ground. Specifically, the Petersen and Bauch quenching transformers have proved useful in many cases. For energies of more than 2,000 kva. these coils, however, are far from fully satisfying. The



Ohmic Resistance in Series with Horn Gaps Has Proved Satisfactory for Suppressing Grounds

author mentions, for example, that in the large German Golpa power house the Petersen coils were disconnected from the buses after some major troubles and that the station has been operating satisfactorily for more than a year without these coils. He recommends the more extensive use of ohmic resistance in series with horn gaps, for which arrangement broad protective claims are made, substantiated by several years of good experience. An apparatus of this class is described, comprising an oil-immersed resistance and a contactor, with a horn gap on the cover of the oil tank. The contactor short-circuits the greater part of the resistance during normal operation, but opens this short-circuit and thereby inserts the full resistance in case of overvoltage within two cycles. An oscillographic record showing the operation of this apparatus is reproduced here. A further innovation is a spiral-wound choke coil made of a ribbon of copper and a ribbon of nichrome in parallel. Such a coil, the author claims, will not only reduce the voltage of an incoming traveling wave but will also smooth out its steep wave front. The use of condensers as overvoltage protectors is not recommended. The protective value of a grounded steel cable above a transmission line is still being discussed, but the majority of investigators and plant managers seem to disapprove of its extensive use.—*Elektrotechnische Zeitschrift*, Nov. 30, 1922.

## Transmission, Substations and Distribution

*Possibilities of Transmission by Underground Cables at 100,000 Volts to 150,000 Volts.*—A. M. Taylor.—Until recent years the methods of trial and error figured largely in the evolution of the transmission of power by underground cables and were successful because of the margin of safety which existed. Today the limits are much closer and a failure is a much more serious contingency, making it necessary that for any further step extensive study of the problems involved, both scientific and commercial, shall be made. Apart from a few pages in which certain fundamental principles are dealt with, this paper, presented before the Institution of (British) Electrical Engineers, consists almost entirely of a description of a special scheme developed for transmitting power over single-core cables provided with concentric potential grading sheaths. Six of the triple concentric cables are employed for a three-phase system and each pair has its six conductors connected to a six-phase supply system, which by being grounded on one side instead of in the center, as is usual, permits of the main conductors of the two cables being worked at a high voltage above earth. A comparison is included of the cost of transmitting 50,000 kw. a distance of 30 miles by this six-phase / three-phase system transmitting at 100,000 volts and the same performance by three-core cables working at 30,000 volts. The saving by the first system is, according to the author, quite pronounced.—*Electrician*, Dec. 15, 1922; *Electrical Review*, Dec. 15, 1922, and *Electrical Times*, Dec. 14, 1922.

## Units, Measurements and Instruments

*Electrical Timing Device for Short Intervals.*—D. Robertson and N. F. Frome.—A short description is given of a timing device for the above purpose, consisting of an inductive resistance in a Wheatstone bridge. The theory of the device is given, as well as an example of its application.—*Journal of the Institution of (British) Electrical Engineers*, December, 1922.

*Electric Telemeter.*—During the past two years the Bureau of Standards has been engaged in developing electric telemetric devices based upon the fact that carbon-contact resistances vary with pressures or displacements applied to their terminals. Difficulties in using carbon-contact resistances are that the contact resistances in the past have been erratic, that such apparatus has shown large hysteresis effects and that these devices are inherently non-linear in their characteristics. The bureau

has investigated these troubles and has found means of eliminating all of them to a degree which makes the apparatus well adapted to a great variety of engineering measurements. These include measurements of strains in bridge members and other engineering structures, measurements of accelerations, vibrations and pressures of practically every description. The apparatus can be made either indicating or recording as desired.—*Technical News Bulletin No.* 68 *of the Bureau of Standards.*

### Illumination

*Theory, Construction and Use of the Photometric Integrating Sphere.*—E. B. ROSA and A. H. TAYLOR.—The first part of this paper deals with the materials and construction of various spheres and describes in detail the construction of a reinforced-concrete sphere used at the Bureau of Standards. It gives tests of the accuracy of integration by this sphere, the absorption of light by the sphere coating and by objects in the sphere and effect of the position of the lamps. Proper methods of operation are also outlined. A fairly complete résumé of the general theory of the sphere is given in the second part, with the addition of a considerable amount of new material, showing how to test the accuracy of the sphere and how to improve the accuracy of integration. A complete bibliography of the subject is also given.—*Scientific Paper No.* 447 *of the Bureau of Standards.*

### Motors and Control

*Methods for Correcting Power Factor.*—E. H. HUBERT.—A practical analysis of how the benefits obtained by correcting power factor can be balanced against the cost in any industrial establishment. Where a large number of motors are used and the loads on them may vary from time to time a careful analysis of operating conditions and power requirements and a wise expenditure of money on corrective measures will show increased profits. The fundamentals to consider in such an analysis are dealt with. The article compares the results with the expenditures in practical examples that can be applied to conditions found in almost every plant. The subject is considered from the viewpoint of the industrial-plant operator, demonstrating to him the advantages to be gained by correcting power factor, among which are better voltage regulations, better rates, in some cases less equipment, reduction of power losses, etc.—*Industrial Engineer,* December, 1922.

*Alternating Current and Iron and Steel Works Practice.*—J. P. HODGES.—The author strongly advocates the use of alternating current in the steel industry. He points out how conditions in power production have changed since 1901 and discusses from the practical point of view the advances that have been made in and the precautions that must be taken with modern electrical equipment. He deals especially with distribution, motors and control gear. The two essentials are continuity of service and output.—*Electrician,* Nov. 24, 1922.

### Heat Applications and Material Handling

*Tipping and Guiding of Vertical Skips.*—G. W. SHARP.—The wear and tear and general condition of rope, guides, shaft timbering, winding engine and all that is accessory to the working of the skip, as well as the skip itself, depend so much upon the manner in which it is guided and tipped that practical improvement in this connection must be reflected in no small reduction of working costs. The author indicates the cause of excessive wear and tear and shows by what means improvement can be effected. Two subjects which are closely related—namely, the designing of tipping gear in such a way as to eliminate as far as possible shocks and excess strains and a description of an improved form of guiding slipper on skips—are the main points brought out by the author. He carefully worked out, illustrating his study with numerous diagrams, the static forces existing in the operation of tipping the skips, and, having made certain assumptions, has added to his calculations and drawings the effects of dynamic forces. This is a very comprehensive article, being about twenty-four pages long.—*Journal of the South African Institution of Engineers,* November, 1922.

*Resistance Welding Transformers.*—J. B. BORGADT.—The author discusses how modern designs of welding transformers tend to eliminate breakdowns, low efficiency and retarded production. The requirement of a good efficient welding transformer can be summed up as follows: Strong electrical and mechanical construction, good regulation, high efficiency, good cooling characteristics and low price.—*Welding Engineer,* December, 1922.

### Electrophysics, Electrochemistry and Batteries

*Small Oil-Engine Battery-Charging Sets.*—The second of a series of three articles on this subject that commenced with the November issue. In the first article the author discussed standard non-automatic house-lighting equipment, defects of the old type of plant and improvements in more recent plants, describing the specific functions of the components of lighting sets. The second installment considers the regulation of current during charge, automatic control, the supply of constant voltage, semi-automatic and automatic sets, type of engines manufactured for this purpose and running cost. In the concluding installment examples of the complete apparatus will be described and illustrated in detail.—*Beama,* December, 1922.

*Standard Cells of Concentric Form.*—YUICHI ISHIBASHI.—A concentric standard cell is designed which is convenient for the insertion of materials and also for washing and drying the glass vessel. As for the voltage constancy, temperature coefficient and internal resistance of this form, there is no difference as compared with the H-form standard cell. The characteristics of recovering to the steady state in both forms of cells for the abrupt change of temperature were studied. Less diffusion lag and more rapid attainment to the apparent constant electromotive force were observed in the H-form cells, but the recovery of the initial electromotive force is more rapid in the case of the concentric cell.—*Bulletin* 113 *of Electrotechnical Laboratories,* Tokyo, Japan.

### Telegraphy, Telephony, Radio and Signals

*Radio Vacuum Tube.*—H. M. FREEMAN and A. K. PHILLIPPI.—It is impossible to compare directly crystal and tube detectors because of their widely different characteristics and method of operation. Although they are apparently more complicated, the theory of operation of tubes is susceptible of more complete analysis than is that of crystal rectifiers. Such an analysis is simply and adequately given in an article by Mr. Freeman, while a study of crystal rectifiers is taken up by Mr. Phillippi in another article.—*Electric Journal,* November, 1922.

*Effect of Local Conditions on Radio Direction-Finding Installations.*—R. L. SMITH-ROSE and R. H. BARFIELD.—An account is given of the experiments carried out during the past year by a sub-committee of the Radio Research Board (England) on wireless direction finding. Experiments are described which provide quantitative data as regards the effects of metal work, coils, aërials, overhead wires and trees on a direction-finding set in their vicinity, and definite figures are given which show the extent in certain cases of errors produced by mountains and buildings.—*Electrician,* Dec. 8, 1922.

### Miscellaneous

*Influence of Temperature on Insulating Materials Used in Electrical Machinery.* — ERNESTO VANNOTTI. — Laboratory tests, as well as the condition of machines which have been running a number of years, show that the temperatures that can be withstood without damage to the insulating materials are considerably higher than those prescribed by the international rules. The present values have probably been chosen so as to guard against too high temperatures caused by defective construction of certain parts of the machines. If exploring coils are placed suitably and with care at the points where overheating is most likely to occur, the value of the permissible temperature should be 10 per cent to 20 per cent higher than the rules permit, the author claims, in order to utilize fully the materials of construction used in the machinery.—*Journal of the A. I. E. E.,* December, 1922.

# Scientific and Industrial Research

A Department Devoted to Reports of Investigations Contemplated or Completed, Research Facilities Available and Suggestions for Co-operative Work

*Conducted by* PROF. VLADIMIR KARAPETOFF, *Cornell University, Ithaca, N. Y.*

[PRINTED IN THE THIRD ISSUE OF EACH MONTH]

[When investigations which have been completed are, in the opinion of the editors, of wide enough interest to the field we serve, details thereof will be presented in other parts of this paper. Contemplated research or that which appears to have limited appeal will be only briefly reported in this section, but details may be had by communicating with the investigator or institution named in the report. Readers are referred to the department "Digest of Electrical Literature" for investigations reported in other journals. The news and engineering sections should also be followed for research reported before technical societies.]

## Research Completed

### Batteries, Lead, Rate of Sulphation of.

A new method has been devised, based upon successive weighings of the positive or negative plates while immersed in the solutions to be tested, which are maintained at a constant temperature. The battery plates were immersed in the various electrolytes and any plate could be brought in the arm of a sensitive balance for weighing. The results showed considerable differences in the rates of sulphation (a) of plates made by various manufacturers, (b) produced by different concentrations of the acid solution, and (c) at different temperatures.—*G. W. Vinal, Bureau of Standards, Washington, D. C.*

### Carborundum as Electrical Resistor Material.

Carborundum might be a good resistance material for high-temperature work since its decomposition temperature is around 4,000 deg. F. However, when it carries electric current hot spots of decomposition temperature seem to develop, although the temperature of the furnace itself may be only 2,500 deg. F. The life of such resistors has been found to be very short.—*J. L. McK. Yardley, Pittsburgh, Pa.*

### Controller of Temperature or Pressure, with Pneumatic Switch.

A controller-recorder has been developed to operate a pneumatic switch, which in turn opens or closes an electric circuit. This arrangement may be used to start and to stop a motor-driven fan or blower, to operate the heating circuit in an enameling oven, etc. A time cam may be added to make the controller follow a desired program of temperature or pressure changes. —*Foxboro Company, Foxboro, Mass.*

### Elevators, Multi-Voltage Control of.

Energy of several voltages is supplied to the elevator motors, usually through the medium of a double-armature balancer generator which floats on the line. Where 240-volt service is available, steps of 60, 120, 180 and 240 volts are obtained from the balancer. Power is delivered to the individual motors by five supply lines—the two outside ones from the source of supply and the three intermediate ones from the balancer. The advantages are economy of energy consumption, due to the practical elimination of resistances; smoothness and rapidity of acceleration and retardation; lower power demands, starting inrushes being greatly reduced, and simplified control equipment.—*W. H. Whitton, New York Edison Company.*

### Fuel Metering, Electric, for Engine Tests

An automatic metering device for liquid fuels has been developed for use with the Sprague electric dynamometer. A fuel tank is placed on a platform scale with an electric contact on the beam. When the fuel reaches the value for which the poise is set the beam falls and closes an electric contact. This causes a bell to ring and operates a relay which automatically starts a stopwatch and a speed counter. The poise is then reset to a lower value, etc. From the data obtained the output, the speed and the fuel consumption per horsepower-hour can be computed.—*Sprague Electric Works, New York City.*

### Iron, B-H Curve of, on Short Samples.

A short bar is clamped in a yoke which closes the magnetic circuit, and a distributed mmf. is applied in such a manner that it is used up bit by bit where produced, thus eliminating magnetic leakage. In order to know when this condition has been reached a secondary coil with soft-iron ends is so placed as to form a magnetic shunt around the sample. The mmf. is adjusted until a ballistic discharge through the test coil becomes zero. Tests by this method have been shown to agree quite closely with the results obtained on ring samples.—*Arthur Whitmore Smith, University of Michigan, Ann Arbor.*

### Magneto, Cobalt Steel, Revolving Field.

Cobalt steel is four times as efficient for permanent magnets as the best tungsten steel. Therefore it has been possible to build an ignition magneto with a stationary armature. The only rotating elements are the solid steel magnet and the cam, which operates the stationary contact breaker. The weight of the new magneto is only about one-sixth of that of an ordinary magneto. For further details see the (London) *Electrician*, Vol. 89, page 443, Oct. 20, 1922.

### Poles, Preservation of.

By forcing hot paraffin containing copper or arsenic salts into timbers under pressure the wood can be preserved from damage by shipworms and other destructive forms of life. The method of application is the same as that now used in treating timber with creosote.—*Paul Bartsch, Smithsonian Institution, Washington, D. C.*

[This discovery of a way to seal poison in wood promises complete protection against the ravages of termites, teredos, etc., and may become of great value in many branches of engineering where wood is employed.—EDITOR.]

### Transformers, Spark-Over Tests on Coils in.

Tests were made on transformers of 30, 60 and 6,000 kva. rating connected to a high-tension line. Spark-overs between one of the line phases and the ground were produced at different distances from the transformers, and the resulting stresses in the transformer coils were measured. In the small transformers the maximum stress always was at the end coils, showing that a line spark-over produced a steep-front traveling wave. In the large transformer the location of the maximum stress depended essentially upon the distance of the spark-over from the transformer, thus indicating the presence of oscillations.—*Sigurd Rump, Baden, Switzerland.*

[This seems to indicate that in large transformers it is not sufficient to provide extra insulation on end coils only, as is the present practice.—EDITOR.]

## Research in Progress

### Core Losses.

A committee is at work to reduce the calculation of electrical core losses as well as of eddy-current losses in machines and conductors to a more rational and scientifically exact basis. Four phases of the work are now being conducted by four universities—Harvard, Washington (St. Louis), Missouri and Massachusetts Institute of Technology—and the General Electric Company, under the supervision of five members of the committee. A number of manufacturers are furnishing the services of their engineers and the facilities of their laboratories. The work has already resulted in a slight change in design of the standard induction motor which will decrease the core losses from 3 per cent to about 2½ per cent without increase in cost.—*National Research Council Engineering Division, New York City.*

### Insulators, Effect of Vibration Upon.

We have in view some experiments to determine the effect of vibration upon the mechanical and electrical strength of suspension-type insulators. The apparatus for making the test has been designed and built, but the actual work has not yet been started.—*R. J. C. Wood, Southern California Edison Company, Los Angeles, Cal.*

### Magnetic Analysis.

A committee has been organized by the American Society for Testing Materials to study the magnetic properties of bodies, to correlate such magnetic properties with corresponding mechanical properties, and to develop suitable methods of testing for magnetic properties, with respect to commercial applications.

### Surges on Transmission Line.

We are doing some research on the actual magnitude of high-voltage surges occurring in the Big Creek transmission lines, this being determined by the use of a photographic surge recorder which we have developed.—*R. J. C. Wood, Southern California Edison Company, Los Angeles, Cal.*

## Suggestions for Research

### Electromagnetism, Fundamental Relationships in.

An investigator who has to do with theoretical problems involving moving conductors, alternating fluxes, currents induced by rotation and pulsation, mechanical forces in the electromagnetic field, etc., is often handicapped by the lack of fundamental equations containing energy and work done. Usually the problem is reduced to a system of simultaneous equations involving only factors of energy, such as currents, voltages, fluxes, etc. In rational mechanics there are Lagrangian equations, Hamilton's principle, the law of least action, etc., which permit one to derive the entire system of equations of motion by taking partial derivatives of certain characteristic functions of the system. While Maxwell and others have shown a possibility of such a method in electromagnetism, much remains to be done to bring this method within the reach of those working out engineering problems involving electrical machinery and apparatus.

### Flash-Over Voltage, Effect of Dampness and Dust Upon.

At 60 cycles the flash-over voltage is considerably lowered by the presence of water, dust, etc., on the surface. At very high frequencies the effect of these factors is very small, indicating a different nature of the phenomenon. This difference is of importance in view of the fact that insulators are often tested by high-frequency oscillating voltages. It would be of interest to establish a theory which would explain the difference in the behavior at different frequencies and give a relationship between the flash-over voltage and the frequency.

### Generating Stations.

Research is urged in the following directions: Turbo-driven generators, (a) temperature limitations, (b) temperature detectors, (c) fire-fighting equipment, (d) closed-circuit ventilation; automatic water-power stations, excitation, auxiliaries, grounding of neutrals, maintenance.—*Electrical Apparatus Committee of the N. E. L. A.*

### Illumination by Wires Exploded b Electrical Discharges.

In order to obtain high-temperature spectra, fine wires were instantly melted by electrical discharges. A large condenser, charged at 26 kv., was used, and some 30 gram-calories of energy were dissipated in one-hundred-thousandth of a second. Without losses the temperature of the wire vapor would have been about 300,000 deg. C. Actually the flash had an intrinsic intensity of light corresponding to a temperature of about 20,000 deg. C., or approximately one hundred times the intrinsic brilliancy of the sun. Many new and interesting phenomena were observed. For details see the *Astrophysical Journal*, January, 1920.—*J. A. Anderson, Mount Wilson Observatory, Pasadena, Cal*

[This method may prove to be useful for intermittent lights for lighthouses, for guiding airplanes at night and for long-distance optical signaling in general—EDITOR.]

# News of the Industry

Chronicle of Important Events and General Activities, Announcements and Reports of Association Meetings, Court Decisions and Commission Rulings and News of Electrical Men

## Six Months' N.E.L.A. Work

**President Smith Reviews His First Half Year of Office—Division and Committee Achievements**

ON the first of January the present administration of the National Electric Light Association entered upon the second half of its term of office, and President Frank W. Smith has taken advantage of this fact to pass the first six months of the association year in brief review. In the January *Bulletin* of the organization he refers to the ever-increasing scope of the work and the consequent growth of executive responsibility, summarizing a few of the activities and accomplishments that marked the latter part of 1922.

The public policy committee, under the chairmanship of Martin J. Insull, met twice in New York, on Sept. 21 and Dec. 5. Many of its members, including the chairman, are devoting much time and effort to constructive work besides delivering speeches and visiting conventions in all parts of the country.

The executive committee met in New York on Sept. 20 and Dec. 6, all the geographic divisions of the association being well represented, those attending including all four vice-presidents. At the last meeting thirty-eight men remained in continuous session for six hours.

Five geographic divisions held conventions, as did seven state associations, and in addition there were many group meetings. All the fourteen geographic divisions are either in the full swing of activity or have organization perfected and are getting under way.

The four national sections—Accounting, Commercial, Technical and Public Relations—held conferences in the latter part of June or the first part of July, and their committees have since assembled in different parts of the country. Interest and attendance have been unusually high.

Officers of the association or representatives from headquarters have attended every important meeting, whereever held.

Radio and Fuel

Radio sub-committees of both the public policy and the electrical apparatus committees are making progress in the handling of this important subject from different points of approach.

On inductive co-ordination, water-power development, customer ownership, relations with banks, merchandising policy, good-will advertising, membership and many other matters of primary importance the appropriate committees have all worked hard and their efforts are bearing fruit.

The financial affairs of the association are reported in very satisfactory condition.

With Nicholas F. Brady, president of the New York Edison Company, as chairman of the general convention committee, John W. Lieb as vice-chairman and Arthur Williams as chairman of the entertainment committee, President Smith foresees an excellent working out of details for the forty-sixth annual convention of the association, to be held in New York City next June.

## Representative Bacharach Pushes His Bill

Representative Isaac Bacharach, whose determination to push his bill to limit the jurisdiction of the federal courts over public utility rate cases was referred to in last week's Electrical World, is circulating an appeal to his colleagues in the House to support this measure. In his letter to them he says:

"This bill has been favorably indorsed by the Governors of the following states: Arkansas, Georgia, Illinois, Indiana, Louisiana, Mississippi, Missouri, Nebraska, Rhode Island, South Carolina, Wyoming, Delaware, Maine, Maryland, Vermont and Wisconsin. It has been also indorsed by the state regulatory commissions of the following states: Arizona, Colorado, Florida, Idaho, Kansas, Michigan, Montana, Nevada, New Hampshire, New Jersey, New Mexico, New York, North Dakota, South Dakota, Tennessee, Utah, Virginia, West Virginia and Oklahoma.

"You no doubt have heard directly from either your Governor or your regulatory commission asking you to support this bill. Hearings on the bill were completed on June 8, and since that time nothing has been done in the matter.

"I am very anxious to have the bill reported to the House at this session of Congress if possible, and I am therefore writing to ask if you will not communicate with the chairman and members of the sub-committee having the bill in charge, expressing your favorable interest in it and asking them to report it to the full committee at the earliest possible date.

"Anything that you may do to aid in getting the bill reported out of committee so that it may be considered by the House at an early date will be very much appreciated."

## Great Plant for Boulder

**Doherty Interests Plan Huge Development on Artificial Lake in Colorado Mountains**

WHAT is designed to be the largest steam plant for the generation of electricity ever built on an artificial body of water in the United States will, if plans just made public are carried through, be constructed four miles south of Boulder on the Denver-Boulder highway by the Denver Gas & Electric Light Company and the Western Light & Power Company, members of the Cities Service group of companies controlled by Henry L. Doherty & Company.

The project includes the purchase of the Boulder Lake, an artificial reservoir high in the mountains, which covers 128 acres, impounding approximately 78,000,000 cu. ft. of water. This lake will be enlarged to cover 380 acres and impound 280,000,000 cu. ft. of water.

An immediate expenditure of $4,000,000 for plant and equipment is purposed, and when the plant and transmission system are completed it is said that the cost will have reached $12,000,000. Present plans are for a generating capacity of 120,000 hp., the possible ultimate rating being put at 250,000 hp.

When the new plant is completed it will serve the cities of Denver, Boulder, Lafayette, Fort Collins, Greeley and all intermediate cities and surrounding towns, going as far north as Cheyenne, Wyo. The old plant at Lafayette will then be abandoned. Pulverized coal from the mines of the vicinity is to be used. Transmission will be at 100,000 volts. It is said that the plant will be ready to supply the larger cities in its territory early in 1924.

## Commonwealth Edison Buys Parsons Turbine

The purchase of a 40,000-kw. Parsons turbo-generator by the Commonwealth Edison Company for use in the new Crawford Avenue station in Chicago was announced in that city this week. The set, purchased from C. A. Parsons & Company, Newcastle-on-Tyne, England, will operate at a throttle pressure of 550 lb., with a total steam temperature of 725 deg. F., and after passing through the high-pressure end of the turbine the steam will be reheated to the initial temperature. The turbine will be used in the new plant along with others mainly of American manufacture. The station is designed to have an ultimate capacity of 500,000 kw.

This is the second turbo-generator of Parsons manufacture that the Common-

wealth Edison Company has purchased, the first being a 25,000-kw. set bought in 1912 and installed in the Fisk Street station, which has operated satisfactorily. Sargent & Lundy of Chicago are engineers in charge of design, with Merz & McLellan of London acting as advisory engineers.

## Idaho Companies Must Pay Irrigation Rebates

Complying with a special act of the last Legislature, the Idaho Public Utilities Commission has issued an order granting a rebate to all irrigation farmers in the state using electricity for pumping. The law exempts power companies furnishing power for irrigation from the payment of certain taxes, but requires them to rebate the entire amount of this exemption to the individual farmer users. The total rebate ordered by the commission amounts to $47,232.87, divided among four power companies.

## Aftermath of "Loop" Decision in Wisconsin

A temporary injunction has been issued by the United States court in the western district of Wisconsin restraining the State Railroad Commission from changing a set of "emergency" rates put into effect by the Wisconsin-Minnesota Light & Power Company in Eau Claire, Menomonie and Chippewa Falls because of the now famous decision of the Wisconsin Supreme Court last June declaring the municipality the legal unit in fixing rates and forbidding the enforcement of uniform charges for all places on the company's "loop" system regardless of the distance from the source of supply. The commission is directed to show reason on Jan. 20 why the injunction should not be made permanent. The company in adopting these emergency rates contended that the old rates which the commission had ordered restored pending a complete revision are confiscatory.

Meanwhile about forty smaller cities which receive their power from the same source, but which are not involved in the case which went to the Supreme Court, are still paying for electricity at the price ordered by the Railroad Commission by the uniform rate method declared illegal.

Basing its action on the Supreme Court decision in the "loop" case, the city of La Crosse applied last week for an injunction forbidding the Wisconsin-Minnesota Light & Power Company from continuing to charge in that city the rates imposed previous to the decision cited. This plea has been denied in the local court, which holds that under the Supreme Court decision relief is to be extended only to municipalities which have duly taken exception to the commission order setting up the "loop" and have duly appealed for relief. The city of La Crosse was not a party to the original action and therefore, the court holds, is neither bound nor benefited by the vacation of the order.

## Getting Artistic Lighting in Theaters

The methods of attaining artistic color lighting in motion-picture theatres and the production of realistic lighting effects on the legitimate stage were the topics discussed at a well-attended Illuminating Engineering Society meeting in New York on Jan. 11. The meeting was conducted by A. L. Powell of the Edison Lamp Works, and the main speakers were Sam Rothafel, managing director of the Capitol Theater, and Louis Hartman, lighting engineer for the David Belasco productions.

Methods for producing artistic color lighting with little scenery were described by Mr. Rothafel, who explained in detail how the lighting effects at the Capitol Theater are planned and executed. Mr. Hartman discussed the lighting of interior and exterior scenes, stressing the point that very often there is a tendency to use too much light.

## Carolina-Tennessee Charter May Be Repealed

A bill has been introduced in the North Carolina Legislature by Senator Dillard which seeks to repeal the charter of the Carolina-Tennessee Power Company on the ground that the charter provisions are so sweeping that the company would acquire dominion over all the undeveloped water-power interests in North Carolina and other companies be shut out. Simultaneously with this legislative fight, in which politics is said to be involved, the Carolina-Tennessee Power Company has instituted suit against the Hiawassee Power Company over the ownership of 500 acres of land in Cherokee County, N. C., upon the possession of which, according to W. V. N. Powelson of New York, the president of the Carolina-Tennessee Power Company, depends the execution of that company's program of hydro-electric development, said to involve the expenditure of approximately $7,000,000 for dams, power plants and transmission system. The repeal of the company's charter would, of course, automatically end both the litigation and the Carolina-Tennessee Power Company's project; but if that company wins its suit and retains its charter, work, according to Mr. Powelson, will begin in sixty days after the verdict. In this case, however, the Hiawassee Power Company is considered certain to appeal to the Supreme Court of the state.

Both Mr. Powelson and H. F. Vanderventer of Knoxville, Tenn., president of the Hiawassee Power Company, are in Murphy, N. C., where the suit is to be heard. The charter of the Carolina-Tennessee Power Company was granted by the North Carolina Legislature in 1909, and its headquarters were to be in Cherokee County.

## Investment Bankers Oppose Governor Smith

Disapproval of the legislative program recommended by Governor Smith of New York in his message to the Legislature, so far as this program relates to the abolition of the existing public service commission and the institution of municipal "home rule," has just been voiced in a report by the committee on public service securities adopted by the board of governors of the Investment Bankers' Association of America. This report says in part:

"The legislation recommended by Governor Smith will create a lack of confidence on the part of the large and small investor within and without the state, thereby seriously impairing the credit of utility companies, and accordingly, until such time as the policy of state-wide regulation is reaffirmed definitely, the expansion of utility service will be greatly retarded.

"For a great many years the policy of state-wide regulation of public utilities has been the established policy of the State of New York. In fact, New York was one of the first states to recognize this principle. It has been followed, as we know, very generally by other states throughout the country, advantageously in the public interest. Furthermore, recognizing the great advantages of judicial regulation, protection of the public interest and freedom from political influences, especially up-state, investors have freely placed funds in these utilities with all the risks attendant to these investments. When viewed in this light, the good faith and moral credit of the state is involved. Investors would not have continued so freely to support the much-needed expansion of utility services by investment in their securities had they expected these industries to be again subjected to the danger of political control and local regulation."

## Cleveland's Fixture Market Shows Trend of Design

Displays of lighting fixtures and parts by about seventy manufacturers marked the fourth annual lighting equipment market held at the Hotel Winton in Cleveland this week, coincidentally with the annual convention of the Lighting Fixture Dealers' Society of America. Although there was only a small attendance of dealers from outside of the Cleveland territory, the exhibits of the manufacturers showed strikingly this year's tendencies in fixture design.

The "high spots" of the meetings of dealers held at the Hollenden Hotel proved to be the "demonstrations," or playlets, illustrating right and wrong ways to sell fixtures and the summary handling of piracy of designs. The strong economic position of the fixture dealer, the standardization of fixture-outlet boxes, the greater use of glassware in the new designs and carton packing were among the topics.

# Transatlantic Conversation Nearly Here

### Speeches Transmitted by Wireless Telephony from New York to England Are Plainly Heard There—Reciprocal Communication Planned in Near Future

A GREAT stride in intercontinental telephony was made last Sunday evening when officials of the American Telephone & Telegraph Company sent messages and made speeches which, by means of wireless equipment, were plainly heard by Guglielmo Marconi and British engineers at New Southgate, a London suburb. Scattered words and phrases have been heard across the ocean before, but this week hundreds of consecutive syllables were, according to cabled comments, heard with distinctness and little was lost.

The first message, containing about 240 words, was spoken by President H. B. Thayer of the American Telephone & Telegraph Company, at exactly 9 o'clock. Eleven minutes later a cable message was received saying that Mr. Thayer's message had been heard and understood. Vice-president John J. Carty then sent a wireless-telephone message, and at 10:10 o'clock this cablegram from Mr. Marconi arrived:

"I have just listened to your radiotelephonic messages, which I have heard distinctly, and congratulate you and all those connected with the research which has led to this achievement."

#### ROUTE OF THE MESSAGES

Mr. Thayer and Mr. Carty spoke from the offices of their company at 195 Broadway and used a telephone connected to the radio equipment at Rocky Point, Long Island, by a telephone circuit about 70 miles long, half of it being underground cable and half open wire, and containing telephone repeaters and equalizers of a type similar to those used on long-distance telephone lines.

The distance from Rocky Point to New Southgate is about 3,400 miles. Prior to the tests of Sunday evening other tests were made to measure the transparency of the atmosphere to radio messages over such great distances. Measurements were also made on the strength which the signals received in New Southgate must have in order to be clearly heard above the noise of static and interference from other radio stations.

Sending apparatus may be set up in England in the near future to make possible conversations by transoceanic radiophone, but months of research and development must elapse before the method can be brought into commercial use. The demonstration was only incidental to a prolonged series of tests undertaken for the purpose of obtaining the accurate information upon which practicable transoceanic telephony can eventually be founded.

#### TECHNICAL FEATURES

The technical features of the communication involved a departure from previous practice in two respects—the use of 10-kw. power tubes and the elimination of carrier currents in transmission.

In the ordinary transmission the voice current, so to speak, is carried along by a carrier current, which usually contains about two-thirds the energy. The carrier current is used to polarize the receiver devices. If the carrier current is, say, 50,000 cycles, the voice current will fluctuate perhaps between 47,000 and 52,000, which necessitates the use of quite a wide ether transmission band.

In the new method twenty 10-kw. tubes are arranged with modulators and filters to radiate into the the ether about 100 kw., composed entirely of voice current. The modulating system is similar in principle to that used in wire telephony and consists of balancing tubes against each other in such a way as to balance out the carrier frequency and radiate the voice current.

Suppression of the carrier and one side band occurs directly after the speech currents come from the telephone line which brings them to the radio equipment. The line current modulates the output of a high-frequency oscillator by the balanced modulating equipment, which eliminates the carrier frequency. A filter is then used to suppress one side band, the other side band being applied to a multistage amplifier, the output of whose last stage is the 100-kw. power applied to the antenna. Thus the new method is improved so that a very narrow band in the ether is occupied in transmitting speech.

By the suppression of one of the two side bands it also becomes possible to transmit twice as many messages simultaneously as is now effected, a feature which will become increasingly important as the use of radio grows and especially at the longer wave lengths.

At the receiving end a local oscillator is used to replace the carrier current in rendering audible the received signals. The vacuum tubes used in the present test, while not the largest which have successfully withstood laboratory trial, are the largest that have thus far been applied to radio telephony, and are characterized by means for sealing large copper thimbles to glass in such manner as to hold the best obtainable vacuum.

The radio apparatus and system used in the test are the result of research and experimental work in the laboratories of the American Telephone & Telegraph Company and in the laboratories of the Radio Corporation of America and its associated companies.

JOHN J. CARTY
Vice-President American Telephone & Telegraph Company

THE experiments which we are now making represent some of the advances which have been made in the first half century of the telephone art, which is now drawing to a close. They belong to the golden age of communication, which has achieved the extension of the spoken word throughout both space and time. But this golden age has not yet ended, and when we contemplate the possibilities of the future we discover that it has only just begun. It is to the future that we must now turn our minds and direct our endeavors

—*Statement from Mr. Carty.*

## General Electric's Broadcasting Heard Abroad

Vice-president Coolidge has received a letter from W. T. Meehan of the General Electric Company informing him that his Christmas address, which was broadcasted on Dec. 24, was heard in both Liverpool and London, as well as in every state in the Union.

## Valuation of Alabama Power Company

President Thomas W. Martin of the Alabama Power Company has given out a statement at Birmingham saying that his company will welcome further investigation to get at the correct valuation of its property for tax purposes. Because of the public discussion of this matter, Governor Thomas A. Kilby in his message to the Legislature advised that it be gone into thoroughly by that body. The Governor holds to the opinion that the valuation placed upon the property holdings of the company in Alabama is very much under what it should be.

President Martin says: "The truth is the Governor has been imposed upon by men who have a political purpose to serve." He says further that there has been no indication on the part of his company that an application would be made to increase rates, as was asserted by Governor Kilby. On the contrary, the company has made substantial voluntary reductions affecting approximately twenty thousand customers.

## For Radio Standardization

**Forty Societies Unite in Movement—A. I. E. E. and Institute of Radio Engineers to Be Sponsors**

A broad program of radio standardization was agreed upon at a meeting on Jan. 12 of representatives of forty radio trade associations and national engineering and scientific societies. The meeting was held in the Engineering Societies Building, New York City, at the call of the United States Bureau of Standards in co-operation with the American Engineering Standards Committee. Dr. F. C. Brown, acting director of the Bureau of Standards, presided, and about one hundred were present.

After full discussion the conference adopted resolutions providing:

(1) That standards for radio apparatus and service should be formulated.

(2) That a broadly representative national committee on radio standardization should be formed under the leadership of the Institute of Radio Engineers and the American Institute of Electrical Engineers, under the procedure of the American Engineering Standards Committee.

Specifications for quality and performance of receiving apparatus, nomenclature and methods of testing and of rating apparatus are to be included in the program.

Dr. J. H. Dellinger, chief of the Radio Laboratory of the Bureau of Standards, showed how the widespread interest in radio had brought with it an increasing demand for uniformity and dependability in radio service and apparatus. The lack of any such standardization had been brought to the attention of the Bureau of Standards by producer, distributor and consumer. There had not previously been a concerted movement to introduce standardization by joint action of all radio interests.

### Sane Standardization Demanded

Dr. A. N. Goldsmith, secretary of the Institute of Radio Engineers, said:

"As every new field of industry passes out of the childhood stage, the need for standardization becomes evident. The main difficulties which at once arise and which emphasize the necessity for cautious procedure are the dangers of stagnation in an only partly developed art, a possible excessive monotony in the resulting product, and a diversion of the best brains from such a field.

"On the other hand, it is only by a reasonable amount of standardization along wise directions that gross abuses of public confidence can be avoided. As a typical instance, consider the objectionable nature of some of the so-called 'information' appearing on nameplates and in the advertisements of radio apparatus. We have seen 'static eliminators,' 'thousand-mile receivers,' 'twenty-plate condensers' and a score of other vague or misleading designations. The purchaser of radio sets and the dealers who handle them are all entitled to protection against this sort of loose description. Thus we are brought face to face with the necessity for sane standardization."

The following advisory committee was appointed to assist in the organization of the national committee and the necessary technical sub-committees: Major L. B. Bender, Dr. J. H. Dellinger, W. A. Fitzgerald, Dr. A. N. Goldsmith, J. V. L. Hogan, Commander S. C. Cooper, George H. Lewis, Max Lowenthal, Donald McNicol, L. T. Robinson, M. C. Rypinski, E. B. Warner and L. E. Whittemore.

# Engineering Council Hails the Future

**Washington Meeting of Federated Societies' Representatives Sees Great Possibilities Awaiting Technical Men in Public Service—Influence of the Body with Federal Government**

FURTHER crystallization of the belief that engineers can render a real public service and that the Federated American Engineering Societies provides a workable medium through which they may unite in rendering it has resulted from the meeting in Washington on Jan. 11 and 12 of the American Engineering Council. The marked characteristics of this gathering were its desire to further international relationships among engineers, its accentuation of the need for engineering colleges to train their students to assume leadership in public affairs, and its endeavors to promote relief in the Patent Office, adequate personnel for the Federal Power Commission, a more comprehensive policy with respect to topographic maps and a higher salary scale for technical men in the federal service. Strongly worded resolutions on these points were adopted.

GELASIO CAETANI

Co-operation on an important scale is to be undertaken with the Forest Service in the matter of reforestation and with the Department of Commerce in the matter of types of government contracts. It was announced that the societies had all but concluded arrangements to undertake two new surveys which will be entirely comparable with those made on waste in industry and on the twelve-hour shift.

Dean Mortimer E. Cooley was re-elected to the presidency of the federation and J. Parke Channing was re-elected a vice-president. Calvert Townley, Philip N. Moore and Gardner S. Williams were elected as new vice-presidents. Mr. Williams was selected to fill out the unexpired portion of the term of Dean D. S. Kimball. H. E. Howe was re-elected treasurer.

One of the most interesting features of the meeting was the banquet of Jan. 11, which was attended by ninety-one guests. On that occasion the principal address was made by Ambassador Caetani of Italy, who is both a mining and a civil engineer of distinction. Extracts from his speech are printed under a separate heading. At this banquet Calvin W. Rice, secretary of the American Society of Mechanical Engineers, reported on his South American trip and urged an interchange of engineering education between the United States and the countries of South America. Elmer A. Sperry, the inventor of the gyro-compass and ship stabilizers, told of the progress being made by the engineering professions in Japan.

In the course of the business sessions some dissatisfaction was voiced with the conduct of the affairs of the Federated American Engineering Societies. The point was made that member societies had too little voice in what was being done and fear was expressed that an effort might be made to make of the federation a super-society. It was pointed out by President Cooley and by L. W. Wallace, the executive secretary, that every effort had been made to conduct the federation so that it would be a sort of House of Representatives—highly responsible to and in no way dominating constituencies. The difficulties were ironed out, and the general discussion by members of the council indicated a complete sympathy with the broad purposes of the federation, though it also emphasized the need of devising every means possible to acquaint the individual engineer as well as the member societies with the work completed and problems to be undertaken.

President Cooley in his address said:

"I am more than ever convinced, after fifteen months of service in the federation, that the opportunities for the engineering profession to do something remarkable in this world are very great. They are so vast that we cannot comprehend them. We do not think of them, we are so busy in our field, we do not even dream of them, and we do

not dream of what we can do or what the opportunities really are."

### INFLUENCE AT WASHINGTON

In the course of his remarks L. W. Wallace, the executive secretary, said: "The Federated American Engineering Societies has become firmly established in the official mind of Washington as an influential and constructive agency that is working in the interest of the public and without any ulterior motive. I shall name only two facts that support my statement. To date the Federated American Engineering Societies has conducted two major investigations, namely, those on waste in industry and the twelve-hour shift in American industry. The introduction to the former was written by the Secretary of Commerce; the introduction to the latter was drafted by the President of the United States."

Mr. Wallace mentioned many instances of the high esteem in which the federation is held by engineers and citizens both at home and abroad, among them the fact that the government of Czechoslovakia had asked permission to reprint the report on waste in industry. This reprint will be in the German language and will be distributed in Germany and Austria as well as Czechoslovakia.

## Caetani to Engineers

**Italian Ambassador Bears Good Will of His Nation to the Technical Men of America**

A NOTEWORTHY feature of last week's meeting of the American Engineering Council at Washington was the banquet on Thursday evening, at which the new Ambassador from Italy, Gelasio Caetani, was the principal guest. Ambassador Caetani is himself a civil and mining engineer, a graduate of the School of Mines at Columbia University, and spent thirteen years in the practice of his profession in this country. In responding to a toast the Ambassador dwelt on the good relations between Italy and the United States and the way in which in some directions the natural bent of the two countries and the respective characteristics of their peoples could complement each other. He said in part:

"I judge that many of the colleagues present at this banquet have followed in life most disparate occupations which often had little to do with engineering. Such has been my personal experience during the agitated years since the beginning of the war. Well, gentlemen, we can say that in each and every occupation we have felt and thought and acted chiefly as engineers.

"Some have made the remark in criticism that engineers lack political intuition and ability. I would answer that a larger dose of logic and positiveness applied to politics would bring great advantages to public affairs.

Paying a tribute to the qualities of the Italian workman, the Ambassador continued:

"Specialization of Italian labor will bring great advantages to the large engineering, industrial and agricultural enterprises which are still to be achieved in the United States. Much, however, is still to be done in Italy itself; its resources are far from being fully developed, and there are many opportunities for American capital, machinery and technical organization to be usefully applied in Italy.

"The electrical industry in our country has made rapid strides, and as to percentage of utilized water power, Italy ranks, I believe, foremost in the world. Electricity is our 'white coal,' and at the present day its use results in an economy of about two billion lire, otherwise necessarily spent on fuel imports.

### ELECTRICAL DEVELOPMENT IN ITALY

"In 1898 the electrical energy developed in Italy amounted only to 87,000 kw.; it increased to 426,000 kw. in 1908, to 1,240,000 kw. in 1918, and power plants for some other 1,000,000 kw. are planned or under construction. About 800,000 kw. is still to be developed.

"On the Tirso, in Sardegna, a reservoir with 416,000,000 cu.m. of capacity is being constructed. It will be the second largest in the world, ranging immediately after the Assuan Dam, and will develop 50,000,000 kw.-hr. and irrigate 60,000 acres of land.

"The newly redeemed provinces in northern Italy are virgin ground for hydro-electric engineering because Austria, for political reasons, prevented the development of the power plants which could only have an outlet toward Italy.

"In the Trentino a reservoir is to be constructed on the Noce torrent of 180,000,000 cu.m. capacity. The dam, 400 ft. high, will be practically a concrete wedge driven in a mountain gully, measuring less than 60 ft. in width at the base and only 100 ft. wide at 300 ft. above the bottom. In southern Italy the large reservoir in construction on the Sila mountain will develop over 110,000 kw. and irrigate large tracts of fertile land.

"Another interesting plan which is gradually being carried through is to connect the northern power plants, fed by the summer streams of the Alps, with those of central Italy, where water is plentiful in winter and rather poor in summer, by a network of high-tension lines and by standardization of voltage to obtain a better seasonal compensation than could be secured by the use of even very large reservoirs.

"Railroads are to be electrified and telegraphs and telephones are to be reorganized and then gradually handed over to private enterprises. Experience has proved that state administration of industrial concerns ends always in a financial and technical failure.

"There are most remarkable possibilities for increasing the commercial and industrial exchange between Italy and the United States. Each of our countries is especially fit for the production of certain kinds of products. You have the raw materials, you produce wheat cheaper than we can, you have the means and the capacity to build machinery in series. We have arts and products of our own and skilled and intelligent workmen to turn out to better advantage any material in which labor accounts for a large percentage of the cost.

"For each item there exists a difference in cost between Italy and America which, like a difference in hydraulic level, causes merchandise to flow from one country to the other and creates a circulation of products; that is, commercial and economic intercourse. These differences are a vital, indispensable requisite for the prosperity of both countries as they cause motion, and there is no life without motion.

"Intercourse between our young students, who in a few years will be the active men of our countries, will be a powerful factor in reaching the principal and ultimate aim I will have in view in carrying out my duty as Ambassador; that is, to strengthen the bonds of friendship and esteem between Italy and the United States."

## Wider Distribution Planned by Niagara & Lockport

The Niagara, Lockport & Ontario Power Company of Buffalo has purchased the stock of the Bradford (N. Y.) Electric Company, which in turn owns all the outstanding stock of the Olean Electric Light & Power Company, and has started to build a double-circuit 110,000-volt transmission line to Olean for supplying Niagara power in the Olean-Bradford district. By the end of this year the company expects to have 110,000-volt duplicate circuits paralleling its 60,000-volt transmission system, with three transformer stations stepping down the voltage from 110,000 to 60,000. This will permit transmitting the "long-haul" power at the higher tension and distributing it through the existing system—an economical method which leaves the present investment intact and avoids the installation of costly 110,000-volt auxiliary equipment at each point of use.

A new 110,000-volt double-circuit line from Dunkirk to Jamestown is under way to connect with the existing transmission system, and there will be a transformer and frequency-changer station at the boundary between Jamestown and Falconer, with an initial 15,000-kva. transformer capacity and 6,000-kva. frequency-changer capacity, suitable for eventual increase to 30,000 kva. and 16,000 kva., respectively, for the distribution of Niagara power in the Jamestown district. Another new substation will soon be started at Olean with 10,000 kva. frequency-changer capacity and 15,000-kva., 110,000-volt transformer capacity, which can ultimately be raised to 20,000 kva. and 30,000 kva., respectively. This station will distribute Niagara power in Olean-Bradford district at 25 cycles and 60 cycles.

## Next A. I. E. E. Program

**Proceedings at Midwinter Convention Will Be of Varied Nature and Sustained Interest**

FOR the eleventh midwinter convention of the American Institute of Electrical Engineers, to be held in the Engineering Societies Building, New York City, on Feb. 14-17, the meetings and papers committee, in co-operation with the convention committee, has prepared a tentative program including not only a number of papers of special merit but also several instructive and entertaining features.

On Wednesday, the opening day, the morning will be devoted to the registration of members and guests and to meetings of the various A. I. E. E. committees. The first technical session will be held in the afternoon, the program being under the auspices of the transmission and distribution committee. The Wednesday evening session, as already announced in the ELECTRICAL WORLD, will consist of a joint meeting with the Chicago Section by the use of telephone connections and loud speakers. Two papers will be delivered by means of the loud speakers, one being presented at New York and the other at Chicago. Lantern-slide illustrations will be shown at both places and a joint discussion will follow. After the telephone meeting an illustrated lecture will be delivered by William B. Potter, who has recently spent several months investigating the electric railway systems of Europe.

On Thursday the morning session will be devoted to a group of papers on miscellaneous subjects, and in the afternoon a technical session under the auspices of the telephone and telegraph committee will be held. In the evening there will be a smoker under the auspices of the New York Section of the A. I. E. E., at which motion pictures showing a new development in speech transmission will be exhibited.

The session on Friday morning will be under the auspices of the electrophysics committee, and on Friday afternoon the final technical session of the convention will be held under the auspices of the measurements and instruments committee. On Friday evening the annual dinner-dance will be held, and Saturday morning will be devoted to visits of inspection to places of engineering interest in and about New York City.

## Plans for the Pacific Coast Convention of A. I. E. E.

Convention committees have been appointed and plans are well under way for the Pacific Coast convention of the American Institute of Electrical Engineers to be held under the auspices of the San Francisco Section, beginning on Sept. 25. The place of the meeting has been tentatively set as Del Monte, Cal. In the program will be featured the hydro-electric developments of the West and the recent accomplishments in high-voltage transmission, and it will contain papers on other timely subjects designed to stimulate wide interest and attract a large attendance. Professor Harris J. Ryan of Stanford University has been named convention chairman and Robert Sibley vice-chairman.

## Army Bill Carries $7,000,000 More for Muscle Shoals

The War Department appropriation bill just reported out from committee carries an appropriation of $6,998,800 for the Muscle Shoals project. In addition, it gives contract authorization for $10,501,200. These sums are intended to provide for the completion of the dam and the installation of eight power units complete. This authorization makes it possible to let contracts for the lock gates, the gates of the dam and such metal work as requires time to fabricate.

## For 1926 Technical Meet

**International Engineering Congress Planned for Sesqui-Centennial Fair at Philadelphia**

A MOVEMENT to hold a World Congress of Engineers in 1926 at the time of the sesqui-centennial celebration in Philadelphia was initiated by the Engineers' Club of that city in December, 1921, and an invitation at that time was extended to the American Society of Civil Engineers, the American Institute of Mining and Metallurgical Engineers, the American Society of Mechanical Engineers, the American Institute of Electrical Engineers and the American Society for Testing Materials. Each was requested to appoint two representatives to meet with a committee of the Engineers' Club of Philadelphia to formulate a plan for such a world congress.

Subsequently a board of management was appointed as follows: A. S. C. E., George S. Webster, Richard L. Humphrey; A. I. M. and M. E., J. Vipond Davies, Charles F. Rand; A. S. M. E., James Hartness, D. Robert Yarnall; A. I. E. E., A. E. Kennelly, Charles E. Skinner; Federated American Engineering Societies, J. Parke Channing, L. P. Alford; Engineers' Club of Philadelphia, W. C. L. Eglin, Charles E. Billin. Richard L. Humphrey was made chairman of the committee on plan and scope, of which the other members are Charles F. Rand, James Hartness, A. E. Kennelly, J. Parke Channing and W. C. L. Eglin. This

## Tentative Program of Midwinter Convention, A. I. E. E.

WEDNESDAY, FEB. 14

*Technical Session*, 2.30 *p.m.*—Report of transmission and distribution committee, E. B. Meyer, Public Service Electric Company, Newark, N. J.; "Apparent Dielectric Strength of Cables," R. J. Wiseman, Okonite Company, Passaic, N. J.; "Short-Circuit Currents in Networks," O. R. Schurig, General Electric Company; "Qualitative Analysis of Transmission Lines," H. Goodwin, Jr., Sanderson & Porter, New York; "The Heavisidion," Vladimir Karapetoff, Cornell University; "Cable Testing and Maintenance," H. S. Phelps and E. D. Tanzer, Philadelphia Electric Company.

*New York-Chicago Joint Session*, 8.30 *p.m.*—"Public Address Systems," G. K. Thompson and J. P. Maxfield, American Telephone & Telegraph Company; "Use of Public Address Systems with Telephone Lines," W. H. Martin, American Telephone & Telegraph Company; lecture, "Observations on Electric Railway Practice," William B. Potter, General Electric Company.

THURSDAY, FEB. 15

*Technical Session*, 10.30 *a.m.*—"Automatic Train-Control Problems," E. J. Blake, Gould Coupler Company, Depew, N. Y.; "Application and Economics of Automatic Railway Substations," L. D. Bale, Cleveland Railway Company; "Single-Phase Regeneration for Series Commutator Motors," L. J. Hibbard, Westinghouse Electric & Manufacturing Company; "The Blondelion," Vladimir Karapetoff, Cornell University; "Transients in Electrical Machinery," W. V. Lyon, Massachusetts Institute of Technology; "1922 Developments in Auto-Valve Lightning Arresters," A. L. Atherton, Westinghouse Electric & Manufacturing Company.

*Technical Session*, 2.30 *p.m.* — "Telephone Transmission Over Long Cables," A. B. Clark, American Telephone & Telegraph Company; "Machine Switching," E. B. Craft, Western Electric Company, L. F. Morehouse, American Telephone & Telegraph Company, and H. P. Charlesworth, American Telephone & Telegraph Company; "Wind Shielding Between Conductors," F. J. Howe, Western Union Telegraph Company; "Wave Antennas," Harold H. Beverage, Chester W. Rice and Edward W. Kellogg, General Electric Company; "Theory of Electric Filter Circuits," L. J. Peters, University of Wisconsin; "Diaphragmless Microphone, for Radio Broadcasting," Philips Thomas, Westinghouse Electric & Manufacturing Company.

*Smoker*, 8.30 *p.m.* — Motion pictures showing new method of speech transmission.

FRIDAY, FEB. 16

*Technical Session*, 10.30 *a.m.* — "Dissymmetrical Electrical Networks," A. E. Kennelly, Harvard University; "New Equation for Static Characteristics of Electrical Arcs," W. B. Nottingham, Westfield, N. J.; "Radiation from Transmission Lines," Charles Manneback, Massachusetts Institute of Technology; "Electromagnetic Forces," Carl Hering, Philadelphia; "Physical Interpretation of Complex Angles and Their Functions," A. Boyajian, General Electric Company; "Permeability," T. Spooner, Westinghouse Electric & Manufacturing Company.

*Technical Session*, 2.30 *p.m.*—"Application and Limitation of Thermocouples for Measuring Temperature," I. B. Smith, Leeds & Northrup Company, Philadelphia; "Measurement of Power in Polyphase Circuits," C. Fortescue, Westinghouse Electric & Manufacturing Company; "Kilovolt-Ampere Demand Measurement," H. C. Fryer, Union Gas & Electric Company, Cincinnati; "Expansion of Oscillography by Portable Instrument," J. W. Legg, Westinghouse Electric & Manufacturing Company; "Measurement of Transients," F. Terman, Leland Stanford University; "Balance Methods in Alternating-Current Measurement," P. A. Borden, Hydro-Electric Power Commission, Toronto.

committee prepared for a conference, which was held in New York City on Tuesday of last week.

At this conference twenty-five or thirty leading engineers from the different engineering organizations expressed their ideas on the scope of the congress, the relation of meetings of engineering societies to the sessions of such a congress and cognate topics. It was brought out that the proposed meeting would be another step toward bringing the engineers of the world closer together, taking up the threads of contact broken by the war and fostering a better understanding of the relation of the engineer not only to the technical problems of the world but to the reconstruction of present-day civilization. Emphasis, it was generally agreed, should, in the program prepared, be laid on these broader relations of the engineer to the public rather than on the presentation of a large number of technical papers.

It was asserted by several of the engineers at the conference that an opportunity was afforded to make engineers abroad better acquainted with the actual engineering achievements and accomplishments in this country by a tour of industrial cities. Those contributing especially to the discussion were A. M. Hunt, H. Foster Bain, Henry A. Lardner, Fred Lavis, A. R. Ledoux, John W. Lieb, Elmer A. Sperry, Mortimer E. Cooley, Charles F. Rand, F. M. Feiker, C. O. Mailloux and Clayton H. Sharp.

## Program Adopted by Western Electrical Inspectors

The recodification of the National Electrical Code, the 600-watt rule and the identification of fuses by color will be some of the subjects discussed at the eighteenth annual meeting of the Western Association of Electrical Inspectors, to be held at the Hotel Sherman, Chicago, on Jan. 23, 24 and 25. The tentative program is as follows:

TUESDAY, JAN. 23

*Morning.*—President's address, reports of officers, report of committee on devices and materials (A. R. Small).

*Afternoon.*—Reports of sub-committees on polarization of wires (A. R. Small), identification of fuses by color (C. A. Bates), protection of armored cable through floors (A. R. Small), switchboards (B. H. Glover), 400-600-amp. fuses (A. R. Small), cabinets (A. R. Small), 600-watt sockets (C. A. Bates), isolated lighting plants (A. R. Small) and exposed live parts (Dr. M. G. Lloyd); reports of committees on fixtures, heaters, signs and lamps (J. C. Forsyth), generating stations and substations (K. W. Adkins) and grounding (W. H. Blood, Jr.).

WEDNESDAY, JAN. 24

*Morning.*—Report of committee on industrial applications (G. S. Lawler), reports of sub-committees on protection of motors (G. S. Lawler), equipment in dusty places (F. F. Burroughs), 2,500-volt motors (G. S. Lawler), varnished-cloth insulation for motor leads (R. B. Shepherd) and transformers for electric furnaces (J. C. Forsyth).

*Afternoon.*—Reports of committees on outside wiring, building supply and services (Dr. M. G. Lloyd) and signal systems, wireless and lighting (Thomas H. Day).

THURSDAY, JAN. 25

*Morning.* — Reports of committees on theaters, motion pictures and places of public assembly (Washington Devereaux) and wiring standards (A. P. Denton); report of sub-committee on 660-watt rule (A. P. Denton and A. R. Small).

*Afternoon.*—Reports of sub-committees on lead-covered wires in conduit (A. P. Denton), size and number of wires in conduit (Arthur L. Abbott) and extensions to wiring in fireproof buildings (A. P. Denton); report of committee on recodification of National Electrical Code (Dana Pierce); election of officers.

Friday, Jan. 26, will be devoted to inspection tours, in charge of F. G. Waldenfels.

## F. W. Smith Prize in N.E.L.A. Educational Courses

President Frank W. Smith of the National Electric Light Association has offered an annual prize of $100 in gold, open for competition to Class B, Class E and Class G members of the association who are subscribers to any of its educational courses, who have been in the continuous employ of a company, firm or individual member of the association during their period of study, and who have completed within the specified time and preceding the first day of January of the year in which each national convention is held, with a grade mark of not less than 90 per cent, the merchandise sales course, lighting sales course, power sales course, practical electricity course, commercial engineering course, elementary accounting course or advanced accounting course of the association.

Applicants for the award must submit a statement reciting in detail in what manner and to what extent the course has benefited the individual or company, or both. This statement must include such facts as increased amount of work accomplished, increased responsibilities assumed, promotions received or increase in salary or income resulting from the study of the course and any other facts which, in the judgment of the applicant, may be evidence to the judges of tangible benefits received.

This prize is to be awarded annually at each national convention of the association to the competitor who, in the judgment of a majority of the members of the committees on education of the Commercial and Accounting Sections, has received the most benefit from any one of the courses.

## Montreal's Rates for Lighting One-Third Those of 1908

A new rate for electric lighting just announced by the Montreal Light, Heat & Power Consolidated represents a reduction of 11.4 per cent from the present rate and, according to the company, will mean an annual saving of upward of $300,000 to consumers. The reduction is from 4.8 cents per kilowatt-hour (6 cents with a discount of 20 per cent) to 4.25 cents per kilowatt-hour (5 cents with a discount of 15 per cent). This is one of the cheapest rates on the continent and is exactly one-third the price charged in 1908, fifteen years ago.

To gain the benefit of the new rate consumers must sign five-year contracts, a system now in force. The reduced rate will go into effect immediately after the contract is signed.

# Brief News Notes

**Promoting Widespread Ownership.**—The stockholders of the Northern New York Utilities, Inc., Watertown, N. Y., have voted to increase the number of shares of common stock from 40,000 to 160,000, decreasing the par value of each share from $100 to $25. This change has been made to render the stock more salable and is in line with the company's policy of broadening the field of individual stock ownership.

**Another Iowa Utility Purchase.**—The Iowa Gas & Electric Company, Washington, Iowa, has purchased the Louisa County Power Company, Columbus Junction. The Louisa County Power Company has a capacity of 175 kw. and serves Columbus City, Columbus Junction, Cotter, Letts and Grandview. This will bring the number of towns served by the Iowa Gas & Electric Company up to twenty-one.

**Sand Springs Plant to Double Capacity.**—The Sand Springs Power, Light & Water Company, which supplies electricity to Sand Springs, Tulsa and a number of other towns in Oklahoma, announces that it will almost double its power plant in 1923. The company now operates a plant at Sand Springs rated at 15,000 kva. An order has just been placed for an additional 12,000-kva. steam turbine, to be delivered early in the spring.

**Flood Destroys Dam and Transformers.**—The concrete dam of the Baker County Power Company on Notchaway River, 10 miles from Newton, Ga., was almost totally washed away on the night of Jan. 6, causing a loss of approximately $75,000. This company furnishes energy to the towns of Camilla, Doerun, Newton, Sale City and Moultrie. Two large transformers were lost, though the power house and most of the equipment remain intact. Repair work will start immediately.

**New York-Ontario Power Company Seeks Rights.**—The International Joint Commission will hold a hearing in New York on Feb. 12 at which it will take testimony in regard to the application of the New York-Ontario Power Company for rights covering a certain amount of water to be taken through the South Channel of the St. Lawrence at Waddington, N. Y. The company has applied to the Federal Power Commission for a preliminary permit covering this proposed utilization of water, but, as in the case of similar applications, it is being held to await the settlement of the whole St. Lawrence matter.

**Wadsworth, Ohio, Gives Up Municipal Plant.** — The municipal electric plant operated by the city of Wadsworth, Ohio, for several years is to be superseded by a contract with the Northern Ohio Traction & Light Company to sell to the city all the energy

it needs for lighting purposes. The contract involves the extension to Wadsworth of the company's 22,000-volt line from Barberton, 8 miles distant. Under the agreement made the city will be able to sell energy for 8 or 9 cents per kilowatt-hour. It has been charging 10 cents for the energy generated in its plant, and notwithstanding this figures show a loss of approximately $14,000 in 1921.

**Third Report of Committee on Inductive Co-ordination.**—The third report of the joint general committee of the N. E. L. A. and the Bell Telephone System on the physical relations between electrical supply and signal systems has just been issued. It embodies the detailed practices for the inductive coordination of supply and signal systems, which are based on the principles contained in the second report, printed in the ELECTRICAL WORLD of May 20, 1922. This second report is reprinted in the present edition in order that the principles and practices together may form a working guide in consecutive order. Copies of the reports in addition to those already mailed may be had by member companies on application to N. E. L. A. headquarters.

**De Forest Aids Radio Work at Yale.**—Dr. Lee de Forest has, it is announced by the Yale Engineering Association, undertaken to establish a library on radio telegraphy and telephony at Sheffield Scientific School and has made a first donation of $1,000 toward this end. The Sheffield school is one of the leaders in radio instruction and research work. Dr. de Forest has also donated $1,200 to defray the expense of an advanced course in radio engineering. Lectures will be given this year early in the second term by Commander S. C. Hooper, U. S. A., Gen G. O. Squier, U. S. A., G. A. Campbell and Lloyd Espenschied of the American Telephone & Telegraph Company, Dr. A. W. Hull of the General Electric Company, Prof. John Morecroft of Columbia University and Dr. L. E. Whittemore of the Bureau of Standards.

**A Big Colorado River Scheme.**—A bold engineering scheme on the Colorado River is proposed by the Colorado River Syndicate, said to have the backing of New York and Philadelphia bankers. W. G. Clark is the consulting engineer. The plan is to build a dam 1,100 ft. high at Boulder Canyon or Black Canyon. This will mean the backing up of water into the lower edge of Grand Canyon National Park and the flooding of a number of small towns. An unusual feature of the plan is that the power house is not to be built at the dam but at the end of a 25-mile tunnel which is to be driven through the hard rock of the region and to carry an average flow of 12,500 second-feet. The scheme also involves the construction of a dam at Bull's Head Rock. This smaller development is to provide power for the construction of the larger project. The proposal is regarded with sufficient seriousness by the Federal Power Commission to insure an investigation of its possibilities.

**Eau Claire (Wis.) and Rochester (Minn.) Municipal Plants Face Predicament.**—Representatives of the Wisconsin-Minnesota Light & Power Company of Eau Claire, Wis., have placed a proposal for a hig-tension line before the City Council. That city is faced with the problem of either spending a large sum on its municipal electric light plant for extensions and improvements or purchasing its future supply of light and power from a private corporation, using its present plant for emergency purposes. The city of Rochester, Minn., is reported to be in a similar predicament, having to choose between spending $75,000 for an additional hydro-electric unit and connecting up with the Wisconsin-Minnesota Light & Power Company at Red Wing, Minn.

# Associations and Societies

**Electric Power Club.**—The annual meeting of the Electric Power Club has been set for June 11 to June 14 and will be held at The Homestead, Hot Springs, Va.

**Pacific Coast Electrical Association.**—The annual convention of this association will be held at the Fairmount Hotel, San Francisco, on June 19-22. The program has not been announced.

**Michigan Electric Light Association.**—The place and date for the tenth annual meeting of this body have already been set, and it will be held in the Hotel Pantlind, Grand Rapids, on Aug. 28-30. Among the topics selected for discussion are uniform methods of accounting, safety in radio installation, development of water power and economy in operation.

**Iowa Engineering Society.**—At the mechanical-electrical session of the convention of this society at Des Moines next week John M. Drabelle, Iowa Railway & Light Company, Cedar Rapids, will give a paper on "Arch and Furnace Design for Iowa Fuel," and Milton W. Arrowwood of Chicago one on "Efficient Use of Pulverized Fuel." The session will be held on Wednesday, Jan. 24.

**Great Lakes Division Technical Committees, N. E. L. A., Meet.**—The Technical Section of the Great Lakes Geographic Division of the National Electric Light Association met at the Hotel LaSalle in Chicago on Wednesday, Thursday and Friday of last week for the discussion of technical problems in that territory. Nearly a hundred men from the four states in the division, in which the committee organizations are virtually identical with those of the National Technical Section, were present.

**Pennsylvania Electric Association.**—A meeting of the geographic sections committee of this association will be held at Pittsburgh on Jan. 23. Topics are: "Aërial Cables," by W. C. Hayman, General Electric Company; "Meters," by Orville Buys, Duquesne Light Company; "Transformers," by M. W. De Merit, West Penn Power Company, and "Training Employees," by J. J. Dougherty, Duquesne Light Company. Brief talks on safety and education will also be made, the latter by A. N. Cartwright, West Penn Power Company.

**Illumination Lectures for Chicago Architects.**—A series of lectures on the approved methods of illumination will be given to architects and architectural engineers from Jan. 22 to Jan. 26 under the joint auspices of the Chicago Section of the Illuminating Engineering Society and the Armour Institute of Technology. This is the first series of lectures which will be promoted in New York, Boston and Philadelphia with the view of assisting architects in their illuminating problems. These lectures will be held in the lecture rooms of the Western Society of Engineers. The tuition fee for the course will be $10. The lecturers will be Ward Harrison, A. L. Arenberg, Prof. E. H. Freeman, A. J. Sweet, Prof. H. H. Higbie, S. G. Hibben, A. L. Powell, J. L. Stair, Norman Macbeth, M. Luckiesh, Otis L. Johnson and George Ainsworth.

## Coming Meetings of Electrical and Other Technical Societies

[A complete directory of electrical associations is published in the first issue of each volume. See Jan. 6 issue, page 78, for latest list.]

Western Association of Electrical Inspectors—Chicago, Jan. 23-25. W. S. Boyd, 175 W. Jackson Blvd., Chicago.

Iowa Engineering Society—Des Moines, Jan. 23-26.

Wisconsin State Association of Electragists—Milwaukee, Jan. 24-26. H. M. Northrup, 23 Erle St., Milwaukee.

Association Municipal Electrical Utilities of Ontario—Toronto, Jan. 25-26. S. R. A. Clement, 190 University Ave., Toronto.

New Mexico Electrical Association—Albuquerque, Feb. 12-13. C. E. Twogood, Albuquerque, N. M.

Electrical Supply Jobbers' Association—Central Division, Chicago, Feb. 13-14; Atlantic Division, New York, Feb. 14. General meeting, Hot Springs, Va., March 21-25. Franklin Overbagh, 411 S. Clinton St., Chicago.

American Institute of Electrical Engineers—New York, Feb. 14-16. F. L. Hutchinson, 33 West 39th St., New York.

American Electric Railway Association—Washington, D. C., Feb. 15-16. J. W. Welsh, 8 W. 40th St., New York.

American Institute of Mining and Metallurgical Engineers—New York, Feb. 19-21.

American Physical Society—New York, Feb. 24; Washington, April 21. D. C. Miller, Case School of Applied Science, Cleveland.

Oklahoma Utilities Association—Oklahoma City, March 12-14. O. D. Hall, 1106 First National Bank Bldg., Oklahoma City.

Southwestern Division, N. E. L. A.—Oklahoma City, March 14-16. S. J. Ballinger, San Antonio Public Service Co., San Antonio, Tex.

Illinois State Electric Association—Chicago. March 16-17. R. V. Prather, 305 Mine Workers' Bldg., Springfield, Ill.

Wisconsin Utilities Association—Milwaukee. March 22-23. John N. Cadby, 445 Washington Bldg., Madison.

American Society of Mechanical Engineers—Montreal, March 28-31. C. W. Rice, 29 W. 39th St., New York.

American Electrochemical Society—New York, May 3-5. Colin G. Fink, Columbia University, New York.

Southwestern Public Service Association—Fort Worth, Tex., May 15-17. E. N. Wills, 403 Slaughter Bldg., Dallas, Tex.

National Electric Light Association—New York, June 4-8. M. H. Aylesworth, 29 West 39th St., New York.

Electric Power Club—Hot Springs, Va., June 11-14. S. N. Clarkson, Kirby Bldg., Cleveland.

# Commission Rulings

**Proper Proportion of Stocks and Bonds.**—The issue of securities which would make the total par value of bonds equal approximately 80 per cent of the securities outstanding and the stock 20 per cent was disapproved by the New Jersey Board of Public Utility Commissioners in passing on applications from the Commonwealth Electric Company of Summit and other companies. Were the proportions changed to 70 per cent and 30 per cent respectively, the commission intimated that approval would be given.

**Common Stock Should Not Be Issued Under Par.**—In granting the Penobscot Power Company permission to capitalize a hydro-electric undertaking by issuing stock and bonds in the proportion of one to two, the Maine Public Utilities Commission said: "It has been the policy of this commission to insist that common stock should be issued at not less than par. The price which the bonds will bring on the market depends primarily upon certain things, among which are the security and the rate of interest and the availability of capital seeking investment at the time such capital issues are offered. Ordinarily it is as well to permit the issue at a discount of bonds carrying a normal rate of interest as to make the rate higher in order to command par for the bonds, but if that is done the sum of the stock and bonds so issued will exceed the total amount of money immediately realized, and the absorption of the difference properly becomes a problem for the stockholders as the corporation proceeds. We believe that the price at which it is proposed to sell these bonds is reasonable under all the circumstances, but we shall provide in our decree that the discount on the bonds be amortized during the life of the bonds."

**Why Federal Income Tax Does Not Belong in Operating Expenses.**—In fixing the rate base for the Pacific Gas & Electric Company the California Railroad Commission excluded the federal income tax from operating expenses, saying: "An income tax has been imposed by the federal government since this commission acquired jurisdiction over power utilities and established what it considered a fair rate of return. This tax is now 12½ per cent of net revenue after bond interest, depreciation and certain other smaller deductions, which in this case is equivalent to approximately four-tenths of 1 per cent on the reasonable rate base found herein. If this tax were allowed as a part of the return to the company, a return of 8.4 per cent at the present time would be approximately equivalent to the 8 per cent allowed in 1913. On the other hand, the company is larger, has a more diversified business and has, by absorption, eliminated the prospect of no small amount of competition. More than ever before the production and distribution of electrical energy is recognized as an essential and basic industry, and the confidence of the investing public in the soundness of state regulation is becoming more firmly established. The benefits to the investor of supervision of financial operations and the encouragement by large utilities of 'customer ownership' have contributed to a wider distribution of securities and a broader market for new issues. Under such conditions a utility should be able to finance itself much more cheaply than before, and we believe that this factor may fairly and safely be considered as offsetting the effect of the federal income tax and of the increase in interest rates during the period of high prices in so far as such interest rates have affected the operations of this company. A return of 8 per cent upon the estimated reasonable investment will therefore be allowed in the present proceeding."

# Recent Court Decisions

**Whether Fatal Accident in Trying to Safeguard Children Involved Contributory Negligence Is for Jury to Decide.**—In attempting to move a fallen electric wire to a safe distance from children playing in the street a citizen of Baltimore was instantly electrocuted. A suit for damages was brought by the State of Maryland (to use of Dove) against the city of Baltimore and the Consolidated Gas, Electric Light & Power Company. The Court of Appeals of Maryland overruled the company's contention of contributory negligence as a matter of law—which had been accepted by the lower court and the case withdrawn from the jury—remanding the case for a new jury trial. (118 At. 753.)*

**Abutting Owner Cannot Enjoin Construction of Duly Authorized and Properly Built High-Tension Line.**—In Smith vs. Central Power Company an owner of abutting land sought to prevent the construction of a high-tension transmission line by the company in fulfillment of its contract to furnish the city of Bucyrus with electrical energy. The Supreme Court of Ohio held that although an owner of abutting property has certain rights peculiar to himself, such special rights do not include the right to prevent the construction in the streets of appliances which have been authorized by the city, and which do not interfere with his access, light, air or view, merely on the ground that they are a menace to life and property, unless such menace is peculiar to the particular abutting owner. High-voltage electric wires, the court averred, though a highly dangerous agency, are not a nuisance unless the manner of erection and maintenance is faulty and not in accordance with the usual custom, and the maintenance of such wire does not constitute the taking of private property without compensation. (137 N. E. 159.)

*The left-hand numbers refer to the volume and the right-hand numbers to the page of the National Reporter System.

**Relations Between Companies Properly Considered in Ordering Extensions.**—In People ex rel. Woodhaven Gaslight Company vs. Nixon the Supreme Court of New York, Appellate Division, held that where a company having a franchise to supply gas in certain territory manufactured no gas, but purchased all it distributed from another company which owned all of its stock, had advanced all the money invested, selected its officers from among its own employees, and arbitrarily divided their salaries and expenses, the Public Service Commission in ordering an extension of the gas mains could properly take into consideration the relation between such companies and was not necessarily limited to a consideration of the expense with relation to the capitalization or stated income of the franchise holder. (196 N. Y. S. 623.)

**Different Rates for Contiguous Consumers of Same Class Discriminatory.**—The right of the Dallas (Tex.) Power & Light Company to charge a higher rate for electrical energy furnished in Highland Park, a suburb of Dallas but a separately incorporated place, than is charged to users in Dallas has been denied by the Texas Court of Civil Appeals, which held that, although Dallas cannot fix the rates for Highland Park nor Highland Park delegate this power to Dallas, none the less any difference between rates charged two groups of consumers similarly classed is an unjust discrimination and that for consumers of like amounts of energy the same rate must apply, whether in Dallas or in Highland Park. This decision was given in the application of citizens of Highland Park for an injunction against the company, which had fixed a rate of 10½ cents a kilowatt-hour for Highland Park as against 6 cents a kilowatt-hour for Dallas.

**Enforcement of Contract Not Interrupted on Claim that Bankruptcy of Utility Would Result.**—The Central Power & Light Company won a suit against the town of Pocahontas, Ark., to enjoin contract rates restored by the town after the abolition of the Arkansas Corporation Commission, which had first granted and then set aside a higher rate. The commission had ordered the new rate continued for six months pending a rehearing which its abolition prevented. The trial court granted the suit and ordered an increase, fixing the amount. This judgment the Supreme Court of Arkansas reversed, holding that, in the absence of a statute, the enforcement of a contract between a city and a utility cannot be interrupted on the ground that it will force the utility into bankruptcy, the only remedy for such a condition being a modification of rates by mutual consent. (244 S. W. 712.)

# Men of the Industry

Changes in Personnel
Accomplishments, Responsibilities, Honors, Appointments and Activities of Men
Engaged in all Branches of the Electrical Industry

## F. C. Shenehon Joins Byllesby Organization

F. C. Shenehon, whose appointment as vice-president and general manager of construction and engineering for the Byllesby Engineering & Management Corporation, Chicago, was recently announced, is widely known as a hydraulic engineer. Mr. Shenehon obtained his engineering education at the University of Minnesota, where he received the degree of B.S. in 1885 and of C.E. in 1895. From 1886 to 1887 he was connected with railroad location and construction in Michigan and in 1888 he became engineer of water power and supplies at Sault Ste. Marie, Mich. In 1891 he became engineer of the ship locks and ship canals on St. Mary's River, Mich., where he stayed until 1902. From 1903 to 1905 he was engineer for the hydraulic investigations of the Niagara-St. Lawrence Rivers. In 1906 he became engineer of hydrography and hydraulics of the Great Lakes and outflow rivers. He then became the head of the College of Engineering at the University of Minnesota in 1909, where he remained until 1917. Since then he has been connected with various water-supply and flood-protection projects, notably at Natchez, Miss., in Minnehaha County, S. D., and on the Big Sioux River in the latter state. He investigated the water-power project of the Northern States Power Company in 1917 and has been constructing engineer for the Minneapolis Gas & Electric Company on the reconstruction of the Coon Rapids dam since 1920. His technical associations include the American Institute of Consulting Engineers and the American Society of Civil Engineers. He also is the past-president of the Detroit Engineering Society.

F. C. SHENEHON

## B. G. Lamme Receives Medal

Benjamin G. Lamme, chief engineer of the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., to whom was awarded the Joseph Sullivant medal, as announced in the Nov. 11 issue of the ELECTRICAL WORLD, was officially presented with the medal on Jan. 12 at the Ohio State University, his alma mater. The presentation was made in the presence of the trustees and faculties of the university, with appropriate ceremonies, in the chapel. President W. O. Thompson made the presentation address.

## Engineers' Council Re-elects M. E. Cooley

Mortimer E. Cooley, dean of the engineering schools of the University of Michigan, was re-elected president of the American Engineering Council, executive organ of the Federated American Engineering Societies, according to an announcement made at the opening of the two days' meeting of the council in Washington last week. Dean Cooley is the second president of the council, his predecessor having been Herbert Hoover, who resigned soon after he entered President Harding's Cabinet. His re-election comes just as he is rounding out forty years at the University of Michigan, broken only by service in the Spanish-American War, during which he was chief engineer of the Yosemite. For many years Dean Cooley has been associated with engineering investigations and appraisals of utility properties, and he has been in charge of appraisal work at different times for the Wisconsin Railroad Commission and the Michigan commission.

**John H. Trumbull**, president of the Trumbull Electric Manufacturing Company, Plainville, Conn., has been made president pro tem. of the Connecticut State Senate for 1923.

**Edward J. Nally**, who took office as managing director of international relations of the Radio Corporation of America on Jan. 1, left New York on Saturday, Jan. 6, on the Steamship *Majestic* for Europe. Mr. Nally is going abroad to attend conferences at Paris, London, Berlin and other centers where plans to mobilize the interests of American, French, English, German and Italian radio companies will be discussed.

## O. D. Street Becomes Vice-president of the McGraw-Hill Company

O. D. Street, well known for the past ten years as general manager of distribution of the Western Electric Company, has been elected vice-president of the McGraw-Hill Company, in executive charge of the ELECTRICAL WORLD, *Electrical Merchandising, Journal of Electricity and Western Industry, Industrial Engineer, Electric Railway Journal and Bus Transportation.* Mr. Street brings to these publications a broad background of business training and a very extensive contact in the electrical industry.

O. D. STREET

Mr. Street entered the organization of the Western Electric Company in 1901 on his graduation from Williams and has a broad practical training. He was in charge of telephone sales on the Pacific Coast, assistant to the president, Atlanta branch manager, general telephone sales manager and latterly general manager of distribution. During the war he rendered invaluable service in reorganizing the warehousing division of the Quartermaster's Corps and establishing an orderly system of forwarding to Pershing's army where chaos had existed before. Under his administration the Western Electric system was expanded by the creation of twenty-two branch houses until Mr. Street was in executive charge of fifty jobbing houses distributing electrical supplies. This responsibility has entailed a personal contact with all sections of the country and all branches of the industry gained in the service of central stations, telephone systems, industrial plants and contractor-dealers, in co-operation with the manufacturers of practically all classes of electrical products. He has become a recognized authority on the broad problem of distribution, now one of the most pressing issues before the industries of America.

Mr. Street was born in Massachusetts in 1877. He is a resident of Bronxville, N. Y. He belongs to the Bankers', University, and Williams Clubs and the Siwaney and Pittsfield Country Clubs.

## F. A. Ketcham General Manager Western Electric Supply Department

Frank A. Ketcham, who has been general sales manager of the Western Electric Company for the past four years, has been appointed general manager of the supply department, effective Jan. 15. Mr. Ketcham became associated with the Western Electric Company in 1900, starting at the Clinton Street office in Chicago. His early work was in connection with the telephone supply end of the business, and

F. A. KETCHAM

in 1905 he became telephone storekeeper. One promotion followed another until in April, 1911, he was made manager. Two months later he received the additional title of central district manager, with supervision over the Cincinnati, Omaha, Indianapolis and Minneapolis houses. Subsequently the Cleveland, Detroit and Milwaukee offices were opened under his jurisdiction. Mr. Ketcham was born in Saginaw, Mich., and was educated at the University of Michigan.

**William J. Hagenah** of the firm of Hagenah & Erickson, public utility engineers, Chicago, who, with a staff of engineers and accountants, has been engaged on public utility investigation work in South America, has returned to the United States. The work in question, which covered gas, tramway, telephone and electric light and power properties, extended over a period of one year and was undertaken for foreign banking interests.

**W. B. Miser**, manager of the Drumright division of the Oklahoma Gas & Electric Company for five years, resigned on Jan. 1. Mr. Miser has been recognized throughout the central part of the state as one of the civic leaders in Drumright and he has headed the most important organizations of the city. The Drumright division is to be consolidated with the Sapulpa and Bristow divisions. R. C. Coffy of Sapulpa will be the manager of the central division, and C. C. Stewart will be the local division manager at Drumright in connection with his work as commercial manager.

**C. A. Miller**, who has been chief electrical engineer of the Goodyear Tire & Rubber Company, Akron, Ohio, for over two years, resigned Dec. 1 to become electrical engineer in the engineering department of the Adirondack Power & Light Corporation, Schenectady, N. Y. Mr. Miller is a graduate of the University of Illinois in electrical engineering and was with Henry L. Doherty & Company for seven years and with the Goodyear Tire & Rubber Company for three years. During this time Mr. Miller has had charge of several large power house and substation developments as well as being assistant general superintendent of the Trumbull Public Service Company of Warren.

**Kenneth A. McIntyre** of the staff of the Society for Electrical Development started early in January on an extensive trip to about seventeen different cities throughout the United States and Canada. Mr. McIntyre's services will be available to local electrical leagues and clubs for meetings with the executives of governing committees, for the purpose of discussing the best methods of effectively carrying on local co-operative work through the interchange of experiences of the various leagues throughout the country. He will also address the industry where meetings are arranged, for the purpose of stimulating interest in local work.

**Harry L. Garbutt** has been appointed merchandising manager for the San Francisco office of the Westinghouse Electric & Manufacturing Company. He went to San Francisco in 1919 to become district supply manager for the Westinghouse company. Born at Port Huron, Mich., in 1879, Mr. Garbutt entered the electrical field at seventeen and for twelve years was engaged in overhead construction work in various Middle Western states. In 1908 he joined the organization of the Drew Electric & Manufacturing Company of Indianapolis, where he remained as sales manager until he became line-material specialist with the Westinghouse company late in 1909. In 1913 he became manager of the line-material section at East Pittsburgh and six years later supply manager for the San Francisco territory, a position he has since held.

## H. F. T. Erben Vice-Chairman of Manufacturing Committee

H. F. T. Erben, whose appointment as vice-chairman of the manufacturing committee of the General Electric Company was recently announced, has been identified with that company since the early beginnings at Schenectady. In October, 1887, Mr. Erben entered the

H. F. T. ERBEN

employ of the Edison Machine Works. With the growth of the company and the later development of the plant at Schenectady, he became designing engineer of the direct-current department soon after the formation of the General Electric Company in 1892.

In 1914 Mr. Erben was made engineer of the Schenectady works, and in March, 1916, he was appointed assistant manager of the works, which position he held until his appointment as works manager in June, 1920. He held that position until his present appointment as vice-chairman of the manufacturing committee, which was effective Jan. 1, 1923.

## Obituary

**Wallace P. Hurley**, who for the past twelve years has been a member of the sales organization of the Westinghouse Electric & Manufacturing Company, died at New Hope, Pa., on Nov. 28 of sleeping sickness. Mr. Hurley, who was a graduate of Purdue University, became associated with the Westinghouse company in 1910, when he joined the illuminating section of the supply department. In July, 1918, he was made manager of this section and one month later left the company to take a commission in the Signal Corps, U. S. Army. At the end of the war he returned and was assigned to the New York Sales office. Mr. Hurley was a member of the A. I. E. E. and of the I. E. S.

**Alexander Kennedy**, president and treasurer of the Pittsfield (Mass.) Electric Company, died at Pittsfield, Jan. 10, aged eighty-two years. Mr. Kennedy was born in Dumfriesshire, Scotland, and came to the United States in 1865. With three others he established the Pittsfield Electric Company in 1883 and became its head. He was a director of the Pittsfield Electric Street Railway Company until that system was merged with the Berkshire Street Railway and was the head of Pittsfield's first board of trade.

## Patience Needed in Solving Our Problems

**An Appeal Against Selfishness and for the Adjustment of Group Controversies as a Preliminary to United Action by Manufacturers, Jobbers and Merchants**

By H. P. Andrae
President, Julius Andrae & Sons Company

THE electrical jobber has been blamed for a good many things. Some of them are properly chargeable to the jobber and others are not. Out of the mass of discussion that has enveloped the electrical industry there seems to be coming, rather slowly but surely, a full recognition that the so-called jobber problem is broader than the jobbing field. It is one of many questions that are incident to the development of the electrical industry as a whole. The basis of its settlement will not be the welfare of the jobber to the exclusion of the rest of the industry. The basis will be the welfare of the whole industry and the best possible development of the service to the public. This is the real foundation on which the entire industry is built.

### Each One of the Branches Must Justify Itself

Broadly, industry may be divided into three parts. The first is the manufacturer, the second the distributing agency between the manufacturer and the retail merchant, and the last the retail merchant himself. Each must justify himself in the performance of a definite service rendered in a way that no other agency can equal.

With the manufacturer, in addition to his routine manufacturing problems, lies the duty of the development of better equipment as the needs of the field he serves may justify. With this is combined a certain class of educational and advertising work that reaches the public in a broad way, keeping the usefulness and service of the product well in the public eye and maintaining a demand for it. Back of his routine manufacturing and development problems lies the bigger duty of keeping the product up to a standard that makes it worth the price paid by the consumer.

The distributing agency, on the other hand, has the obligation of placing the product in the hands of the retailer at a cost and on a basis of service that can be provided in no other way. While this agency does not come into contact with the buying public directly, it has a definite responsibility in educational work in that it must see that the retail dealer is properly equipped to give service. This equipment cannot be insisted on and the dealer forced to equip himself, but it must be done through an indirect educational process. This is more difficult than a direct educational job would be. Distributing agencies, properly equipped and justifying themselves on a service basis, require an investment in plant, brains and energy that reaches enormous figures. The man who merely receives an order and passes it on to the manufacturer, taking his commission and having no further responsibility, will have a hard time to justify himself.

The retailer, coming into immediate contact with the consumer, not only has his merchandising problems to face but the duty of completing the educational and development work undertaken by the manufacturer and carried on by the distributing agency by bringing to the individual consumer the service that the others have developed. Backed by the manufacturer and distributing agency, he must see that the consumer actually gets value received for his money. Unless this chain of operation can be followed through successfully, an industry falls partly or wholly short of justifying itself, because it fails to render the service paid for.

### Nothing Is Gained by Heated Controversy

Nothing can be gained in the long run by the manufacturer, the distributor and the dealer getting on opposite sides of the fence and throwing "rocks" at each other. Each group has individual problems that are of little or no direct interest to the others. Each group has problems that are common to all. The quickest and surest way to the solution is agreement among the individuals of each group on the problems affecting that group only. This means getting together on the basis of the greatest good to the group and not for the advantage of some particular faction that may be powerful for the moment. So long as there are individuals who will seek to turn every move to immediate personal advantage there will be strife and discord in the group and it will be impossible for that group to meet the others and discuss the common problems of the industry. In short, the manufacturers, jobbers and retailers must settle their own individual problems on a broad give-and-take basis before it will be possible for them to make much progress when they meet as an industry to develop co-operatively the service that the public must have.

### An Electrical Manufacturer Raises This Question —

"WHY should a manufacturer whose factory is located, say, in Syracuse carry branch stocks in New York and Boston when there are in the two cities anywhere from two to three hundred jobbing houses selling the class of goods which this manufacturer produces? The principal effect is to keep in business so-called jobbing houses which have not the financial resources to carry the volume of material which it would be necessary for them to have in order to do business if they drew their supplies from the manufacturer's factory stock. Manufacturers' branch stocks thus tend to multiply the number of jobbing houses, of which, as every one knows, there are too many. Is it good for the industry?"

Concretely, much of the controversy in the electrical industry is based on suspicion of motives, trade rivalries and the fears of individuals that they are not getting their just due. These sources of discord must be cleared away before much progress can be made in putting the industry as a whole on the basis of full health. We must cease to view our problems as manufacturers', jobbers' or dealers' problems, to be solved for the selfish advantage of one or the other group, and view them as broad problems of the industry, to be solved for the best interests of the greatest number and for the betterment of service. This may sound altruistic, but as a matter of sober fact it is the one sure method of preventing throat-cutting competition, and also what is still worse, the adoption of policies that mean certain monetary loss, where some one fears that some one else will get an advantage or is going to do something that will create resentment.

A "devil-take-the-hindmost" policy has never failed to wreck those concerned in it. Much of the confusion in the electrical industry right now is traceable to the newness of its development and to temporary causes incident to financial depressions. The biggest influence for clearing up the situation will be clear thinking from an industry and public service viewpoint and above all patience in plugging away at the problem. There is no such thing as a quick settlement. The condition will only be changed by a concerted effort to put the industry as a whole solidly on the next step upward in the progress of development.

# Who Is to Guide the Non-Electric Store

**How This Growing Influence May Be Molded Into Our Scheme of Distribution as a Constructive Help to Electrical Dealers —The Jobbers' Responsibility**

By A Manufacturer

It would be well, it seems to me, if the manufacturers and jobbers of electrical appliances, devices and materials that go into the homes of the people would give more careful thought and planning to directing and controlling the growing distribution of electrical merchandise through non-electric stores. Electrical construction will naturally remain permanently in the hands of men of the electrical i. dustry, and the sale of electrical appliances and accessories will also continue to be an important and growing fe. ture of the business of the central-station company, contractor and dealer. But we know from our own personal observation that a constantly increasing amount of these commodities is going to be sold by men outside of our industry, for the simple reason that the general merchant is an enterprising trader, very much alive to the wants and needs of the people to whom he sells. And as the ordinary householder becomes more and more interested in these goods and buys more of them, he will find more and more electrical merchandise offered to him in the stores which he habitually frequents in sea ch of other miscellaneous household supplies.

The company with which I am connected and the majority of other electrical manufacturers have restricted their distribution largely within the electrical industry. Many manufacturers of domestic appliances who were already established in the hardware, drug and department-store field electrified their lines when electric cooking devices became popular and began to sell percolators and other utensils, until today the hardware and department stores are selling electrical appliances in wide variety and in considerable volume. Accessories such as shades, plugs, fuses and other devices which can be attached to or plugged into approved wiring, however, have continued to be looked upon more as a distinctly electrical line and to be sold mainly thr gh the electrical trade. But even h non-electric distribution is beginnin o edge in. Inquiries are continually received from large mail-order houses, chain-store groups or other large distributors in the general merchandise field, large orders are flashed at manufacturers, and many of them sell. Whether we like it or not, therefore, the non-electric store is becoming a growing factor in the marketing of these goods.

It is clearly time, therefore, for electrical men to realize that their goods are fast progressing toward the staple stage, when the public demand will attract all classes of merchants to the sale of this household electrical merchandise. We must, besides, recognize the fact that, after all, the service of the public is the prime consideration, and if it will facilitate the sale and use of electrical appliances and accessories to have them on display in stores other than those of purely electrical dealers, it is to the interest of us all to have it so. For even the electrical dealer himself will benefit, because the more pressure is put behind the sale of these goods the faster the market will develop and the better the business will be. Consequently, the problem is not how to prevent or retard this growing sale through non-electric stores, but rather how to guide it and develop it along the most constructive lines.

### The Jobber's Responsibility

The opportunity lies in the direction of the electrical jobber, for if he will function as distributor for the non-electric store as well as for the man whom we now call the regular electrical dealer, he will gradually knit the general merchant who sells electrical merchandise into the organized electrical distribution system. He will guide him through the dangers of his inexperience and make surer his prosperity. He will protect the existing electrical dealer against careless or ill-advised competition, with the result that he will profit by this greater pressure of market building and not be hurt by a struggle for the existing business. He will assure a better, fuller merchandising service to the public, which will be for the advancement of all electrical interests. And the jobber can do this by calling on these non-electric merchants who do or could profitably sell the electric line, by interesting them more deeply in the principle and purpose of the electrical industry, by influencing them to feature and support devices that the electrical industry is pushing, and by ultimately lining up the man behind the electrical department in the non-electric store to feel himself not a free-lance outsider but a member of the local electrical community concerned in co-operating in all its constructive plans for market development.

All this the electrical jobber can do to his own good profit, and the manufacturer can assist him greatly by practical co-operation in selling plans. It would surely be to the advantage of the rest of the industry.

# Business Conditions

A Survey of Important Developments in the Electrical Market Including Data on Production, the Sales Outlook, Credits, Exports, the Metals and Other Conditions Affecting Cost, Supply and Demand

## Insulating Material Business Is Strengthened by Automotives

Increased production in the automotive industry and heavier buying by radio manufacturers are the major influencing factors in the present active insulating material market. A leading company in the Eastern territory states that his sales for the last six months of 1922 show an increase of over 60 per cent in comparison with the first six months of 1922.

Deliveries for insulating material are for normal periods. There have been no recent price changes, although there is a possibility of a price increase if the present upward trend of prices on raw materials continues. The sales outlook for the next six months is considered good, although one important manufacturer expects a falling off in business for this year as compared with 1922.

## Collections in Atlanta Show Improvement

Taken as a whole, collections have shown some improvement during the past thirty days. Jobbers report municipalities and the larger central stations as paying promptly, with an improvement to be noted in the length of time taken by industrials to liquidate accounts. Payment of accounts by the small contractors, however, continue slow, and it requires continuous efforts to obtain moneys due.

Trade acceptances are being dealt in to a small extent, but there is a disinclination on the part of purchasers to use this form of credit. No likelihood of a tightening up of credit in the next thirty days is expected, and one of the larger houses expresses the opinion that collections will continue to improve for the rest of the year. Increases in the value of agricultural products should enable small-town merchants and industrial companies to improve their financial conditions materially, and the outlook is bright for a continued improvement.

## Purchases for Spring Delivery Are Heavy in Cleveland

Electrical business in Cleveland is quite active in all lines, according to the January *Monthly Business Review* of the Federal Reserve Bank of Cleveland.

"The extensive building program which has been put through this fall has brought additional loads on the power plants," says this periodical, "and is partially responsible for the strength of business in that particular field, although the development in many industrial fields is also requiring additional electric power and equipment. There is an unusually heavy demand for bare and insulated electrical wires and lead-covered cables. A large concern reports that orders booked during recent months in the aggregate are about double those for the corresponding months of last year. The placing of so much business at this time of year is looked upon by manufacturers as rather unusual and is attributed to the fact that copper has shown a rising tendency. It is also true that purchases for spring delivery are heavier than for some years past, and this is looked upon in the trade as an evidence that public service corporations are contemplating considerable extension."

## Crude Platinum Prices Drop

Prices of crude platinum dropped from \$2 to \$3 an ounce within the last week. Crude platinum can be obtained from \$109 to \$112 an ounce, while refined platinum is nominally quoted at \$118. The sudden appearance of 800 ounces of sweepings and reclaimed metal, together with the failure of consuming demand to reach the point refiners expected, brought about lower prices. Imports during the last week were four boxes of about 80 ounces each from South American countries.

## Smelter Production of Copper 475,000,000 Lb. Heavier

Smelter production of copper in 1922, according to the United States Geological Survey, covering actual production for eleven months and estimated production in December, was about 981,000,000 lb., an increase of 475,000,000 lb. over 1921. Production was resumed by practically all large mining companies except the United Verde Copper Company by or during April, 1922, one year from the general shutdown. Smelter production of copper for December, as estimated by the companies, was 103,300,000 lb., or at the rate of about 1,240,000,000 lb. a year.

Total production of new refined copper from domestic sources was about 897,000,000 lb., 288,000,000 lb. more than in 1921. Refinery output of new copper obtained from domestic and foreign sources, including imports of refined copper, was about 1,398,000,000 lb. In addition to output of new refined copper, about 112,000,000 lb. of secondary copper was produced at refineries, making total refinery output 1,510,000,000 lb.

Up to Sept. 21 total imports of copper in ore, concentrates, matte, blister and refined copper were 363,443,226 lb., of which 75,556,317 lb. were refined copper and 192,050,397 lb. blister. Exports for the first ten months were 634,501,851 lb.

## Survey Shows Substantial Rise in Wages of All Labor

A nation-wide survey of wage changes covering four hundred thousand wage earners in twenty-three industries just completed by the National Industrial Conference Board shows a substantial rise in hourly and weekly earnings in all classes of labor from July, 1922, to October, 1922. In only two industries, lumber and rubber, was there a decrease in hourly wages during this period. In automobile manufacturing and book and job printing a slight decline took place in weekly earnings.

The average hourly earnings of all wage earners covered in this investigation were \$0.238 in July, 1914. In July, 1922, they had risen to \$0.484, in August to \$0.486, in September to \$0.495. In September, 1922, therefore, the average hourly earnings of all the wage earners covered were 108 per cent higher than in July, 1914.

The average weekly earnings of all wage earners, which were \$12.27 in July, 1914, had risen to \$23.09 in July, 1922, to \$23.31 in August and to \$23.88 in September. In the latter month they were 95 per cent above the July, 1914, level. The average weekly earnings of unskilled labor appear to have increased more since 1914 and during July, August and September of 1922 than those of skilled labor. Average weekly earnings of unskilled labor in July, 1922, were 87 per cent above 1914 and in September, 1922, 95 per cent above pre-war levels, while those of skilled labor in July, 1922, were 86 per cent above 1914 and in September, 1922, had risen to 92 per cent above the July, 1914, level.

The actual hours worked per week per wage earner also increased from 47.7 in July to 48.2 in September, although this figure is still below that

## Comparative Prices of Station Supplies

| | Current Price | Four Weeks Ago | One Year Ago |
|---|---|---|---|
| Soft steel bars, per lb. | \$0.0296 | \$0.0295 | \$0.0258 |
| Cold finished shafting, per l | 0.0378 | 0.0375 | 0.0337 |
| Brass rods, per lb. | 0.1742 | 0.171 | 0.1516 |
| Solder (half and half), per lb. | 0.2425 | 0.24 | 0.2058 |
| Cotton waste, per lb. | 0.1175 | 0.11 | 0.10 |
| Washers, cast iron (½-in.), per 100 lb. | 4.33 | 4.33 | 4.50 |
| Emery, disks, cloth, No. 1, 6-in. diameter, per 100 | 2.96 | 3.11 | 3.20 |
| Machine oil, per gal. | 0.36 | 0.36 | 0.40 |
| Belting, leather, medium, off list | 49% | 37% | 44% |
| Machine bolts, up to 1-in. x 30-in., off list | 51½% | 52% | 58% |

for July, 1914. Plant hours and the nominal working week also improved steadily during July, August and September of this year, though these also were still considerably below the pre-war levels.

## December Was Best Month for Chicago Motor Sales

The Chicago motor sales rate maintained during October and November kept advancing steadily upward during December, with the result that five manufacturers report December their best month of the year. Although the year's motor activity did not start to come back until July, the latter half of the year overcame some of the sluggishness of the first six months. Relative comparative figures of the year's business at present are not available in most cases, but one company reports a 20 per cent increase for 1922 over 1921. The other companies declare that their total business is above their 1921 figures. The greatest demand has been for sizes ranging from 1 hp. to 20 hp. Prices are firm and deliveries are slowing up, with a three-month to four-month period for promised shipments. Stocks are in good shape with few exceptions where an accentuated demand has depleted that one size. With the increase in price of the raw materials, cotton, rubber and copper, there is a feeling that the price tendency will be upward.

## Declares Recent Demand for Cleaners Was Phenomenal

"Demand for electrical household cleaners during the last few months of 1922 was phenomenal, to judge by the experience of the P. A. Geier Company." Such was the recent statement of General Manager Frank J. Gottron of this Cleveland concern. He declared that on Dec. 30 his factory, after a month of working a night shift as well as going at full daytime capacity, had on hand only 600 Royal cleaners, 8 per cent of the regular factory minimum.

"December business showed a 25 per cent increase over normal," said Mr. Gottron, "and orders for January shipment are far above the usual volume, which proves that the trade is sold out. Chicago dealers were so hard pressed for machines in the last days before Christmas that one factory representative there, in trying to help a certain dealer fill his orders, could locate only thirty cleaners although he telephoned forty stores.

"The company never before experienced such heavy Christmas buying, even in the war-boom days, and orders were still pouring in after the holiday at such a rate that production was not halted during the yearly inventory taking but was continued at a fair rate of speed."

## Chinese Electrical Imports Show Heavy Gain

In his report to the Department of Overseas Trade on the commercial and economic situation in China, H. H. Fox, commercial counselor to the British Legation at Peking, says of electric light and power that the customs report for 1921 shows that the importation of electrical materials and fittings rose from 6,300,000 taels in 1920 to 13,200,000 in 1921. Adverse trade conditions caused a marked decline in the sale of small lighting plants, which is partly ascribed to the installation of new or improvement of existing plants for public light services. Many contracts for large power and light plants for cities in the interior were settled, and there is an increasing tendency to install larger units of 1,000, 2,000 and 5,000 kw., while only a couple of years ago 200 kw. and 400 kw. were considered sufficient to meet requirements. These installations are bound to have an effect on China's industrial progress. It is interesting to note that a Chino-German company purchased during the past year a large quantity of land near Soochow for the manufacture of motors and electrical appliances, this being the first project of this nature to be mooted in China.

## Anaconda Acquires Chile Copper

The Anaconda Copper Company has acquired control of Chile Copper through purchase of the holdings of the Guggenheim family. This gives Anaconda the source of cheap copper necessary to make it the great manufacturing-producing company in copper that United States Steel is in iron and steel.

This will give Anaconda the leadership in copper that Amalgamated, its precursor, held prior to the advent of the "disseminated coppers," and rounds out the plan conceived when Anaconda acquired American Brass. Tying a current low-cost producer to Anaconda gives the enterprise a financial stability that will probably never be lost.

Anaconda, according to officials, must still develop Andes as well as the zinc-producing ground of the Butte camp acquired last summer by purchase of the Anselmo and other ground. However, from now on its problem will be to round out the manufacturing end with zinc-oxide works, acid-phosphate plants, a brass foundry and fine-wire mill at Great Falls, thus developing a market for its large bodies of phosphate in Idaho and Montana and the sulphuric acid that it can make at Anaconda, as well as utilizing to the utmost the geographic advantage of having copper, zinc and cheap power available in the center of the West, whence Pacific Coast and trans-Mississippi enterprises can be advantageously supplied with copper wire and brass. Acquisition means no change in Anaconda's program for developing its South American Andes property. Anaconda will purchase copper from the Chile company at the market price, and the return on its investment will be in dividends from Chile profits.

## The Metal Market

Producers continue to quote 14.75 cents, delivered, for prompt copper and for deliveries extending over the next two or three months.

Sales have not been so large as they averaged toward the close of 1922, but neither have producers as much copper available. Some have been forced to decline offers at the ruling price. However, there is no scarcity of the metal, for others are able to supply up to 1,000-ton or 2,000-ton lots for any delivery from spot on. Only one producer or consumer reports any tendency to shade the 14.75-cent price where the freight rate is anywhere near normal, and this report was only a rumor.

NEW YORK METAL MARKET PRICES

| Copper | Jan. 10, 1923 Cents per Pound | Jan. 17, 1923 Cents per Pound |
|---|---|---|
| Electrolytic | 14.75 | 14.75 |
| Lead, Am. S. & R. price | 7.25 | 7.40 |
| Antimony | 6.35 | 6.35 |
| Nickel, ingot | 36.00 | 36.00 |
| Zinc, spot | 7.05 | 7.00 |
| Tin Straits | 38.87½ | 38.87½ |
| Aluminum, 98 to 99 per cent | 23.00 | 23.00 |

## Instrument Market Brightened by Growing Interest in Accurate Control

Electrical instruments generally are in good demand, according to manufacturers' representatives, although nothing spectacular marks the current trade. Well-known lines are enjoying a continuing run of orders, the business embracing a great variety of applications. Interest in the relations between power-factor and rates in industrial circles is slowly bearing fruit in the use of more and more curve-drawing apparatus, and the attempt to gain more accurate control of electric heating process work is also a factor in the instrument market.

Radio fans are buying instruments much more freely than formerly, even for lower-priced tube sets, and the demand of automobilists for attractive dashboard equipment is growing. Although many instruments are of long-standardized varieties, there does not seem to be any marked tendency to stock heavily on the part of either agents or jobbers. By maintaining close touch with the factories current needs are being comfortably met, and the outlook for the year's business is excellent.

For additional information regarding present conditions in the instrument market in fifteen important centers of the country turn to "Week in Trade" on page 191.

# The Week in Trade

**Prices When Quoted Are Those Reported at the Opening of Business on Monday of This Week for Points West of the Mississippi River and on Tuesday for All Eastern Points**

BUSINESS in electrical supplies is somewhat slower than last week, a short lull following the heavy buying experienced during the last few weeks of the old year and inventory taking by the jobbers and dealers. Wholesome conditions prevail, and manufacturers expect a large amount of the season's heavy orders to be signed within the next two or three weeks. Construction of residences and commercial buildings continues at a fair rate. Increased production is reported in the iron and steel and textile industries. Orders from the central-station companies are in greater volume.

**New York.**—A stiffening in prices for wire, conduit, armored cable and loom is noted, following a slightly increased demand from the building industry. Prices of some makes of fixtures are lower. Competition in the vacuum cleaner has forced some reductions. Central-station business is somewhat improved. Some manufacturers report raw material shortages and transportation difficulties. Stocks generally are normal.

**Boston.**—The demand for electrical supplies has slightly subsided during the past week, and jobbers are making the most of the opportunity to close gaps in stock. Railroad difficulties are hampering deliveries and heavy snows and rains have retarded highway travel. Building operations in New England continue at good volume and general manufacturing shows improvement. Manufacturers of electrical machinery are seeking more skilled labor. Prices are stiffening in loom, lead-covered cable and non-indicating fuses. Quotations on fixtures are weaker in some cases owing to large stocks. Deliveries on some types of meters are now running on a four to six weeks' basis. Central stations have suffered little from storms thus far. Telephone facilities are far behind installations, and the demand for new electric lighting service is outrunning the immediate satisfaction of many applications.

**Chicago.**—Jobbers report that the start of this year's business exceeded that of 1922. Approximate estimates on the volume of increased business obtained during the year are found to vary between 20 and 30 per cent over 1921. With an increasing price trend on wire, the demand has risen. The conduit supply is still low, requiring close attention to shipments and prices. Pole dealers report a steady demand, but the freight situation is such that deliveries are uncertain. During the week one high-tension manufacturer sold three 33,000-volt substations rated at 450, 600 and 900 kva. to a Middle Western Utility. Foreign purchases have been active for the 110,000-volt air-break switching equipment. Another firm received orders for 2,300-volt indoor switching equipment for a California utility. Fuses rated at 70,000 volts are the main volume of another concern.

The demand for flatirons, according to most jobbers, is featureless. Prices remain unchanged. The call for rectifiers for storage batteries is fairly steady, being stimulated by the radio demand for charging the "A" battery. Only the largest jobbers carry this equipment, but stocks are low at the present time. Dealers declare that while their sales rate on electrical instruments for the past three months has been good, the month of January is starting with the same maintained rate.

**Atlanta.**—General conditions in the Southeast are the best for some time, and electrical jobbers and dealers are most optimistic over the prospects for the year. While prices have been reduced in a few items, the general trend is upward. Now that inventory is over orders will begin to be placed to bring stocks up to normal, and this, together with the sales campaigns that are being launched, will see the movement in all lines stimulated. One of the largest central-station companies in this section has announced an improvement and expansion program for 1923 which will call for the expenditure of $6,500,000 and other central stations are planning similar programs. Building material prices have advanced somewhat, but this is having little effect on building in Atlanta, and this year will doubtless be the biggest in its history. Cotton has reached the new high of 27.39 cents, which is having a stimulating effect throughout the territory. The increasing interest of Eastern industries in the establishment of mills in the South indicates that building materials and electrical equipment lines will receive a considerable boost before the year is over.

Christmas witnessed an unusually good volume of sales in flatirons, and the general outlook for 1923 is very bright. One of the largest jobbers is beginning a sales campaign, and increased sales are anticipated, with adequate stocks on hand to meet the demands. Prices are firm and no changes are expected for some time. Jobbers report good sales of rectifiers, particularly those jobbers concentrating on sales of radio equipment. Jobbers report a slow movement in the electrical instrument line and anticipate little interest to be displayed.

**St. Louis.**—A steady and strong demand for flatirons has existed since last summer, and as a result of a conservative policy in carrying stocks on the part of both jobbers and dealers turnovers have been good and profits very satisfactory. The increased trade before holidays reduced stocks materially below normal, but normal stocks again obtain. While competition continues keen, prices are fairly well stabilized. The increased use of radio tubes requiring storage batteries has greatly stimulated the sale of small low-priced rectifiers. There is some demand for larger machines for electric automobile charging and for moving-picture machines, but neither of these fields may be classed as active. On the whole, stocks are in suitable condition. There is a tendency on the part of industrial plants to consider portable instruments as somewhat of a luxury, and sales during the recent period of business quietude have been dull. Some improvement is found now, due to occasional purchases for the purpose of checking power consumption and factory efficiency. Recording-chart instruments are increasingly popular for this purpose. Switchboard instruments are experiencing fairly good sales because of expansion on the part of central stations and the smaller municipal plants. Slightly better sales are found in the coal districts since the strike settlement.

**Cleveland.**—The week's business has been slow. Firm prices prevail and demand generally is steady. Conservatism has been the predominant note. The most spectacular feature was an active movement in small motors. Poles and high-tension equipment orders were somewhat lower this week, new construction having been retarded by unfavorable weather conditions. The same weather conditions were advantageous to heater sales, however, jobbers reporting their movement as brisk. Demand for conduit continues to prevent overstocks, while the supply of wire is improved.

**New Orleans.**—Because of the demand of radio users, business in rectifiers has increased conspicuously during the last month or six weeks. Business in electrical instruments is slow. There is never much demand, except sporadically, when some institution or school lays in a large supply. The flatiron business is sluggish.

**St. Paul-Minneapolis.**—The market for flatirons is slowing up slightly after the holidays, but the steady undercurrent of demand for this staple article is not materially affected. Dealers report a flood of "bargain" irons and a good deal of price cutting by department stores, mostly on inferior goods. The inclination here is toward a decline in prices. Many dealers are cutting slightly to offset the department-store raid. Small-size rectifiers are keeping pace with the radio sales, being in good demand, while the larger sizes are sluggish. The supply of both, particularly the small sizes, is low. Instruments are steady here, but since central-station work and any other switchboard work is slow, it doesn't seem reasonable that instruments could be anything else.

# Demand, Supply and Price Trend of Eighteen Commodities as Sold in Fifteen Cities

Explanation:
Demand: Steady, Slow or Active
Supply: Normal, Low or High
Price Trend: Firm, Decreasing or Increasing

Next Week
Reports will include

San Francisco.—Jobbers' annual inventories disclose far larger stocks than in 1922, but the vastly increased construction business with its larger individual orders and greater rate of turnover demands such increased stocks, and they are not viewed with any apprehension. Collections have steadily lengthened throughout the past year until they now average just beyond sixty days. Credit managers feel that this rate must be improved and are ready to take measures for vigorous handling. All customers are required to better their own collections, to scrutinize carefully their own credit risks and generally to put their own financial houses in order. The number of failures and of seriously overdue accounts has more than doubled since last year and will run to a higher proportion of sales volume, even considering the 1922 increase in business. New accounts are very cautiously handled and personally followed until they have been proved satisfactory. Prices on such wiring staples as rubber-covered wire, tape and lamp cord have increased about 10 per cent.

Denver.—January business continues satisfactory. Local supply of electrical material and equipment is seriously curtailed by a one-hundred-thousand-dollar fire in a large warehouse. Fortunately the annual inventory had reduced stocks to a minimum. Manufacturers with warehouse stock and other jobbers are co-operating with the company suffering the loss in filling orders and caring for business until emergency stock can be obtained. Lack of winter weather has allowed continuance of the building program. Local permits exceed those of last month for same period. Credits have been tightened owing to slow collections. In the house-wiring business contractors in severe competition are allowing work, obtained on unreasonably low bids to remain unsettled.

Portland-Seattle.—Electrical jobbers report reasonably good business for this time of year. Sales are less than before the holidays but better than a year ago. Dealers are experiencing a very marked decrease in sales, as are contractors on certain classes of work. A number of large industrial installations are under construction at present, and the prospects are very good for the coming season. Farm plants are not moving rapidly, but inquiries are becoming active again. An advance of 5 per cent in the price of washing machines is reported and copper wire also has advanced about 5 per cent since the first of the year. Construction for 1922 was the greatest in the history of the Northwest.

# Activities of the Trade

Devoted to News of the
Manufacturer, Jobber, Agent, Contractor and Dealer, Including Important Orders and Contracts for Apparatus and Equipment

### Bosch Business Increasing

The American Bosch Magneto Corporation's production is running 70 per cent ahead of a year ago and is approaching normal, according to President Arthur T. Murray, who reports an operating force of 1,600 at the opening of the year. Prospects for 1923 he regards as excellent. A production of $10,000,000 to $12,000,000 is forecast at the main factory in Springfield, and $5,000,000 to $6,000,000 at the Gray & Davis plant in Cambridge.

### G. E. Conference at Pittsfield

Members of the newly organized merchandising department of the General Electric Company had a three days' conference in Pittsfield, Mass., recently, at which electric fans formed the chief topic of discussion. Experts on the manufacture and merchandising of fans were present from all parts of the country. J. O. Weathersby was toastmaster at a banquet which concluded the sessions, and R. H. Heaney, head of the merchandising department, and C. C. Chesney, manager of the Pittsfield works, were among the speakers.

### Chicago Branch Improves Store

The Manhattan Electrical Supply Company, 112-114 South Wells Street, Chicago, has changed and regrouped its internal store departmental locations with a view of improving the handling of local business. The offices formerly on the first and fourth floors were placed on the second floor, which gave the first floor more room for merchandise display. The entire first floor has also been redecorated and refinished, with the addition of new showcases and lighting fixtures.

For improving the firm's distribution in the Middle West the following salesmen were added the first of the year: Carl Mack, Oshkosh, Wis.; Charles Stegmaier, Cleveland, Ohio; Vincent Lonergon, Milwaukee, Wis.; Joe Hughes, Kokomo, Ind., and Robert Burns, Indianapolis.

### Northern Engineering Works Changes in Addresses

The Northern Engineering Works, electric crane and hoist builders of Detroit, announce changes in addresses of their local sales offices as follows: New York City, 30 Church Street, room 623, in charge of H. C. Rood; Philadelphia, 51 Estey Building, in charge of John H. Bricker; Chicago, 53 West Jackson Boulevard, room 630 Monadnock Building, in charge of M. H. Haeger of the Abell-Howe Company, and St. Louis, 606 Pontiac Building, in charge of J. S. Davidson.

### Birtman Electric Holds Sales Conference

A ten-day executive sales conference was held at the Edgewater Beach Hotel, Chicago, starting Jan. 2, by the Birtman Electric Company, 640 West Lake Street, Chicago. The purpose of this conference with the ten newly appointed divisional sales managers was to work over and adopt plans for the distribution of the "Magnetic house cleaner," a product of eighteen years of development.

Ten divisional offices will serve as headquarters for 110 branch offices, whence will radiate 3,000 sales engineers. Of these 110 district managers thirty have already been appointed. The ten divisional sales managers are as follows: Boston, F. J. Caldwell; New York, J. K. Tyner; Washington, C. H. Magee; Detroit, B. K. Sheldon; Chicago, W. R. Noxon; Minneapolis, V. V. Corbin; Seattle, Ralph Wilder; San Francisco, H. G. Gute; Dallas, F. C. Roeggl; Kansas City, E. V. Swanstron.

The organization has for fifteen years been engaged in manufacturing housecleaning devices, fractional-horsepower motors and electrotherapeutical equipment. The manufacturing floor space of 55,000 sq. ft. will make possible the production of a thousand cleaners a day. The conference terminated by a banquet at the University Club on Jan. 11.

### Gibb Instrument Company Is to Make and Sell Pabst Products

The Gibb Instrument Company, Bay City, Mich., has taken over, under exclusive license, the manufacture and sale of the automatic and semi-automatic electric arc-welding machines developed and heretofore manufactured by the Fred Pabst Company, Milwaukee, under its various letters patent, and has contracted to act as selling agent for the Pabst line of patented covered electrodes. The Fred Pabst Company has spent more than two years in the development of this line of equipment, and the field of application is said to be very wide, embracing the welding of tanks, range boilers, bells, drums and tubing. The Gibb Instrument Company has announced its intention to encompass the entire range of electric welding equipment, and this contract marks a long step in that direction.

### Westinghouse Secures Extensive New Sales Field

The Westinghouse Electric and Manufacturing Company has concluded an agreement with the Metropolitan-Vickers Electric Company, Ltd., which provides the opening of much foreign territory for independent trade for the Westinghouse company, which can now enter New Zealand, Australia, South Africa and India to book new business directly.

Under the old agreement of 1919, superseded by the present agreement, Westinghouse could not book business in the above territories as the field was opened only to Metropolitan-Vickers, who manufactured all their capacity permitted, turning the overflow over to Westinghouse.

Westinghouse has outlined an extensive selling campaign for the territory newly opened, and some of the best salesmen are now on their way to enter negotiations for available business. Additional men will be sent in a few days.

The significance of the new agreement is that Westinghouse, through its extensive sales organization, will be able to compete more successfully for new business in this territory and at the same time will receive the full manufacturer's profit on all orders booked.

### Kerite Increases Capital

The Kerite Insulated Wire & Cable Company, Seymour, Conn., has filed a certificate with the Secretary of State adding $812,000 to its capital stock. The addition calls for 8,120 shares of "B" stock.

### Piedmont Plans New Building

The Piedmont Electric Company, Asheville, N. C., is having plans made for the erection of a five story building, 44 ft. x 100 ft., for its own use. It will cost about $50,000 and will be designed to house one of the most complete electrical establishments in the South. The firm has been in operation in Asheville since 1902 and has had a branch in Greensboro three years.

### Louis Allis Sales Conference

The Louis Allis Company of Milwaukee, manufacturer of motors, held a general conference of its sales staff at the plant in Milwaukee, Dec. 11 to 14, at which were present the sales engineers and distributors from all the territories in the United States and Canada.

In addition to the discussion of general sales problems, special analysis and study was made of a number of interesting new motor applications which the company has recently been making, and the meeting was addressed by various representatives of manufacturers of control apparatus. The conference concluded with a dinner to the entire staff.

## Ohio Electric and Controller Appoints Alabama Agent

The Ohio Electric and Controller Company, 5900 Maurice Avenue, Cleveland, announces the appointment of the Southern Industrial Engineering Company, Inc., American Trust Building, Birmingham, Ala., as its agent for the sale of "Ohio" magnets in Alabama.

This company also announces the opening of an office in St. Louis. Thomas E. Beasley will be district sales manager in charge of the motor and magnet sales in the St. Louis district.

## New Jobbing Firm Opens in Appleton, Wis.

A new corporation to be called the Langstadt Electrical Company has opened temporary quarters in Appleton, Wis. Organizers of the new company are A. C. Langstadt, E. A. Killoren and A. A. Schneider. Application will be made to the Railroad Commission for permission to incorporate for $100,000, with the three men as part owners. The concern will do a general electrical business, including contracting, jobbing and retailing.

Mr. Langstadt formerly was president of the Langstadt-Meyer Company and one of the founders of that firm thirty years ago. He disposed of his interest recently to August Meyer and will become head of the new company and its general manager. Mr. Killoren formerly was salesman for Lanstadt-Meyer Company, and will be sales manager for the new company. Mr. Schneider, who served the Langstadt-Meyer firm as foreman of construction for twenty-three years, will act in a like capacity for the new firm.

## General Electric Orders Increase 50 per Cent

Orders received by the General Electric Company for the three months ended Dec. 31, 1922, totaled $66,568,333, an increase of 50 per cent over the corresponding three months of 1921. New business booked in twelve months of 1922 totaled $242,739,527 as compared with $179,721,680 for 1921, an increase of 35 per cent.

**The Flexlume Sign Company**, 74 Kail Street, Buffalo, manufacturer of metal electric signs, etc., is planning the erection of a new factory at Military Road and Skillen Street, to cost $45,000.

**The Acheson Graphite Company**, Buffalo Avenue, Niagara Falls, New York, manufacturer of electrodes, electrical products, etc., plans the erection of a new one-story addition.

**The C. J. Litscher Electric Company**, 41 Market Avenue, Grand Rapids, Mich., manufacturer of electrical products, has arranged plans for rebuilding its three-story factory recently destroyed by fire. The new structure is estimated to cost $150,000, with machinery.

**The Trumbull-Vanderpoel Electric Manufacturing Company**, Bantam, Conn., has increased its capital stock from $300,000 to $400,000.

**The Colonial Electrical Division of the National Lamp Works** has opened a branch office at 9 South Clinton Street which is in charge of Charles A. Nash, former president and general manager of the Nash-Odell Company.

**The Perfection Specialties Company**, Elkhart Lake, Wis., has been organized by George C. Trotter, E. C. Trotter and William K. Burk, to manufacture radio condensers and other apparatus and devices for wireless communication. This company will operate in part of the plant of the Lake Laboratories Company, the original enterprise of George C. Trotter, which manufactures electric phonograph motors. Some additional tool-room and floor equipment is being purchased for this company.

**The Federal Lighting Fixture Manufacturing Corporation**, 35 North Ninth Street, Philadelphia, has leased two floors in the building at 33 North Eleventh Street in order to increase its floor space.

**The Combustion Engineering Corporation**, 43 Broad Street, New York City, announces the acquisition of the Quinn Oil Burner & Torch Company. W. R. Quinn, former president of the Quinn Oil Burner & Torch Company, is now associated with the Combustion Engineering Corporation as its manager of the fuel-oil department.

**The Galvin Electric Manufacturing Company**, manufacturers of electric motors and apparatus, announced on Jan. 1 its removal to new and larger quarters at 3314 South Broadway, St. Louis.

**The Gibraltar Battery Manufacturing Company**, Tenth and Lancaster Avenues, Dallas, Tex., has been incorporated to manufacture electric storage batteries and equipment and is in the market for equipment, including small motors and a large potential charging outfit. The company is in the manufacturing end only and will sell to dealers. A. Swanson is president of the company.

**The Wissler Instrument Company**, 601 North Broadway, St. Louis, manufacturer of engineering instruments, has acquired a four-story building, 65 ft. x 100 ft., at 15 Pine Street, for a new plant. A. Wissler is president of the company.

**The Watkins Manufacturing Company**, Wichita, Kan., manufacturer of wireless equipment, has plans for a two-story factory, 50 ft. x 140 ft., at 208 North Waco Street, to cost about $50,000.

**The Uehling Instrument Company**, Paterson, N. J., has appointed the Mine & Smelter Supply Company, El Paso, Tex. as its exclusive representative for $CO_2$ recording equipment and other power plant recording instruments in Arizona, New Mexico and west Texas, as well as in the Republic of Mexico north of Mexico City.

## Western Electric Company Announces Important Sales Appointments

The Western Electric Company announces important organization changes, which were effective Jan. 15, as follows:

F. A. Ketcham has been appointed general manager of the supply department. For the past four years Mr. Ketcham has been general sales manager.

G. E. Cullinan assumes the position of general sales manager. Mr. Cullinan entered the employ of the company upon his graduation from Williams College in 1901 and for several years was connected with the New York house. He went to St. Louis in 1907 and was manager there from 1909 to 1918, when he went to Chicago as central district manager.

L. M. Dunn, who for the past three years has been manager of the Eastern district, which includes the New York and the New England territory, has been appointed general merchandise manager of the general manager's staff.

W. J. Drury has been made manager of the Eastern district to fill the vacancy created by Mr. Dunn. Mr. Drury has been sales manager of the New York house for the past three years and is succeeded in that capacity by J. F. Davis, who has been sales manager of the Boston branch for the same period.

T. E. Burger has been made sales manager at Boston. Mr. Burger was for thirteen years connected with the Los Angeles and San Francisco organizations, being sales manager of the former. More recently he has been on the staff of the Society for Electrical Development.

W. P. Hoagland has been appointed central district manager in charge of the Chicago and Minneapolis branch houses. For the past three years Mr. Hoagland has been sales manager at Chicago.

J. H. Gleason takes the position of Chicago sales manager. Mr. Gleason has been power-apparatus sales manager at Chicago.

H. L. Grant, who for the past three years has been general appliance sales manager, located at New York, has been appointed Erie district manager, a new grouping of the distributing houses at Cleveland, Pittsburgh, Detroit and Cincinnati. Mr. Grant's headquarters will be at Cleveland. A. M. Collins continues as manager of the Cleveland house.

It is interesting to note that all of these organization changes are in the nature of promotions. This is in line with the Western Electric Company's consistent policy of advancing men who have made good in their previous capacities.

## Foreign Trade Notes

PERUVIAN WATER-POWER CONCESSIONS.—The transfer of water rights or water-power concessions in Peru, according to *Commerce Reports*, must obtain approval within sixty days of the Bureau of Waters and Irrigation. Otherwise the transfer will not be recognized or registered.

CHANGES MADE IN SPANISH WATER-POWER LAW.—Certain changes have been made in the hydro-electric law of Spain, *Commerce Reports* states, by a decree of Nov. 10, 1922. The duration of concessions in general shall be seventy-five instead of sixty-five years, counting from the date of the partial or total exploitation of the concession, with exceptions in certain instances. For such exceptions the period of franchise will be ninety-nine years. Upon the expiration of a franchise the whole property will revert without cost or lien of any kind to the state and will become public property. Special exceptions as regards reversion of properties to the state are made in the case of projects of less than 200 hp. used by private industry.

THE YBBS (AUSTRIA) HYDRO-ELECTRIC PROJECT TO BE FINANCED BY TAX.—A municipal tax of 1½ per cent on gas consumption and 4 per cent on electric light, *Commerce Reports* states, was announced recently in the Austrian papers for the purpose of financing the electrification on the Ybbs, undertaken by the commune of Vienna. This tax is expected to yield approximately 1,750,000 crowns a month and to equal the sum expended on the Ybbs project monthly for wages and material.

PROPOSED ELECTRIC RAILWAY FOR JAPAN.—Plans are under way by the Toho Electric Power Company, according to *Commerce Reports*, to organize a subsidiary company, to be known as the Sangu Electric Railway, which will be supplied with hydro-electric power generated in the vicinity of Yokkaichi. The proposed railway is to furnish more adequate transportation between Nagoya and Uji-Yamada and to the grand shrines of Ise at the latter place.

CONCESSION ASKED FOR HYDRO-ELECTRIC PLANT IN ARGENTINA.—Application has been made to the provincial government, *Commerce Reports* states, by Segundo Calderon for a concession covering the construction of a hydro-electric plant to supply electricity in the city of Rio Cuarto, Argentina, and surrounding territory.

ELECTRIFICATION OF THE HORSE-CAR LINE IN MONTEVIDEO PROPOSED.—A bill authorizing the executive to issue mortgage bonds to the amount of 3,500,000 pesos for the electrification of the northern tramway (the government-owned horse-car line) in Montevideo, according to *Commerce Reports*, has been favorably reported upon by the committee of the chamber to which it was referred. Before it becomes a law the bill must come up for a vote in the Chamber.

## Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number.

An exclusive agency is desired in Denmark (No. 5,001) for complete radio sets and parts thereof.

An agency is desired in Norway (No. 5,017) for electric wiring devices such as switches and sockets, all kinds of marine fittings, all kinds of unmounted knife switches, and wireless telephone apparatus.

An agency is desired in Italy (No. 5,026) for electric bulbs and electric irons.

An agency is desired in Switzerland (No. 5,045) for electric conveying trucks for factories.

An agency is desired in Poland (No. 5,058) for alternating-current motors, three-phase, 50-cycle, 120/210 volts and 220/380 volts; direct-current motors, 110/220 volts; installation material, electrical apparatus, ammeters, voltmeters, wattmeters, etc.

DEMAND IN BOLIVIA FOR ELECTRIC HEATERS.—There is a good demand in Bolivia, *Commerce Reports* states, for electric heating apparatus, especially among the foreign colony in La Paz.

TRANSFORMERS FOR MORWELL (AUSTRALIA) POWER SCHEME.—Tenders will be received by State Electricity Commission of Victoria, Melbourne, Australia, until March 31 for transformers for the Morwell power scheme, specification (No. 23/8.)

ELECTRIFICATION OF THE TRANS-PYRENEAN (SPAIN) RAILWAY.—The Ministro de Fomento has been authorized to call for tenders for equipping (for electrical operation) the Ripoll-Puigcerda Railway, which extends across the Pyrenees. Particulars may be obtained from Señor Ingeniero Jefe de la Segunda Division de Ferrocarriles, Calle de Balmes, Barcelona, Spain.

## New Apparatus and Publications

MOTOR FOR TYPESETTING MACHINE.—An offset motor for use with typesetting machines has been brought out by the Cushman Electric Company, Concord, N. H.

TOOL BAG.—A tool bag for electricians, contractors, linemen and others engaged in the electrical industry has been brought out by A. Bruns & Sons, 50 Ralph Avenue, Brooklyn, N. Y.

INSULATED-WIRE STRIPPER.—A device for stripping the insulation from ends of wire and cord has been developed by Wallace G. Grossman, 79 Walker Street, New York City.

ELECTRIC COOKER.—The Excel Electric Company, Muncie, Ind., has developed an electric cooker which operates on 110 volts and 660 watts.

HEADLIGHT FOR MINE SERVICE.—A locomotive incandescent headlight for mine service has been developed by the Jeffrey Manufacturing Company, Columbus, Ohio.

SHADOW SHIELD.—A shadow shield for indirect and semi-direct lighting units has been developed by the Macbeth-Evans Glass Company, Pittsburgh, Pa.

RECORDING INSTRUMENTS.—The Uehling Instrument Company, Paterson, N. J., is distributing a twelve-page folder in which it describes the "Uehling" combined barometer and vacuum recorder for low-pressure turbine and condensing plants.

WELDING AND CUTTING EQUIPMENT.—The Alexander Milburn Company, 1416-1428 West Baltimore Street, Baltimore, is distributing a new catalog covering the "Milburn" line of welding and cutting equipment.

ELECTRIC MOTOR.—Bulletin No. 406 issued by the Louis Allis Company, Milwaukee, describes the "L-A" type H. D. (heavy-duty) motor.

RADIO RECEIVING SET.—The Machen Radio Manufacturing Company, 4639 East Thompson Street, Philadelphia, has brought out a new radio receiving set, known as "Machen Clearad," designed to operate on radio-frequency lines.

RECEPTACLES.—A new line of standard receptacles, made single and duplex, known as the "Gilto" type, has been developed by the Machen Electric Manufacturing Company, 4639 East Thompson Street, Philadelphia. These receptacles are also in its "No-lus-Plug" type.

STEAM TURBINES.—The De Laval Steam Turbine Company, Trenton, N. J., is distributing two leaflets, one describing and illustrating the "De Laval" equipment in the Crown Willamette paper mill at West Linn, Ore., and the other the "De Laval" equipment for the Marquette Cement Manufacturing Company, La Salle, Ill.

## New Incorporations

THE BERTRAM (TEX.) LIGHT & POWER COMPANY has been incorporated with a capital stock of $9,000 by P. M. Rodgers, R. J. Bostic and M. B. Rodgers.

THE TEXAS ELECTRIC & ICE COMPANY, San Antonio, Tex., has been chartered by R. W. Morrison, A. C. Prucha and H. C. Loehr. The company is capitalized at $90,000.

THE ST. ALBANS (W. VA.) ELECTRIC & LIGHT COMPANY has been incorporated with a capital stock of $100,000. The incorporators are J. E. Campbell, W. G. Matthews and G. F. Skidmore.

# Construction News

**Projects, Plans, Bids and Contracts, Contemplated or Under Way**

## New England States

WESTBROOK, ME.—The Public Utilities Commission has granted the Mallison Power Company permission to issue $125,000 in bonds. Of the proceeds $45,000 will be used in connection with the construction of a new power station at Mallison. The cost of new construction work contemplated is estimated at between $80,000 and $85,000.

SUNAPEE, N. H.—The Lake Sunapee Power Company has prepared plans for the construction of its proposed power plant at Sunapee Harbor, to cost about $300,000.

WORCESTER, MASS.—The installation of an ornamental lighting system on Southbridge Street from Washburn to Cambridge Street is under consideration.

NORWICH, CONN.—The Uncas Paperboard Company, recently organized with a capital of $1,500,000, to operate at the former mill of the Ironsides Board Corporation, contemplates the installation of electric power equipment in connection with extensions and improvements.

## Middle Atlantic States

ALBANY, N. Y.—Steps have been taken by a committee of property owners for a new lighting system on the Albany-Troy road. A. E. Leu, Albany, is chairman of the committee.

BINGHAMTON, N. Y.—The Binghamton Light, Heat & Power Company contemplates the erection of an electric transmission line from here to Sayre, Pa., to cost about $225,000.

JAMESTOWN, N. Y.—The Jamestown Chair Company will build a one-story power house, 25 ft. x 75 ft., at its local plant.

NEW YORK, N. Y.—Bids will be received by the board of purchase of the city of New York, Room 526, Municipal Building, until Jan. 23 for furnishing incandescent lamps to the Department of Water Supply, Gas and Electricity. Grover A. Whalen is chairman of commission.

NEW YORK, N. Y.—The Fulton Ice Company, 18 East Forty-first Street, will install electric power equipment at its proposed ice-manufacturing plant at 138-40 Cherry Street, to cost about $100,000. Ophuls & Hill, 112 West Forty-second Street, are engineers.

OWEGO, N. Y.—The Owego Light & Power Company has contracted with the Binghamton Light, Heat & Power Company, Binghamton, for electricity from the Binghamton plant for a period of ten years. The Binghamton company has also made arrangements with the Binghamton Railway Company for an exchange of power, and transmission lines will be built for this purpose.

SYRACUSE, N. Y.—The erection of a hospital building, power house and laundry building on Prospect Avenue for the St. Joseph's Hospital, to cost about $500,000, is under consideration.

THIELLS, N. Y.—Bids will be received by Mortimer B. Patterson, president of board of managers of Letchworth Village, 7 Wall Street, New York City, until Feb. 1, for construction, including heating, sanitary and electrical work, of attendants' home, assembly hall and industrial building (girls' group) at Letchworth Village, Thiells. L. F. Pilcher, Capitol, Albany, is state architect.

NEWARK, N. J.—Bids will be received by Charles P. Gillen, Director of Parks and Public Property, City Hall, until Jan. 24, for electric and mechanical equipment for the new Center Market, as follows: (a) Electric generating plant; (b) boiler plant and steam piping; (c) market equipment; (d) refrigerating plant; (e) elevator equipment; (f) ventilating apparatus. George B. Hopper and Frank Grad, 116 Market Street, are associated architects.

TRENTON JUNCTION, N. J.—Bids will be received by the board of trustees, New Jersey School for the Deaf, until Jan. 31, for the construction of a transformer house

at the institution and the installation of electrical work in the entire group of buildings now in course of construction. Arnold H. Moses, Temple Building, 415 Market Street, Camden, is architect in charge.

WASHINGTON, N. J.—The New Jersey Power & Light Company has acquired the system of the Washington Electric Company and will extend its transmission lines for local service. The plant will be remodeled for a transformer station and extensions made to the local distributing system.

ALLENTOWN, PA.—The Pennsylvania Power & Light Company is planning to erect a 66,000-volt tower transmission line from Milton to Lockhaven. Electricity will be supplied to cities and towns along the line.

BLOSSBURG, PA. — Gannett, Seeley & Fleming, Inc., engineers, 204 Locust Street, Harrisburg, have organized the Northern Power Company with a capital stock of $500,000, to take over and merge the Blossburg Electric Light & Power Company and sixteen other electric companies operating in this district. The new company will construct a generating plant near Blossburg, to cost about $150,000.

EASTON, PA.—Plans are being prepared by Lockwood, Greene & Company, engineers, 101 Park Avenue, New York City, for a four-story, 80-ft. by 100-ft. factory and a 250-hp. power plant for the Binnery & Smith Company.

EBENSBURG, PA. — The Penn Central Light & Power Company, Altoona, contemplates extensions and improvements to the system of the Ebensburg Light & Power Company, recently acquired.

INDIANA, PA. — The Pine Township Power Company and the Green Township Power Company are being organized to build and operate transmission systems in Pine and Green Townships. James Collins Jones, Bullitt Building, Philadelphia, represents the companies.

JOHNSTOWN, PA. — The Penn Public Service Corporation is planning to erect a number of transmission lines.

JOHNSTOWN, PA. — The Penn Public Service Corporation has acquired the systems of the Warren, DuBois and Jefferson Electric Light & Power companies, operating in Warren, Jefferson, Clearfield and Indiana Counties. The properties will be merged and extended, including the construction of additional substations. The Penn company contemplates the construction of a hydro-electric plant on the Youghiogheny River.

PHILADELPHIA, PA.—Bids will be received by the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., until Jan. 30, for electric storage batteries for the local naval aircraft factory, in lots of 6, 25, 50, 100 and 200. (Schedule 421.)

PHILADELPHIA, PA.—The Philadelphia & Reading Coal & Iron Company, Reading Terminal, is planning to build a series of steam-driven electric power plants for its coal-mining properties and shops at Pottsville, to replace the present steam and compressed-air service. The plans call for the erection of at least five power stations and the merging of the existing power plants at Good Springs and Locust Point with the system. C. B. Hadesty is general manager.

READING, PA.—The Metropolitan Edison Company will increase the capacity of its power plant at West Reading from 33,000 kw. to 70,000 kw. Plans are also being prepared for the installation of hydro-electric equipment at the station of the York Haven (Pa.) Water & Power Company, recently acquired. New transmission lines will be built.

READING, PA.—The Reading Coal & Iron Company plans to equip all its mining properties in Northumberland and Schuylkill Counties with electrically operated machinery. The project will include the construction of five or six plants, to cost about $500,000.

WILLIAMSPORT, PA.—Extensions and improvements, it is said, will be made to the plant of the Lycoming Edison Company, to cost about $500,000.

SHELBYVILLE, DEL. — The Delaware Light & Ice Company contemplates rebuilding its local electric light and ice-manufacturing plant, recently destroyed by fire, with loss of about $75,000.

BALTIMORE, MD.—The Baltimore Ice Manufacturing Company, Lewis and Lexington Streets, will install electric power equipment at its proposed ice-manufacturing plant, to cost about $125,000.

BALTIMORE, MD. — The Consolidated Gas, Electric Light & Power Company contemplates placing its wires underground on the Falls Road, from the old to the new city line. Underground conduits will be laid from the city line to the power house in Mount Washington.

BALTIMORE, MD.—A power house will be built in connection with a new ward building at the Baltimore Children's Hospital, Forty-first Street and Green Spring Avenue. William G. Beecher and Smith & May, Calvert Building, are associated architects.

CLAREMONT, VA.—The H. J. Arrington Company contemplates purchasing a complete electric light and power plant for commercial service in a small community.

WASHINGTON, D. C. — Bids will be received by the Bureau of Supplies and Accounts, Navy Department until Jan. 23 for electric wire and cable for eastern navy yards (Schedule 416).

## North Central States

BATTLE CREEK, MICH.—Bids will be received by the director United States Veterans' Bureau, office of the Quartermaster General, 2306 Munitions Building, Washington, D. C., until Feb. 16 for construction of a 500-bed Neuro-Psychiatric Hospital to be erected at Camp Custer, Battle Creek. The work will include the construction of about thirty buildings complete with sewer, water, heating and lighting systems, etc.

DETROIT, MICH. — The Detroit Edison Company has issued $1,500,000 in bonds, part of the proceeds to be used for extensions and improvements. Plans are being prepared for an addition to the substation at Milan, to cost about $25,000.

NORTH FORUM, MICH. — The State Prison Board, Jackson, contemplates the installation of a power house in connection with a new state prison here, to cost about $3,000,000. Smith, Hinchman & Grylls, Marquette Building, Detroit, are architects.

CLEVELAND, OHIO.—Bids will be received at the office of the commissioner of purchases and supplies, City Hall, until Jan. 26 for station transformers.

CLEVELAND, OHIO.—Bids will be received at the commissioner of purchases and supplies, City Hall, until Jan. 26 for furnishing coal and ash handling equipment, radial brick chimney, feed-water-heater shells and equipment for treating boiler make-up water for the Fairmount pumping station, division of water.

INDIANAPOLIS, IND.—The Terre Haute, Indianapolis & Eastern Traction Company has been granted permission to construct an addition to its steam-operated electric generating plant on West Tenth Street, including new transmission and distributing lines, substations, etc., to cost eventually about $6,000,000.

CHICAGO, ILL. — The Commonwealth Edison Company is preparing plans for a 320,000-kw. power plant at Crawford Avenue and Thirty-fifth Street, to cost about $5,000,000. Graham, Anderson, Probst & White, 80 East Jackson Boulevard, are architects.

SHELBYVILLE, ILL. — Bids will be received by the City Council until Feb. 5 for the installation of a municipal electric light and power plant. Plans and specifications may be obtained from the W. A. Fuller Company, Railway Exchange Building, St. Louis.

BEAR CREEK, WIS.—Electricity will be supplied in Bear Creek to farmers along the Bear Creek Road and in the towns of Maple Creek, Lebanon, Deer Creek and a portion of Black by the Star Electric Heat & Power Company, recently organized as a subsidiary of the Wisconsin Traction, Light, Heat & Power Company. Power to operate the system will be purchased from the Wisconsin Traction, Light, Heat & Power Company, Appleton. W. R. Cornwell, New London, will be manager of the new company.

DELAVAN, WIS.—The Southern Wisconsin Electric Company is planning to change its local system from three-wire, three-phase, 2,300 volts, to four wire, three-phase, 2,300 volts. The cost is estimated at about $12,000.

GRANTSBURG, WIS. — The Burnett County Light & Power Company has petitioned the Railroad Commission for authority to issue $20,000 in notes, the proceeds to be used for extensions to its plant and system during the coming year.

LANCASTER, WIS. — The Interstate Power Company will soon begin work on the reconstruction of its transmission line from Postville to Waukon. The voltage will be changed from 13,200 to 33,000.

MANITOWOC, WIS. — Plans are under consideration by the Public Utilities Commission for extensions to the municipal electric lighting and waterworks systems. The installation of a new generator and automatic stokers, etc., at the electric plant is contemplated.

STURGEON BAY, WIS.—The installation of an ornamental lighting system on Cedar Street in the business district, to cost about $9,000, has been approved by the City Council.

ST. PAUL, MINN.—The Ford Motor Company, Highland Park, Mich., has applied to the Federal Power Commission for permission to build a hydro-electric power plant on the Mississippi River, to be used in connection with a proposed assembling works to cost about $2,500,000. In the event of refusal a steam-driven generating plant will be built.

BRANSON, MO. — The Empire District Electric Company, Joplin, has completed plans for the initial unit of its proposed local hydro-electric power plant, to cost about $2,500,000. The entire project will involve an expenditure of about $10,000,000.

OSCEOLA, MO.—Plans are being prepared by Arthur L. Mullergren, Gates Building, Kansas City, consulting engineer, for the construction of a hydro-electric plant in Osceola, to cost about $450,000. It will be operated by a company now being organized by E. E. Peake, Kansas City.

CHESTER, NEB.—Plans are being prepared for the installation of an electric distributing system in Chester. The Prince-Nixon Engineering Company, Peters Trust Building, Omaha, is engineer.

## Southern States

MORGANTON, N. C. — The Drexel (N. C.) Furniture Company will install a power house in connection with its proposed local factory, to consist of four two-story buildings, 75 ft. x 250 ft. each.

RALEIGH, N. C.—The Carolina Power & Light Company contemplates the erection of a 60,000-volt substation near the State Hospital in Raleigh.

TUXEDO, N. C. — The Manufacturers' Power Company is preparing plans for the construction of a local hydro-electric plant, with ultimate capacity of 70,000 hp., to cost about $4,000,000.

VANCEBORO, N. C. — Contract, it is understood, has been placed for the installation of a municipal electric light plant.

WILMINGTON, N. C. — The Tidewater Power Company contemplates erecting a transmission line from Wilmington to Warsaw, and from Warsaw to Clinton to supply electricity in those towns and intermediate points. The Tidewater company will sell power in bulk only, and it is expected that companies will be organized in each town to distribute electricity locally. C. W. Petty of Clinton has entered into a contract with the company for energy to be distributed in that town.

ATLANTA, GA.—The Georgia Railway & Power Company is arranging an expenditure of $6,500,000 for extensions and improvements in 1923, to include a 22,000-kw. hydro-electric plant at Tallulah Lake, to cost $1,000,000; completion of the power plant at Tugalo; transmission line from Atlanta to Tallulah, Commerce, Winde and Noreros, to cost $750,000; substations and line extensions at Atlanta, to cost about $500,000, and extensions and improvements to the traction system and gas plants to cost $2,500,000.

BONIFAY, FLA. — The Council has awarded a contract to the Houston Power Company, Dothan, Ala., to supply electricity for lamps and motors in Bonifay. The service will be supplied from the plant at Newton, Ala.

KNOXVILLE, TENN. — The Tennessee Lumber Manufacturing Company will build a power house at its proposed local plant.

CARSON, LA.—The Delta Land & Timber Company will install a substation in connection with the rebuilding of its local plant, recently destroyed by fire, causing a loss of about $150,000.

HOUMA, LA.—The contract for the construction of a municipal electric plant, waterworks system and filtration plant has been awarded to the Merkel Machinery & Contracting Company, Kansas City, Mo. The cost is estimated at $250,000.

MONROE, LA. — The Southern Carbon Company will build power houses at its proposed plants at Swartz, Spyker and Fowler, La., to cost about $1,500,000.

MONROE, LA.—The Bell Manufacturing Company contemplates the installation of a power house in connection with extensions to its plant.

ARDMORE, OKLA. — The Consumers' Light & Power Company will soon take bids for a power plant, to cost about $100,000. The W. A. Baehr Corporation, People's Gas Building, Chicago, Ill., is consulting engineer.

PAUL'S VALLEY, OKLA.—Bonds to the amount of $53,000 have been voted for the installation of a municipal electric plant. V. V. Long & Company, Colcord Building, Oklahoma City, are engineers.

CUERO, TEX. — The City Council has granted the Texas Central Power Company permission to erect a new transmission line from its power plant on the Guadalupe River to Cuero.

FORT WORTH, TEX. — Bonds to the amount of $250,000 have been voted for extensions to the municipal electric light and power system.

PORT ARTHUR, TEX.—The Board of Education plans to build a two-story power house in connection with extensions to the local high school.

SAN ANTONIO, TEX. — The tentative budget of the San Antonio Public Service Company provides for extensions and improvements to the electric power plant and street-railway system, to cost about $1,000,000.

## Pacific and Mountain States

KETTLE FALLS, WASH. — Plans are being prepared by the White Pine Sash Company, Spokane, for the erection of a band sawmill, including power plant, dam, logging road, etc., at Kettle Falls, to cost about $150,000. F. W. Horstkotte, Mohawk Building, Spokane, is engineer.

PASCO, WASH.—The Pacific Power & Light Company contemplates extensions and improvements in this section, including additional transmission lines, to cost about $450,000.

PULLMAN, WASH. — The Washington Water Power Company plans to erect a 60,000-volt transmission line to Moscow, Idaho, 11 miles, to replace the 22,500-volt line.

ASTORIA, ORE.—Plans have been prepared by the Hammond Lumber Company for the erection of a new lumber mill, box factory and power house, to replace its plant recently destroyed by fire. The loss is estimated at about $700,000.

ANDERSON, CAL.—The Pacific Gas & Electric Company is planning to remodel the local street-lighting system.

BANNING, CAL. — The San Gorgonia Power Company has been granted permission by the State Railroad Commission to construct two hydro-electric plants near Banning and also authority to issue $100,000 in bonds and $100,000 in capital stock.

LOS ANGELES, CAL. — The Southern California Edison Company has received permission to issue $1,761,000 in bonds, the proceeds to be used for extensions to its system.

OAKDALE, CAL. — The Oakdale and South San Joaquin irrigation districts are arranging a bond issue of $3,750,000, of which $1,516,000 will be used for the construction of a power plant for joint service.

SAN FRANCISCO, CAL. — The Pacific Gas & Electric Company contemplates building a machine shop, meter shops, transformer shop, warehouse and other miscellaneous structures.

SANTA BARBARA, CAL.—Plans have been approved for the installation of a street-lighting system on Anacapa and Pedregosa Streets, Riviera district.

SCALES, CAL.—Plans are under consideration by Peer & Berkey for the construction of an irrigation project, including hydro-electric plants to develop 36,000 hp., using impulse wheels directly connected to generators. The project includes two diversion dams, several storage dams, steel-pipe line, canals, etc. J. P. Sweeney, Nevada Bank Building, San Francisco, is representative.

SELMA, CAL.—The installation of an ornamental lighting system in the business district is under consideration.

SYLMAR, CAL.—The construction of a power house at the Olive View Sanitarium is under consideration by the Board of Supervisors, Los Angeles.

## Canada

BARNET, B. C.—The erection of a high-tension transmission line crossing over Burrard Inlet to Barnet, to cost about $90,000, is under consideration by the British Columbia Electric Railway Company, Vancouver.

AMHERST, N. S.—The Nova Scotia Electric Commission is considering a hydro-electric development near Amherst, where it is estimated that about 600,000 hp. can be developed.

BROCKVILLE, ONT.—The Town Council has passed a bylaw authorizing an appropriation of $57,645 for improvements to the Hydro-Electric system.

DUNDAS, ONT. — The Hydro-Electric Power Commission of Ontario is planning to rebuild its local substation and transformer station, recently destroyed by fire, to cost about $125,000. F. A. Gaby, Toronto, is chief engineer.

GALT, ONT.—The ratepayers have authorized an issue of $125,000 in debentures for extensions to the Hydro-Electric system.

MEAFORD, ONT.—The ratepayers have approved a bylaw providing for an extension to the Hydro-Electric transmission line. The bylaw for the purchase of the plant of the Georgian Bay Milling & Power Company was defeated.

OTTAWA, ONT.—The ratepayers have approved a bylaw to purchase the street railway owned by the Ottawa Electric Company. Extensions are contemplated, including the construction of 17 miles of single track, the erection of car barns and the purchase of forty-seven new cars, to cost about $1,500,000.

TORONTO, ONT.—The Toronto Hydro-Electric Power Commission of Ontario has decided to carry out plans at once for the complete conjunction of the former Toronto-Niagara system with the Hydro-Electric system.

TORONTO, ONT.—Plans are being considered for equipping the Grand Trunk Railway from Toronto to Hamilton and from Hamilton to Niagara Falls, for electrical operation, also for laying additional tracks for fast radial service, a total distance of 80 miles. A. F. Stewart, 407 Old Union Station, is chief engineer of the Canadian National Railways.

MONTREAL, QUE.—Interests connected with the Shawinigan Water & Power Company have organized the St. Maurice Power Company to operate as a subsidiary in connection with utilizing the Big Gres Falls on the St. Maurice River for development of hydro-electric power. The company will be capitalized at $8,000,000 and will authorize an issue of $12,000,000 in bonds.

## Electrical Patents

**Announced by U. S. Patent Office**

(Issued Dec. 26, 1922)

1,440,225. EMERY WHEEL STAND; J. J. Koukol, Cuba, Kan. App. filed April 6, 1921. One or more stones can be attached and operated on same piece simultaneously.

1,440,305. ELECTRIC HEATER; E. N. Lightfoot, New York, N. Y. App. filed Jan. 9, 1920. Resistance elements represent clusters of logs.

1,440,325. SAFETY RAZOR; R. H. Wilhelm, Chicago, Ill. App. filed Aug. 9, 1921. Flashlight placed in handle.

1,440,354. BATTERY PLATE; J. J. Hanna, Ordway, Col. App. filed April 8, 1922. Allows for expansion and contraction of plates.

(Issued Jan. 2, 1923)

1,440,365. TELEPHONE SYSTEM; R. W. Augustine, Chicago, Ill. App. filed July 31, 1916. Code-ringing system for different stations upon poly-station line.

1,440,389. JUNCTION BOX FOR CONDUIT PIPING; J. W. Jones, Perth, Scotland. App. filed March 3, 1923.

1,440,402. ELECTRIC HEATER; H. Meredith-Jones, New York, N. Y. App. filed Dec. 14, 1921. Room heater provided with racks for drying clothes.

1,440,407. DETECTING CIRCUITS; H. S. Osborne, New York, N. Y. App. filed July 2, 1920. Carrier-current receiving apparatus.

1,440,419. TROLLEY-WIRE GUARD; D. Stitt, Morgantown, W. Va. App. filed May 19, 1922. Guard normally extending below the trolley wire automatically swung out by passage of trolley wheel.

1,440,432. WIRELESS RECEIVING SYSTEM; C. T. Allcutt, Pittsburgh, Pa. App. filed June 25, 1921. Receiving system for undamped signal impulses.

1,440,470. METHOD AND APPARATUS FOR TESTING WELDS; I. F. Kinnard, Wilkinsburg, Pa. App. filed April 21, 1921. By comparing resistance and reluctance of weld with unwelded part.

1,440,490. REGENERATION OF ALTERNATING-CURRENT COMMUTATION MOTORS; L. M. Perkins, Wilkinsburg, Pa. App. filed Jan. 25, 1919. Manual control of phase relation of exciting voltage regulates regenerative torque.

1,440,502. METHOD OF AND APPARATUS FOR MAKING FINE METALLIC POWDERS AND COLLOID SOLUTIONS; J. Slepian, Wilkinsburg, Pa. App. filed Jan. 8, 1920. Electrolytic process.

1,440,511. SECTION BREAK DEVICE; N. J. A. Wahlberg, Pittsburgh, Pa. App. filed Nov. 11, 1919. Section switch for mine trolley.

1,440,515. MELTING FURNACE; H. G. Wellman and C. D. Gilpin, Cleveland, Ohio. App. filed May 17, 1920. Adopted to melt non-ferrous metals for making bronze, brass and similar castings.

1,440,519. ELECTRIC BAKE OVEN; J. C. Woodson, Mansfield, Ohio. App. filed June 3, 1921. Means for equalizing heating effects at both ends of oven.

1,440,551. ELECTRIC POWER PLANT; H. R. Patterson, Toledo, Ohio. App. filed Sept. 10, 1919. Engine-driven storage-battery set.

1,440,651. ATTACHMENT PLUG; R. B. Wolcott, Cleveland Heights, Ohio. App. filed Dec. 23, 1916. Swivel plugs.

1,440,678. METHOD OF PLATING WOODEN ARTICLES; F. Hachmann, St. Louis, Mo. App. filed Dec. 31, 1920. Electrolytic process.

1,440,693. ELECTRICAL WATER HEATER; H. R. Montgomery, Dayton, Ohio. App. filed Jan. 7, 1921. Automatic pipe-line heater.

1,440,711. ARC-WELDING APPARATUS; P. P. Alexander, Lynn, Mass. App. filed July 26, 1921. Automatic or semi-automatic type in which metallic electrode is automatically fed to work.

1,440,724. ELECTRODE FOR ELECTRIC FURNACES AND PROCESS FOR MANUFACTURING THE SAME; C. W. Söderberg, Christiania, Norway. App. filed Sept. 8, 1919. Tamping or pressing an electrode material into metallic mantle.

1,440,729. ELECTRIC STEP-BY-STEP MOTOR OF THE UNWOUND-ARMATURE TYPE; J. W. French, Glasgow, Scotland. App. filed March 30, 1921. Three motor elements, each comprising an electromagnet and an unwound armature.

1,440,750. ELECTRIC RIVET HEATER; E. Schroder, Berlin, Germany. App. filed July 6, 1921. Cooling electrodes by evaporating liquid held in cavity in electrode.

1,440,752. TELEPHONE TEST SET; R. B. Stone, Nashville, Tenn. App. filed Sept. 9, 1919. Hand telephone set for use along railways.

1,440,760. ELECTRICAL COIL; S. R. Wright, Rawdon, near Leeds, England. App. filed Aug. 22, 1921. Method of winding high-voltage coils to prevent initial surges.

1,440,774. ELECTRICAL DEHYDRATOR; W. O. Eddy, Los Angeles, Cal. App. filed Dec. 19, 1921. Adapted to remove water from petroleum emulsions.

1,440,775. DEHYDRATOR; W. O. Eddy, Los Angeles, Cal. App. filed Dec. 19, 1921. For petroleum emulsions operated by electrostatic field.

1,440,776. DEHYDRATOR; W. O. Eddy, Los Angeles, Cal. App. filed Dec. 27, 1921. Upper electrode adjustable.

1,440,778. WATER INDICATOR FOR OIL WELLS; W. L. Foster, Whittier, Cal. App. filed May 21, 1921.

1,440,804. DIRECTION INDICATOR; E. B. Wagner, San José, Cal. App. filed Aug. 6, 1919. Direction indicator for automobiles.

1,440,826. ELECTRICAL HEATING ELEMENT FOR PRESSURE COOKERS; E. G. Hager, Kimberly, Idaho. App. filed July 5, 1921.

1,440,828. DEHYDRATOR; F. W. Harris, Los Angeles, Cal. App. filed Sept. 18, 1919. Process of removing water from petroleum oils.

1,440,834. RADIO COMMUNICATION; C. V. Logwood, Chicago, Ill. App. filed July 2, 1921. Transmitting equipment comprising several vacuum tubes.

1,440,835. PROCESS OF AND APPARATUS FOR DEHYDRATING PETROLEUM EMULSIONS BY OSMOSIS; W. Meredith, Alameda, Cal. App. filed Feb. 14, 1921.

1,440,840. AUTOMOBILE HEADLIGHT; F. A. Reece, Chestnut Hill, Mass. App. filed Sept. 22, 1917. Lamp bulb containing two light centers with an opaque member between them throws all rays downward.

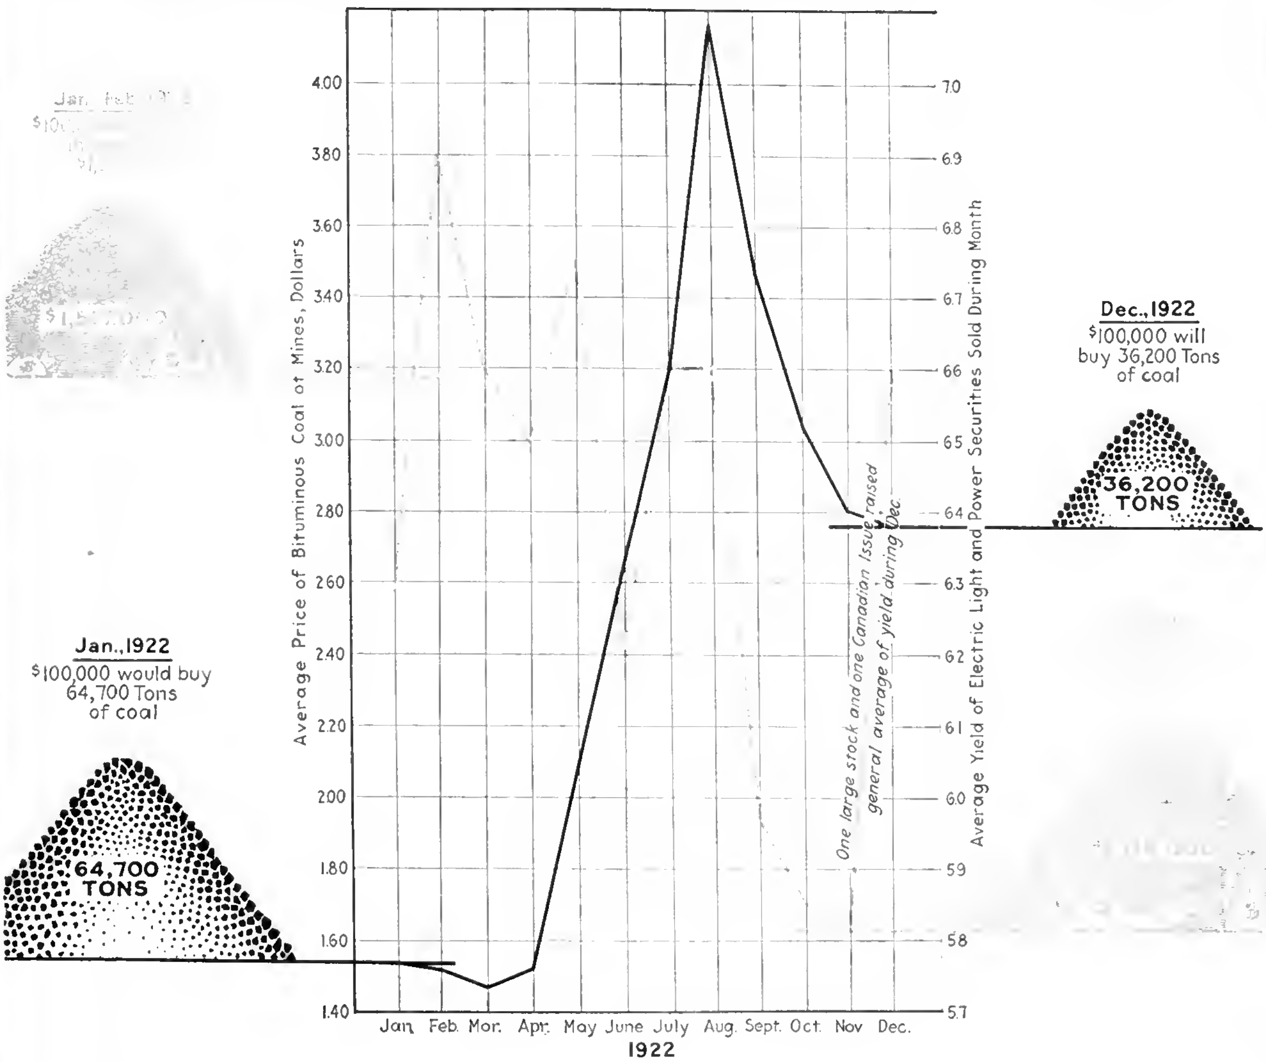
1,440,879. ELECTRIC SYSTEM FOR VEHICLES; T. L. Lee and R. H. Sullivan, Rochester, N. Y. App. filed Jan. 20, 1921. Automatic storage-battery-charging system.

1,440,951. ARMATURE CONSTRUCTION; V. G. Apple, Dayton, Ohio. App. filed April 27, 1918. Insulation and support for armature and commutator.

# Business Facts for Electrical Men

Selected Statistics Presented Graphically for the Use of All Interested in Analyzing the Trend of the Electrical Business

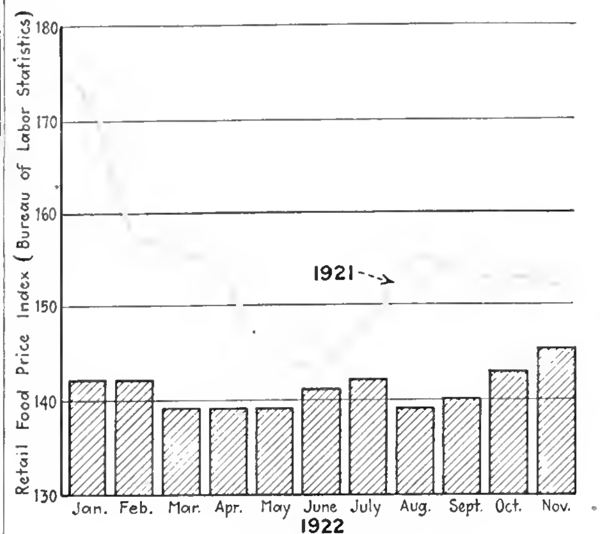
## During 1922 Cost of Money Fell While Cost of Fuel Rose



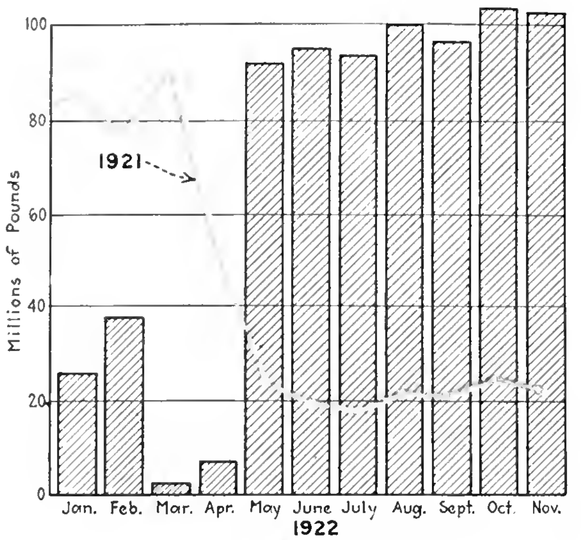
## A Year Calling for Extreme Economy and Large Expenditures

NECESSARY extensions to central-station equipment call for hundreds of millions of dollars during 1923. A very large portion of this amount must be borrowed from the public, and interest on the loans must be paid. The year opens with the possibility for efficiently managed companies to borrow at a cost under 6 per cent, which is significant when it is remembered that at the opening of 1922 the average yield demanded was 6.6 per cent and in August, 1920, it was over 8 per cent. This means that the industry will be much better able to meet the largely increased demands for electrical energy by added equipment and that the profits from the new load will not be eaten up through payments of interest.

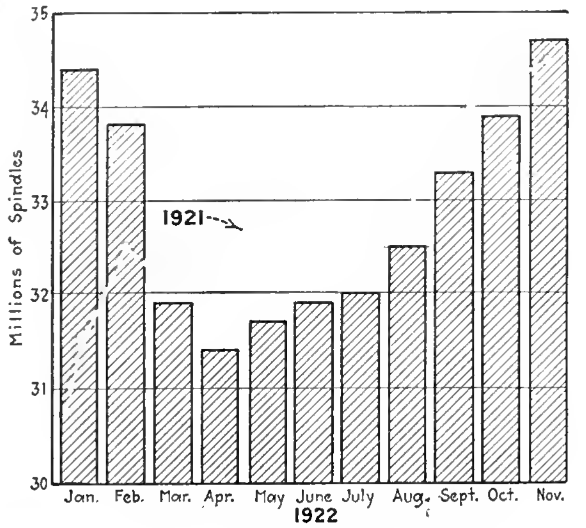
The thorn in the rose is the price of coal. Fuel costs almost twice as much as it did a year ago, and the cost of fuel forms almost 75 per cent of the production expenses of a large generating plant. The encouraging fact is that the cost of coal will undoubtedly decrease as the year advances.



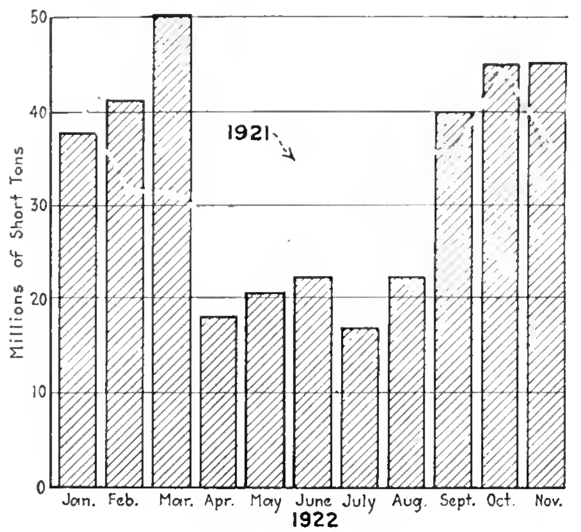
Index of Retail Food Prices



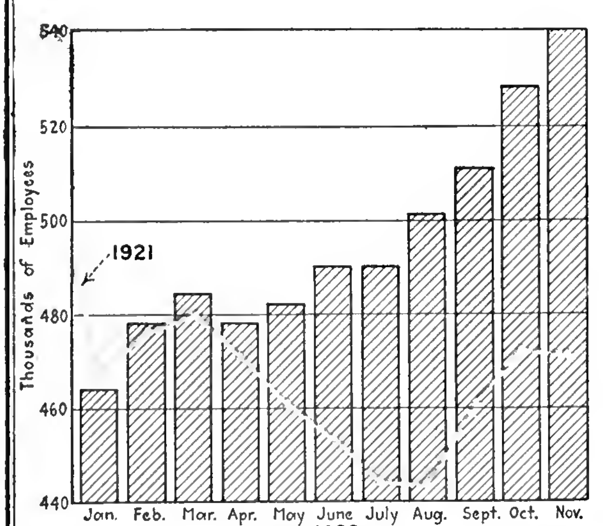
Copper Production



Activity of Spindles in Cotton Mills



Bituminous Coal Production



Employees in Factories of New York State

# A Job for Every Workman

THE transition of the country from a period with much lack of employment to one in which few men are looking for work was one of the most remarkable economic changes witnessed during 1922. The low point in employment, as indicated by the employees in the factories of New York State, was during July and August of 1921. Subsequent to that date employment increased by almost uniform steps until by the end of 1922, a period of sixteen months, the number employed was about 20 per cent greater than in August, 1921. In other words, in New York State alone almost 100,000 more men were employed in the factories on Jan. 1, 1923, than at a period sixteen months previous to that date.

Another skyrocket movement during 1922 was in the production of copper. In one month, from April to May, the production of copper jumped over 1,200 per cent, or from 7,026,000 lb. to 92,048,000 lb. The production for the first eleven months of 1922 showed an increase of 36 per cent over a similar period in 1921, but was almost 30 per cent below the 1920 figures. Exports of copper were 29 per cent greater than in 1921 on the basis of ten-month figures.

# What to Do

THE world is full of good advice. We are plenteously supplied with theorists and prophets willing and eager to point us all along the paths of progress. There are so many plans and purposes and opportunities before the face of every man interested in the development of the electrical industry that oftentimes there seems to be no sure place to begin.

With the whole wide world spread to his eyes and with the greatest service to render that has ever blessed mankind, the electrical man is often baffled with the question of "what to do." The time is short, the task is great and ambition urges to divergent ends.

Fundamentally there are four things to do, four ways to work that simplify the problem and help to set a course and get the work done. There are four principles around which the development of the electrical industry can well be organized:

1. Use the agencies now in the field. Employ the tools that are at hand. Continue the methods that experience has proved good until the work that they will do has been completed.

2. Follow the line of least resistance. Undertake first those things most possible. Concentrate on getting actually done that which will contribute each time the next advance in the purpose and the progress.

3. Proceed along national lines of thought that will take advantage of the interest and the inclination of the masses of the people. Carry forward step by step in the direction of the popular demand, guiding the industry in its growth, but not attempting to resist its natural trend, rather following and serving it.

4. Apply the actual work as an individual and a local effort. Assume responsibility to do first all that can be done to prosper the next job. Make the little things done each day tie into the upbuilding of the electrical industry in the community as the prime consideration and the basis of all bigger plans.

IN the last forty years thirteen million customers for electric service have been connected to the lines of the central station. Not long ago three dollars income per capita in a community was considered good, but today a revenue of thirteen dollars per inhabitant is not uncommon. New consumers are taken on by the thousand in great selling drives. The project to electrify America is really not so big a job as it appears. It can be done. It has been already started.

But no plan, no policy alone will ever accomplish it. Whatever is achieved will be the product of the daily work of engineers, manufacturers, jobbers, central-station men, dealers and contractors who, supported by the co-operation of the entire industry, look to see what to do, each in his town, and then do it.

# Walter Sherman Moody

*A pioneer in power transformer design and a specialist in insulating and magnetic materials.*

THE transformer and the induction motor are the two machine developments that have created the alternating-current electrical systems. The great networks of high-voltage transmission lines owe their existence to the development of the transformer, and Walter Sherman Moody stands in the same relation to this device that Nikola Tesla does to the induction motor.

Back in 1888, while an instructor at the Massachusetts Institute of Technology, Mr. Moody helped William Stanley demonstrate the Goulard and Gibbs alternating-current system. He was so greatly fascinated by its possibilities that he devoted his energies to this field of research. He was assistant engineer with the Thompson Electric Welding Company from 1888 to 1892 and then became a designing engineer with the Thomson-Houston Company at Lynn and became chief engineer of the transformer department of the General Electric Company when the merger occurred. While with the General Electric Company he has made notable contributions to the art, holding nearly fifty patents, and he was the originator of the circular-coil type of transformer with a core of approximately round cross-section. He also was the designer of the first "air-blast" transformers.

Today he is chief engineer of the transformer department of the Pittsfield works of the General Electric Company and has general supervision of transformer engineering at the Fort Wayne and Lynn plants. He has helped make possible a growth in transformer size and rating from the small figures of the early days to those of today, with ratings of 25,000 kva. and 220,000 volts.

Born in Chelsea, Mass., Sept. 20, 1864, Mr. Moody was graduated in the first electrical engineering class from the Massachusetts Institute of Technology in 1887. He taught in his Alma Mater for one year and then entered upon his career as a transformer engineer. Believing that he should know materials, he got into close touch with Sir Robert Hadfield in the development of silicon-steel alloys and co-operated with the Allegheny Steel Company in the first production of silicon-steel sheets. He also became a specialist on insulating materials and the metallurgy of iron and copper.

In the midst of his technical activity Mr. Moody found time to write many authoritative papers and to co-operate with the activities of other men in the industry. He is a fellow of the A. I. E. E., a member of the N. E. L. A. and the American Electrochemical Society. His social affiliations are with clubs in Schenectady and Pittsfield.

# Editorial Comment

Electrical World, January 27, 1923

Volume 81 Number 4

## Persecution by the News Reporter

WHY should the newspaper reporter prey upon the electrical industry? For instance, recently two persons were found dead in a bathroom. One body lay in the water, the other upon the floor. And this is what the news sleuth wrote—in his final paragraph:

> Coroner Blank thought it was improbable that the deaths were due to electrocution. Occasionally, he admitted, a person taking a bath gets a shock strong enough to kill if, while still in the water, he touches an electric light fixture. Death by electricity, however, generally marks its victim, even though the burn be a small one, and no such scars were to be found on either body.

Now, all were agreed that it was not "death by electrocution." All would have doubtless agreed that neither was it death by forest fire, cyclone, automobile collision or swallowing false teeth. But this the reporter does not speculate upon. By suggestion, however, he spreads abroad the hurtful thought that death by electrocution is not uncommon, though the coroner would not "admit" it in this case. All this is bad for the central-station company. It is bad for all electrical men—which in turn is bad for the newspaper. But the reporter does not think about this, and so he speculates about this tragedy and says, "It might have been electricity, but it wasn't." And the reason that he does not realize how he harms the electrical industry is because no electrical man has ever gone to the trouble to take him out to lunch and explain it all. For friendly personal contact with the men who write this local news will develop understanding.

## Operating Code Makes for Permanent Economies

A PERMANENT operating code is an aid to economy in the operation of a central-station system. It reduces the harmful effect of the frequent changes in personnel that are sometimes unavoidable. Another advantage is that while highly paid engineering and executive talent can be used to formulate the code and to revise it at intervals, yet the operations favored can be carried out by men who, though lacking high technical knowledge, are better suited to handling the operating forces.

In the modern central-station system too frequently an able executive and engineer organizes various methods of procedure as he works his way to the front ranks, only to find later, upon studying his organization in detail, that his rules of operation have been changed by his successor to the detriment of the system. He often finds, too, that a change in a foremanship makes it necessary for him to supervise the new incumbent's work minutely in order to insure efficiency. With the grade of labor used in subordinate positions executive supervision over every detail is required. A written operating code helps greatly in improving these conditions, particularly if along with the code an educational plan is intelligently pursued.

As a practical matter it has been found very difficult to formulate such a code on a national basis, because the changing conditions in the art and the personal opinions of minor executives are difficult obstacles to overcome. None the less, a code offers many opportunities for putting the best methods of the industry into practice, and several companies have formulated codes for their own use and have proved their efficiency through trial. The ELECTRICAL WORLD in this issue starts the publication in the Central Station and Industrial Practice department of such a code. It hopes that a valuable discussion will follow on which a more universally applicable code can be based.

## Advisory Publicity Council Deserves Support

THE announcement that the publicity council which has been serving as an active advisory board to the Society for Electrical Development will from now on function also for the Joint Committee for Business Development is a gratifying evidence of progress. This council is composed of a group of the directors of publicity of the principal electrical manufacturers and central-station companies. Through its association with the joint committee, also, it will become in effect an advisory publicity council for the industry and an instrument for assisting and harmonizing to some degree the many independent influences which the electrical industry is now exerting in various forms of advertising and publicity.

An interesting case, of recent report, offers a good example. A certain group of manufacturers has apparently decided to employ a publicity man to organize a joint campaign of publicity in the form of "human interest" articles written around their particular appliance, which will be broadcasted to the newspapers of the country, with the expectation that many will be printed and thereby advertise the product of the group. But it happens that for several years the Society for Electrical Development has maintained a press service to provide a well-balanced presentation of the story of electricity in the home and industry, written in popular form, and about 450 newspapers are accepting it as legitimate news and using it. Moreover, the state committees for public information, which have been organized through the efforts of the National Electric Light Association and the other national utility associations, are providing the press with an ample amount of current facts on public utilities, and their articles and items are widely accepted. For independent groups of manufacturers, therefore, to enter the arena and begin to deluge the press of the country with a flood of "news stories" which because of their more limited topic would necessarily smack of propaganda might shake the entire confidence of the press. The fact that news of electrical

developments and activities has become recognized as of vital interest to the public is a great achievement. The newspapers must not be provoked to alter their friendly attitude by any attempt to cram selfish "copy" down their throats.

The broader activity of this advisory publicity council should provide a responsible authority that may serve the industry well in guiding all its advertising efforts along constructive, helpful lines and avoiding wasteful duplication or hurtful mistakes. Its work should have the strongest possible support from all branches of the industry, so that their combined publicity may be synchronized as perfectly as possible.

### Inductive Co-ordination and Public Duty

REAFFIRMATION by the Supreme Court of the State of Washington of its findings, rendered last fall, that the prior occupancy of a highway by telephone wires did not obligate a power company which had paralleled these wires by a properly constructed transmission system to bear the cost of metallicizing them again draws attention to the mutual obligations of utilities under such conditions toward each other and toward the public. In this case the power company had done everything that the present development of the art suggests to confine inductive influence to its proper channels, but the physical condition of the telephone system, which was grounded, made it unduly susceptible. The telephone system, the court clearly holds, had an equal duty to perform in putting its plant into a condition that would not place an undue burden on the power company and the public it serves. Despite the court's enunciation, in its second pronouncement—in order, it said, to quiet unnecessary alarm—of the obvious fact that its declaration that priority in time does not give a superior right to occupancy applied only to the case under review, the inference is that such priority has no effect on the obligations toward each other of the two classes of utility. In every case that arises these obligations must be determined by other facts than the mere question of which utility was first in carrying its service to the public over a highway which both have the right to occupy.

### Financing Rural Extensions

FINANCING of rural line extensions has been a vexing problem all over the country because the revenue from most extensions of this character has been so small that they cannot be considered on the same basis as other classes of business. There have been almost as many extension policies in use as there are utilities in the field, and the confusion caused by the contradictory nature of the many policies has almost led many utility men to throw up their hands in despair. In a few cases the problem has been faced on a broad basis and an earnest attempt made to bring all the fundamental factors into consideration. One of these attempts is the study, extending over two years, made by the technical committee of the Northwest Electric Light and Power Association. The annuity plan of financing extensions as evolved by the committee is described elsewhere in this issue by R. M. Boykin, its chairman.

Without so stating, the committee starts with the assumption that commission regulation has put the returns from the operation of any given property on such a basis that the ratio of investment in certain items of property to the annual revenue is such as to provide a proper return to the utility. The utility under the suggested plan is then required to make investments for future consumers on this same ratio basis, and an annuity method of determining the advance payments to cover losses that must be borne by the consumer is applied to cover the remainder of the financing cost. The committee further assumes that the course of business development on any extension will be sufficient to place the extension on a paying basis in a reasonable period of time.

While these two assumptions are probably correct for Pacific Northwest conditions, they do not apply in some other sections of the United States, and for this reason the method suggested is probably not available for application over the whole country. However, it does represent an attempt to cover the fundamentals, and even though it may not cover all situations in its present form, it adds something toward the solution of the question and deserves serious study as one method of meeting the problem of financing not only rural extensions but other classes of extensions as well, particularly those in which the future development to a paying basis in the ordinary growth of a territory is an assured fact or at least as nearly so as anything of this nature can be.

### Dominant Position of Anaconda Copper

AS THE largest user of copper in the world, the electrical industry has more than a passing interest in the purchase of the Chile Copper Company by the Anaconda Copper Mining Company. The combination will make the Anaconda company, which for almost forty years has been the country's greatest producer of red metal, the dominant figure in the copper markets of the world. With 16 per cent of the world's copper output to its credit, the company is in a position to make or break the copper market. If it shall become conscious of its strength as well as deeply sensible of its obligation, it can exercise the same sobering influence over the price of red metal that the United States Steel Corporation exercises over the price of iron and steel. The copper industry has long needed some such stabilizer among the half dozen or more great groups of copper producers.

That the Anaconda combination will have any effect in sending the price of copper downward is greatly to be doubted. Ever since the war the economic position of copper has been greatly unsettled. Overproduction was followed by shutdown and then by distribution of virgin metal and scrap from stock. Prices have been chaotic. If the enlarged Anaconda company shall prove to be nothing more than a stabilizer, it will justify itself. However, those who know John D. Ryan and Cornelius F. Kelley realize that the Anaconda will not be content to lead a passive existence. It has always been numbered among the enterprising companies of the country. It has linked itself with the electrical industry in more ways than one, and as goes that industry so will go the Anaconda. Its wagon is hitched too firmly to our star to lumber or to deviate from the path of progress.

## A Practical Example of a Superpower System

THERE has been no little propaganda for the construction of superpower systems for the distribution of energy on a large scale along the Eastern seaboard. As Mark Twain once suggested with regard to the weather, "A great deal has been said about it but nothing done." Nothing, that is, has been done beyond preliminary studies and estimates for public consumption. As has happened many times before in power transmission matters, the Pacific Coast is on the job. Frank G. Baum's article on the Pit River power transmission system, of which the first part appears in this issue, describes a superpower network stretching more than 200 miles northward from its base load around San Francisco Bay. The operating voltage of 220,000 is now well within reach as a practical working pressure. From an engineering standpoint, therefore, the voltage is not surprising, although still impressive. Of far more interest to engineers at large are Mr. Baum's comments on the necessity which gave rise to this particular form of transmission on a large scale and the economic phase of what otherwise would seem an unusual project.

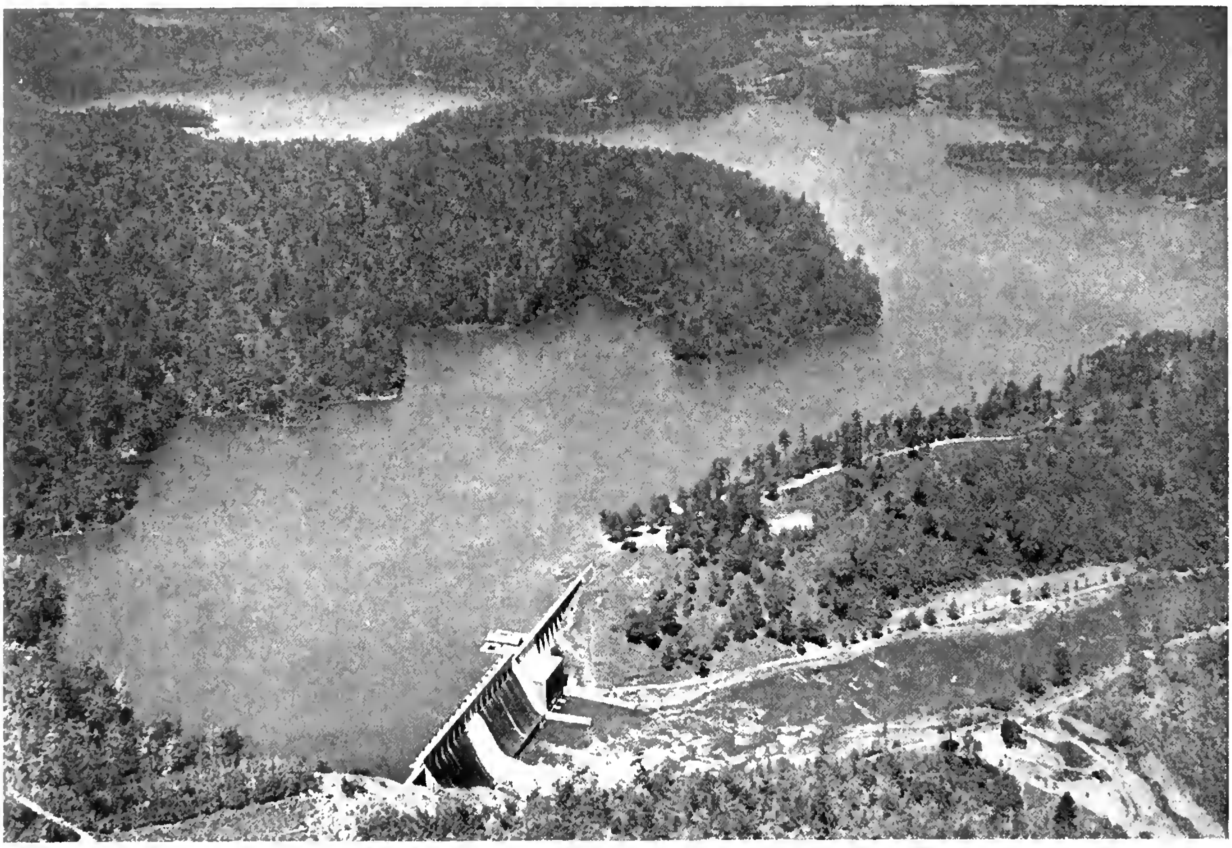
The point of the matter is that California as a whole is wonderfully well served with electrical energy. The networks in the southern, central and northern parts of the state are of remarkable extent and complication, so that more than 80 per cent of the population is actually served, a proportion much larger than that served in any other part of the country, especially the extreme East. The more electricity is used in everyday life the more call for it quickly comes, so that the situation which had to be met by the Pacific Gas & Electric Company was the provision for the San Francisco district of a very large amount of additional power which the existing networks could not supply. The water powers of California grow better and more reliable as one passes northward, and by far the best available source for great additional energy was to be found on the Pit River. The development here means 100,000 kw. at once and two or three times more in the near future. The striking novelty in this great long-distance project was not the addition of the Pit River powers to the existing network; it was rather the plan of boring through this network with a straight-away transmission line aimed to supply the rapidly growing power load around San Francisco Bay and to turn back the power from the widely ramifying networks to build up an intensive service of their own. In Mr. Baum's view, and he is unquestionably right, carrying out the project in this way means a great simplification, especially from the operating standpoint. The Pit River load is thus made independent and can be regulated as a whole without the complication of tying in with an already intricate network. The voltage on the long line can be dealt with by synchronous condensers of no very exaggerated size and held substantially constant at the load and irrespective of variations. Meanwhile it still remains possible to use in an emergency the existing network and the Pit River power to help out each the other's temporary deficiency, although this is not intended to be in the least degree the normal method of operation. Mr. Baum fully appreciates the importance of distributing power to all the communities of the state and criticises with a great deal of justice the timidity which endeavors to draw the load to the power instead of distributing the power to the load.

The transportation of electrical power is the least of the transportation problems which today confront industry. A new manufacturing center means new difficulties in the accumulation and distribution of material vastly more troublesome than any electrical distribution which might serve to place the plants in a better situation with regard to the transportation market as a whole. Further, it is undoubtedly desirable to check the extreme centralization of industry which is now going on. It would be much better to distribute the work over fifty towns and cities than to concentrate it in one of them, where, inevitably, high expense, a difficult labor situation and overcrowding with all its trail of misfortunes will hold sway. To be perfectly frank about it, a great industrial city is usually by no means a pleasant place in which to live, rarely well governed and almost universally overtaxed. In this civic sense the work of the distribution system which brings cheap power to the country in general, instead of confining it, as now too often happens, to a few big centers, is of primary importance, as Mr. Baum very pointedly shows. The interconnection which has gone on in California and elsewhere is, within its limitations, vastly efficient in providing general distribution at moderate expense, but when the time comes for a very large additional amount of power the Pit River plan exemplifies the best way of providing it to simplify the operating conditions. Of some of the other details of the project Mr. Baum will tell more next week. It is sufficient now to point out that the line involves no startling changes in practice, although the graded insulator string, of which the usefulness has been well proved, is a feature which does not appear sufficiently often on American lines. The Pit River system is certainly a most notable addition to the already great development on the Pacific Coast, and Mr. Baum's further studies, especially as regards the operating characteristics of the power plants themselves, will prove of much interest.

## Build Up the Distribution System

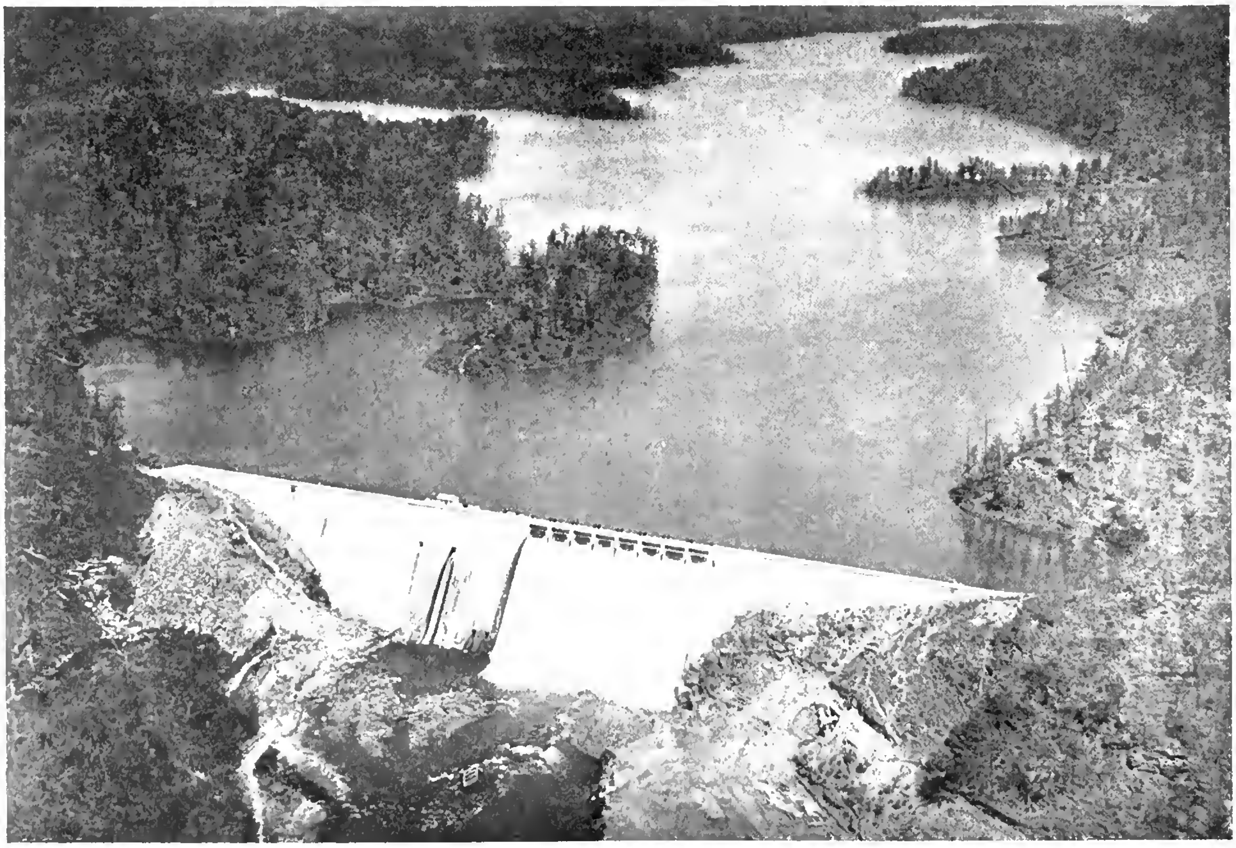
COMPLAINTS come sometimes from the distribution department that central-station executives do not appropriate money to it with the same readiness they show when the power-plant department is concerned. Many things may be to blame for this condition where it exists, but in many cases unfamiliarity with the distribution department's needs is the chief. Perhaps a little human vanity, easily pardonable, also plays its part; for almost every company takes great pride in constructing a fine generating station. Yet when monumental power houses involve, as too frequently they do, an expenditure for decorative and architectural effects out of all proportion to the condition of other parts of the system the error in judgment is manifest.

The distribution system is the one place today where maximum operating economies can be obtained through the application of good engineering and ample funds. In too many cases the existing distribution system represents an accumulation of historic systems many of which are obsolete, but whoever heard of junking a distribution system because of this? Another factor that calls for judicious expenditure is that the distribution system rapidly gets overloaded. Money spent in putting in reserve cable capacity and large ducts will be returned with interest as the system grows. Shoestring financing, on the other hand, is only pennywise. Ungrudging executive support should back the distribution engineers in their plans for development.



## Georgia Railway & Power Company Develops Southern Water Powers

This company has already developed 150,600 hp. and upon completion of the Tugalo plant will have 234,000 hp. available from water power. Upper view, Mathis or Lakemont dam and lake. The reservoir stores 1,369,000,000 cu.ft. of water. Below is Burton lake and dam, which stores 5,280,000,000 cu.ft. of water.



# The Pit River Power and 220,000-Volt Transmission Problem

## PART I

### Analysis of a California Power Problem Which Involved Transmission and Economic Questions of Unprecedented Magnitude and Pioneer Engineering of Noteworthy Character—Interconnection Not the Solution

By FRANK G. BAUM
*Consulting Hydro-Electric Engineer, San Francisco, Cal.*

THE chief merits of hydro-electric developments are that they tend (1) to stabilize rates for power uses and therefore to extend the use for electric power, (2) to equalize the rates for power as between the larger and smaller cities, so that the smaller towns and cities may build up industries, and (3) to conserve coal, oil and labor needed for other industries.

Many of the earlier water-power developments were not a success because they were developed for a lighting business rather than for a power business. It is the power load that has made a financial success of water-power developments and electric transmission, and in California we have many communities which owe their beginning and progress largely to hydro-electric power and transmission. Electric service and rates in California for given classes of service are practically the same in cities of 5,000, 50,000 and 500,000 population. I believe the real solution of the power problem must keep this fundamental of practically universal service throughout in mind. Electric service is too popular now to make it possible to deny the use of this service to a large proportion of the people or to have the cost so high in the smaller cities that the growth of the nation must take place in the larger cities.

I believe the recent overshadowing defeat of the proposed initiative constitutional amendment in California to turn the hydro-electric developments of the future over to the state was primarily due to the fact that electric service in California is almost universal. A secondary reason was the customer ownership, but the service to the customers was first necessary to develop the customer ownership. The problem is political as well as economical, but fortunately the best solution which gives stabilization of rates and wide service is also the best solution for the industry and nation.

## Natural Conditions in California Plus Great Individual Initiative Have Resulted in the Development of Large Power Transmission Systems

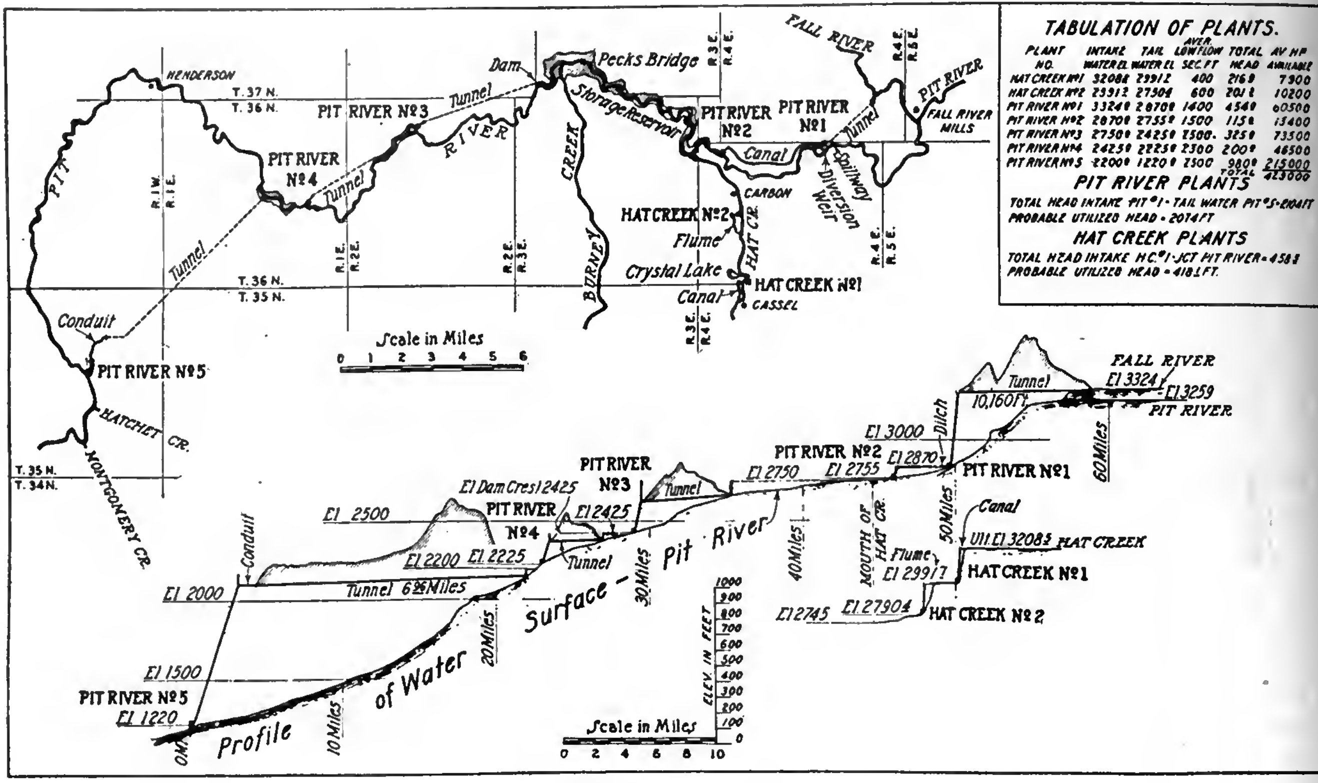
THE writer of this article has been connected with water-power and electric transmission developments in California since 1898 and has devoted his entire time and thought to this industry. He believes that what has taken place in California is a result of natural conditions plus strong individual initiative, which have resulted in a great advantage to the industry. The natural condition in California is that the water power is in the mountains east of the great interior valleys, and in order to bring the power to the large industrial centers near the seacoast the power transmission lines had to cross these valleys. Naturally there was developed along the transmission lines power business for mines, cities, industries, farms, etc., and this has resulted to the great advantage of the state as well as the power industry.

The following analysis of results attained in California was written by the author of this article in 1914 ("The Economic Value of Electric Transmission," Technical Publishing Company, San Francisco). Results today show that the economic value of electric transmission is proving the statements very conservative:

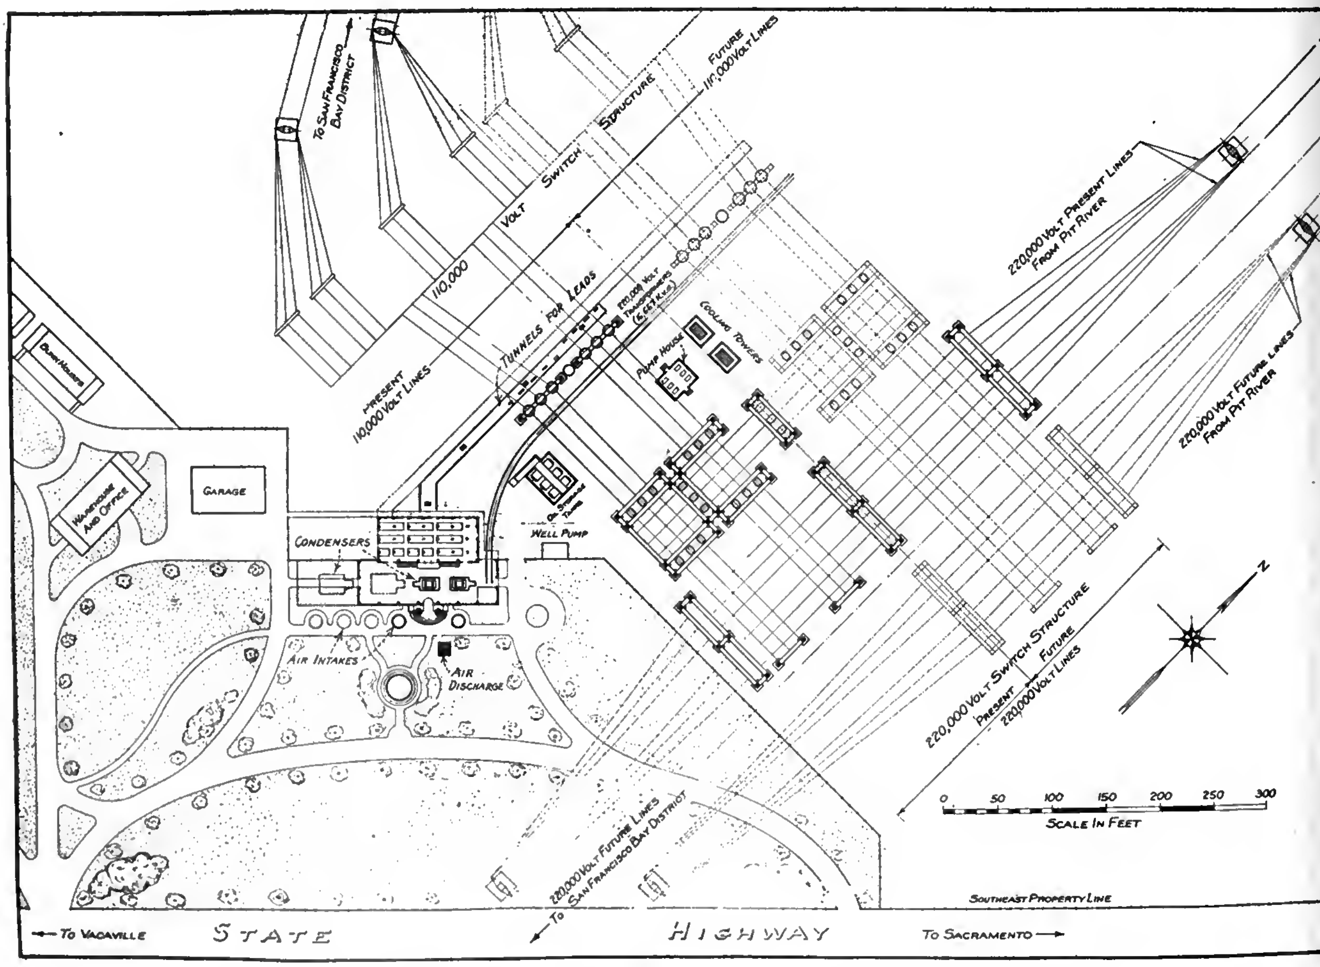
"The men who built the first electric power transmission systems in California did not realize how rapidly and to what magnitude the business would grow; yet, in a general way, they did appreciate the great advantages to be gained by a transmission system furnishing power to operate various industries from large, efficient power plants, instead of each industry supplying its own power from a small, inefficient plant. The economy to the consumer in any particular case could, of course, be determined and the saving to the power user effectively shown, but as the power transmission lines operating as a unit have become larger and made to cover more and more territory, the additional advantages of having large power systems supported by a varied series of industries have added additional economy and stability to the large systems and have also added general benefits to the industries and communities. The total result gives strong reasons for the increase of the electric transmission systems to cover generally a wider territory and more diversified industries.

"The result of such a system covering a wide area is that the same service in electric power is available at the mining camps in the mountains and to the small towns and industries in the central part of California as is supplied to the larger cities. Aside from the economies of such a system resulting from the 'banking' of the facilities, the power conditions throughout this area tend to become equalized, resulting in a distribution of population and industries not otherwise possible, and resulting, also, in adding to the general stability of the country and in great saving in capital and operating expenditures for the industries and cities served. Very often it enables the establishment of an industry—for example, a small factory, a rock quarry, a cement plant, a farm—at a point otherwise prohibited, adding to the economic value of the district.

"In consequence of this electrical development industries are being established in many of the smaller towns and outlying districts where the employees can live more advantageously, and the natural effective result is a healthy growth of all parts of the state, a large saving in operating expenses, capital and resources, a general equalizing of opportunities, and, on the whole, a tremendous economic gain for the communities, increasing in geometric ratio. It is naturally to the interests of the people that the power systems be extended as rapidly as conditions warrant, as the resultant economies from the extension of the business will of necessity redound to their benefit. For this reason, as I said before, California, or any state or nation having available cheap power, need never fear decay."



PLAN AND PROFILE OF THE CONTEMPLATED 400,000-KVA. DEVELOPMENT ON PIT RIVER

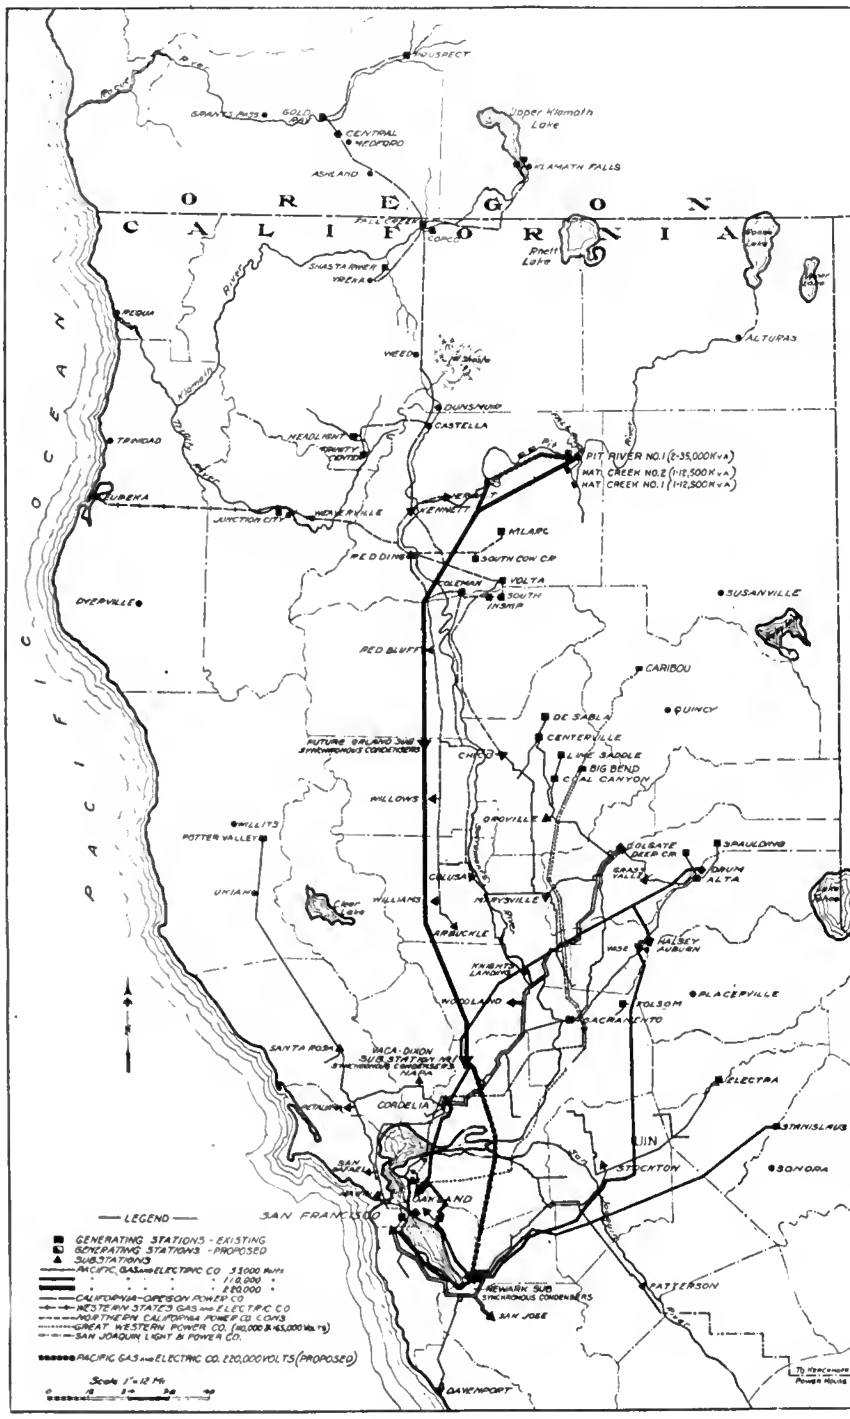


AT THE VACA SUBSTATION THE INCOMING PIT RIVER POWER IS TRANSFORMED, SWITCHED AND DISTRIBUTED TO THE SAN FRANCISCO BAY DISTRICT

With more than 80 per cent of the people of California enjoying electric service, there is little to fear from socialistic ownership schemes; but in many Eastern states less than one-half the people have electric service, and the smaller towns and cities have no real power service to help build up their industries, and I think the danger from this situation is serious. Electric men therefore have a responsible part to play in the future distribution of population of industries, on which depends the stability of the country as a whole as well as the stability of the power industry.

The power streams of California improve generally as one goes north, and gradually, as predicted years ago, the transmission lines have tended to be built from north to south. We required a large, dependable power supply, and Pit River gave us what was necessary, even though an extra hundred miles of transmission line was added. It will be noted that the Pit River power is farthest north, and that this power is taken through to serve the San Francisco Bay district loads, 200 to 300 miles away, without displacing the power step by step from north to south, as might at first glance seem to be the solution of the problem. Before entering into a description of the plants and transmission system the underlying reasons for the design and construction of the system will be given.

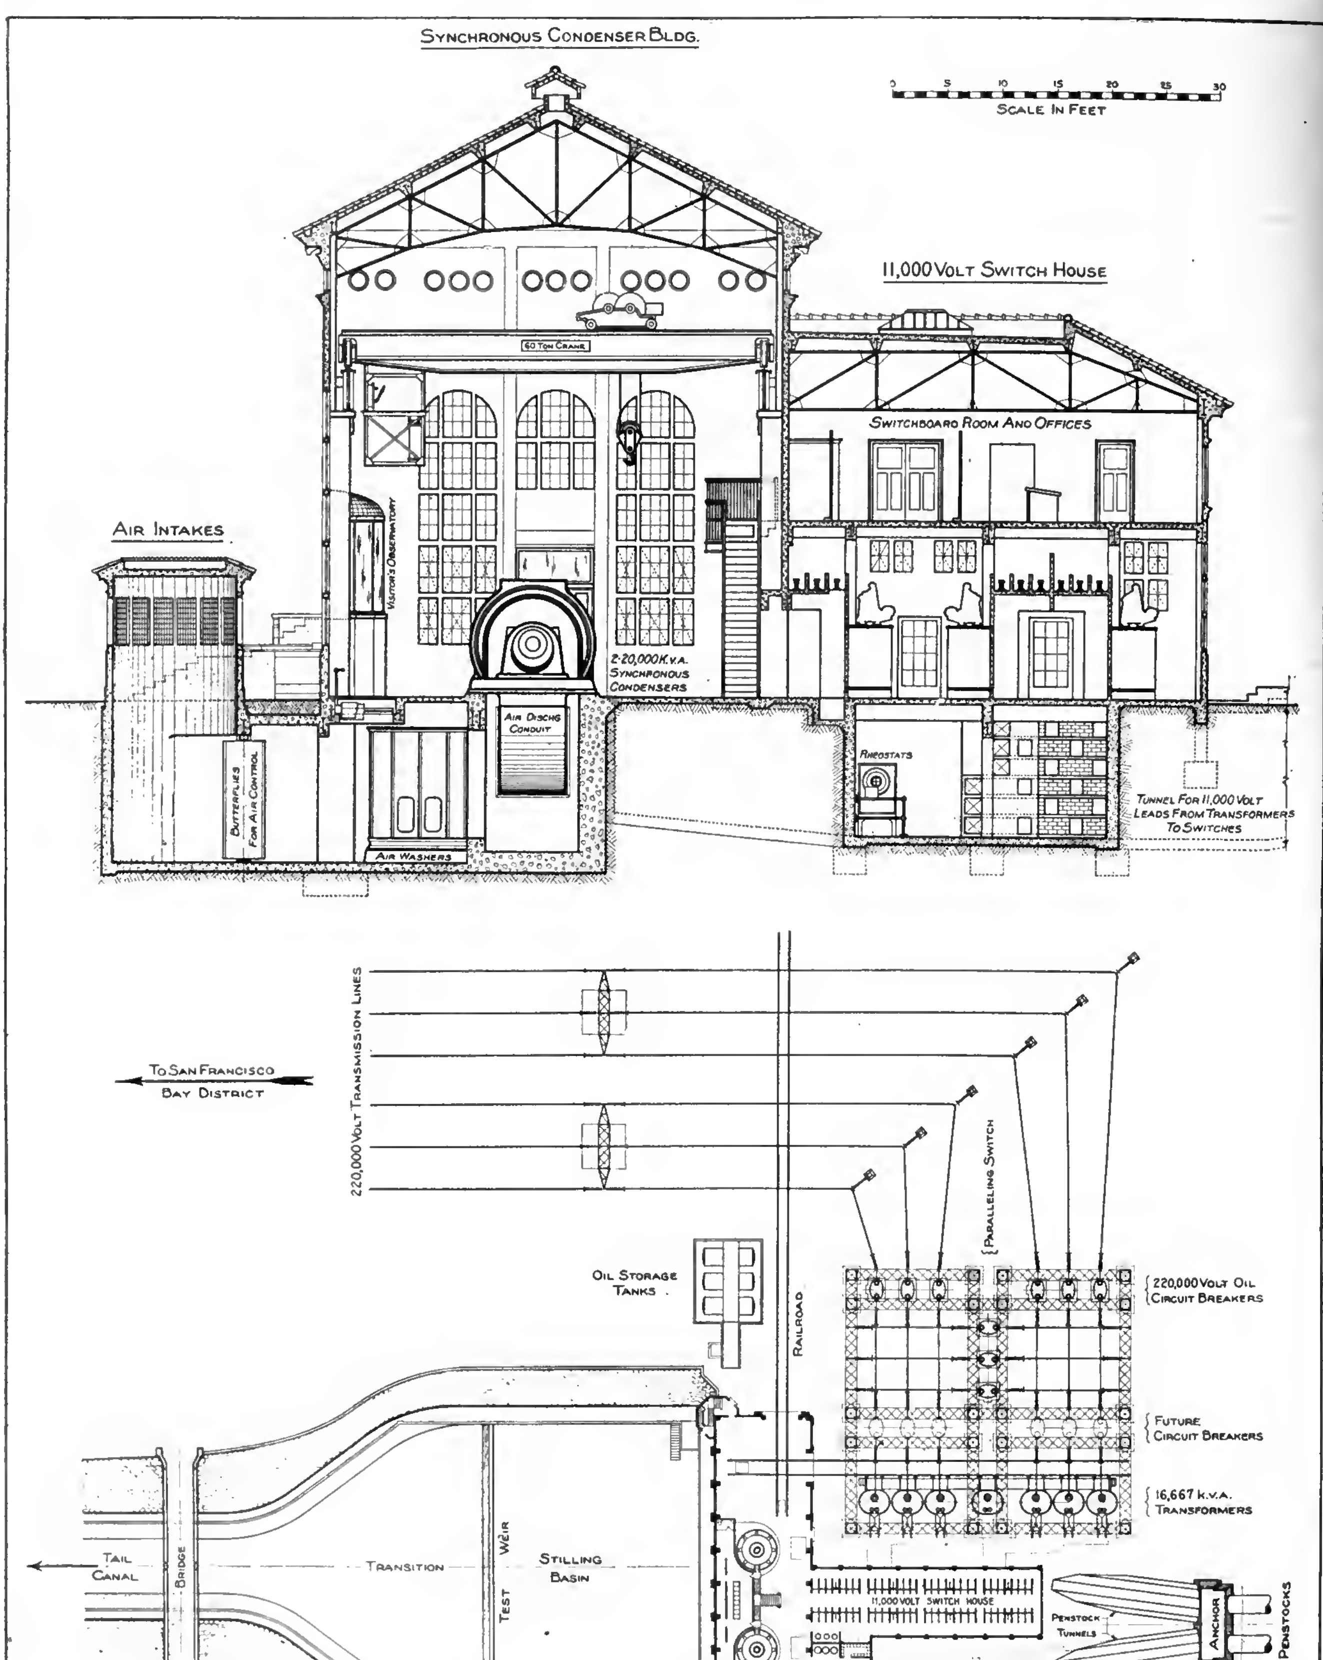
It was necessary to deliver to the bay district about 100,000 kw. at once and another 100,000 kw. within three to five years. Instead, therefore, of using the old and smaller developments and transmission lines to deliver their power into the bay district and have the Pit power displace the valley district loads, we decided to take the Pit River power to the bay district, where the large load is more concentrated and is more nearly of the magnitude of the power supply. In other words, it was thought best to join the big power supply to the large demand by a transmission system proportionately large. Further, we have now a future base power supply that solves our problem for some time. There will be ultimately about 400,000 kva. developed on the Pit River.



A CALIFORNIA SUPERPOWER SYSTEM WITH A 220,000-VOLT LINE

To have solved the problem by having the Pit power displace the valley power and have this power then go to San Francisco Bay would have required the reconstruction of many power stations and transmission lines and substations and would have created a system difficult to operate. By taking the big power supply directly to the large market by a large-capacity transmission system the problem became merely one of building a new large system complete. We thus tie up units of supply and transmission to loads that are commensurate. It required courage on the part of the engineers and the financiers to attack the problem in this big way, for it required the expenditure of approximately $20,000,000 for the power system, transmission lines and substations to deliver the first power to the 110,000-volt and 55,000-volt lines on the west side of San Francisco Bay. Only a large power system can do things on this large scale.

If the problem had been the development and transmission of say 25,000 kw. to 50,000 kw., the old method of displacing the power generated at one place for the power generated in an adjacent district might possibly have been used. For comparison, if we were to raise a few truck loads of potatoes in the Pit River region, we would transport them to Redding or Red Bluff, and



SUBSTATION BUILDING AND LAYOUT OF MAIN PLANT

A large switch house and synchronous condenser building at Vaca substation is shown in the upper view. The lower view gives a plan of the Pit No. 1 development with connections through outdoor transformers to the 220,000-volt lines.

the Redding or Red Bluff potatoes would displace those raised near Chico, and those would replace an equivalent amount near Sacramento, and finally the surplus would reach the large San Francisco market. But if we were to raise 1,000 carloads of potatoes in the Pit River region, then the right disposition is to take the large surplus supply direct to the large market.

It is believed that the solution of this power problem, which required for economy 220,000-volt design and transmission construction, will be followed by many similar enterprises in the United States of America in the next few years. For the power problems have become of such magnitude, owing to the large single power units and stations and the large markets, coupled with the high prices of coal, that the question of the transmission system must be attacked in a proportionately big way, if the electric power industry is to meet the needs of the times.

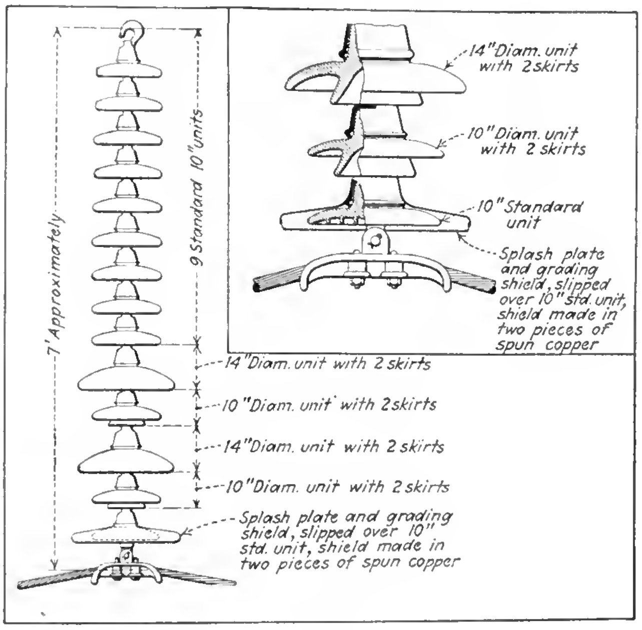
We could not expect the old county and city roads that made possible a speed of about 10 miles an hour and loads of 1 ton or 2 tons to meet the needs of present-day automobile traffic. Roads allowing a speed of 40 miles an hour and loads of 5 tons are required. Connecting up the old-fashioned roads would not have given a national or state highway system that would meet present-day needs. A new system of highways had to be designed and built to meet the new requirements.

### Interconnection Not the Solution

Similarly, interconnecting the small-capacity power lines built out from various points for local uses will not generally give a transmission system to meet the needs of the electric power industry. We need large high-power transmission lines that will carry the power from places where there is little demand, like the St. Lawrence, the Niagara, the Southern Appalachians, the Rocky Mountains, etc., to places of large demand, and the transmission system capacity must be commensurate with the power available at these sources and commensurate with the needs in the large industrial regions.

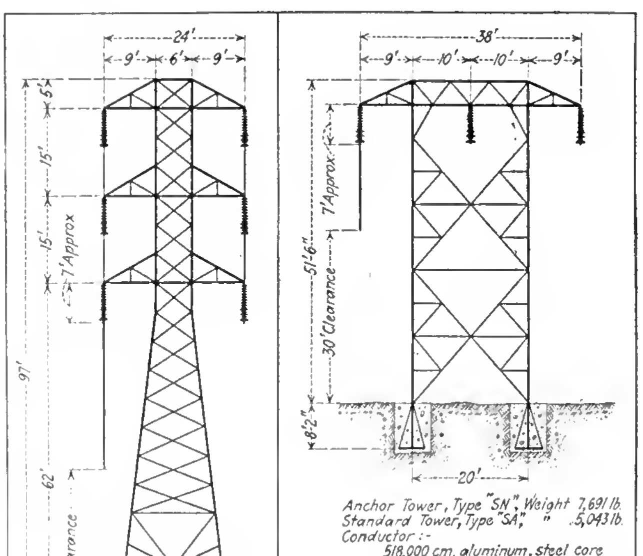
Without the automobile and truck there would be no need of the modern highway system, and similarly without the development of the large steam and hydraulic power units and without the big markets, there would be no need for the high-power transmission systems we must have. Without a feasible power transmission system the problem could not be solved, but with a transmission system laid out on a big scale* so that we may transmit say 100,000 kw. to 150,000 kw. per circuit and 200,000 to 300,000 kw. per tower line, we have a solution of the transmission problem commensurate with the wonderful development of the water-power and steam units in the past few years and commensurate with the needs of the large markets in the Eastern States. Electric power units are now generally of 20,000 kw. to 60,000 kw. capacity and 75,000-kw. units will be in use in a few years. Single power stations of 100,000 kw. to 500,000 kw. are now being constructed. The power-transmission circuits must of course have capacities commensurate.

To attempt to find a local demand for the whole of these large powers, as was done at Niagara, because in the early days of the electrical industry there were no transmission systems developed, is uneconomic and unsound for the industry and from a standpoint of



DETAILS OF INSULATORS USED ON PIT RIVER LINE

national stability. For to be stable we should have the industries of the country diversified and spread out over the country as much as possible, building up the smaller communities as well as the large centers. At present places like Niagara, New York City, Boston, Philadelphia, Chicago and other places have much cheaper power than obtains in the smaller cities and towns. This does not make for a healthy growth of the states and nation. We need a transmission system



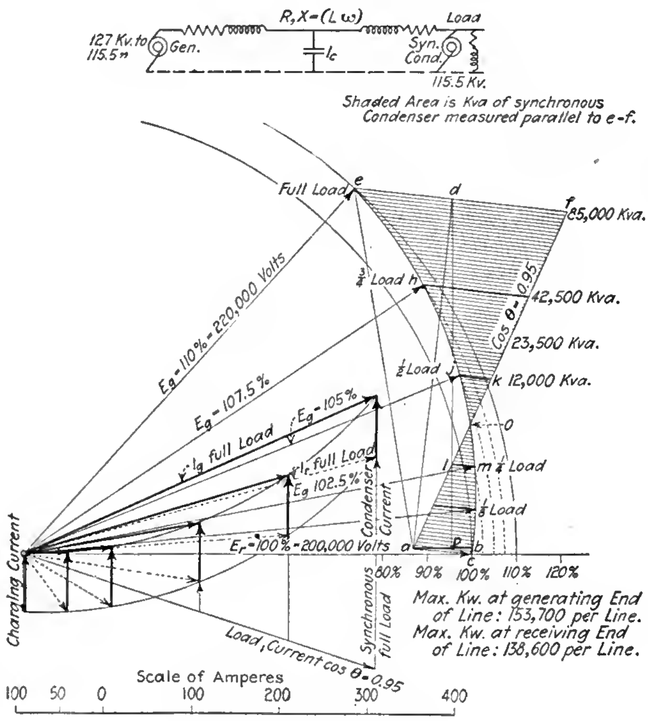
TOWERS USED ON PIT RIVER LINE

Left—Main-line double-circuit towers, used in valleys. Right—Towers used in the mountains, where snow and ice make vertical spacing inadvisable.

*See "Voltage Regulation and Insulation for Large-Power Long-Distance Transmission Systems," by F. G. Baum, *Transactions A. I. E. E.*, June, 1921, pages 643-648.

which will take the power from the large producing centers to the smaller as well as the larger consumption centers and more nearly equalize power conditions in small and large cities. That is the fundamental basis of the electric power problem and on that basis the problem has been successfully handled in California and a few other states.

It is not sound practice to allow all the water powers of Niagara to be used locally to the advantage of a few industries, but part of this power should be required to flow out into the smaller cities to help them prosper. Similarly, the water power of Muscle Shoals and other sites of great potentiality should not all be used locally to the advantage of a few industries, but a very large proportion of this power should find a market through the construction of transmission lines that will take



THE SYNCHRONOUS CONDENSER IS USED TO GET GOOD LINE REGULATION

it to available markets and build up present communities. In that way we will spread out the advantages of water power among more people, and this will in turn create a more favorable public opinion for the logical development of water power and transmission systems to meet the needs of the states and nation. I believe the men in the electrical industry in California will see the logic of the reasoning now that there is available a transmission system with which to back it up.

## Pit River 220,000-Volt Transmission Line

Recently there has been completed in California the first step of what I believe confidently to be the forerunner of many similar systems covering large power producing and consuming regions, and I believe an account of this achievement and the reasons therefor, as above given, will be of interest to the industry as well as to those far-sighted financial men and business men who have ability and vision, energy and courage combined in the proper proportions.

The Mount Shasta Power Corporation (a subsidiary of the Pacific Gas & Electric Company of California) has completed the first step of a series of power developments on the Pit River, which is in the northeastern part of California, and has constructed a transmission line to the San Francisco Bay region. The first power development consists of two stations of 12,500 kva. each and one station containing two units of 35,000 kva. each, making a total of 95,000 kva., with step-up transformers for 220,000-volt delivery to a transmission line 202 miles in length and to the first substation. This substation contains 100,000 kva. in transformers, which lower the voltage to 110,000 for secondary transmission and to 55,000 for primary distribution to the San Francisco Bay district.†

The power load of the bay district first justified (about 1898-1900) the construction of plants of about 10,000 kw. easterly and northeasterly from the bay. The Standard Electric Company's network was first designed for 60,000 volts, 60 cycles, and a grounded system. This system was also adopted by the Bay Counties Power Company. The two systems formed the nucleus for the present network of the Pacific Gas & Electric Company. I have always advocated 60 cycles and a grounded system, believing that this should become standard for the United States. I believe the grounded system necessary for any large high-voltage system.

As already stated, the construction of the transmission lines across the Sacramento Valley developed considerable power business outside the bay districts. At the present time practically all power used in this section is electric power, and this great diversity has resulted in a high load factor for the system and has also greatly stabilized the earnings of the Pacific Gas & Electric Company.

San Francisco and Oakland, the larger cities in the bay district, justify steam plants for local insurance, as well as to give an economical proportion of steam and hydro-electric power as determined by the load curve of the system.

The growth of the system, as is generally known, has been very rapid, and this growth has been in the valley cities as well as the larger cities, owing to the policy of the company and the natural conditions in the territory, as explained above. The Pacific Gas & Electric system now has a daily load of about 200,000 kw. average and a peak load of about 275,000 kw., giving a very high load factor. About forty different power plants supply power to the system, which consists of several thousand miles of transmission lines. This growth has occurred in about twenty years.‡

## Line Regulation

In a second article the Pit River power plants will be described. The transmission line designed for 220,000-volt operation is the only part of this development which is pioneer work.‖ Manufacturers have been ready for some time to furnish transformers and switches for 220-kv. service, as well as generators and turbines of the rating required for this voltage. Therefore our studies were concentrated largely on the problems of line regulation and insulation. The line regulation we consider solved with the help of synchronous condensers, without which operation at this voltage would be

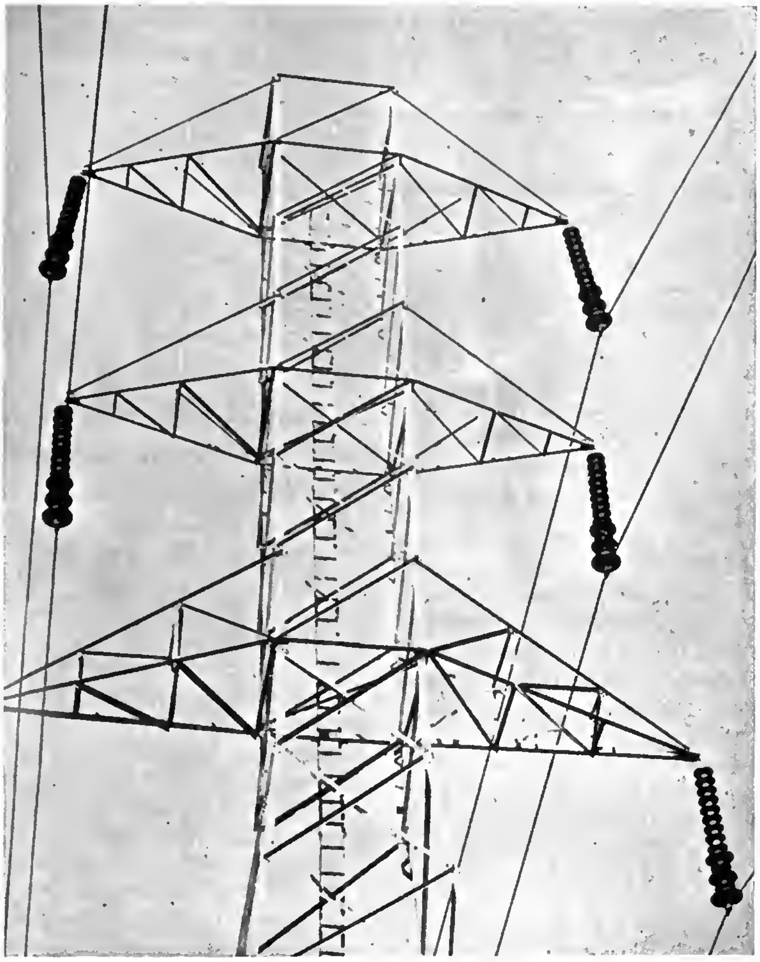
†See "Rebuilding a Transmission System," by J. P. Jellyman, Electrical World, Sept. 16, 1922.

‡See "Progress of Power Industry in Far West," by F. G. Baum Electrical World, May 22, 1920, and "Potential Water Power in California," by F. G. Baum, *Pacific Service Magazine*, July, 1920.

‖See "Voltage Regulation and Insulation for Large-Power Long-Distance Transmission Systems," by F. G. Baum, *Transactions A. I. E. E.*, June, 1921, pages 643-648.

impracticable. A description of the transmission line, which was so designed that we shall get (1) a stable line, (2) a constant-voltage line and (3) a reversible line was contained in the paper above referred to and will be only briefly alluded to here. (Interesting articles on the 220-kv. line, discussing the use of distributed condensers for stabilization and regulation of potential, have been written by F. W. Peek, Jr., *Transactions A. S. C. E.*, November, 1922, and Prof. A. J. Ryan, *Transactions A. S. C. E.*, December, 1922.)

On long lines at high voltages the charging current at no load, being a leading quadrature current, causes a voltage rise over the line when flowing over the reactances found in its circuit. At heavy loads the power current causes a voltage drop flowing over resistances and reactances in the circuit. Thus, by introducing at no load a lagging quadrature current, voltage rises may be compensated for, and by introducing at heavy load a leading quadrature current, voltage drops may be compensated for. This the synchronous condenser will do, so that it becomes in effect a variable reactor at excitation below normal and a variable condenser at excitation above normal. Two condensers each of 20,000 kva. capacity at leading quadrature current, giving 12,000 kva. at lagging quadrature current, are installed at the Vaca substation at the end of the line. This station has room for an additional condenser of 40,000 kva., which will become necessary when the load grows. Condensers will be added at the center of line when required for regulation and stabilization of potential under operation at 220,000 volts.



A GREAT AMOUNT OF RESEARCH WAS REQUIRED TO DEVELOP THE GRADED INSULATORS FOR THE 220,000-VOLT LINE

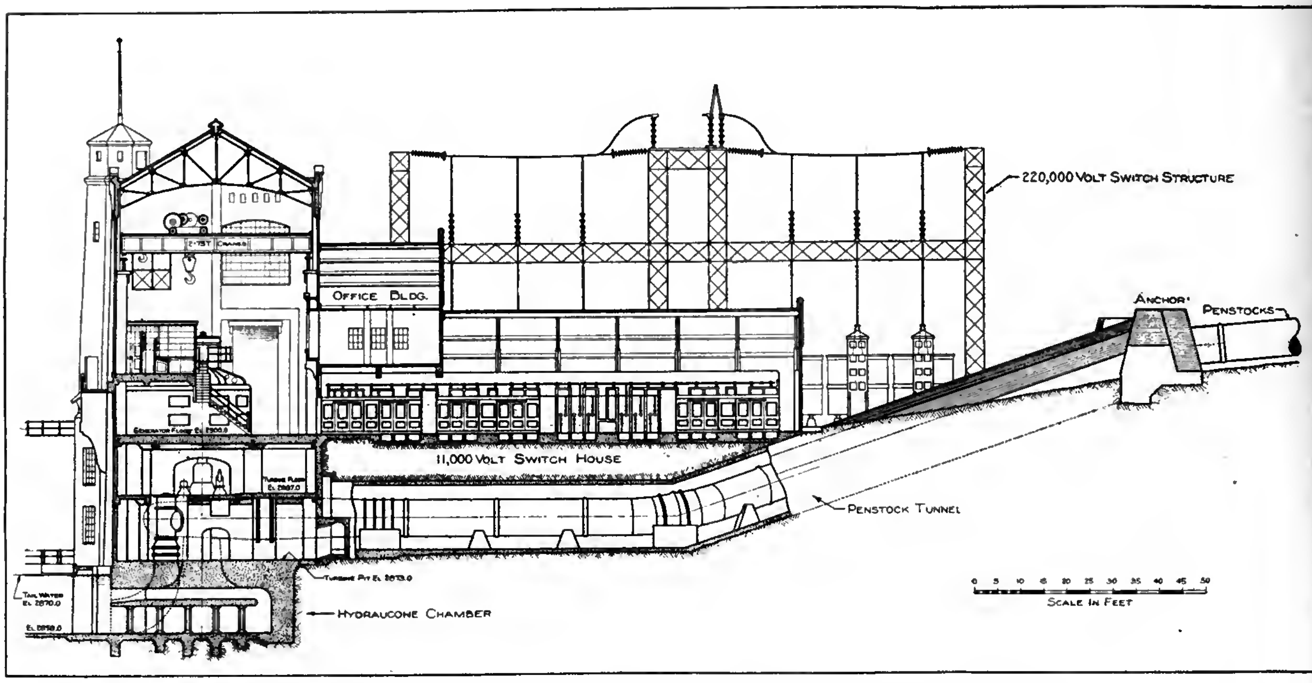
### LINE INSULATION

The line insulation was studied extensively in the various laboratories of the country, as described in the 1921 A. I. E. E. transmission paper referred to. A discussion of the reasons pro and con for the selection of the string of insulator arrangements used would lead too far for the present article. Suffice it to say that the chosen string is not considered the final solution in the insulation for high voltages, although we expect better operation at 220 kv. with the arrangement referred to than is now obtained on 110-kv. lines. It will be necessary to study the problem continuously not alone for 220 kv. but for 100 kv. and upward, so that we shall not fall into a state of self-assurance and neglect the matters, as was done when the suspension insulator first was introduced. All interested parties are now alert as they appreciate the very great importance to the future of the power industry of the highest type of line insulation for all voltages.

A typical string, as shown in Fig. 3, is made up as follows, counting from the tower arm nine standard 10-in. disks, one two-skirted 14-in. disk, one two-skirted 10-in. disk, and then what we call a splash plate and grading shield combined. The latter is made of spun copper in two pieces which are slipped over a standard 10-in. insulator unit, short-circuiting it, and suspended from the string as is any insulator above. Below this is the line clamp. The diameter of the shield is 16 in., and its purpose is twofold. First it serves as a splash plate during a rain with heavy drops and brings about on the unit next above it a surface condition similar to that which exists on all the rest of the units. Without it the undersurface of the last unit would be dryer than that of any other, piling up the voltage on it. Second, it assists in a better voltage distribution between the units by control of the capacity currents. The assembly gives a string length of about 7 ft. Voltages of the order of magnitude of 500,000 are necessary to flash over such a string. Experiments bearing on the problem are still going on, but briefly the writer may say he is convinced that the solution of the insulator problem for 220-kv. operation requires:

1. A long string of insulators, so that birds, etc., will not cause short-circuits.
2. A string containing five to seven units, so as to give good natural potential distribution, reducing the shield to small proportions.
3. The surfaces to be of such design that the maximum discontinuity of water streams caused by rain, dew or fog will result.
4. Each unit to be designed for good potential distribution under wet and dry conditions.

The construction of the second Pit River line was not completed over the mountain section before winter set in. The lines are therefore operating at 125,000 volts. This is to be raised later to 175,000 and then to 220,000.



VERTICAL SECTION OF PLANT AT PIT RIVER, SHOWING LOCATION OF SWITCH HOUSES AND MAIN UNITS

The main-line double-circuit towers shown in the illustration were used in the valley, while double towers were used in the mountains, where heavy snow and ice makes vertical spacing inadvisable. The conductor cables used are shown in tower drawings.

### Vaca Substation

The Vaca substation is designed to receive at the present time all the Pit River power, to regulate the voltage and to distribute at 110,000 volts the power to the San Francisco Bay region. Later other stations will be erected as required. (See plan of station, on page 206.

Two banks of 50,000 kva. each are installed. They are auto-transformers, two-to-one ratio for full voltage. There is a tap at 165,000 volts, and they may be operated at 110,000 volts without auto-transformation.

The synchronous condensers are started and operated from tertiary and quarternary deltas, these windings also transforming and absorbing the triple-frequency exciting current.

To a great extent the layout is similar to that at Pit No. 1, and it is exactly so for the 220,000-volt equipment. There is a large 110,000-volt switch rack in addition, but the 11,000-volt switches are housed in a very similar manner. The control room, being on the second floor, overlooks the extensive high-tension switch and transformer yard. Connection is made at Vaca substation to the 110,000-volt line from the South Yuba River power house at Drum.

The transmission-line towers were furnished by the Pacific Coast Steel Company of San Francisco. The insulators were furnished by the Ohio Brass Company and the Locke Insulator Company. The high-tension switches are Westinghouse. This company also furnished the two 20,000-kva. synchronous condensers with special regulators for voltage control at the receiving end of the line. The step-down transformers were furnished by the General Electric Company.

The system was placed in operation on Sept. 30, 1922, with a clean score for all apparatus.

## Financial Results of Norwegian Hydro-Electric Nitrogen Company

THE Norwegian Hydro-Electric Nitrogen Company, which makes nitric acid directly from air by the arc process, has had a remarkable financial success, according to E. Kilburn Scott. As a manufacturing concern it is a triumph of exact scientific engineering skill, and as a financial proposition it is unique, he declares. Unlike some other companies, this concern has paid handsomely ever since it started, seventeen years ago. It is estimated that the total annual output is worth over £2,000,000. During the last ten years the capitalization of the company has increased enormously until it is now 57,000,000 kroner, or £3,200,000 at normal exchange, and the capital of Rjukanfos, one of the subsidiaries, is 100,000,000 kroner, or £5,500,000. The dividends on common and preferred stock have increased from 5 per cent and 8 per cent respectively to 15 per cent.

# The Physics of Hysteresis Loss

## Attention Directed to the Importance of the Heaviside Formula in Bringing About Co-ordination in the Essentials of This Subject

BY A. PRESS

SO MUCH has been written about hysteresis since the time of Oliver Heaviside's treatment of the subject in his "Electromagnetic Theory" (Vol. 1) that it is surprising greater co-ordination in the fundamentals of the subject has not resulted. Many of the difficulties which Professor Whitehead ably brought together in a letter to the ELECTRICAL WORLD printed on Nov. 11, 1922, can nevertheless be explained if note is taken of some recent work in which no less than two mechanical models of hysteresis have been evolved. (See *Physical Review*, June, 1922; Lees, *Philosophical Magazine*, September, 1922.)

In the writer's view too little attention has been paid to the Heaviside formula:

$$B = \mu_0 H + I = \mu_0 H + \mu_1 H = B_0 + B_1 \qquad (1)$$

Most engineers and physicists have preferred the simpler form of expression

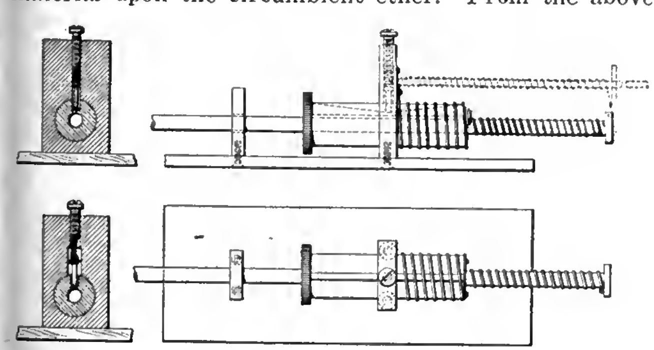
$$B = \mu H = (\mu_0 + \mu_1) H \qquad (2)$$

with consequent loss of proper emphasis. Thus it should be clear that in the ether itself there can be neither magnetic nor electric hysteresis proper. Such hysteretic phenomena as may be present at all, whether viscous or static, must be a property of matter and not the ether.

Indeed, in keeping with formula (1) for the magnetic case we also have for the electrical counterpart the formula:

$$D = D_0 + D_1 = K_0 E + K_1 E \qquad (3)$$

(See Heaviside "Electromagnetic Theory," Vol. III, page 44.) The hysteresis diagram should therefore only strictly involve the co-ordinate $H$ or $E$ (the applied forces respectively), on the one hand, and the magnetic displacement $I$ and electric displacement $D_1 = K_1 E$, due to the effect of the material dielectric and magnetic material upon the circumbient ether. From the above

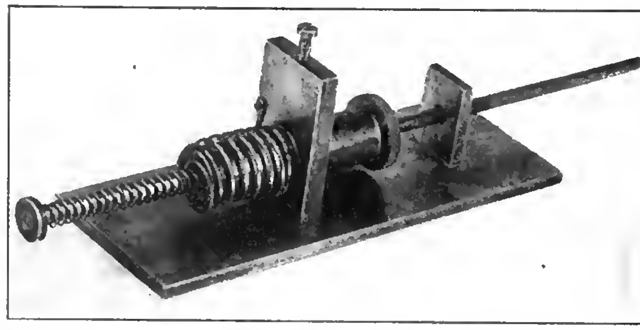


DETAILS OF MODEL APPARATUS WHICH CLARIFIES CONCEPTION OF HYSTERESIS

point of view magnetic and electric coercivities can only have proper reference to the $H$-$I$ and $E$-$D$ diagrams and cannot be employed in the manner hitherto obtaining in nearly all physics textbooks which have been written since the time of Ewing.

Conduction phenomena can never be considered as a pure ether effect. It properly refers to the material medium as contradistinguished from the enveloping ether. The same thing is true of the term dielectric strength. (A recent writer aimed to measure the dielectric strength of the ether!) To speak of the resistance of the ether is equally absurd, for conductance cognates matter, not the ether.

To answer the hysteretic conundrum of Professor Whitehead attention may be invited to the model. The ether has permeability $\mu_0$ ($k_0$ for the electric case) and is simulated as a spring constraint between the rod, giving the displacement $B$ or $D$, and the enveloping barrel giving the displacement $B_1 = I$ or $D_1$, due to the influence of the magnetic material or dielectric matter upon the ether. The ether co-ordinate of displacement is with respect to the frame supporting the rod and barrel.



MODEL FOR EXPLAINING ACTION OF HYSTERESIS

The $I$ and $D_1$ displacements are controlled by the barrel spring between its one end and the above frame. To produce hysteretic lag a frictional constraint is introduced mounted on the frame and engaging with a groove on the outside surface of the barrel in question. A set screw and spring within the vertical support of the frame controls the frictional contact between a lug and the spline mounted hollowed-out to give greater frictional constraint for extreme movements of the barrel.

### LUG ACTS AS A PISTON

To simulate viscous hysteresis it is necessary to have the lug above referred to working as a piston within the leaky confines of the vertical support. This is illustrated in the figure. On the other hand, diamagnetism is indicated by an additional spring control between the further end of the rod (see dotted line) and the supporting frame.

Let us then see to what extent known hysteretic phenomena are explainable by means of the above clarifying model. Professor Whitehead refers to electric soakage. This is explainable by the fact that the frictional constraint has included a leaky piston in the bore of the frame in which the friction spring occurs. On the other hand, it is very clear that at high periodicities the piston chamber, whether under compression or tension, has no time to permit any material leakage to occur, and therefore the apparent dielectric constant varies.

It is true that on a sudden application of direct-current potential only the initial charge should be taken to obtain the true dielectric constant for high frequencies. Needless to say, there is no obvious interconnection between the leakance of the piston chamber or the strength of the spring controlling the friction contact and that true resistance factor of the material which is in the nature of a fluid frictional property of

the conduction current rather than the material dielectric counterpart. For there are in fact two types of dielectric—the ether dielectric with its Maxwellian displacement current $dD_0/dt$ and the less emphasized material dielectric with its displacement current $dD_1/dt$, neither of which constitutes a conduction current in the Maxwellian sense. Loss may, however, occur with respect to $dD_1/dt$ (hysteresis) but not with respect to the former.

It may be noted in passing that the proposed mechanical model for hysteresis can be helpful in understanding mechanical phenomena. Thus the spring constraint on the rod corresponds to the crystalline conservative element of the metal, whereas the barrel constraint and its frictional hysteresis-producing control would have to correspond to the non-conservative filler or amorphous material between the crystals.

# Economics of Rural Line Extensions

## Growing Demand for Service Makes Simple Rules Protecting Both Consumer and Utility Necessary—Annuity Plan as Evolved by Committee of Northwest Electric Light and Power Association

By R. M. BOYKIN*
*Vice-President and General Manager*
*North Coast Power Company, Portland, Ore.*

FOR many years there has been a persistent and growing demand for electric service from farmers and small property owners living adjacent to improved highways and large centers of population. This demand is constantly increasing as highways are improved. The problem of determining upon what basis the rural line extension should be made is largely financial, but there are commercial and practical problems that should be considered, and possible future growth must never be forgotten. These matters have had serious consideration from executives, engineers and commercial men belonging to the utilities of the Northwest and other sections. In some instances well-meaning staffs of state regulatory bodies have attempted to make rules in an endeavor to cover adequately all questions that may arise. The resulting rules have become involved beyond description, are wholly or partly unworkable, and fundamental principles have been buried in a maze of meaningless words.

During the past two years the technical committee of the Northwest Electric Light & Power Association, feeling that line extensions into rural districts should be encouraged, since these districts are the backbone of our national life, has devoted a great deal of time and study to the solution of the problem of financing rural extensions. This study was predicated upon the fact that rules as simple as the facts underlying their making and equitable alike to the utility and the consumer are the only kind that will survive. It was recognized that of necessity all points could not be covered in the rules and that such a task should not be attempted. The purpose of the rules should be to establish a working basis for determining the amount which any electrical utility can afford to invest in an extension, with due regard to the interests of existing consumers, assuming that at the time the utility is in successful operation and reasonably able to finance itself. The rules should also determine under what conditions such an extension may be required when the investment necessary is greater than what is justified by the return.

A line extension is defined as a branch from or a continuation of an existing primary or secondary distribution system, or both, to serve new customers. A line extension includes all labor, material and apparatus used in the line extension up to the customer's service outlets and includes the meter. Reinforcing existing lines or increasing the capacity of transformers to provide additional capacity for existing customers should not be considered as a line extension.

That part of the cost of increasing the capacity of existing lines and apparatus and that part of the cost of overbuilding of secondary lines with primary lines which is made necessary by an extension to serve new customers should be considered a part of the cost of such line extension.

### TRANSMISSION AND DISTRIBUTION SYSTEMS MUST BE SEPARATED

A primary or secondary distribution system should not be confused with a transmission system used primarily for the transmission of electrical energy between generating stations, between substations or between generating stations and substations.

A line extension may consist of poles, wire, transformers and other material and apparatus, or it may consist only of wire on existing poles.

To determine the amount a utility in "successful operation and reasonably able to finance itself" should invest in a rural extension, the following language is suggested: "The minimum amount to be invested by any utility in an extension will bear the same ratio to the estimated annual revenue from the new extension as the total investment in the distribution system of the utility bears to the total annual revenue from the system. That is to say, if the utility's total investment in its distribution system is $100,000 and the annual revenue from this system is $50,000, then the investment ratio is two to one and the utility should invest two dollars in an extension for every dollar of estimated annual revenue to be derived from the extension." No prospective rural customer complains, but rather considers himself fortunate when told he will receive service upon the same ratio of investment to earnings as his urban brother.

The necessary investment in rural lines is frequently several times the ratio above referred to. It is the provision of funds to meet this excess cost and caring

*Chairman technical committee Northwest Electric Light and Power Association.

for the fixed charges thereon that troubles the utility and the customer and is the only real problem that has been a nightmare to regulating authorities and utilities alike. The utility is often more able than the customer to provide the funds to meet this excess cost in the line and facilities, in which case the customer, in addition to the rates, should pay annually certain charges on the excess investment until the rural line extension becomes self-supporting. It should be remembered that the rates paid to a "successfully operated utility" reflect all cost and a reasonable return on "the minimum amount to be invested by any utility." The annual amounts that should be paid by the customer on the excess cost, or investment, until the rural line extension is self-supporting are as follows:

A—Interest (return or cost of money).
B—Taxes.
C—Depreciation.
D—Operation.
E—Risk and contingencies.

These items should be expressed as a percentage of the excess cost in the rural line extension and in many cases have been found to be: A, 8 per cent; B, 1 per cent; C, 5 per cent; D, 6 per cent, and E, 2 per cent.

An inquiring mind would ask: "When does a rural line extension become self-supporting and the customer cease paying the fixed charges on the excess investment in the extension?" The extension may be said to be self-supporting when the ratio of the total investment in the extension to the revenue derived from the extension equals the investment ratio for the specific system under consideration as defined above. There will be in most rural extensions a gradual increase in the business and revenue from the lines as the territory served becomes more settled, so that the annual payments, A to E inclusive, should gradually decrease and become nil when the extension is self-supporting. The annual amounts that should be paid by the customer on the excess cost should, therefore, be for each year one-half of the first year's payment, and this sum should be paid each year until the self-supporting period arrives. This period can be obtained from statistics and fairly closely estimated. The length of time required for an extension to become self-supporting will perhaps vary in many sections of the utility property and will be from a few years in some sections to perhaps twenty years or longer in others.

It is highly desirable to close the transaction with the customer at the time the contract is made, rather than have the average annual payments on account of the excess investment in the line paid in annual instalments up to the beginning of the self-supporting period.

### The Annuity Plan

To enable the transaction to be closed at the time of executing a service contract by a customer the annuity principle of finance is recommended. Such a plan contemplates the payment to the utility by the customer of the principal of an annuity computed at 4 per cent compound interest. The yearly payments earned by the principal of the annuity should be sufficient to return to the utility the average annual payments (one-half of A to E inclusive each year) necessary to defray the charges on the excess investment in the rural extension to the time it becomes self-supporting. At the end of this period the principal is exhausted. The following table shows the payment necessary in order to produce $1 per year for the years shown and at the end of each year, the principal being exhausted. The computation is at 4 per cent compound interest.

| Period of Years | Principal | Period of Years | Principal |
|---|---|---|---|
| 5 | $4.452 | 15 | $11.118 |
| 8 | 6.733 | 18 | 12.65 |
| 10 | 8.111 | 20 | 13.59 |

Since it is proposed that the extension shall be financed by the utility, the title should remain with the utility; also, since the amount paid by any prospective customer is only sufficient on the average to make good the actual deficit resulting from the construction and operation of such extension, no customer is entitled to a refund of any amount paid by him.

### Details of Method

The following example will aid in a clear understanding of the method of financing that is proposed:

| | |
|---|---|
| Applicants—rural lighting residence | 5 |
| Estimated cost of providing service | $510 |
| Annual estimated gross earnings from tariff | $130 |
| Estimated time to become self-supporting | 10 years |
| **FACTS** | |
| Investment in company distributing system | $100,000 |
| Gross earning from company distributing system | $50,000 |
| Investment ratio | $2.00 to $1.00 |
| Payments on excess investment, per cent | 22 |
| **SOLUTION** | |
| Minimum investment that should be made by company, $130 × 2 | $260.00 |
| Excess investment, $510 — $260 | 250.00 |
| Fixed charge on excess investment 22 per cent of $250 | 55.00 |
| Average annual fixed charge, half of $55 | 27.50 |
| Principal of annuity to be paid by customer to company, 8.111 times $27.50 | 223.05 |
| Amount to be advanced by each customer to defray deficits for ten years | 44.61 |

The rates charged should be those prevailing for the same class of service in the nearest urban district, with perhaps higher minimums to compensate for additional losses in longer lines and greater transformer losses. Utility representatives and commission engineering staffs have given much thought to the matter of refunds, a somewhat vexing problem. From the commercial and practical side of the problem refunds are a source of annoyance. The idea of finance expressed above eliminates this problem. It should be borne in mind that the utility must develop its rural business on a basis that will be self-supporting within a reasonable time, but care should be used so as not to reflect a burden on the urban consumers. Whatever scheme of financing rural extensions is evolved it must be one to encourage and develop rural electric service. On this point the Wisconsin commission says: "Not only must the business be permitted to earn the same rate of return as is reasonable for urban business, but the utility must be permitted to make terms as to financing which will make possible the immediate investment of considerable sums of money in rural extensions without taxing the resources of the utility for securing capital."

Many ideas have been expressed as to methods of finance. Some advocate that groups of customers organize and engage in utility business. Such ideas have little or no merit. Encouragement of such organizations by the supplying utility is an effort to evade the responsibility. This plan is discouraged.

After a thorough study of many financial plans taking into consideration the commercial, practical and future aspects of rural line extensions, the natural conclusion drawn is that the subject is so involved that only a few simple rules should be made. To cover every point adequately is impracticable and out of the question.

# The Neon "Glim Lamp"

## A New Signal and Decorative Lamp for Use on Higher Voltage Distribution Circuits Which Uses Electric Discharges in Neon Gas

BY ARTHUR PALME
Pittsfield, Mass.

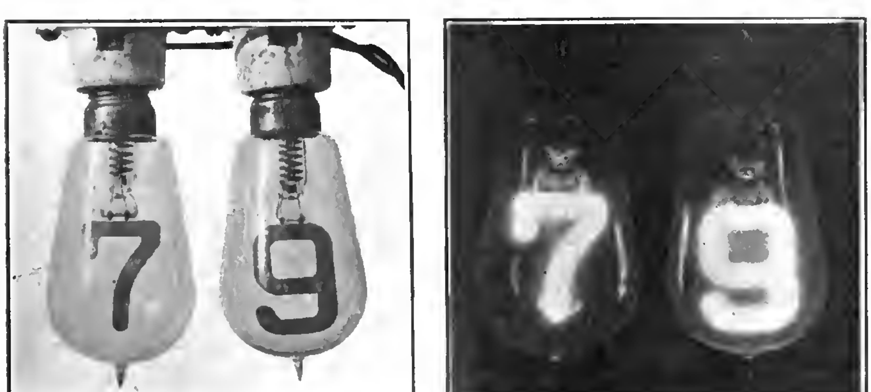
THE glim lamp derives its luminosity from an electric discharge between two electrodes placed together and inclosed in a rarefied atmosphere of neon gas. The lamp operates like an electric valve; that is to say, if a direct-current potential of more than a certain critical minimum is placed upon its two electrodes, the cathode will be luminous, the anode will remain dark. If alternating current is impressed, both electrodes will *appear* to be simultaneously luminous. In fact they are luminous one at a time, but with commercial frequencies of 25 cycles to 60 cycles the alternations of light and dark will occur so rapidly that the eye will see only a permanent glow of both electrodes simultaneously. At 25 cycles, however, the flicker is quite pronounced. The critical or minimum voltage to start any visible discharge is 180 volts for direct current and 130 volts for alternating current. The color of the luminous electrodes is a pleasing pinkish-orange with a blue-violet fringe on the edges. The manufacturer labeled the lamps "5 watts, 210-240 volts." Actual measurements showed a consumption of 11 milliamperes for alternating current and 8.8 milliamperes for direct current at 220 volts in both cases. The difference between the amount of current required by a lamp fed by alternating current and the amount required by the same lamp fed by direct current might permit one to assume the power factor of the lamp to be in the neighborhood of 0.8, but as the lamp is really a small condenser, this figure appears to be much too high.

The shape of the electrodes is governed solely by the use of the lamp. The most obvious use of these lamps is for sign lighting in the form of letters to spell out words or names, etc., or in the form of figures for luminous house numbers. Any word may be spelled out with a number of letter lamps mounted closely side by side; but a limited number of letters or numbers may also be combined in one long glass tube to spell out a complete name or a high house number. For instance, the name of a doctor may be spelled out in one tube and mounted over the entrance to the physician's house, the lamps continuing to burn during the night hours. Assuming a consumption of 2 watts per letter, a sign bearing the name "Dr. Jones" would require only about 15 watts, and its operation at a charge of 10 cents per kilowatt-hour would cost about 1½ cents for ten hours. For general signal lights the electrodes are shaped in the form of a semisphere, radiating the light uniformly downward at all angles. The brightness of the lamps is about 0.7 cp. to 1 cp., but the pinkish light is very conspicuous and can be seen easily even in daylight and for a considerable distance. Such plain signal lamps have a great variety of uses. They make excellent indicator lamps to show the position of a switch in circuits of more than 130 volts alternating current, the lamp being connected parallel to the switch. The lamp will burn at open switch, regardless of the ohmic resistance in the consuming circuit, because the latter is as a rule infinitely smaller than the very high internal resistance of the lamp. Connected in parallel to a fuse, the lamp will indicate the blowing of the fuse. A lamp with one electrode shaped like a plus sign and the other like a minus sign can be used as a very simple polarity tester for all direct-current circuits of 180 or more volts.

ACTUAL SIZE OF LAMP, SHOWING DETAILS OF CONSTRUCTION

All bulbs containing a letter or a figure have fastened to the central contact on the Edison base a short wire spiral, so that proper contact is insured for more than a full turn in the socket. This will permit one to turn the lamp always to the right position, regardless of the depth of the socket thread.

For European conditions, where 220-volt distributing systems outnumber overwhelmingly the 110-volt networks, these lamps become popular in a remarkably short time. For 110-volt direct-current circuits they are obviously useless. On alternating-current 110-volt supplies a small booster transformer is all that is needed. This transformer should be wound preferably as a 110/220-volt auto-transformer and should have a rating according to the number of "glim lamps" to be energized, calculating 2 watts to 5 watts per lamp or per letter. The so-called "toy transformer" has more than ample capacity to supply ten of these lamps. The manufacturers guarantee them a life of several thousand hours.



THESE NEON LAMPS ARE POPULAR IN EUROPE ON THE 220-VOLT CIRCUITS —BEFORE AND AFTER ILLUMINATION

# Some Economic Phases of Engineering

## Methods of Evaluating Increase of Equipment Efficiency in Studies of Plant Design Suggested—Mathematical Formulas that Have Been Developed for Such Studies

By GEORGE F. MARSTELLER

*Electrical Engineering Department, Utica Gas & Electric Company*

ENGINEERS whose duty it is to approve specifications of apparatus, layouts of systems and similar work do not always give sufficient consideration to the underlying economics of their problems. For some cases there is a tendency to get the best quality regardless of cost or to make sure of some quality regardless of value. The mechanical, electrical or thermodynamic efficiency either receives too much attention or not enough. The following article embodies a few reflections along these lines which it is hoped may at least stimulate a more considerate attitude toward this interesting subject.

When the constancy or variation of conditions over a given period of time can be ascertained with a reasonable degree of accuracy or reliability, it is the aim of all true engineering to specify machinery equipments or entire systems which will have an economic efficiency that will ultimately earn the greatest financial returns on a given investment of capital and not necessarily have the greatest physical efficiency at lowest or highest first cost. For example, to obtain the greatest number of kilowatt-hours from the least possible number of B.t.u.'s or pounds of coal does not necessarily imply the most economical operation, since it may require too great an investment. Illustrations could be cited where many an otherwise fine and modern installation incurs at least twice the service cost necessary to perform its economic function properly. Obviously, then, the specification of any apparatus, unit or equipment available for selection does not depend on the first cost or physical efficiency alone, but on their mode of operation, interest charges, useful life and load factors of power and time as well.

As in most practical engineering calculations so also in this domain does the correct solution of a problem depend upon certain premises or constants. Evidently, the accuracy of the most elaborate method of calculation can never exceed the trustworthiness or reliability of these constants. This statement, too, is another mathematical axiom which seems often to be entirely overlooked. Naturally, then, in the correct determination of these constants or suppositions much caution is required, since here experience and research are at a premium and find their greatest value. Hasty conclusions and too close adherence to conventional methods, sometimes established by custom or prestige rather than by practical facts, often lead to unjustifiable errors.

One item which is commonly subject to these propensities is the depreciation rate. For instance if the life of a unit is taken as fifty years, then the depreciation rate is generally taken to be $100 \div 50 = 2$ per cent; i. e., if $R$ is the depreciation rate in per cent and $n$ the number of years, plotted against each other, then $100 = nR$ is thus assumed to follow a curve represented by a rectangular hyperbola. A little examination will readily show that such an assumption is incorrect, since it entirely fails to take into account the steadily growing interest on the depreciation reserve accumulated.

An abbreviated derivation of the following formula, based upon the well-known compound-interest principle, will illuminate this point:

Let $E$ = first cost of the unit or equipment,
$V$ = annual amount to be set aside for depreciation,
$I$ = interest rate on money,
$R$ = depreciation rate.

Provided that the very indefinite scrap value of the unit or equipment to be replaced shall be considered applicable to the new purchase and not be treated as if it were a capital asset, the equation $R = V/E$ will give exact values of the depreciation rate.

The depreciation reserve $M$ at the end of the first year is evidently:

$$M_1 = V \qquad (1)$$

At the end of the second year we have:

$$M_2 = M_1\,(1 + I) + V = V[(1 + I) + 1] \qquad (2)$$

At the end of the third year:

$$M_3 = M_2(1 + I) + V = V[(1 + I) + 1]\,(1 + I) + V = V[(1 + I)^2 + (1 + I) + 1] \qquad (3)$$

Multiplying $M_3$ by $(1 + I)$, we get:

$$M_3(1 + I) = V[(1 + I)^3 + (1 + I)^2 + (1 + I)] \qquad (4)$$

Substracting (3) from (4), we have:

$$M_3[(1 + I) - 1] = V[(1 + I)^3 - 1] \qquad (5)$$

and consequently from (5):

$$M_3 = \frac{V}{I}\Big[(1 + I)^3 - 1\Big]. \qquad (6)$$

Similarly, at the end of the fourth year:

$$M_4 = \frac{V}{I}\Big[(1 + I)^4 - 1\Big]. \qquad (7)$$

And in general, at the end of any number of years, or $n$ years:

$$M_n = \frac{V}{I}\Big[(1 + I)^n - 1\Big]. \qquad (8)$$

But at the end of $n$ years the depreciation reserve must equal the first cost $E$, so that:

$$E = M_n = \frac{V}{I}\Big[(1 + I)^n - 1\Big], \qquad (9)$$

and the depreciation rate being $R = V/E$, substitution gives:

$$R = \frac{V}{E} = \frac{I}{(1 + I)^n - 1}. \qquad (10)$$

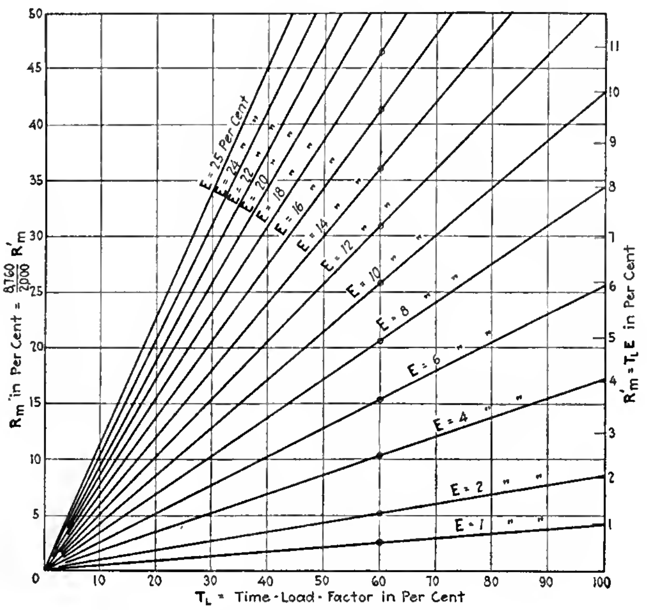
If it be assumed that the useful life of the machine or equipment is say, fifty years, and the interest on money, $I$, is 5 per cent, the formula (10) would give:

$$R = \frac{0.05}{(1 + 0.05)^{50} - 1} = 0.4777 \text{ per cent,}$$

thus showing an error of nearly 315 per cent with

respect to the conventionally acquired depreciation rate of $100 \div 50 = 2$ per cent. For the same interest rate the error decreases as $n$ decreases, but even at $n = 25$ years, the difference would still be 91 per cent. At $I = 10$ per cent and $n = 25$ years, the error would be $(4 - 1.0168) \div 1.0168$, or about 294 per cent. It is, therefore, evident that this subject of depreciation, and appreciation for that matter, cannot be taken lightly.

Sometimes a few calculations will throw light on points which seem uncertain and entirely indefinite, thus arriving at comparative values that fit the special conditions under consideration. As an illustrative example, let it be desired to determine the additional investment we can afford for a new machine of similar capacity and general mechanical features, but having a perceptible increase in efficiency.



A GRAPHIC CHART AIDS IN MAKING EASY THE MATHEMATICAL SOLUTIONS

Let the old machine be a turbo-generator, costing originally, say, \$80,000. Furthermore, let 7,500 = kw. capacity of both old and new machine. Also, let this be the mean load, differing more or less from this constant load for a total time which is negligible in comparison with the time of the total yearly run.

20 = estimated useful life of machine in years,
11 = percentage of interest, taxes, depreciation, etc.
12.8 = pounds of steam per kw.-hr. of old machine,
12.4 = pounds of steam per kw.-hr. of new machine,
8,760 = hours per year,
8 = pounds of steam per pound of coal,
$\frac{3.2}{2{,}000}$ = price per pound of coal in dollars,
$\frac{1}{3}$ = time-load factor; i.e., that factor which, multiplied by 8,760 gives the total number of hours during which the machine was running throughout the year.

Then, from the above, the total annual interest charges will amount to:

$$80{,}000 \times 0.11 = \$8{,}800.$$

Cost of coal per year for old machine:

$$\frac{12.8}{8} \times 7{,}500 \times \tfrac{1}{3} \times 8{,}760 \times \frac{3.2}{2{,}000} = \$56{,}064.$$

Cost of coal per year for new machine:

$$\frac{12.4}{12.8} \times 56{,}064 = \$54{,}312.$$

Saving in coal due to increased efficiency:

$$56{,}064 - 54{,}312 = \$1{,}752.$$

Since the annual interest charges on the old machine amounted to \$8,800, the additional investment on the new machine over the old one can *at the most* be such that the annual interest charges on the difference in cost equal the annual saving in total operating expenses. If we pay more than this without a compensating feature of some sort within the useful life of the apparatus, more money must be paid out on account of additional interest charges than is coming in from a saving in operating expenses in the form of increased efficiency, decreased maintenance, attendance, etc.

Since for simplicity of illustration we have assumed the general structural features of the more efficient machine to be similar to the old one, the items of attendance, maintenance, etc., will also be the same, and therefore cancel each other for the purpose of economic comparison. Where such items cannot be assumed identical within a reasonable degree, they naturally must be taken into consideration also.

The general condition may be represented symbolically as follows. Let:

$O_1$ = operating expenses of old machine,
$O_2$ = operating expenses of new machine,
$M_1$ = investment in the old machine,
$M_2$ = investment in the new machine,
$I_n$ = total interest charges.

Then, for the total annual charges against the two machines to be equal we must have:

$$M_2 I_n + O_2 = M_1 I_n + O_1$$

hence,

$$M_2 - M_1 = (O_1 - O_2)/I_n \qquad \text{(A)}$$

If for any reason the interest charges should not be the same, then evidently:

$$M_2 I_{n_2} + O_2 = M_1 I_{n_1} + O_1$$

and

$$M_2 = \frac{O_1 - O_2}{I_{n_2}} + M_1 \left(\frac{I_{n_1}}{I_{n_2}}\right) \qquad \text{(B)}$$

Returning to the numerical values above and substituting, we have:

$$M_2 - M_1 = 1{,}752/0.11 = \$15{,}927.28.$$

Therefore: $M_2 = (80{,}000 + 15{,}927.28) = \$95{,}927.28$, which represents the greatest total investment that can be allowed for the new machine.

To determine the interdependence between two or more quantities, we can generalize these relations algebraically and may proceed as follows. Let:

$S_1$ = pounds of steam per kw.-hr. of old machine,
$S_2$ = pounds of steam of new machine,
$O_1$ = yearly operating cost of old machine,
$O_2$ = yearly operating cost of new machine,
$M_d$ = initial cost of old machine,
$M_w$ = greatest permissible cost of new machine,
P = pounds of steam per pound of coal,
$T_L$ = time-load factor (as defined previously),
$I_n$ = interest charges, assumed same for both,
Kw. = capacity of both old and new machine, running at a nearly constant mean and rated load,
$C/2{,}000$ = cost per pound of coal in dollars,
8,760 = number of hours per year.

The yearly operating cost in coal for the old apparatus is then:

$$O_1 = \frac{8{,}760 \times T_L \times \text{kw.} \times C \times S_1}{2{,}000 \times P}$$

$$= 4.38 T_L C\text{kw.} \times \left(\frac{S_1}{P}\right) \qquad (1)$$

If $S_2 < S_1$, as it obviously should be, we have:

$$O_2 = S_2/S_1\, O_1 = 4.38 T_L C\text{kw.}(S_2/P) \qquad (2)$$

And

$$O_1 - O_2 = 4.38 T_L C\text{kw.}\ [(S_1 - S_2)/P] \qquad (3)$$

Therefore

$$V = M_w - M_d = 4.38 T_L C\text{kw.}[(S_1 - S_2)/PI_n] \quad (4)$$

where $V$ is the difference in investment cost between the two machines, or the greatest allowable additional investment as the price of increased physical efficiency.

Now, $(S_1 - S_2) = S_1(1 - K')$, where $K'$ is a factor such that $S_2 = S_1K'$ and $K' = S_2/S_1$, and therefore $100S_2/S_1\ (1 - K') = 100(1 - K_1) = E =$ *increase* in per cent in efficiency of the new machine over the old one.

Consequently,

if $K' = 0.98$, $E = 2$ per cent,
if $K' = 0.96$, $E = 4$ per cent,
if $K' = 0.93$, $E = 7$ per cent,
if $K' = 0.90$, $E = 10$ per cent, etc.

However, the actual expenditure will equal:

$M_2$ + cost of removal — depreciation — salvage, etc.

Putting $C = P = I_n = \text{kw.} = S_1 = 1$, equation (4) above reduces to $R_m = M_w - M_d = 4.38T_L\ (1—K^1)$, where $R_m$ will be a coefficient which when plotted against $T_L$ is proportional to $E$, and equation (4) becomes:

$$V = M_2 - M_1 = (C\text{kw.}S_1/P\ I_n)\ R_m \qquad (5)$$

Since $R_m$ is a straight-line function between $E$ and $T_L$, it is only necessary to compute the various values of $R_m$ for one value of $T_L$, say 60 per cent, and connect these with the origin of the rectangular co-ordinates, and for purpose of plotting:

$$R_m = 4.38 \times 0.6 \times E = 2.628\ E. \qquad \text{(See Fig. 1.)}$$

In the foregoing numerical example we have: $K' = S_2/S_1 = 12.4/12.8$; $T_L = \frac{1}{3} = 33.33$ per cent, then:

$$R_m = 4.38/3 \times [1 - (12.4/12.8)] = 0.045625,$$

or since $E = 1 - 12.4/12.8 = 3.12$ per cent, such values as $R_m$ could be read off a diagram directly, and therefore from (5) we get:

$$V = \left[\frac{3.2 \times 7{,}500 \times 12.8}{8 \times 0.11}\right] \times [0.045625] = \$15{,}927.28,$$

which is the same result as attained formerly.

From the diagram it is evident that a time-load factor of, say, 38 per cent and 12 per cent increase in efficiency is economically equivalent to a 57 per cent time-load factor and 8 per cent increase in efficiency, since evidently for the same value of $R_m$ (or more generally $R^1_m$) $38 \times 12 = 57 \times 8$, etc. In general $T_{L_1} E_1 = T_{L_2} E_2 = T_{L_3} E_3 = R^1_m$, and therefore we can readily read off from such a diagram by what percentage we may increase and correspondingly decrease either the time-load factor or the gain in efficiency and still justify the same greatest permissible investment.

In the previous simple problem the comparative values of $S_1$ and $S_2$ alone were considered. In a similar manner any other factor or combination of factors could be studied. By attaching to the values of $E$ in Fig. 1 a broader meaning than the previous example would seem to indicate and using it in connection with $R^1_m$ various useful results may be readily read off.

It must be remembered that until now we have dealt with the cases of loads which were considered practically constant. Since it is rarely the case that, for example, a turbo-generator carries the same load continuously, modifications of the foregoing formulas must be made to allow for the conditions of a constantly variable and fluctuating load.

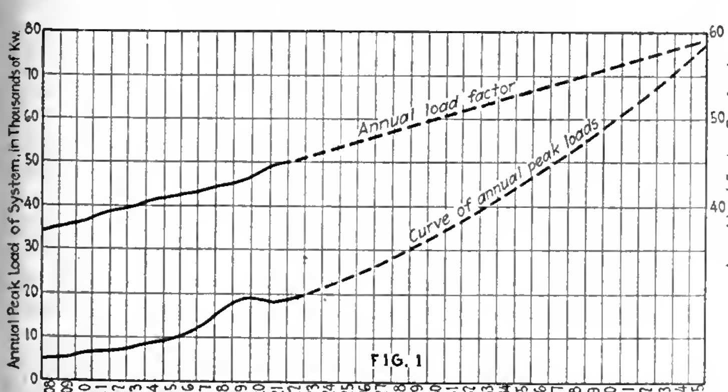
This phase of the subject will be discussed as applied to a specific illustration in an early issue of the ELECTRICAL WORLD.

# Analysis of a Building Program

## Graphs Used to Make Concise and Readable Masses of Figures Needed in Power Company's Building Program

BY CHARLES P. DUNN
Seattle, Wash.

THE detailed study of even a simple central-station building program involves a great many pages of output calculations and cost estimates, and the summary is often a confusing array of figures which are difficult to visualize in their proper relations and to weigh one against the other, unless the results of the study, stripped of all trimmings, are presented in the form of graphs. Often much of the work connected with the calculations can be done graphically with sufficient accuracy and with a small fraction of the labor that would otherwise be required. Excessive refinement of calculations pertaining to future events is futile. The work is fundamentally a guess, a scientific guess to be sure, but figures carried out to the $n$th decimal place do not fool the business men to whom the work



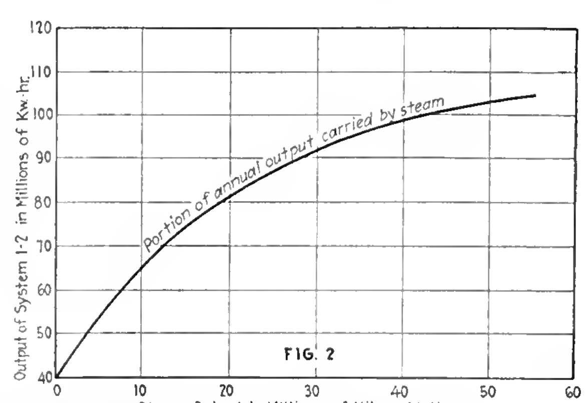


FIG. 1—EXTRAPOLATION OF CURVES SHOWING PAST GROWTH OF SYSTEM PREDICTS THE FUTURE. FIG. 2—GRAPH TO DETERMINE AMOUNT OF LOAD TO BE CARRIED BY STEAM PLANTS

is presented and do not increase their respect for the man who does the guessing.

Almost any industrial enterprise might profitably be visualized in the manner indicated by the following brief outline of a study of a power company's expansion program.

Fig. 1 shows an estimate of future loads and load factors extrapolated from the curve of past performance or calculated from probable local conditions which may influence the growth of the industry.

The present plant is assumed as consisting of:

(1) A 15,000-kw. hydro-electric plant, with daily storage only, with output limited to 10,000 kw. on 50 per cent annual load factor in dry years; cost $2,500,000.

(2) A 15,000-kw. steam plant; cost $1,500,000.

The future possibilities to be considered are:

(3) A hydro-electric plant of 22,000 kw. capacity on 50 per cent annual load factor, with storage ample for complete control of stream flow; plant to cost $3,500,000, of which $2,500,000 is invested in works which will be a part of plant (4).

(4) The extension of (3) to a plant of 80,000 kw. capacity on 55 per cent annual load factor, at an additional cost of $6,000,000.

(5) The construction of the plant described as (4) without the preliminary step (3), at a cost of $8,500,000.

(6) Increase of (1) to 20,000 kw. capacity on 50 per cent annual load factor by additional storage and additional machinery, at a cost of $1,500,000.

(7) Additional steam installation at $90 per kilowatt.

By a study of loads, load factors and hydrographs a series of performance calculations are made covering each possible combination of the present system with the proposed future plants. The portion of the load which must be carried by steam at various system loads is determined for the different combinations and for convenience is recorded in curves, of which Fig. 2 is a sample.

The probable performance having been determined, cost of power curves can be obtained by considering fixed, operating, maintenance and fuel charges. These curves are shown in Fig. 3, the vertical scale being cost per kilowatt-hour, the horizontal scales being time, peak load, annual output and annual load factor.

The curves in Fig. 3 are identified by groups of numbers representing combinations of the possibilities listed above, as: Curve 1-2 represents the cost of power delivered by the present system at various loads; curve 2-6 represents the present system with the present hydro-electric plant expanded as per item 6 in the preceding list; curve 1-2-5 shows the cost of power with the 80,000-kw. plant added to the system at once and forcefully pictures the folly of over-construction.

The object to be attained is to plan the construction so that the costs follow as nearly as possible the lower limit of the group of curves. It is evident that the extension of the present plant as per item (6) would be of immediate advantage if it could be put in operation at once. However, by the time this extension could be built and put in service it would be of no more advantage than group 1-2-3, and from 1925 until 1930 the group 1-2-3 gives the cheapest power of any combination.

Additional power must be ready by the time the load reaches the dry-season capacity of the present system (25,000 kw.) in the fall of 1925. The choice lies between 1-2-3 and 1-2-5 for the first step in the program. If plant No. 5 is built at once, the cost of power will be sharply increased and will be higher than could be obtained in other ways for at least ten years, the advantage of this construction being more than ten years in the future, where curve 1-2-5 is the lowest of the four nearly parallel curves. If plant No. 3 is built, we may follow the curve 1-2-3 to a load of 46,000 kw., then make

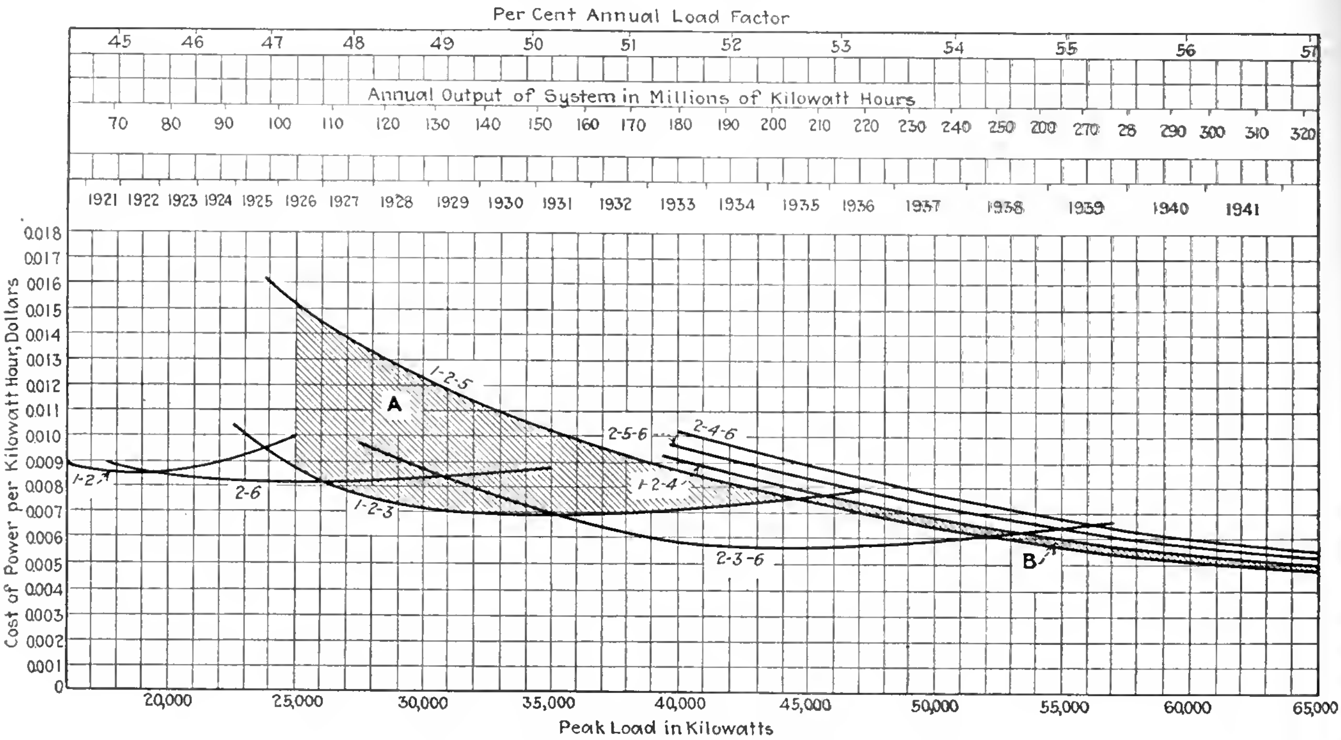

FIG. 3—COST OF POWER CURVES OBTAINED BY CONSIDERING ALL CHARGES

the change to 1-2-4, or we may follow 1-2-3 to 35,000 kw., then 2-3-6 to 56,000 kw., then 2-4-6.

There is little doubt that the first proposition, 1-2-5, is inadvisable because it would cause a loss represented by the shaded area *A* against a gain represented by the shaded area *B*. The second and third propositions appear to be nearly equal in value, and a decision between the two requires careful study. In comparing savings on the chart it must be kept in mind that a dollar saved in 1925 is worth considerably more than one saved in 1935. It would, no doubt, in some cases be advantageous to distort the horizontal scale on the basis of "present worth" of the possible savings, so that areas under the curves would represent dollars at the present time and could be compared directly.

The upward trend of the curves near their ends is due to the cost of fuel as the load approaches the ultimate capacity of the system under consideration and a substantial load is carried by the steam plant. The addition of more steam capacity has not been shown on this chart because there is no opportunity to make a saving thereby. The construction of an additional steam plant would move all the succeeding curves up on the cost scale.

There are usually certain factors in a problem which the engineer does not attempt to express graphically because they are difficult to evaluate, such as legal proceedings, availability of funds, the value of designing the system in such a way as to insure continuity of service, etc. It must also be remembered that the immediate future is more important than the remote future; the forecast of costs and events is more accurate for the near than for the future. This concisely presented best possible approximation is much better than vague, poorly expressed guesses, and if revised from time to time to suit changing conditions, is sure to prove of great value.

**A Place Set Apart for Suggestions, Comments and Criticisms, to Which All Men of the Electrical Industry Are Cordially Invited to Contribute**

## Proper Ratio of Tooth Width to Slot Width

*To the Editors of the* ELECTRICAL WORLD:

Discussion such as that of F. S. Dellenbaugh, Jr., on page 1158 of the ELECTRICAL WORLD for Nov. 25 are very interesting and instructive and should be a help in the checking of design work. It would seem that instead of reserving the quantities $B$ and $\phi$ as the working variables, $\phi$ and $w$ should be so considered, since in most cases $B$ can be taken as a constant, for, with given conditions of frequency, etc., $B$ is of fixed value, being subject to some manipulation in extreme cases. Of course, with very narrow teeth $B$ can be made greater without much increase of iron loss.

Taking the equation as given and operating on $\phi$ and $w$, the same conclusion is reached: Slot width should equal tooth width for the most economical results, the final value of $\phi$ being $L\psi B\pi D/2p$.

Some time ago the writer attacked this problem from a slightly different angle. The equations were applied to the case of an armature with a comparatively small number of paralleled side slots, giving the tooth considerable angularity and bringing in the matter of tooth depth.

Let $D$ = diameter of armature,
$L$ = active iron length,
$t$ = tooth depth,
$w$ = slot width,
$n$ = number of slots,
$Z$ = number of conductors in series.
$E$ = emf. produced.
$B$ = tooth density,
$\psi$ = polar enclosure.

It is required to make $E$ as large as possible by suitable relation of slot width to tooth width, assuming a given ampere capacity or size of conductor, so that output is proportional to volts.

Neck of tooth then $= \dfrac{(D-2t)\pi}{n} - w.$

$Z = Ktwn$, or the conductors in series are proportioned to total cross-section of the slots, $K$ being a constant.

$E = \int Z\phi$, assuming the speed as fixed, and can be expressed as

$$\int Ktwn\psi BLn\left[\frac{(D-2t)\pi}{n} - w\right], \text{ or}$$

$$K\psi BL(\pi Dtwn - 2\pi t^2wn - tw^2n^2).$$

Now, letting $w$ and $t$ be constant, varying the number of slots $n$:

$$dE/dn = K\psi BL(\pi Dtw - 2\pi t^2w - 2tw^2n)$$

and

$$\pi Dtw - 2\pi t^2w - 2tw^2n = 0$$

whence $\quad n = (\pi Dtw - 2\pi t^2w)/2tw^2,$

or $\quad wn = \pi(D-2t)/2,$

showing that the total neck area should be half of the perimeter at the base of the tooth.

If $w$ and $E$ are the variables with $n$ and $t$ as constant,

$$dE/dw = c(\pi Dtn - 2\pi t^2n - 2twn^2).$$

Where $c$ is a constant,

$w = \pi(D-2t)/2n$, which is a repetition of the above.

Suppose $t$ is the variable, then:

$$dE/dt = C(\pi dwn - 4\pi twn - w^2n^2)$$

and $\quad t = (\pi D - wn)/4\pi;$

but, as above, $\quad wn = \pi(D-2t)/2,$

$$t \text{ becomes } \frac{\pi D - \pi[D-2t]/2}{4\pi} \text{ or } t = D/6.$$

From which it appears that for parallel side slots the neck should equal the slot width and the depth should be one-sixth the diameter.

The last is probably of academic interest only, as other considerations would eliminate this in all but small armatures.

Another feature of particular interest is that of slot space factor. A moment's consideration will show that with decreasing slot width a point is reached where the slot insulation will cut the wire space down to nothing, such a slot having a width of twice the slot insulation plus the cotton taping or other coil insulation. As such insulation is generally greater than 0.100 in., it can readily be seen that the slot width should be substantially greater than the width of the tooth. This can be shown below where $Z$, instead of being equal to $Ktwn$, is now $Ktn(w-k)$, where $k$ is the difference between slot and wire widths.

By differentiating as before, $n$ becomes

$$(\pi D - 2\pi t)/2(w-k)$$

and $\quad w = (\pi D - 2\pi t + 2nk)/2n,$

showing that either the number of slots or their width must be increased to maintain maximum output as the slot insulation increases. This, too, is in accord with practice.

The same line of reasoning can be extended to the value of $t$, because here again we have a certain amount of constant loss of space at top, center and bottom of the slot, which within the limits of the design may be considered constant. The result will show that the greater the proportion of slot section occupied by anything except copper, the larger should be the slot and the thinner the teeth to secure the maximum use of material. JOHN H. HERTNER.

Hertner Electric Company,
Cleveland, Ohio.

*To the Editors of the* ELECTRICAL WORLD:

Mr. Hertner's discussion upon the design of slot and tooth dimensions is very gratifying, and it is interesting to note that he obtains the same results from a slightly different standpoint. I did not intend to imply in my article that $B$, the tooth density, was to be considered a variable in the design. It was merely assumed as a variable temporarily and the conditions necessary for making it a minimum were determined. This obviously implies the minimum material necessary, and the flux density itself may be brought to any desired value by changes in length or diameter without affecting this minimum condition.

Mr. Hertner's further discussion upon the effect of insulation is valuable for a practical application of the results. It would be interesting in this connection to investigate also the effect of varying the size of copper as the total number of armature conductors is changed. It is usually necessary to do this in actual design since more conductors result in more heat loss, and even though there be greater facilities for conduction away from the copper, the total loss within an armature of fixed over-all dimensions must in general be approximately constant. This is a little difficult to handle theoretically since the relation between the number of conductors and the size of each one is somewhat uncertain and would vary with different types of design. F. S. DELLENBAUGH, JR.,

Department of Electrical Engineering,
Massachusetts Institute of Technology,
Cambridge, Mass.

## Laminated-Frame Arc-Welding Generators

*To the Editors of the* ELECTRICAL WORLD:

In your issue of Sept. 16 J. F. Lincoln illustrates the use of a stabilizing reactance in the arc circuit by comparing it to a flywheel in a mechanical system. The illustration is made clearer if this splendid analogy is carried a step further. Obviously the current in the electric system corresponds to velocity or speed in the mechanical system, and the voltage corresponds to force or torque. The purpose of adding flywheel effect is evidently to oppose rapid changes in speed and never to assist in obtaining "almost instantaneous adjustment of speed." Its function is to assist or oppose the torque of the driving mechanism in accordance with the torque requirements of the load so as to maintain nearly uniform velocity. Similarly, in a direct-current circuit, electromagnetic inertia or inductance is inserted for the very purpose of opposing sudden changes in the current by assisting or opposing the generator terminal voltage.

Manifestly, the object sought by laminating the frame is then to make the generator itself adjust its terminal "voltage" rapidly enough to maintain nearly uniform current with less assistance from the reactance. In my letter of Sept. 9 I criticised a statement in a catalog, that lamination of the frame makes it possible for the "electric current" to adjust itself "almost instantly" to any demand. My statement in this connection was: "The idea which it is intended to convey probably is that a rapid change of flux permits a rapid change of terminal voltage, so that a substantially constant current can be maintained when the resistance of the arc circuit varies rapidly." This statement harmonizes perfectly with Mr. Lincoln's mechanical analogy, and had he read my letter carefully, he would probably have arrived at a different conclusion in regard to my missing the point on this subject.

Mr. Lincoln further states that the voltage adjustment of any commercial machine is a gradual process, comparatively. I emphasized this point very strongly in my original letter, indeed insisted that a failure to recognize the relative meaning of the expression "rapidly changing flux" when used in this connection has been responsible for greatly overestimating the benefits received from laminating the frame.

In a paper on design of arc-welding generators (*Transactions A. I. E. E.*, Vol. XXXIX, Part 2) the writer has derived formulas for the transient currents of a separately excited differential generator when the resistance in the external circuit is suddenly changed from one value to another. As stated in the appendix to the paper, the formulas were derived on the assumption that in the sizes under discussion the mutual induction due to eddy currents in the frame is negligible, and yet the calculated values checked very well with values from oscillograms.

However, such analysis is not necessary, for the present at least, as Mr. Lincoln furnishes a good criterion for the usefulness of the laminated frame, namely, the extent to which it makes it possible to reduce the reactance in the external circuit. In the above-mentioned issue of the *Transactions* A. M. Candy of the Westinghouse company describes the operating characteristics of a generator having a solid frame (rolled), but in the design of which were embodied some special features tending to stabilize the arc circuit. The inductance used with this generator was given as 3½ millihenries at 100 amp. and approximately 2 millihenries at 200 amp. Furthermore, it was stated that the generator operated quite satisfactorily over a fairly wide range of current without any external reactance. Will merely laminating the frame permit the use of less inductance as a commercial proposition?

But that is not all. By the disposition of part of the commutating coil in the main pole flanges so as to obtain a large leakage flux interlinking with the coil considerably more inherent stabilizing effect can be obtained than was possible by means of the special features in the machine discussed by Mr. Candy. The writer fully agrees that prevention is better than cure, and inasmuch as the reactor at the best can only be considered a cure, I strongly recommended in my previous letter that designers concentrate their immediate efforts toward the elimination of the reactor. My opinion is that that can be done much more effectively by other means than laminating the frame, and so far the replies to my letters have in no wise tended to alter this opinion. K. L. HANSEN

Milwaukee, Wis.

# Central Station and Industrial Practice

Installation, Operation, Maintenance, Test and Repair of Generation and Distribution Equipment, and Methods of Economically Utilizing Electric Service in Large Industrial Plants

## Advantages of Scheduled Inspection Over Individual Responsibility

TWO methods are commonly employed by general managers and operating executives in checking the upkeep and repair of properties, the degree of efficiency maintained, the relative utility or obsolescence of equipment and the maintenance of said upkeep, efficiency and utility from year to year.

The first method, and the one commonly used by executives of the old school, is to place such responsibility once for all upon some appropriate individual, as, for instance, the plant superintendent, and consider the matter closed. The plant superintendent has several alternatives in handling this assignment. He may delegate the task to his assistant or immediate inferior in rank, who will in turn redelegate it on down the line, where it will eventually receive, perhaps, the thought and diligence of that employee least fitted by perspective, attitude or training to accept it. Each head from the chief executive down will be occasionally inspired to note some oversight, failure in effectiveness or dereliction of duty and will straightway prod his immediate delegates into activity and so on down the line. This is the so-called military type of management.

### Proper Inspection Impossible by Disinterested Persons

We can say little for the disinterested and indifferent custodian who not only fails to delegate this duty to an individual whose characteristics fit him for such responsibility, but also fails to keep alert to the conditions himself. If his habit of mind continues, upon being confronted with conditions resulting from the absence of remedial and modernizing upkeep, his tenure of office is apt to be short-lived.

The "exceptional superintendent" to whom this assignment holds an especial appeal may pursue other tactics. His interest and sense of pride in the property may be reflected in his mental attitude to the extent of refusing to intrust this function of custodian to any one, least of all an inferior officer or employee. This type of executive pursues a similar course in other capacities and will usually be found overworked, harassed and burdened by each added duty or assignment. Each responsibility will doubtless receive honest, dependable treatment to the extent of his ability. In any event, assuming normal conditions, his plant and equipment will acquire the aspect of an efficient, well-maintained property.

### Specific Instructions Necessary for New Employees

There comes a time eventually when the exigencies of industrial unrest (resulting in increased labor turnover), plant additions or other material changes or developments occur to add to previous burdens and necessitate a complete shifting of former adjustments. The new apprentices must find their places in uncharted ways, and there is a serious breakdown in the plan of operation that formerly functioned smoothly. Specific instructions to new employees must be stated and restated and followed up at high expense of time and energy, and even then the results of unexpected omissions constantly arise. Should the "exceptional executive" be absent at such a time, the result may be chaotic.

There is, however, another method in very general use but representing an entirely new school in executive thought and practice. It will not be adopted by the old "military type" executive or the "exceptional type" who aims to drive all the nails in his plant or property himself. It may be called scheduled inspection functionally maintained. A clearly defined task is set before each operating custodian. The schedule will state nothing that is in the least degree vague or indefinite, but on the contrary each task will be carefully and completely circumscribed. It will conform to Gilbreth's definition of a standard: "A standard is simply a carefully thought-out method of performing a function or a carefully drawn-out specification. The idea of perfection is not involved; it is simply the best that can be devised at the time the standard is drawn. Improvements in standards are wanted and adopted whenever and wherever they are found. There is nothing to preclude innovation. A proposed change is scrutinized as carefully as the original standard by as competent counsel. They are a constant invitation to experiment and improvement."

It is the recognition and acceptance of the above premises and the logical conclusions so afforded that we believe justify our confidence and persistent effort in attempting to render scheduled inspection increasingly effective in the operation of the Central Hudson Gas & Electric Company's system.

Few managers purposely neglect or postpone work essential to efficient maintenance of properties. There is a failure in bringing to attention needed changes and repairs, a lack of system in directing the inquiry, and an absence of follow-up treatment in pursuing the subject through to completion.

### Inspection May Be Supplemented by Outside Forces

Schedule inspection is a resultant of two viewpoints—staff and line. In application it may be supplemented by expert "outside inspection" services in addition to the occasional managerial survey and regular insurance inspection. In relation to upkeep a man exclusively detailed to handle minor plant repairs and construction orders may often be used to advantage.

A schedule is impersonal and consequently more amenable to criticism and review than the best-intentioned custodian; it is insistent upon comprehensive treatment regarding each item of its check list; it may not be unduly postponed, since it is sub-

ject to immediate and imperative "follow-up."

The scheduled method is, in our opinion, strong in precisely those elements where the method of responsibility minus adequate written instructions, report and follow-up is weak. It is regular and prompt where the older method is at best occasionally delayed through pressure of seemingly more important duties. It is independent of personnel where change in the latter may prove disastrous. It may well be, however, that susceptibility to improvement is its main attribute and that even where present schedules may prove inadequate they will at least afford a basis upon which more consistent practices may be subsequently established and from which better results will accordingly ensue.

E. W. BAKER.

Central Hudson Gas & Electric Company, Poughkeepsie, N. Y.

## Spacers Aid Storage of Parts in Stockroom

MATERIAL in the stockroom of the Stamford (Conn.) Gas & Electric Company is stacked in unusually compact order by the use of corrugated-board spacing sheets, as shown in the accompanying photograph. By careful attention to the proper labeling of bins as to kind of material and size, with the orderly packing illustrated, the company finds it easy to keep track of supplies and to maintain what virtually amounts to a continuous inventory of material on hand in the bins themselves. The amounts on hand can be

INVENTORY OF STOCK FACILITATED BY CORRUGATED SPACERS

verified with the utmost rapidity by multiplying the numbers of units in each row by the number of rows and this product by the number of tiers. The entire stockroom presents the appearance of the small section photographed.

## Roller Bearings Reduce Mill Motor Maintenance

MARKED reductions in mill motor-bearing troubles have resulted from the use of roller bearings in this type of equipment, according to a paper recently presented before the Philadelphia section of the Association of Iron and Steel Electrical Engineers by L. J. Hess, chief electrician Youngstown (Ohio) Sheet & Tube Company. Mr. Hess has done much original work along the line of roller-bearing design for mill motors. His first installation of roller bearings was made on a Westinghouse series crane motor on hoist service about six years ago. The bearings were of the spring-roller type, but the design was unsuccessful, owing probably to lack of study of the problem and to the transition through which bearing design was passing in this establishment.

### ROLLER BEARINGS USED TO ADVANTAGE ON HOT-METAL CRANE

About four years ago another installation was made of a solid roller-type bearing on a Crocker-Wheeler size EW series motor driving, in tandem with a similar motor, the bridge of a 100-ton hot-metal crane in a mixer building. Previous to this application, a four-month run on babbitt bearings on this drive was considered good, while frequent armature changes, broken bands and flat spots were the rule. At the time of the application the commutator was badly worn, had an estimated life of three months with babbitt bearings, and rewinding was close at hand. After the roller bearings were installed the motor ran about nine months before the commutator began to throw bars. Electrical repairs were then made, and the bearings have since been running without trouble either in armature or bearings. No grease or oil has leaked into the windings or upon the commutator, and a recent inspection shows a bearing wear of only about 0.004 in., which is the ordinary tolerance for a new babbitt bearing.

By making a new motor head Mr. Hess developed a roller bearing which has given excellent results in the Westinghouse type K motor. This involved a comparatively small casting and eliminated difficulties formerly experienced with the bronze sleeve-type bearing. At present roller bearings have been developed for the Crocker-Wheeler type SM, sizes CW, DW, EW and FW, and the Westinghouse type K, Nos. 3, 4, 6 and 8 frame motors. These bearings the Youngstown company carries in stock, and as fast as the repairs to armatures necessitate new shafts and the repair record of the motor indicates the necessity of roller bearings they are put on. Besides careful design of shafts and bearings, heat treatment of shafts is also desirable in order that the surface may be harder and tougher to withstand the action of the race. Using a steel with 0.50 per cent carbon, quenched in oil at 1,500 deg. and drawn back to 850 deg., a shaft is obtained which is tough and moderately hard, with the added refinement of grain and improvement of the breaking strength.

From experience with about sixty sets of bearings, Mr. Hess has found the following advantages:

1. Electrical repairs to commutators and windings are greatly reduced because at least 50 per cent of these troubles arise from oil and grease working upon the commutator and front V-ring.

2. Commutator wear is materially reduced because there is no jumping due to loose bearings with resultant flashing and flat spots.

3. Equalizer connections are relieved of abnormal duty because the armature is held constantly in the center of the magnetic field.

4. Broken bands due to rubbing are unknown.

5. Pinions are kept accurately in mesh and crowding of teeth is obviated.

6. Inspection cost is reduced through improved commutation and less attention to lubrication.

7. The cost of lubricants is reduced almost to nil, as the bearings consume practically no grease.

8. Labor and lost time during armature changes and charges against electricians in mills are reduced.

The writer stated that in ordering a considerable number of mill motors he would specify roller bearings.

In the discussion the desirability of permitting further time for standardization of bearings to be effected in designing circles was brought out.

D. M. Petty, superintendent electrical department, Bethlehem Steel Company, Bethlehem, Pa., predicted that in the near future either ball bearings or roller bearings for motors will be the rule rather than the exception. Ball bearings on a 20-hp. shear motor with pinion drive have been running over two years, against a sleeve-bearing life of three months. The importance of adequate size in ball bearings was also brought out in the discussion.

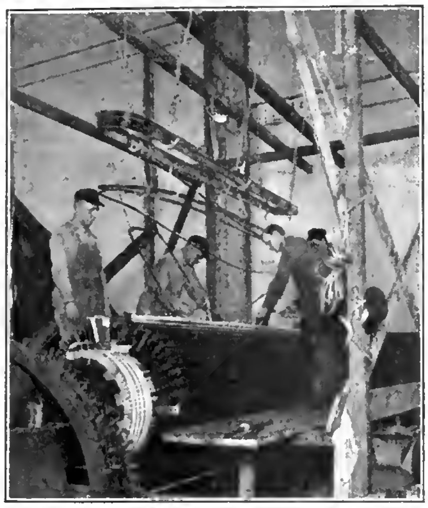
## A 30,000-Kw. Rotor Rewound in 74 Days

WITHIN seventy-four days after an opened field coil was found on a 30,000-kw. generator in the Connors Creek plant of the Detroit Edison Company the entire field was rewound and the machine back in service. This 1,800-r.p.m., 12,200-volt unit had been in operation since June 11, 1920. Trouble was first experienced on Aug. 18, 1922, when it was found that after the unit was brought up to speed there was no voltage on the stator.

After removing the end bells it was found that the field connections between poles had broken. When the machine had been shut down in cooling off, the ends of a coil had separated, causing an open circuit. Since the installation of the coils and the wooden spacers showed excessive heating, it was decided to rewind the entire field. The first work was to sledge out 480 brass and iron wedges, which was accomplished in about a week's time with very little damage to the wedges.

In lifting out the coils they were twisted and bent out of shape very badly, as the slot insulation was baked hard and had stuck to the coils and slots. The coils were then annealed before they could be straightened. As there was no convenient means of obtaining more than 900 amp. at low voltage, a blowtorch was used which annealed only the ends. It was then necessary to make a press to straighten the coils and flexible connections were connected to the ends.



RELAYING-COIL METHOD FOR REINSERTION IN ROTOR

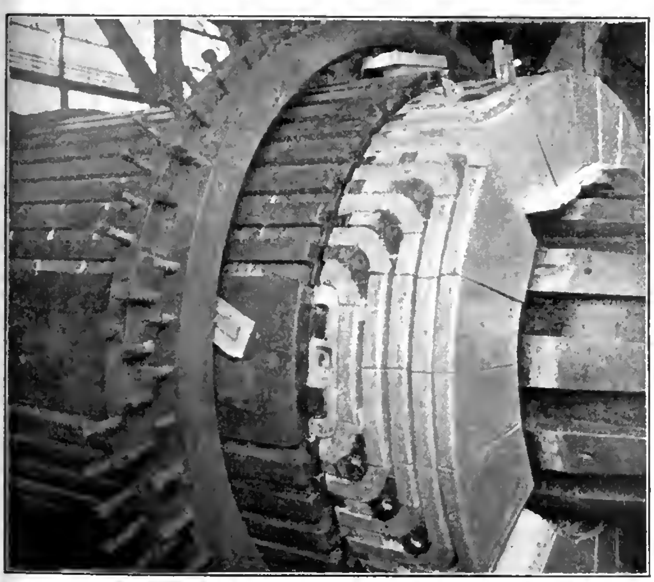
The coils were then insulated with mica tape wound by hand, and each turn was varnished as it was wound. The method of relaying a coil when being replaced in the rotor is shown in one of the accompanying illustrations. A new cell was placed in the iron slot and each turn of copper dropped in place and then driven in with fiber boards and rawhide mallets. The inner coil, being the hardest to place owing to the short radius of the end turns, required a 90-deg. twist in each end to slip it over the core, but when in place this twist was hammered out.

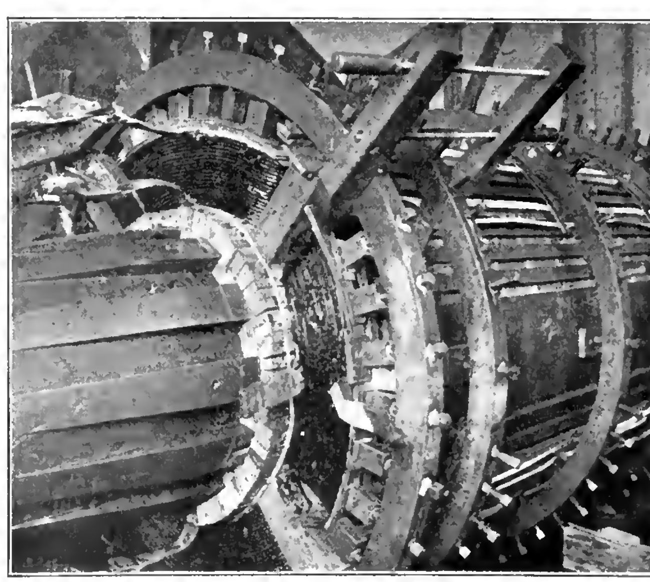
Pressure rings were used in forcing the upper coil into place, and current was applied to warm the insulation to make it more pliable. The twenty coils had each to be heated and pressed separately, then the entire field was baked for five days. Aluminum pins were used in securing the end turns instead of wooden blocks because, besides holding the insulation in place and preventing its mushrooming from centrifugal force, they carry the heat to the retaining bells, where it is dissipated. After the retaining bells were replaced the field was again baked for a period of four days and then placed back in the armature. The repaired unit started to generate electricity again on Oct. 31, 1922. The total time required to complete the work was equivalent to 11,855 man-hours.

A. N. SIMMONS.
Detroit Edison Company,
Detroit, Mich.

## Control of Direct-Current Generator Fields

RECOMMENDED practice for the control of direct-current generator fields as adopted by the Electric Power Club shall be to omit field switches from direct-current generator panels, it being understood that





LEFT—FIELD ALUMINUM SADDLE AND WEDGES ON END TURNS OF 30,000-KW. ROTOR AT CONNORS CREEK BEING DISMANTLED. RIGHT—PRESSURE RINGS AND CURRENT AID IN FINAL ASSEMBLY

when no field switch is used the field rheostat will be designed to reduce the field current to a point which will not allow the building up of voltage on the generator.

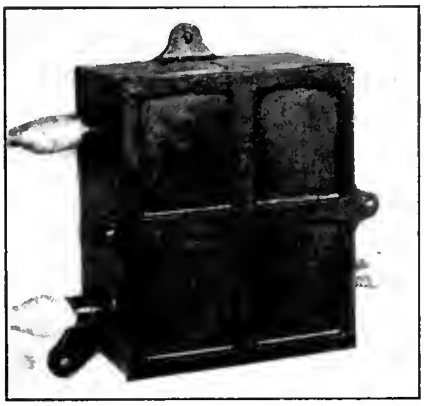
Chicago, Ill.

## Reliable Operation Insured by Solenoid Switch

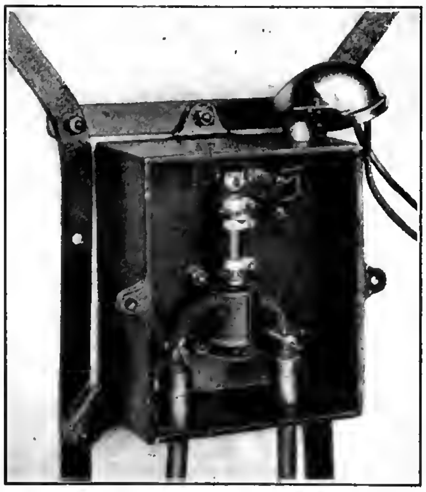
A SWITCH that has proved very useful in connection with the operation of illuminated traffic signals at street intersections has been developed by the United Electric Light Company of Springfield, Mass.



MOISTURE-PROOF BOX USED WITH OR WITHOUT HANGERS

These signals contain two 50-watt mill-type "Mazda C" lamps, operated from 110-volt alternating-current circuits. The switch is installed in a manhole and connected to the series street-lighting circuit, which insures regular operation of traffic signals.

This switch consists of a stationary contact and a movable contact, the latter being brought into contact with the former when the solenoid is energized by the high-voltage circuit. The contact is thus held until such time as the high-voltage circuit is cut off, when the contact is broken by gravity. The magnetic circuit of the solenoid contains a large leakage path, so that a quick break follows the cutting off of the current from the series coil.



SOLENOID SWITCH ADAPTABLE TO UNDERGROUND AND OVERHEAD SERVICE

The contacts and solenoid are mounted on an insulated panel of non-hydroscopic material and inclosed in a cast-iron box, such as is shown in the accompanying illustrations. The cover of the box is fitted with a lead gasket, and the cables are brought in through brass sleeves wiped on, making the box moisture-proof, so that it may be installed in any desired location. The switch box is 8 in. long by 10 in. wide and 4 in. deep, fitted with three lugs for attaching to the wall of the manhole. The box may also be fitted with hangers for installation on cross-arms when used with overhead construction.

## General Switching Recommendations

IN SWITCHING operations speed is desirable, especially in cases of emergency, but unless an operator is absolutely sure of every move he makes rapid manipulation of switches may serve only to increase rather than diminish the trouble. The best indication of the correct performance of switching operations is obtained by intelligently observing the ammeters during the switching. For example, when one transformer bank is carrying a certain load its ammeter indicates the amount of current. If another transformer bank is connected in parallel with the first one, the two banks should divide the load in proportion to their capacities and their ammeters should indicate this division of the current.

In order that switching operations may be facilitated the Philadelphia Electric Company employs the following rules:

1. The operator should always know with certainty the proper steps to take in switching of any kind, and his moves should always be made with his attention fixed upon what he is about to do.
2. Ammeters and pilot lights must always be observed when performing any switching operations.
3. In case of trouble proceed as rapidly as accuracy permits and carry out a definite plan thought out in advance.
4. Consult the load dispatcher before carrying out any switching operations on the system under his control, except where delay will result in danger to life or property. In this emergency the operator may proceed with such operations as he thinks necessary and report to the load dispatcher immediately afterward.
5. All switching, when possible, should be checked by another person in company with the one performing the switching operations.

## Rules for Changing Shifts in Boiler Room

WHEN changing shifts in a stoker-fired boiler room it is necessary for the incoming shift to report before the outgoing shift leaves in order to determine existing conditions so that the water tender or boiler operator may assume full responsibility for immediate operation even under the most unusual conditions.

Special attention should be paid to the report on the automatic feed-water regulators since the sticking of these valves will either flood the boiler or let it run dry. The specific rules in regard to changing shifts followed by the Philadelphia Electric Company are given below:

At the beginning of each shift, before taking over the shift, the water tender or boiler operator must proceed as follows:

1. Blow down the working column and gage glass on each boiler and test the gages by opening the gage cocks to determine the water level.
This should be done by the water tender or boiler operator, but any one else detailed may blow down duplicate columns under supervision of the water tender or boiler operator.
2. Examine the fires and see that the stoker speeds and drafts are adjusted properly for the ratings developed. Note the position of wind box extensions, clinker-crusher doors and clinker-crusher speed.
3. Examine the gage board to see that all instruments are in operation.
4. The water tender or boiler operator leaving the shift must report to his relief any unusual or special conditions pertaining to the apparatus and fires. Special attention must be given in this report to the condition of the automatic feed-water regulators and hand-operated feed-water valves.
5. On taking over the shift the water tender or boiler operator assumes full responsibility for further operation.

# "Fool-proof" Disconnecting Switch

**Electrical Interlock in 66,000-Volt Outdoor Switching Station Prevents Opening Under Load, While 45-Deg. Mounting Maintains Safety Factor of the Insulators**

SIMPLICITY in bus structure, with lack of complicated wiring, has been insured in the 66,000-volt outdoor switching stations of the Duquesne Light Company by the use of the specially designed, gang-operated disconnecting switch shown in the accompanying illustrations. Other advantages gained by use of this switch are:

(a) It may be electrically or mechanically interlocked with the accompanying oil switch to prevent opening under load.

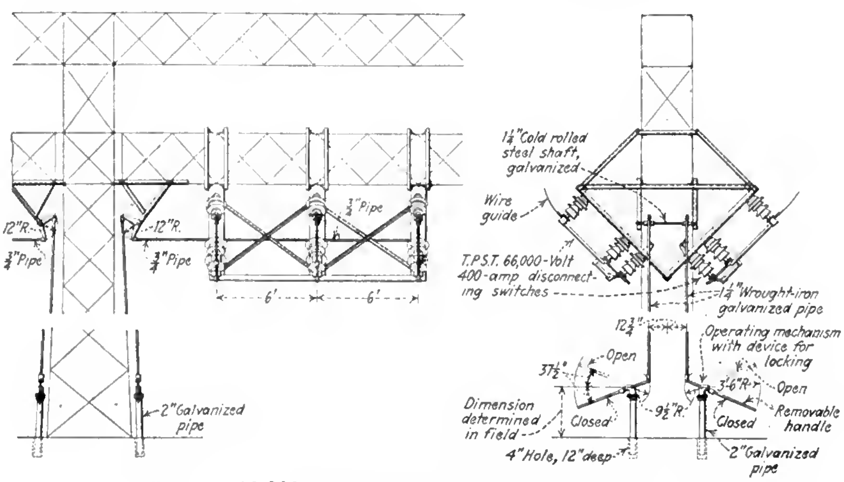
(b) It may be mounted high up on the structure when structural features of substation design make this desirable.

(c) Complete isolation of an oil switch may be effected in a few seconds, whereas the operation of six single-pole units with a long hook stick may take several minutes when time is very valuable during an emergency.

(d) The operating handle may be grounded and thus eliminate the danger from a switch hook stick becoming a partial conductor.

(e) The operating handle may be locked in either the open or closed position.

The interlock between oil circuit breaker and disconnecting switch is obtained by the following sequence of operations: Under normal conditions a key remains continuously inserted in a lock on the switchboard, permitting operation of the oil circuit breaker by means of the controller or by relay action. When the oil circuit breaker is to be inspected or repaired the key is removed, tripping the breaker (if this has not already been done) and opening the closing circuit to prevent reclosing. The key is then used to unlock the disconnecting switches, which are then opened manually, the padlock being replaced in such a way that they are also locked open. Upon completion of repairs the disconnecting switches are closed and the key is again inserted in the lock at the switchboard, permitting normal operation of the oil circuit breakers. Instead of installing the lock on the switchboard, it may be installed in the oil circuit breaker control housing, which would have certain advantages in a large outdoor station.



DETAILS OF 66,000-VOLT DISCONNECTING SWITCH, SHOWING OPERATING MECHANISM

The switch shown has a special rotating mechanism which permits mounting at any angle desired. With the base mounted at 45 deg. to the vertical, taps to the bus can be made short and direct, and the absence of turns and bends in the switch and transformer wiring permits the use of ordinary stranded conductors and standard suspension insulators and hardware. To secure the angular mounting the base is framed into the steel structure, thus eliminating castings in the insulator supports. By slightly modifying the steel structure horizontal or vertical mounting can be obtained.

The switch has been adapted for use with 22,000-volt and 66,000-volt lines, and in the substation shown the same design of switch, with various ratings, has been used on both the high-tension and the low-tension sides of the transformers.

Similar switches for 22,000-volt structures have been employed in one of the substations of the West Penn Power Company. These switches also bring out the advantage that gang operation eliminates difficulties from extreme mounting heights and at the same time facilitate the construction of buses from standard line material.

## Development of Electrical Advertising

**Data from 143 Cities Show Wide Variation in Use, but a Uniformly Large Opportunity Exists for More Business If Energetic Efforts Are Made**

By H. H. Magdsick
Chairman Sign, Display and Billboard Committee, Commercial Section, N.E.L.A.

THE rate of increase in the use of electrical advertising through more and larger displays and the substitution of higher-wattage lamps in existing signs was previous to the last year about 15 per cent annually. A much faster growth was evidenced during 1922. This has been attributed to two major influences: First, publicity managers are appreciating more fully the many advantages and the comparative efficiency of this medium and are appropriating a constantly growing part of their advertising budget to it; second, central station commercial managers are realizing more generally the desirable and profitable nature of the electrical advertising load and are joining in organized stimulation of the field.

Surveys conducted by the Lighting Sales Bureau of the National Electric Light Association have brought out clearly the opportunity for increasing central-station revenue by the promotion of electrical advertising. One hundred and thirteen central stations assisted in a recent survey by furnishing detailed information from their cities, and sign manufacturers supplemented this with data from thirty other cities. These surveys reveal some interesting facts regarding the development of electrical advertising in the 143 cities, which have an aggregate population of 6,300,000.

In Table I, showing the number of different types of displays, it is interesting to note that of the 250,000 listed 112,000 were exposed lamp signs and 81,000 were inclosed lamp signs. That is, 77.2 per cent of the total was purely electric advertising. Illuminated bulletin and poster boards accounted for 50,000, or 20 per cent, and 7,000 displays, or 2.8 per cent, were for building outline lighting.

These 250,000 electrical displays, as shown in Table II, have a total of 15,000,500 sockets, in which lamps varying in size from 5 watts to 250 watts and even larger are used. The average wattage per socket is 13.2. The largest sign has a connected load of 300 kw. and 20,000 sockets, the average connected load is 800 watts with sixty sockets, and the smallest is 25 watts in one socket.

In addition to the tabulated information shown here, the surveys have emphasized some fundamental facts with regard to increasing the use of electrical advertising:

1. The opportunities for development are relatively the same in cities of all sizes. In large cities and small cities organized sales effort has succeeded equally well in promoting a high per capita use, and it is also true that lack of stimulation has everywhere resulted in a lower use of this medium.

2. The opportunities exist in all

TABLE I—TYPES OF ELECTRICAL DISPLAYS

| | |
|---|---|
| Exposed lamp signs | 112,000 |
| Inclosed lamp signs | 81,000 |
| Bulletin and poster boards | 50,000 |
| Building outline and marquise lighting | 7,000 |
| Total | 250,000 |

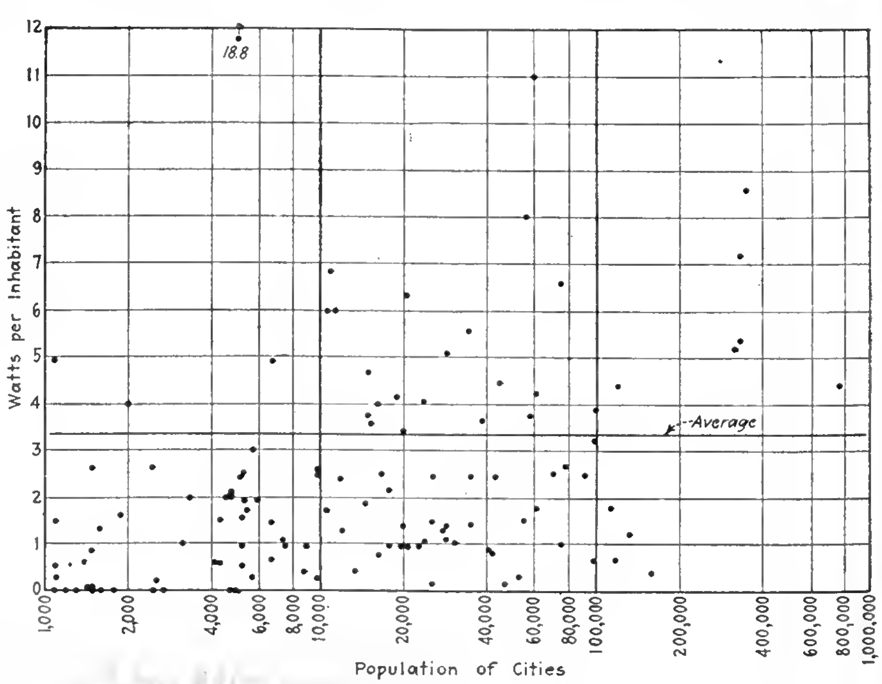
TABLE II—LAMP SIZES AND CONNECTED LOAD OF SIGNS AND DISPLAYS

| Lamp Size, Watts | Per Cent of Total Lamps | No. of Lamps | Kw. Connected | Per Cent of Total Wattage |
|---|---|---|---|---|
| 5 | 39.2 | 5,860,000 | 29,300 | 14.8 |
| 10 | 43.8 | 6,680,000 | 66,800 | 33.2 |
| 15 | 3.0 | 448,000 | 6,700 | 3.4 |
| 25 | 7.4 | 1,108,000 | 27,600 | 14.0 |
| 40 | 0.5 | 81,000 | 3,240 | 1.6 |
| 50 | 3.2 | 471,000 | 23,500 | 11.9 |
| 60 | 0.3 | 38,000 | 2,280 | 1.1 |
| 75 | 0.6 | 89,000 | 6,700 | 3.4 |
| 100 | 1.5 | 160,000 | 16,000 | 8.0 |
| 150 | 0.2 | 34,000 | 5,100 | 2.6 |
| 200 | 0.3 | 52,000 | 10,400 | 5.2 |
| 250 and larger | 0.2 | 24,000 | 1,200 | 3.0 |
| Total | . | 15,005,000 | 198,820 | .... |

Average 13.2 watts per socket

Largest display has a connected load of 300 kw. and ........ 20,000 sockets
Average display has a connected load of 800 watts and ........ 60 sockets
Smallest display has a connected load of 25 watts and ........ 1 sockets

Note—Use of 5-watt lamps is decreasing rapidly, while use of the 15, 25 and 50-watt sizes is increasing.



ELECTRICAL ADVERTISING IN WATTS PER INHABITANT IN 143 CITIES

sections of the country. Again, it is found that North, East, South and West respond enthusiastically wherever organized effort is made.

3. In industrial and commercial cities, trading centers and agricultural districts, summer and winter resorts, and cities of all types, this medium is effective and has been used extensively whenever vigorously offered.

TABLE III—CLASSIFICATION OF CHIEF USERS OF ELECTRICAL ADVERTISING

| | No. of Sockets |
|---|---|
| 1. Theaters (motion-picture and legitimate) | 2,680,000 |
| 2. Automotive (sales offices, garages, oil stations) | 1,500,000 |
| 3. Restaurants (cafés, lunch rooms, etc.) | 1,290,000 |
| 4. Clothing (stores, tailors, cleaners, etc.) | 1,280,000 |
| 5. Hotels (rooming houses, etc.) | 1,260,000 |
| 6. Banks (investment houses, etc.) | 780,000 |
| 7. Drugs | 700,000 |
| 8. Shoes (stores, repair, etc.) | 385,000 |
| All others | 5,000,000 |

4. The actual development in specific cities of all sizes and districts, however, does vary directly with the efforts at promotion put forth. The average development as shown in the accompanying chart is equivalent to $3\frac{1}{3}$ watts per inhabitant, corresponding to an energy consumption of about 5 kw.-hr. annually.

It is usually assumed that the greatest development of the sign and display load is found in the larger cities. This is true only to the extent that selling effort has been better organized. In the small cities the development may be as high or higher when proportional effort is made. The average of $3\frac{1}{3}$ watts per inhabitant is weighted according to population and not according to number of cities. Some cities report only 0.1 watt per inhabitant, while other cities show 10 watts per inhabitant or more. If the development is brought up to that already obtaining in the best 10 per cent of the cities, the central-station revenue from electrical advertising will be increased from its present figure of $15,000,000 to $35,000,00.

## Three Exclusively Electric Garages for New York

IN ANTICIPATION of a great increase in the use of electric trucks in New York during the next two years garage managers are making substantial enlargements in their service facilities and at least one stable, recognizing that the days of the horse-drawn vehicle are numbered, is being converted to a garage. In the stable of the Wendall & Evans Company, which had room for two hundred horses, the stalls are being removed, new floors laid, and when the alteration is completed there will be facilities for garaging 175 electric vehicles. This garage will handle electric vehicles exclusively.

The Commercial Truck Company also has leased a large building on Nineteenth Street, and when alterations are completed it will operate a service station and garage with accommodations for 150 trucks. The Walker Vehicle Company has outgrown its present quarters in Long Island City and has just given contracts for the erection of a new building. The garage will occupy a plot 100 ft. x 100 ft., will be three stories high, with 30,000 sq.ft. of floor space, and will be able to care for 350 electric trucks.

## Chicago Electric Shops Break Sales Records

TOTAL appliance sales by the Commonwealth Edison Company for the last year smashed all former records established in the company's branch stores. Not only did the total sales for 1922 far exceed those of any other year, but in December they were greater than during any previous month in the history of the company, and on one day during the month the previous high day's record was passed by more than $10,000.

Perhaps the most remarkable fact about this last feat was that the day on which the record was made was selected in advance, so that the record breaking was no chance happening, but the result of an efficiently planned campaign.

E. A. Edkins, general manager of electric shops, selected Thursday, Dec. 21, as the day. Careful preparations were made a week in advance. Mr. Edkins held a meeting of all the salespeople in the electric shops, explaining to them the purpose of the plan, and asking them to work at more than top speed on that day. He also interviewed the branch store managers, the outside salesmen, the supervisors, the cashiers and the credit department, enlisting their co-operation.

The result of this excellent planning was that on the day chosen a total of $51,700 worth of merchandise was sold. The previous high record, made in December, 1920, was about $40,000. Mr. Edkins is enthusiastic over the manner in which the employees in his department and those working with that department responded to his request.

"Credit for the accomplishment," he said, "must go to all the people who are concerned in the drive. It was only by the co-operation of the salespeople in all of the stores, the outside salesmen and the cashiers that we were able to do it."

Although the figures are not yet complete, indications are that the sales for December reached the high mark of $540,000, and that the total gross sales for the year 1922 were more than $3.500,000, about $300,000 more than the previous high year, 1920.

## Customers Have Choice of Rates in New Schedule

STEPS have been taken by the British Columbia Electric Railway Company, Vancouver, B. C., to differentiate between domestic and commercial customers under a new lighting schedule put into effect on Jan. 1. Under an agreement with the City Council of Vancouver by which the street-railway franchise was altered to allow the company a 6-cent fare and other adjustments, the company agreed to reduce the domestic lighting rate from 6 cents to 5 cents a kilowatt-hour.

There are about five thousand commercial lighting customers in the city, including a large number of small offices, small stores or combination stores and residences. The company has offered to its commercial customers the 5-cent lighting rate, but with a minimum charge of $1 per month per kilowatt-hour connected. Schedules have been mailed to every customer to be filled in, and these will be checked by the company during the year. The domestic minimum charge is 50 cents per month.

On the other hand, if any commercial customer, such as the small office or store, does not wish to pay the minimum charge of $1, he may continue to pay 50 cents a month minimum, but his rate for energy will be 6 cents a kilowatt-hour. Most of these small customers have an extremely low load factor, using light only for an hour or two a day and only in winter. This is the company's reason for making a higher charge to such customers than to residences.

Another feature of the Vancouver rates is the differentiation between the center of the city and the suburbs. Vancouver proper covers a small area, whereas one-third of the

population of the greater city resides in self-governing municipalities. These municipalities must make separate agreements covering utility services. Several years ago the company made a greater reduction in the city than in the suburbs, and today the domestic rate in the latter is 7 cents a kilowatt-hour, with possibility of a reduction if agreements are negotiated with the respective municipalities.

## Analysis of Residential Load Conditions

BY J. A. ROCKWOOD
Valuation Engineer Portland (Ore.) Railway, Light & Power Company

INCREASES in the use of electrical energy in the home have been one of the interesting features of electrical progress since the war, and a recent analysis by the Portland Railway, Light & Power Company reveals conditions which are typical in many companies.

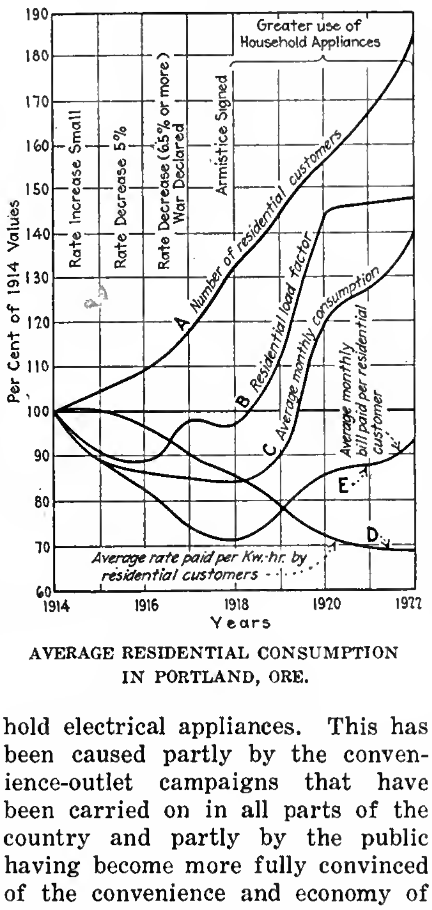
Up to November, 1918, there had been relatively little change in the amount of energy used by the householder, but in December, 1918, there was a marked increase in the average residential consumption in comparison with the same month of the preceding year. In January, 1919, there was an even greater increase per customer when compared with January, 1918. It was first thought that there must be some unusual cause back of such a noticeable increase, but it is now evident that this is a permanent condition. The consumption per customer has mounted steadily until now it is about 65 per cent greater than in 1918.

The earnings per customer also have increased, but not in the same proportion as the kilowatt-hour consumption. The increases in revenue have averaged about 30 per cent between 1918 and 1922. Owing to a sliding scale the average rate per kilowatt-hour has decreased about 20 per cent. These changes in unit figures make it plain that there has been a decided increase in the use of electrical energy by the average residence consumer, and the accompanying curves express these changes graphically. It will be noted from the chart that no changes in rates have occurred since the middle of 1916.

A part of the increase is due to the growing popularity of the electric range. There are now about 1,600 electric ranges on the company's system, but it is significant to note that very few of these were being added during the period that the greatest increase occurred. It is therefore evident that a large proportion of it is due to the use of other electrical appliances, especially small portable heaters used to supplement the regular house-heating system.

The sale of these heaters has been very active during the past few years, and many people have turned to their use when only a small amount of heat is required in order that they may save on their fuel bills.

Then, too, there has been a general increase in the use of all house-



AVERAGE RESIDENTIAL CONSUMPTION IN PORTLAND, ORE.

hold electrical appliances. This has been caused partly by the convenience-outlet campaigns that have been carried on in all parts of the country and partly by the public having become more fully convinced of the convenience and economy of electric service. Another factor has been the tendency toward better illumination in the home, which is reflected in greater consumption and has more than offset the expected decrease because of the more efficient "Mazda" lamp. The sudden increase noted in December, 1918, was no doubt the result of a relaxation from the economies practiced during the war, although, as will be noted from the curves, these economies did not result in any serious decrease in the average consumption during the war.

## What Other Companies Are Doing

**Worcester, Mass.**—In one month a single representative of the Worcester Electric Light Company, covering on foot the outlying districts of the city, sold 446 lamps from a portable supply to small storekeepers, distribution being by hand. Of these, 217 were sold to increase the illumination of existing installations, the increase in connected load being from 10,220 watts to 16,850 watts. Many of the remaining sales were to fill empty sockets or to replace burned-out units. Edwin Mandeville is in charge of the commercial lighting department.

**Salt Lake City, Utah.** — In the year ended Nov. 30, 1922, the employees' mutual aid association of the Utah Power & Light Company paid death claims amounting to $3,700 and sickness, accident and refund claims to members totaling $2,550. A surplus of $7,967 was divided among 826 members of the association, prorated according to the length of membership. Employees who were members throughout the year each received $10.25, the largest dividend ever paid by the association.

**Hartford, Conn.**—A compact calendar for the new year has been prepared by the Hartford Electric Light Company, carrying each month a practical message to the customer about the convenience and economical use of electric service. The calendars are mounted on cards only 3⅜ in. x 6¼ in. in size, and, instead of featuring the company's name, emphasis is placed upon the value of electricity as a servant. Suggestions are given monthly on cleaning lamps, fuses, metering, extra switches, wages of the electrical servant, repair service, the porch light, hot-weather comforts, electric heaters, lamp renewals, glare and lamp selection.

**Poteau, Okla.**—The first of a series of employees' meetings of the Oklahoma Gas & Electric Company was held at the Poteau office on Jan. 4. These meetings are planned to be held every two weeks and will alternate between this town and Heavener. Their avowed object is to discuss ways and means of improving service rendered the company's customers. Entertainment features are planned in order that they may be made as attractive as possible.

# Digest of Electrical Literature

Including Brief Abstracts of and References to Important Articles Appearing in the Scientific and Engineering Press from All Parts of the World

## Hydro-Electric Development and Steam Equipment

*Hydraulic Turbines for Very Low Falls.*—F. JOHNSTONE-TAYLOR.—Owing to the attention being bestowed on the development of even quite small water powers and the necessity of developing water-power resources to the utmost, irrespective of the available fall, considerable attention is being paid to the low head turbine. The result is that these water turbines have now reached a high state of efficiency and are being built of a type which is suitable for driving all kinds of electric generators. —*Electrical Times*, Nov. 23, 1922.

*The Hydro-Electric Power Station at Fully, Switzerland.*—The working of hydro-electric power stations in the Alps, which are operated by water courses fed by glaciers, is entirely dependent upon the quantity of water available. Low water occurs in the winter, and tl. periods of high water are in the summer months. At low water the flow is generally much below the average, and when the equipment of the stations does not include steam reserves as a standby power the output may fall to very low limits during the winter. A means for overcoming this difficulty is the provision of water reservoirs at a high level, and one of the most interesting examples of a power station under such conditions is the one at Fully, Valais, Switzerland, which operates under a head of 1,650 m., this probably being by far the highest working head ever utilized. The building of this installation, including the power house, turbine foundation, pipe lines, etc., was surrounded by very many difficult problems, and a detailed description of the manner in which these were overcome is given. The pipe line connecting the reservoir with the plant is 4,625.5 m. long and is made of welded pipes varying in thickness from 6 mm. to 20 mm. It is operated at pressures up to 60 atmospheres. Four turbo-generators are used. These are designed for a flow of 200 liters per second at minimum head and for a normal power of 3,000 hp. each. The turbines operate at a normal speed of 500 r.p.m. — *Engineering*, Nov. 24, Dec. 1 and Dec. 15, 1922.

## Generation, Control and Switching

*Improvements of Power Factor.*—GISBERT KAPP.—This posthumous paper, presented before the Institution of (British) Electrical Engineers on Nov. 16, 1922, deals with the use of such consuming devices, or such addition to existing consuming devices or apparatus, as will improve the operating power factor of a plant. The paper is divided into three parts. The first part deals with the economical limit of power-factor improvement in relation to capital outlay. The concluding pages deal with meters and tariffs which allow the effect of a consumers' power factor to be assessed in money. Various methods of indicating kilowatt maximum demand and wattless kilovolt-amperes are described, and particulars of the tariffs employed by companies in England are given. The middle section of the paper, which is by far the longest, describes the equipment which can be used for power-factor improvements and brings together a useful amount of critical information on rotary and static condensers, synchronous induction motors, rotary converters and phase advances in their application to the correction of power factor.—*Electrician*, Dec. 1, 1922, and *Engineering*, Nov. 24, Dec. 1 and Dec. 8, 1922.

## Transmission, Substations and Distribution

*Factors Affecting Bulk Underground Transmission.*—P. DUNSHEATH. — Two possible methods of transmitting large amounts of power underground are discussed. These are (1) direct-current systems and (2) alternating-current systems using a multi-core cable or single-core cables. Some of the problems encountered are common to each of the systems, but each system has its own peculiar points, and the recognition of these without arriving at adequate methods of handling them has resulted in a curious state of affairs in which different engineers select totally different systems for practically identical conditions. Some of the systems described are the 110,000-volt line of the Metropolitan Electric Supply Company (England), using single-core cables; the 60,000-volt single-phase transmission line used in connection with the electrification of the St. Gothard system between Switzerland and Italy, in which single-core cables are used, and the 50,000-volt line of the Union d'Electricité, Paris. The author considers sheath losses, longitudinal current losses, the effect of armoring, dielectric losses, thermal characteristics, etc., of the types of cables now in use in Europe.—*Electrician*, Dec. 1, 1922.

*Japanese High-Voltage Power-Transmission Systems.*—S. W. HAYES.—Super-power systems in the United States have been thoroughly discussed in the American technical press within the last few years, but little has been published about similar developments in other countries. Japan's progress in high-voltage transmission is of interest. In this article, the first of a series, the author takes up some of the more general features in connection with the larger power transmission systems and then goes into further details relative to interesting features of the generators, transformers, synchronous condensers, switching equipment and other important devices. — *Electric Journal*, December, 1922.

## Units, Measurements and Instruments

*Thermionic Voltmeter.*—The vacuum tube forms a convenient method of measuring alternating electromotive forces of any frequency, because, owing to its asymmetric conductivity, an alternating electromotive force of which the mean value is zero produces an alternating current the mean value of which is not zero and which is readily measured by an ordinary milliammeter or microammeter. Two methods of using the triode valve as a rectifier are described. One method employs the curvature of the anode current/grid potential characteristic, while the other employs the curvature of the grid current/grid potential characteristics.—*Engineer*, Dec. 15, 1922.

*Testing of Materials Used in the Manufacture of Electrical Equipment.* —C. DAWSON.—The tests on metals that are described are tensile, compression, shearing, bending, torsion, impact, hardness and magnetic. For sheet and molded insulation the following tests are described: Mechanical strength, plastic yield, electric strength and insulation resistance; for oils, electric strength, insulation resistance, viscosity, flash point, chemical reaction and sludge, while for varnishes the tests described include electric strength, flexibility, acidity and time necessary for drying.—*Journal of the Institution of (British) Electrical Engineers*, December, 1922.

## Illumination

*Lighting in Factories and Workshops.*—The third report of the Home Office departmental committee (England) marks a new stage in the treatment of the above subject. The two previous reports are first summarized. The primary recommendation contained in the first report stated that there should be a statutory provision in general terms requiring adequate and suitable lighting in every part of a factory or workshop and giving power to the Secretary of State to define such lighting. In the second report general requirements in regard to avoidance of glare, elimination of inconvenient shadows and absence of flicker were made. In the report recently issued the requirements in regard to glare are supplemented by an indication that when a brilliant source is covered by a small shade the brightness may considerably exceed 15 cp. to 20 cp. per square inch and should be treated as a source and its position with regard to the worker limited accordingly. The chief question

considered in the third report is the degree of illumination needed for the actual carrying on of work. The committee presents a comprehensive schedule of industrial operation, divided into two classes described respectively as "fine work" and "very fine work," the former requiring 3 foot-candles and the latter about 5 foot-candles.—*Illuminating Engineer (London)*, Vol. 15, No. 7.

## Motors and Control

*Flour-Mill Electrification.* — The power employed in the flour industry in Canada is shown by kinds and classes in the statistical table reproduced herewith. This table is divided according to the number of units of each class, the total horsepower installed and the horsepower actually developed. A comparison of the figures shows that there is still a large field for electrification.—*Electrical News*, Dec. 15, 1922.

EXTENT OF ELECTRIFICATION OF FLOUR MILLS IN CANADA

| Kinds of Power Used | No. of Units | Mfrs' Rating, Hp. | Actual Hp. |
|---|---|---|---|
| Boilers | 231 | 17,828 | 12,706 |

*Electrical Equipment for Cotton Mills.*—G. W. ROBERTSON.—The electrical equipment of Mill No. 8 of the Riverside Division of the Riverside and Dan River Cotton Mills is described. As the equipment of these cotton mills is mostly standard apparatus, the author tells the greater part of the story by means of illustrations.—*General Electric Review*, December, 1922.

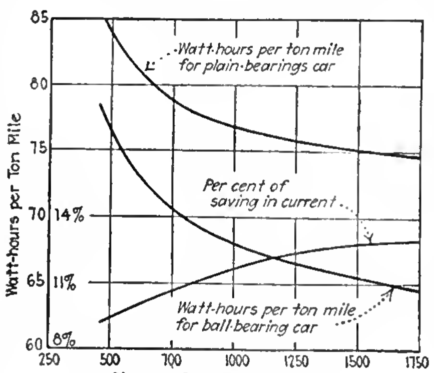
## Heat Applications and Material Handling

*Electric Arc-Welding Apparatus and Equipment.* — J. CALDWELL. — General information regarding the power requirements of welding processes and descriptions of generators and other electrical machines used in welding were given by the author in a paper presented before the Institution of (British) Electrical Engineers on Dec. 14, 1922. In an appendix to the paper a description of an apparatus is given by means of which, for the purpose of experimental investigation, an ordinary electrode may be set to do the work by the use of gears driven by an electric motor. Observations were made of the nature of the deposit through a magnified view on an image screen as well as of the arc. Oscillograms show the alternating current used for the arc to have a curve which is in form a triangular peak with a base of about two-thirds of the duration of each alternation. Claims are made in the paper that flux coated electrodes are essential for alternating-current work and are preferable to bare wires when direct current is used.—*Electrician*, Dec. 22, 1922.

*Electric Furnaces for Heat Treatment of Steel.*—A. W. LAMONT.—The special features of design and operation of electric furnaces are discussed with particular reference to the furnace installation of the Transcona shop of the Canadian National Railways. The furnace which is used at the Transcona plant is designed to heat 5,000 lb. of locomotive side rods and main rods from room temperature up to a temperature of 1,500 deg. F.—*Engineering Journal* (Canada), January, 1923.

## Traction

*Anti-Friction Bearings for Electric Cars.*—O. R. WIKANDER.—A review is made of the results obtained from the use of anti-friction bearings in the United States and abroad, together



POWER CONSUMPTION FOR CAR WITH BALL AND PLAIN BEARINGS

with a description of some of the principal types now in use. The main advantage claimed for the use of ball bearings is the decrease in starting torque due to the smaller starting friction of ball bearings as compared with plain types. The power consumption for a motor car equipped first with ball bearings and then with plain bearings is shown in the accompanying illustration.—*Electric Railway Journal*, Dec. 16, 1922.

## Electrophysics, Electrochemistry and Batteries

*Electrical Resistivity and Temperature Coefficient of Manganin.*—SKEZUG KIMURA and KIKUJI SAKAMAKI. — The resistivity and temperature coefficient of copper manganese alloys and the effects of other elements are investigated. From their experimental results the authors have found that a straight copper-manganese alloy can furnish the best manganin and that there is no need of adding other elements for the purpose of improving its resistivity and temperature coefficient. The straight copper-manganese alloys of about 13 per cent manganese made in the authors' laboratory have a specific resistance of 45 microhms and a temperature coefficient at 22.5 deg. C. of 0.00000348. — *Researches of the Electrotechnical Laboratory, Tokyo, Japan.*

*Dry-Cell Specifications.*—The Bureau of Standards has issued specifications for the standard sizes of dry cells and flashlight batteries. These specifications are a revision of similar specifications prepared several years ago and published in the first edition of Circular No. 79, on the electrical characteristics and testing of dry cells. A limited number of copies of the new specifications are available for distribution prior to publication of the second edition of the dry-cell circular.—*Technical News Bulletin No. 68 of the Bureau of Standards.*

## Telegraphy, Telephony, Radio and Signals

*Use of Telephones in Moving Trains.*—B. ROSENBAUM.—The article describes a method of communication from a stationary telephone to a subscriber traveling on a train which was tried on a 275-km. stretch of track between Berlin and Hamburg. All previously tried methods required either a very large amount of energy in the sending station or else a high antenna somewhere upon the train. The former was too costly; the latter was impossible owing to the limited overhead room in cuts and tunnels. The tests described were made by the use of high-frequency currents with wave lengths of between 3,000 m. and 4,000 m. emitted from a station near the main line and carried in a wire along the tracks. The author goes into full details as to the best arrangement of the high-frequency current-carrying wire which carries the speech to the train. It is claimed that energies of only 5 watts to 50 watts were required to establish perfect speech transmission.—*Jahrbuch der Drahtlosen Telegrafie und Telephonie*, November, 1922.

*Theory of the Telephone Receiver.*—L. C. POCOCK.—Some of the simpler electromechanical properties of the telephone receiver that can be derived from the well-known receiver equations first formulated by Poincaré and the experimental researches of Kennelly and his collaborators are described. The equations of a telephone receiver in a generalized form, taking cognizance of some second-order effects, have been given more recently by Wegel and are reviewed in this article.—*Electrician*, Dec. 22, 1922.

*Comparison of Condensers at Radio Frequencies.*—This pamphlet describes the method of comparison of the capacity and effective resistance or phase difference of two condensers one of which has already been standardized. The method used is that of comparison by substitution; that is, tested and untested condensers are compared by inserting them in turn in a circuit which is brought to resonance with a source of undamped waves.—*Letter Circular No. 77 of the Bureau of Standards.*

## City Vs. Power Company

**Louisville and Byllesby Interests Fight Before Federal Commission for Falls of Ohio**

JUDGING from the arguments presented at a hearing before the Federal Power Commission and by the apparent attitude of Secretary Weeks, its chairman, the probabilities favor an ultimate decision for the Louisville Hydro-Electric Company in the conflict which has arisen with the city of Louisville for power rights at the Falls of the Ohio. The Louisville Hydro-Electric Company is a subsidiary of the Louisville Gas & Electric Company—a Byllesby interest.

The arguments for the Louisville Hydro-Electric Company hinged on the fact that it already has a development of 60,000 hp. provided by an existing steam plant and has in construction a new unit which will furnish an additional 30,000 hp. of steam power. With this installation it is in a position to make excellent use of the variable power which will be developed at the government dam. Moreover, it was pointed out that the company has a complete distributing system serving not only Louisville but the entire surrounding region, power lines radiating as far as 60 miles from the city.

### Louisville's Broad Project

The city was represented by former Governor Thatcher and by Gen. William L. Seibert, the constructor of the Gatun Dam. In their arguments it was brought out that Louisville proposes to develop this power through its water company, a private corporation all of whose stock is owned by the city. It is the desire of the city's company to supply power to the entire tributary region, including that which lies adjacent to Louisville in Indiana. Letters from the Mayors of Jeffersonville and New Albany were presented to show that Indiana authorities would not oppose such a plan. It is the ambition of the city to secure a supply of cheap power with which to attract industries, and its plan is to develop 75,000 hp. to 100,000 hp. by developing steam auxiliaries or erecting an auxiliary power plant on either the Green or the Cumberland River. The point was made that the city is anxious not to interfere with the existing business of the Louisville Gas & Electric Company.

Col. William Kelly, the chief engineer of the Federal Power Commission, pointed out that the maximum demand in Louisville and in the cities of Jeffersonville and New Albany during 1920 was 61,000 kw. and that the average load was 25,000 kw. For that reason he is inclined to regard it as questionable whether Louisville could market 100,000 hp. in addition to the 90,000 hp. furnished by the Louisville Gas & Electric Company.

## Potomac Company's Rates Before Supreme Court

Arguments were heard before the United States Supreme Court on Wednesday of this week in the appeal of the Public Utilities Commission of the District of Columbia from the decision of a lower court setting aside the valuation placed by the commission upon the properties of the Potomac Electric Power Company as the basis for rates. This case is being followed with particular interest by consumers of electricity within the District of Columbia and by stockholders of the corporation not only because the rate for energy is involved but because of the impounding of the difference between the rates sought by the commission and those charged by the corporation. This difference amounted to approximately $3,200,000 on Jan. 1, and the sum will be distributed among the consumers or among the stockholders according to the decision of the Supreme Court.

The main point of dissension is reproduction value. The company also alleges that the commission made improper deductions for depreciation, it being alleged that, because of constant replacements, no actual depreciation existed. The company further asserts that the commission improperly excluded three properties owned by the company. These three properties are valued by the company at more than $1,000,000.

When the commission began valuation of the properties of the Potomac company, in 1915, it took reproduction values as of July 1, 1914. In deciding the case in May, 1917, it added the actual cost of replacements made from July 1, 1914 to July 1, 1916. The commission declared the value to be $11,231,170 and ordered a 20 per cent reduction in electric rates.

The company contended that reproduction values should have been taken as of July 1, 1916, the year in which actual hearings in the case began. It asserted that the enhanced value of its structural property between July 1, 1914, and July 1, 1916, was $2,521,000 on account of rising costs due to the war. The president of the corporation contended that the value as of July 1, 1916, should have been $15,642,431.

## Deschutes Power Case Up

**Federal Commission Thought Likely to Decide the Contest in Favor of Columbia Valley Company**

AFTER an exhaustive hearing granted to representatives of the Bend Water, Light & Power Company of Bend, Ore., and of the Columbia Valley Power Company, it seems probable that the Federal Power Commission will reject the proposition of the Bend company and will execute the preliminary permit requested by the Columbia Valley Power Company.

The Columbia Valley Power Company, which is financed by Iowa, Philadelphia and New York interests, was an early applicant for a preliminary permit for the Metolius site on the Deschutes River. The preliminary permit was authorized by the commission on Oct. 10, 1922, but its execution was withheld when the Bend company, backed by an unusual volume of local sentiment, filed a belated application.

At the hearing the Columbia Valley company's representatives stated that they would make no argument as they are entirely willing that the question be settled on its merits. The Bend company devoted practically all of its two hours to an attack on the conclusions of the engineers of the Federal Power Commission. These engineers hold that the Bend project is of doubtful economic feasibility. The reflection on the commission's engineers became so pointed that Secretary Weeks declared he would tolerate no further aspersions on their motives or fairmindedness.

### An Unparalleled Pumping Scheme

The proposition is to irrigate 83,000 acres of land in central Oregon by pumping water an average lift of 771 ft. It is admitted that the project is without parallel in the development of irrigation farming in the United States. Engineers of the Reclamation Service joined with those of the power commission in declaring the project not feasible. It was contended that experience in Idaho, where conditions are similar, has shown that land cannot be irrigated profitably where it is necessary to lift the water more than 100 ft.

Col. William Kelly, the chief engineer of the Federal Power Commission, estimated that, making every possible allowance for the cheap power which the Deschutes will furnish, it would be impossible to bring power costs below $3 a horsepower-year. The engineers of the Bend company have arrived at a much lower figure and before a decision is made they will try to justify it.

Mathis and Burton Lakes, Which Together Store 6,649,000,000 Cu.Ft. of Water for Tallulah River Developments

# Georgia Company's Expansion Program

## More than $6,500,000 to Be Expended on the Mathis Development, on the Completion of the Tugaloo Plant, for Transmission Lines and in the Atlanta Zone

EXTENSIVE additions to and improvements of the Georgia Railway & Power Company's systems have been started which will constitute the largest program ever undertaken by the company in a single year, more than $6,500,000 being appropriated for the work. The plans provide for new power plants, substations and transmission lines in various parts of the state, in addition to improved gas and street-railway service in Atlanta. The chief additions which will be made to the electric service facilities are indicated on the accompanying map. More than $1,350,000 will be spent during 1923 for transmission lines outside the 7-mile zone centered at Atlanta, $1,000,000 for the Mathis hydro-electric development, and about $700,000 to complete the Tugaloo development, which was started in 1917 but suspended during the war. The remainder of the $6,500,000 will be spent inside the Atlanta 7-mile zone. It is expected that the Mathis development will be completed by the fall of 1924 and the Tugaloo development in the fall of this year.

The Mathis-Tallulah development will involve a 1-mile tunnel from Lakemont dam, which will feed water into the power house under a 190-ft. head and develop 12,000 kw., or 63,000,000 kw.-hr. annually. This station, which will be several miles from the existing Tallulah Falls plant, will be remotely controlled from there. Water from the Mathis station will then pass through the Tallulah Falls plant and join the flow from the Chattooga River to feed the Tugaloo plant.

The Tugaloo development, which will have a generating capacity of 50,000 kw. at 152-ft. head, will provide more than twice the annual output of Mathis, or 129,790,000 kw.-hr.

A modernization of the Morgan Falls, or Bull Sluice, station will also be completed this year, increasing the capacity 35 per cent. This work is already well under way.

Already leading from Tallulah to Atlanta is a double-circuit, 100,000-volt transmission line. An additional line of the same voltage will be completed to Atlanta by way of Toccoa, Commerce, Winder and Norcross, where step-down substations will be installed. This line will not only improve the reliability of service to Atlanta but also that to the east and southeast of the line. Power from Tugaloo, Mathis and Tallulah will be controlled at a switching station at Tallulah.

Next year a 110,000-volt line will be built from Lindale substation, which will be increased in capacity from 3,000 kw. to 10,000 kw., through Summerville, Lafayette and Chickamauga to Chattanooga, where it will connect with the Tennessee Power Company's system. At the same time a 38,000-volt line will be run from Marietta to Tate.

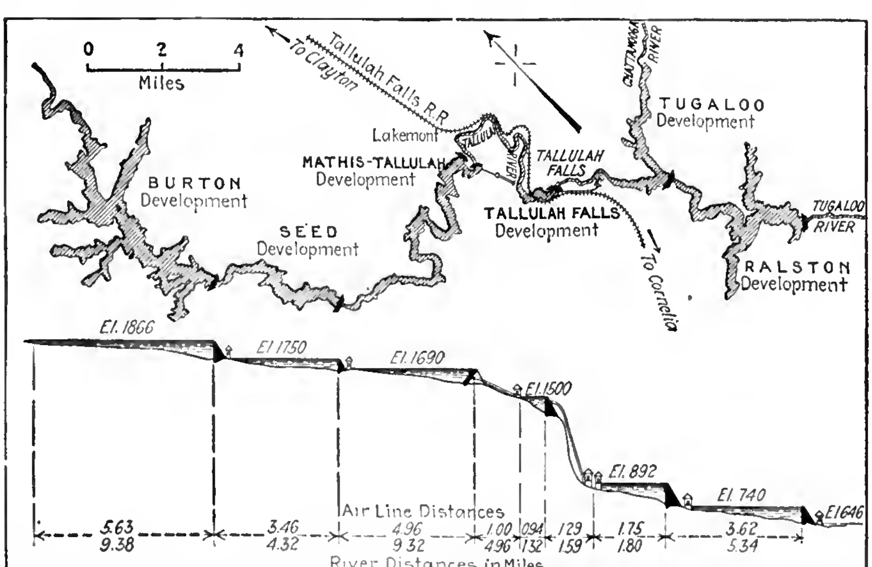
Inside Atlanta this year a 19,000-volt loop will be completed to increase the reliability and quality of service. In addition to this, extensive improvements will be made in the city's substations, and the Butler and Davis Street steam plants will be enlarged.

All of the foregoing improvements will be made with the next five or ten years' load growth in mind. The present total developed water power on the Georgia Railway & Power Company's system is 150,600 hp. Upon completion of the Tugaloo plant it will be 234,000 hp. In addition to this, however, the entire generating capacity will be backed by six other power companies in Alabama, Tennessee, Georgia and North and South Carolina. The interconnected companies have a total rated capacity of 1,010,355 hp. and are on three separate and distinct watersheds. From extreme tip to tip of the interconnected systems is 900 miles. Notwithstanding this great distance, they have all exchanged energy in emergencies during the past three years very successfully and advantageously.

The need of the development work undertaken by the Georgia Railway & Power Company is indicated by the fact that 46,000,000 kw.-hr. additional consumption may be expected on the company's system by the end of 1923 owing to the natural growth of existing loads and to new business which may be obtained exclusive of the increase in consumption resulting from growth of street-railway and interurban business. The foregoing consumption will represent an increase of 17 to 18 per cent over the corresponding amount for 1922.

### How Interconnection Has Helped

Some indication of the mutual benefits received from the superpower system, of which the Georgia Railway & Power Company is a part is afforded by last year's record of exchange of energy



Relative Positions of Existing and Proposed Hydro-electric Development on the Tallulah and Tugaloo Rivers, Georgia

between this system and the six systems with which it is interconnected. The amount of energy received from and delivered to the connected systems was approximately as follows: Tennessee Power Company, 15,000,000 kw.-hr. and zero respectively; Alabama Power Company, 18,000,000 kw.-hr, and 1,500,000 kw.-hr.; Columbus Power Company, 5,000,000 kw.-hr. and 3,250,000 kw.-hr.; Central of Georgia Power Company, 6,000,000 kw.-hr. and 6,000,000 kw.-hr.; Southern Public Utilities Company, 1,500,000 kw.-hr. and zero; Southern Power Company, zero and 27,000,000 kw.-hr. Most of the energy purchased by the Georgia Railway & Power Company was received during October, November, December and January, the dry season. It should be observed that the foregoing receipts and deliveries of energy merely indicate the system from or to which energy was delivered and do not necessarily indicate its ultimate destination. Many times the energy was relayed to some other system. In general, the Georgia Railway & Power Company requires the delivering company to deliver 5 per cent more energy than is to be relayed to the distant company to compensate for line losses. In some cases standing contracts are held for receiving or delivering a definite amount of energy each year, but in general the exchange of energy is only for emergency purposes. By agreement of the interconnected companies, the system operator of the Georgia Railway & Power Company has supervision over the interchange of energy and the operating methods involved in making the interchange. The chief problem is to maintain the proper frequency and voltage to facilitate interchange and division of the wattless current as well as voltage regulation. The contracts, in general, cover only the amount which shall be paid for the energy, there being a fairly uniform

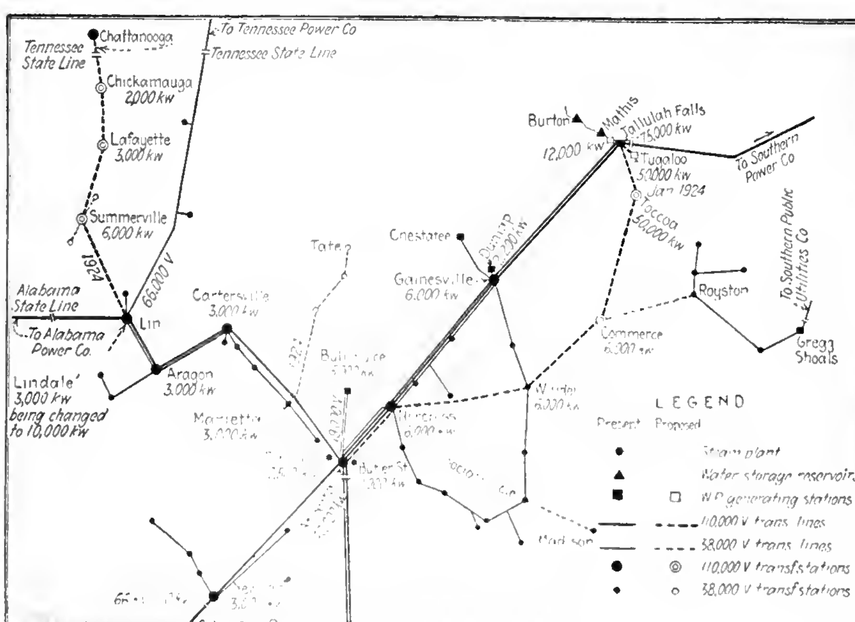
SITE OF 50,000-KW. TUGALOO DEVELOPMENT, WHICH UTILIZES COMBINED FLOW FROM TALLULAH AND CHATTOOGA RIVERS

This dam and power house which will be completed before Jan. 1, 1924, will add approximately 50 per cent to the company's waterpower output. The dam will be 140 ft. high and will form a lake covering 557 acres.



GEORGIA RAILWAY & POWER COMPANY'S SYSTEM, SHOWING DEVELOPMENT PROPOSED

rate for hydro-electric energy but a sliding rate for steam power depending on the price of coal.

Except where standing contracts exist for a fixed amount of energy each year, no company is compelled to deliver or accept any energy. If one company desires energy, it endeavors to see who will furnish it and no company is compelled to give it unless it has surplus power available.

This development is in charge of Charles G. Adsit, vice-president and executive engineer of the Georgia Railway & Power Company. A special construction force of about 1,500 men will be employed.

## International Paper Company Has New 25,000-Kw. Plant

Water will, it is announced, be turned into the International Paper Company's new storage basin at Sherman Island, N. Y., within a few weeks, and the plant is expected to be in operation about June 1 with an installed capacity of 25,000 kw. Contracts are already in hand whereby industries and consumers in the surrounding territory will purchase the full output.

This plant is on the Hudson River within a few miles of the company's Glens Falls mill. The International has three other plants in the vicinity, but none of the power generated will be consumed by these mills.

## Tax-Free Bonds Disapproved by Lower House

The resolution to submit to the states an amendment to the United States Constitution to prevent the exemption of securities from taxation was adopted by the House of Representatives this week by a vote of 293 to 101. The resolution thus commanded five more than the two-thirds vote required to pass a constitutional amendment resolution.

Twenty-four Republicans opposed the resolution, while twenty-three Democrats supported it.

## Chicago Electric Club Has Ambitious Program

Three concrete plans for promoting the electrical industry were sponsored by the Electric Club of Chicago at its "inspiration day" luncheon on Jan. 23 as part of a progressive program to be carried out during 1923. President Paul W. Koch said that the first thing was to start sectional technical groups among club members for the purpose of studying one particular subject. The second was to "tie in" with the "more and better business" campaign of the N. E. L. A. by starting a bureau to lay definite plans for developing each section of the industry from the central station to the contractor. The "electric home" idea was the third plan, and it was forcefully championed by Walter Collins, secretary of the Electrical Contractors' Association of Chicago, who declared that the Cleveland Electric Club had been instrumental in causing sixty-five "electric homes" to be built in 1922.

## Commercial Side of N. E. L. A. Promoted at Denver

Seventy-five leading central-station commercial executives from all parts of the country, East as well as West, met at Denver this week for the midwinter session of the N. E. L. A. Commercial Section committees. The purpose of holding the meetings so far west was to encourage a large attendance of central-station commercial men from that part of the country and make them feel that Eastern men are interested in their problems.

Discussing plans for the New York convention in June, Oliver R. Hogue, chairman of the Commercial Section, said: "The electrical industry is now getting into its commercial stride, and the national convention of 1923 will be of the greatest commercial significance in the history of the central-station business. Much important information on selling methods will be presented at the convention and many surprises are in store in the presentation of this material. Not only will every central-station executive want to be present himself, but he should see that his commercial manager and the principal members of his selling staff are also on hand for the important general and commercial sessions. The 1923 meeting is going to be a shirtsleeve convention, by which I mean that the commercial men are going to take off their coats and go after the business."

G. Bertram Regar, chairman of the Lighting Sales Bureau, pointed out some of the commercial possibilities in the field of lighting sales. It is possible, for example, he said, with benefit to the customer in general, to double the intensity of existing lighting installations, and since lighting makes up 58 per cent of the total central-station income today, tremendous increases can thus be achieved in central-station gross business. The Lighting Bureau's program for 1923 will be concentrated on the two important subjects of residence lighting and store lighting. Papers and reports will be prepared and circulated well in advance. Novel means are being planned for the dramatic visualization at the convention of business-getting ideas.

The Power Sales Bureau, C. K. Nichols chairman, expressed a desire to learn of the problems of the West and to make the work of the committee of more value to Western commercial men. Particular attention will be devoted to new types of drives and control which will increase production and lower operating costs. Plans for carrying on the industrial heating school will be carried forward. Western men emphasized the necessity for holding such courses in the West. The Power Sales Bureau fully appreciates this need, and next year the work will be started through the various geographic divisions.

## Joint Committee for Business Hard at Work

At a meeting of the executive committee of the Joint Committee for Business Development held in New York on Jan. 9, P. R. Labelle, power sales manager of the Shawinigan Water & Power Company, Montreal, was elected a member of the executive committee, and J. S. Tritle, merchandising manager of the Westinghouse Electric & Manufacturing Company, was included in the membership of the general committee. Director Lane announced that the committee now had 749 correspondents.

It was decided to make a list of available electrical publications prepared by the national associations co-operating with the committee and distribute it to the trade. C. E. Greenwood, chairman of the appliance department, announced that he was preparing a booklet on vacuum cleaners and another on commercial cooking; P. B. Zimmerman, chairman of the lighting department, is at work on a domestic lighting prospectus, and A. K. Baylor, chairman of the wiring department, reported progress.

A newly created electrical transportation department has Charles R. Skinner, Jr., of the New York Edison Company, as chairman. The electrification of textile mills is to be taken up by the electric power department, of which H. H. Holding is chairman. C. K. Nichols, chairman of the department of electric heating and melting, reported that he had gathered material for a series of booklets.

The original plans for the joint committee prize contest have been somewhat changed, and the committee will announce on Feb. 10 the rules governing the award of a cup to the electrical club, league, local association or local company which reports the most effective and interesting local activity. Five other prizes in the form of plaques will be awarded for meritorious local activities.

A motion was passed to consolidate the advertising committee of the joint committee and the publicity advertising council of the Society for Electrical Development into one body. It was decided that the first publication to be sent out to the committee's correspondents would be one on store and show-window lighting.

## Fitkin Properties Report Year of Records

Representatives of the properties operated by the General Engineering & Management Corporation of New York, known as the "Fitkin group," held their annual convention last week at the offices of A. E. Fitkin & Company. They consisted of the local operating heads of the Tidewater Power Company, Commonwealth Light & Power Company, Interstate Electric Corporation and the Morris & Somerset Electric Company and their subsidiaries, numbering twenty-six electric light and power, gas, water, ice and street-railway companies serving more than a hundred communi-

ties in New Jersey, Pennsylvania, North Carolina, Florida, Texas, Missouri, Kansas and Michigan. This organization has just completed the most successful year in its history as owner and operator of public utilities. As of Nov. 30 last, the number of customers served by these combined properties in the twelve months previous increased by development and acquisition of new properties from 29,151 to 48,961 and the capacity of their central stations from 8,315 kva. to 40,595 kva.

Meetings were held throughout the week and the keynote was distinctly optimistic. Plans for commercial expansion and development were the chief consideration. In addition to the organization program, the convention was addressed by F. W. Smith, president National Electric Light Association; M. R. Bump of Henry L. Doherty & Company, A. K. Baylor of the General Electric Company and Earl E. Whitehorne, commercial editor ELECTRICAL WORLD.

## Carolina-Tennessee Company Wins—Appeal Taken

The Carolina-Tennessee Power Company won a victory in the hearing at Murphy, N. C., of its suit against the Hiawassee Power Company over the right to power sites, referred to in the ELECTRICAL WORLD for Jan. 20, page 176, before Judge P. A. McElroy. The Hiawassee company will, however, as predicted, appeal to the State Supreme Court. Officials of the Carolina-Tennessee company are confident that the Legislature will not repeal its charter.

## Indiana Legislature Acting on Commission Bills

One of three measures affecting the administration of the Indiana Public Service Commission which were introduced in the State Legislature has been killed in the Senate, another is coming up as a special order of business, and the third, a House bill, is still in committee.

The bill killed provided that utility bond issues should not exceed the taxable valuation of the company. It was reported for indefinite postponement by the committee on finance, and the report was adopted by a viva voce vote. The bill before the Senate would require the taxable valuation of a utility to be the basis on which rates are made. This bill came out of committee with a divided report, a majority favoring indefinite postponement. It is possible that a public hearing may be held on the measure. The House bill would authorize the holding of a referendum to decide whether a municipally owned public utility shall be exempt from operating under the Public Service Commission. A majority of the committee is expected to favor it.

## Code Changes Discussed by Electrical Inspectors

In the first two days of the eighteenth annual meeting of the Western Association of Electrical Inspectors at Chicago this week twenty-three proposed changes of the National Electrical Code were considered in view of the revision to be made this year. These changes, contained in the report of the electrical committee of the National Fire Protection Association, were explained by Chairman Dana Pierce, as being the outcome of three years of investigation into troubles reported by and protests made by electrical inspectors. Unless further protests are made the new changes will go into effect after a public hearing at New York on March 12.

Among the most prominent changes are those which require color identification of fuses. Fuses for 600 volts will still remain red, 250-volt cartridge fuses of 15 amp. capacity and less are to be yellow or orange, and fuses over 15 amp. are to be green. To aid in distinguishing plug fuses, those of 15 amp. and under are to have a hexagonal opening in the brass cap through which a mica window will appear. To insure rigidity flush-switch and receptacle metal plates are to have a thickness of 0.04 in.

C. A. Bates, reporting on the 600-watt sockets, declared that some manufacturers were now in a position to furnish this class of equipment.The new rules require their use wherever flexible cords are used.

George Ainsworth, New York, opened the Wednesday discussion by favoring the adoption in new buildings of outlet boxes having a depth of at least ½ in. for all side-wall outlets. By such a uniform regulation designers could be certain that their fixtures would be properly installed.

A 3-in. minimum diameter for side-wall outlet boxes flush with the plaster was favored by Edwin L. Kopp, Louisville. Such construction would be in line with the development trend of fixtures and would aid in competing with foreign fixtures which, while artistic, do not pass inspection tests.

Regarding motor protection, A. R. Small, Chicago, felt that the new Rule 8C should be reworded. Too much leeway by special permission should not be given, he thought, since it would only confuse inspectors.

The question of proper wiring for cold-storage plants was raised by R. E. Moran, Memphis, who said that his experience with conduit had forced him to go back to weatherproof wiring and porcelain insulators. J. C. Forsyth, New York, gave his experience on this class of wiring. By paying proper attention to joints and repainting them twice a year, he had had little trouble.

Although no report on 2,500-volt motors was presented, W. J. Canada, New York, voiced the opinion that when properly installed the fire risk was no greater than with motors operating at lower voltages. With the increasing growth of industrial voltages he urged that attention be given to this class of equipment.

## Another Utility Information Bureau Started

The Louisiana and Mississippi Public Service Information Bureau was organized Jan. 19 at the New Orleans meeting of the committees of the Southwestern Geographic Division of the National Electric Light Association. W. J. Aicklen, Jr., general manager of the Consumers' Light & Power Company of New Orleans, was elected chairman of the committee to organize the bureau. Its work will include distinctive bulletins and news services for the two states, according to the plans adopted. H. C. Abell, chairman of the committee on organization of state information bureaus, and M. H. Aylesworth, executive manager N. E. L. A., were at the meeting and aided in the organization.

The completion of this plan means that there will be a public service information bureau for every state in the Southwestern Geographic Division. This is one of the objectives that President E. H. Kifer of the division had set for his administration.

DELEGATES FROM IOWA, MISSOURI, KANSAS AND NEBRASKA AT THE MIDDLE WEST DIVISION CONFERENCE, KANSAS CITY, JAN. 10

## Power Versus Irrigation

### Flathead Lake Project, Now Before Power Commission, Involves Important Principle

ACTIVE consideration of the Flathead Lake power project is being begun by the Federal Power Commission. The development of the 275,000 hp. which can be harnessed at that point has a bearing on the development of the Columbia Basin project of the State of Washington, and officials of that state are urging that no power rights be given unless the interests of irrigation have priority. The Federal Power Commission probably will be influenced in this case by the relatively greater importance of the power possibilities of the project, and there is reason to think that the commission will not be inclined to accept all of the conditions which the Washington State officials would impose.

The Rocky Mountain Power Company, which is a subsidiary of the Montana Power Company and of the Anaconda Copper Mining Company, was one of the first to apply for a preliminary permit following the passage of the water-power act. The commission, having in mind that a conflict would take place between those who would develop the power and those interested in irrigation on the Upper Columbia, appointed a board to report on the project. This board found that Priest Lake and Pend d'Oreille Lake have all the storage capacity necessary for the Columbia Basin project provided that the natural flow from Flathead Lake is not interfered with during the critical months of the irrigation season. For that reason the board recommended that Flathead Lake be reserved for power users and the two lower lakes for irrigation storage.

#### Power Versus Irrigation

The case is of unusual interest not alone because of the large amount of power involved but because of the principle concerned in deciding just how far water for agricultural purposes may take precedence over that to be used for power purposes. In this instance the logical development of Flathead Lake for power purposes would affect adversely a small portion of the territory which it is planned to irrigate. It is typical of numerous cases where the logical development is to use the upper storage for power purposes, providing for the restoration of the water lower down after it has served the former end.

## Federal Power Commission Proceedings

A license covering two small projects on the San Gorgonia River in California has been granted by the Federal Power Commission to the San Gorgonia Power Company. The company has a long-term lease to sell the output of the plants to the Southern Sierras Power Company. A license also has been granted to the Idaho Power Company for a transmission line from Caldwell, Idaho, to Ontario, Ore. The requirement in the license of the Snow Mountain Power Company of San Francisco that additional machinery be installed in its power house before Dec. 31, 1922, was extended for one year. The project may be sold to the municipalities adjacent to San Francisco Bay.

Preliminary permits were granted to the Eureka (Mont.) Hydro-Electric Company, covering a small project on Graves Creek in the Blackfeet National Forest; to Thebo, Starr & Anderton, Inc., covering two projects on the McCloud River, in the Shasta National Forest, and a project on the American River near Placerville involving 25,000 hp.; to the Clarion River Power Company for two dams in connection with its licensed project near Foxburg, Pa.; to the Alabama Interstate Power Company, a subsidiary of the Alabama Power Company, covering a comprehensive development on the Tallapoosa River involving four dams and power houses, and to Anna P. Gray for three small projects on South Colony Creek in Custer County, Col. An extension of one year was granted R. W. Hawley to carry out the conditions of the preliminary permit issued to him on Aug. 24, 1921, for a project on Silver Creek in California.

## Helena (Ark.) Gas & Electric Company Sold

Possession of the Helena Gas & Electric Company of Helena, Ark., passed on Jan. 15 to the Arkansas Utilities Company, which now owns and operates electric plants at Clarendon, Cotton Plant, Kingsland, Brinkley, Fordyce and Rison. The Arkansas Utility Company is a subsidiary of the Community Power & Light Company. The Helena property will be consolidated with the other holdings of the company in Arkansas, and J. M. Wharton, who was secretary-treasurer and manager of the Helena utility, is to be general manager of all the plants, with headquarters at Helena.

## Danger of New Coal-Mining Strike Thought Past

The conference of bituminous coal operators and union miners of Illinois, Indiana and Ohio has unanimously adopted a basic wage scale agreement to become effective April 1, 1923, and remain operative for one year. This agreement continues the present basic wage scale which became effective after the strike in August, 1922, and was originally drafted in 1920. This action, it is thought, gives definite assurance that there will be no national coal strike in the soft-coal fields for one year.

The fundamental cause of the instability of the bituminous coal-mining industry that has its effects in unreasonably high prices, labor troubles and transportation difficulties is a surplus of mines and miners, according to the preliminary report of the United States Coal Commission sent to President Harding and Congress on Monday of last week.

"There can be no permanent peace in the industry until this underlying cause of instability is removed," says the report of the fact-finding commission established to study the coal industry.

## Standards Committee Has 122 Projects Under Way

Speaking recently before the Boston Section of the American Institute of Electrical Engineers, Dr. P. G. Agnew, secretary of the American Engineering Standards Committee, said that 122 projects are being worked upon by the committee at present, that thirty organizations are represented on the committee today and that twenty-eight standards have already been adopted as a result of its work. About a thousand individuals are at work in different organizations upon the problems of duplication, and more than two hundred national bodies are co-operating with the committee in its service. There are now fourteen national standardizing bodies affiliated with the committee. Last year the work of the committee increased more than 50 per cent. The United States, Great Britain and Germany have led the world in standardization brought about by firms engaged in industry.

In a discussion following Dr. Agnew's address Dr. A. E. Kennelly defined standardization as "the selective adoption of instrumentalities used in co-operative work for aiding joint effort and eliminating waste." Prof. D. C. Jackson pointed out that standardization should lead in the long run to the greater development of individual effort.

## Natural Gas for Generating Electricity

Utilization of the natural gas of the Amarillo field in Texas for generating electricity on a scale of great magnitude is being considered by large financial interests, according to S. J. Keese, an engineer of Los Angeles, Cal., who has been investigating the available gas supply of the existing wells and the cost of the proposed electric project. It is stated that there is now a production of 1,000,000,000 cu.ft. of gas a day from twenty-seven wells that are scattered over the proved territory of 1,200 square miles in the Panhandle of Texas. Mr. Keese's surveys have had in view the feasibility of using natural gas for generating sufficient electric power to operate the trains of the Atchison, Topeka & Santa Fé between Kansas City and Albuquerque, N. M.

It is thought that the Santa Fé is favorably inclined to the proposition provided the power cost is not too great. While Mr. Keese's figures are not as yet available, it is predicted that the initial cost of electric power pro-

duced with natural gas will not be much in excess of that generated from water power.

The project of laying a pipe line from the natural-gas field to Denver, Col., is still in abeyance. The estimated cost of such a line and the necessary equipment is $16,000,000, which is believed by some engineers to be prohibitive. The wells of the Amarillo field are of enormous production, the largest one gaging 180,000,000 cu.ft. a day, and the underground reservoir of the fuel is thought to have been barely touched.

## Texas Bureau's Figures on Natural Gas as Fuel

Compilations made by the Texas Public Service Information Bureau at Dallas, Tex., show that the use of natural gas as fuel in electric power plants has increased steadily throughout the states having this fuel available, according to George McQuaid, in charge of the bureau. Mr. McQuaid's investigations disclose that in September, 1922, the volume of gas consumed in electric power plants exceeded 100,000,000 cu.ft. a day for the first time. The figures for the month showed an average of 103,500,000 cu.ft. daily. Texas was sixth in this list, having used a total of 238,041,000 cu.ft. during the month. California used 624,056,000 cu.ft. and Oklahoma 444,008,000 cu.ft.

Mr. McQuaid goes on to say that only fifteen states have natural gas available for fuel for power plants. Fuel oil is used to some extent by power plants in all the states except ten, while coal is used by them in all states except California, Idaho, Nevada and Utah. Utah alone produces all its electric energy by water power.

## Power Company Sues Utilities Commission

The Colorado Power Company, which has made several ineffectual efforts to secure an increase in rates, has brought suit in the United States District Court against the three members of the Colorado Public Utilities Commission. The company asks that the commission be restrained from enforcing the schedule of rates authorized by it in 1920, asserting that the central system of the corporation earned a gross revenue in 1922 of only $682,663, netting $55,156, exclusive of government taxes, and that this is a return on the valuation of only 0.51 per cent.

A 40 per cent increase was sought in 1920 on average rates and 20 per cent on special contract rates. This is again prayed for. If the rates sought had been allowed during 1922, it is claimed, the gross revenue would have been $837,769 and the net revenue $176,251, or 1.60 per cent on the valuation.

The "central system" comprises the Shoshone development, the Boulder development, the Georgetown development and the Leadville system, all hydro-electric. The company's valuation is $11,000,000. It is set forth that it operates its systems over sections of the state sparsely populated, high mountain ranges and territories unprotected from fierce storms, and that the rates now in effect are unfair, unreasonable and confiscatory.

## Underwriters Review Year

### More Work Was Accomplished in the Electrical Laboratories in 1922 than Ever Before

THE volume of work in the electrical department of the Underwriters' Laboratories during 1922 exceeded that of any preceding year, according to the official report, recently issued, and necessitated the employment of more engineers and laboratory assistants. The development of a multitude of special appliances for the utilization of electricity in home, office and factory continued steadily and was reflected in the increase of applications to the department for examinations and tests, the engineers having been constantly called upon to devise new test methods to bring out the characteristics and essential features of installations and of devices so new that standards based upon service records are incomplete or wholly lacking.

Vending machines, advertising and display devices, electrical toys, "permanent-wave" hair-dressing appliances, devices for waxing motion-picture films, anchors for screws in walls, surgical and dental appliances and so forth lent variety to the routine work on wires, wiring devices and the more standardized things.

The extraordinary spread of "radio" threw a large amount of work on the department. Grounding switches, lightning arresters and other small fittings were most numerous, but reports were also made on elaborate and expensive outfits for the complete power equipment of amateur or professional transmitting stations.

During the year a standard was developed on a form of rubber-sheathed cord, known as "type SJ" cord, which is for use on portables where the conditions are less severe than for the "type S" cord developed in 1921. In co-operation with the committee on new developments of the National Fire Protection Association's electrical committee, investigations of three new special forms of wiring were made. Of these one was later withdrawn by the submitter, one was passed by the Laboratories and one is still being studied.

Several new automatically regulating electric flatirons have been tested and label service is now in prospect on such irons to distinguish them sharply from irons which lack this protective feature.

In the Laboratories' new quarters in New York there is to be a much larger and better equipped electrical testing station, laid out with special attention to present-day standards of safety and with many more facilities for expeditious work.

## Illinois Utility Plans Issues of $20,000,000

The Public Service Company of Northern Illinois has filed an application to the Illinois Commerce Commission for permission to issue $20,000,000 in new bonds and stocks. This increase in capital is to finance a large program of expansion of generating facilities and also to retire some securities falling due in the near future. The application covers the issuance of $5,000,000 of 5½ per cent first lien and refunding bonds, an increase of 100,000 shares in no-par-value common stock and $5,000,000 additional 6 per cent preferred stock. The proceeds of this bond issue will go in part to retire $1,750,000 collateral notes which mature Feb. 1 and in part toward the erection of the new Waukegan generating plant now under construction, which will start operation about Sept. 1, and to increase the capacity of the Joliet generating station by the addition of 30,000 kw. The two projects last named will require about $9,000,000.

Stockholders will be asked at the annual meeting on Feb. 26 to increase the common stock by 100,000 shares of no par value and the preferred stock by $5,000,000. If approval is obtained, the company will later ask permission for the issuance of 52,980 shares of additional no-par-value stock.

## Last Year's Work of Joint Fuel Committee

A report on the work done by the Washington office of the joint fuel committee of the National Electric Light Association, the American Gas Association and the American Electric Railway Association has been made by John Price Jackson, the managing director, to John W. Lieb, the chairman of the committee.

The character of the work that has been done for individual utilities is outlined as follows: Giving information as to procedure, government regulations, etc.; obtaining priorities where needed, increasing car supply, accelerating car movements, preventing confiscation of cars, relieving stress caused by embargoes, endeavoring to prevent the necessity for paying excessive prices, advising as to where coal of the right quality is purchasable, aiding the shipment of plant supplies, providing cars for coke and carrying on other work which develops in particular instances.

At the close of the year, the report says, the emergency situation had largely relaxed and the government methods were reasonably well established. Emergency cases of specific utilities requiring aid had declined greatly in number.

The fuel situation in the country, however, is still upon an unsettled basis, and should a long period of genuine blizzard weather occur many utilities would again be thrown into the emergency class.

## New Code of Ethics

**Committee of Four Major Engineering Bodies and Heating Society Formulates Principles**

A NEW code of ethics drawn up by a joint committee of the American Society of Civil Engineers, the American Institute of Mining and Metallurgical Engineers, the American Society of Mechanical Engineers, the American Institute of Electrical Engineers and the American Society of Heating and Ventilating Engineers, under the chairmanship of Prof. A. C. Christie of Johns Hopkins University, has been made public. Its text follows:

"Engineering work has become an increasingly important factor in the progress of civilization and in the welfare of the community. The engineering profession is held responsible for the planning, construction and operation of such work and is entitled to the position and authority which will enable it to discharge this responsibility and to render effective service to humanity.

"That the dignity of their chosen profession may be maintained, it is the duty of all engineers to conduct themselves according to the principles of the following code of ethics:

"1. The engineer will carry on his professional work in a spirit of fairness to employees and contractors, fidelity to clients and employers, loyalty to his country and devotion to high ideals of courtesy and personal honor.

"2. He will refrain from associating himself with or allowing the use of his name by an enterprise of questionable character.

"3. He will advertise only in a dignified manner, being careful to avoid misleading statements.

"4. He will regard as confidential any information obtained by him as to the business affairs and technical methods or processes of a client or employer.

"5. He will inform a client or employer of any business connections, interests or affiliations which might influence his judgment or impair the disinterested quality of his services.

"6. He will refrain from using any improper or questionable methods of soliciting professional work and will decline to pay or to accept commissions for securing such work.

"7. He will accept compensation, financial or otherwise, for a particular service from one source only, except with the full knowledge and consent of all interested parties.

"8. He will not use unfair means to win professional advancement or to injure the chances of another engineer to secure and hold employment.

"9. He will co-operate in upbuilding the engineering profession by exchanging general information and experience with his fellow engineers and students of engineering and also by contributing to work of engineering societies, schools of applied science and the technical press.

"10. He will interest himself in the public welfare in behalf of which he will be ready to apply his special knowledge, skill and training for the use and benefit of mankind."

The representatives of the A. I. E. E. on the joint committee were Prof. Comfort A. Adams, Giuseppi Faccioli, George F. Sever and L. B. Stillwell. The code has already been adopted by the A. S. M. E.

## Brief News Notes

**American Power & Light Acquires Minnesota Utilities.**—The stock of the Minnesota Utilities Company, an electric light and power concern owned by Wausau (Wis.) investors and supplying a number of small cities in Minnesota, has been purchased by the American Power & Light Company of New York.

**Alabama Legislature Backs Ford.**—Henry Ford's proposal to lease and purchase government power sites and property at Muscle Shoals has been indorsed in a joint resolution of the Alabama Legislature. A committee will be named by the Senate and House to draft "suitable resolutions" to forward to Congress through Alabama Representatives and Senators.

**Trunk-Line Electrification Project in Ontario.**—Sir Henry Thornton, the new president of the Canadian National Railways, announced recently that electrification of the Grand Trunk Railway from Toronto to Niagara Falls via Hamilton and St. Catharines is the only means of providing for the increased traffic. He added that there were no serious obstacles to electrification.

**Indiana Commercial Men for Commission.**—The result of the referendum vote taken by the Indiana State Chamber of Commerce in the local chambers of the state on the question of retaining or abolishing the Public Service Commission was overwhelmingly for its retention, though many believed there should be changes made in the law.

**Oconto and Peshtigo Companies Become Northeastern Power Company.**—Two small Wisconsin electric light and power companies, the Oconto Service Company and the Peshtigo Electric Company, have been merged in the Northeastern Power Company, a subsidiary of the Wisconsin Public Service Corporation of Milwaukee, and Charles M. Haffeler will manage the two plants from Oconto. At Peshtigo an attempt to bring about municipal ownership failed signally.

**New Indiana Transmission Lines.**—Construction work on a 33,000-volt transmission line from Newcastle to Cambridge City, Ind., is now under way. The 13,200-volt line from Cambridge City to Connersville will be changed to 33,000 volts. This includes the installation of 33,000-volt substations at Connersville, Milton, Cambridge City and Newcastle. The construction of a high-tension transmission line from the Norway plant of the Indiana Hydro-Electric Power Company to Logansport has been authorized and construction will start immediately.

**Wisconsin Hydro-Electric Company Takes Over Chetek Plant.**—On Jan. 4 the Wisconsin Hydro-Electric Company, whose headquarters are at Amery, Wis., not Apple River, as stated in "Brief News Notes" on Dec. 30, took over the Chetek Light & Power Company, and it will supply the customers of the latter from its 25,000-volt line. This line is to be extended in the spring to Sand Creek and Colfax, a distance of about 25 miles, where it will connect with the company's existing line and complete a loop system.

**Badger Public Service Company Wins Right to Enter Calumet, Wis.**—The Circuit Court at Madison, Wis., has reversed the decision of the State Railroad Commission which granted the Eastern Wisconsin Electric Company permission to extend its lines into the town of Calumet and barred out the Badger Public Service Company. The long-drawn-out contest over the exclusive right to serve Calumet with light and power has now been appealed to the Wisconsin Supreme Court.

**Dynamos on the Dead Sea.**—Plans for the electrification of Palestine by raising the level of the Sea of Galilee and harnessing the historic River Jordan, involving an initial expenditure of $10,000,000, are described in "Palestine—Its Commercial Resources, with Particular Reference to American Trade," by Addison E. Southard, American Consul at Jerusalem, just published by the Department of Commerce. The scheme calls for the canalization of the Jordan Valley from the Sea of Galilee to the Dead Sea, where, under irrigation, it is expected that copious crops can be produced.

**Negotiations of Alabama Power Company for Montgomery Utilities Completed.**—With negotiations for the purchase of the Montgomery Light & Water Power Company and the Montgomery Light & Traction Company from Henry L. Doherty & Company completed and the sale ordered by a federal judge, as necessitated by the companies being in the hands of receivers, only the formal approval of the Alabama Power Service Commission is needed to consummate the transfer. The petition will be heard by that body on Feb. 12.

**French Government to Assist Rural Electric Service.**—A bill adopted by the Council of Ministers in France authorizes 4 per cent loans to communes, agricultural societies and approved syndicates through the National Office of Agricultural Credit for the extension of electric service in certain country districts. The loans will be guaranteed under conditions similar to those under which loans for cheap dwellings are obtainable. The total of the government loans is limited to 600,000,000 francs and an amount equal to the loan must in every case be raised by the community or society applying for it.

**Shawinigan Water & Power to Develop St. Maurice River.**—The Shawinigan Water & Power Company has formed a subsidiary company under the name of the St. Maurice Power Company, Ltd., to develop Gres Falls and Gabelle Rapids on the St. Maurice River, Quebec. The new company has common-stock capital of $8,000,000 and an authorized bond issue of $12,000,000, of which $10,000,000 is now being issued by a New York syndicate.

**Stanley Library Given to Pittsfield Works.**—The entire technical library of the late William Stanley, electrical inventor and founder of the Stanley Electric Company of Pittsfield, Mass., which became part of the General Electric Company, has been given by his widow, Mrs. Lila Stanley, for the permanent use of employees of the General Electric Company in Pittsfield. In the library are about a thousand volumes on scientific subjects, including a set covering the researches of the Royal Society of London from 1665 to 1800.

**North American Company Buys General Squier's Patent.**—The North American Company has, it is reported, purchased the patent rights of the "wired-wireless" system of transmission and receiving radio apparatus invented by Major-General George O. Squier, Chief Signal Officer, U. S. Army, which facilitates the broadcasting of news, entertainment and music over the entire wire systems of power and light companies in connection with regulation sending and receiving sets. It is said that the North American Company will supply a radio service to its power consumers in Cleveland, Milwaukee, St. Louis and other cities where it operates.

**Colorado Colleges Learn About the Utilities.**—A movement enlisting the co-operation of colleges and universities has been started by the Rocky Mountain Committee on Public Utility Information. The plan includes lectures before students and faculties and also classroom study. Where provision could be made actual utility courses have been added to the curriculm. The work began on Jan. 8, when Carl D. Jackson of Madison, Wis., formerly president of the National Asociation of Railway and Utilities Commissioners and former chairman of the Wisconsin Railroad Commission, began a series of lectures that were to include every university in Colorado.

**Johnstown (Pa.) Company Seeks to Expand.**—The Penn Public Service Corporation of Johnstown, Pa., is seeking from the state commission the right to acquire for $3,500,000 the Warren Light & Power Company, the Jefferson Electric Company and the DuBois Electric and Traction companies, all in western Pennsylvania. When this merger shall have been completed the field of the new company will spread out over nearly a fourth of the state. The main source of power for the system is to be the Clarion River dams, the first of which is now under way. From these dams a network of high-power transmission lines is, according to published plans, to be spread over more than 150 townships in the territory of the Penn Public Service Corporation.

**Investment Bankers Take Hand in New Brunswick Power Situation.**—Representatives of the Investment Bankers' Association of the United States and the Bond Dealers' Association of Canada waited recently on the Premier of the Province of New Brunswick respecting their request that arbitration be resorted to between the city of St. John and the New Brunswick Power Company for the purchase of the power company's plant. The Premier insisted, however, that the city had a perfect right to erect a civic distribution system in competition with that of the power company and said that "the investors in the New Brunswick Power Company when they purchased their stock or bonds did not acquire with such securities the exclusive right to distribute light and power in the city." It is not thought the government will interfere.

# Associations and Societies

**Electric Club of Louisville, Ky.**—This club has elected the following officers: President, W. W. Crooker; vice-president, Will A. Link; secretary-treasurer, David Schneider; directors, James Clark, Jr., Frank A. Hamel, George M. Miller, A. G. Renau and Samuel B. Storm.

**Tri-State Water and Light Association.**—The thirteenth annual convention of the Tri-State Water and Light Association, embracing the Carolinas and Georgia, will be held at Birmingham, Ala., on April 17 to April 20, according to an announcement by the secretary, who said that the executive committee had selected the Alabama city because it is proposed to amend the constitution of the association at the approaching meeting to include Florida, Alabama and Tennessee.

**Ohio Metermen Convene at Cleveland.**—The second conference of the year for metermen of the Ohio Electric Light Association was held Jan. 18 at the Hotel Statler, Cleveland. R. H. Wolford of the Ohio Power Company dealt with "Meter Laboratory Equipment and Maintenance," and W. A. Holliday, Cleveland, with "Field Testing Equipment and Its Maintenance." An exhibit of laboratory and field testing instruments was made by J. L. Wright, chairman of the meter committee.

**February Section Meetings of the A. I. E. E.**—The following Institute section meetings have been scheduled for February, 1923: Boston, Feb. 13, "Caribou Hydro-Electric Development," A. A. Northrop; Detroit-Ann Arbor, Feb. 9, "Electricity in a Tire-Making Plant," D. H. Baer; New York, Feb. 2, "The Gaseous Conductor Lamp," D. McFarlan Moore; Pittsfield, Feb. 1, annual dinner; Toronto, Feb. 9, "Carrier Current," Mr. Vennes; Providence, Feb. 2, "Seeing but Not Observing," William H. Blood, Jr.; Worcester, Feb. 15, "Interior Wiring," Prof. A. L. Cook.

**New Executive Board for American Council.**—The executive board of the American Engineering Council for 1923 will, in addition to the officers of the Federated American Engineering Societies, whose names were published last week (page 178), be constituted as follows: American Institute of Electrical Engineers, C. G. Adsit, F. B. Jewett, William McClellan, L. F. Morehouse and C. F. Scott; American Institute of Mining and Metallurgical Engineers, Galen H. Clevenger, Charles H. McDowell and Allen H. Rogers; American Society of Mechanical Engineers, L. P. Alford, A. M. Greene, Jr., John L. Harrington, Fred J. Miller and P. F. Walker; jointly representing American Society of Safety Engineers, American Society of Agricultural Engineers, Society of Industrial Engineers and American Institute of Chemical Engineers, M. G. Lloyd, S. H. McCrory and J. W. Roe; regional directors, A. E. Lindau of Buffalo, W. H. Hoyt of Duluth, Charles H. Gow of Boston, W. J. Fisher of York, Erskine Ramsay of Birmingham, L. A. Canfield of Des Moines, O. H. Koch of Dallas and J. C. Ralston of Spokane.

## Coming Meetings of Electrical and Other Technical Societies

[A complete directory of electrical associations is published in the first issue of each volume. See Jan. 6 issue, page 78, for latest list.]

New Mexico Electrical Association—Albuquerque, Feb. 12-13. C. E. Twogood, Albuquerque, N. M.

Electrical Supply Jobbers' Association—Central Division, Chicago, Feb. 13-14; Atlantic Division New York, Feb. 14; general meeting, Hot Springs, Va., March 21-25. Franklin Overbagh, 411 S. Clinton St., Chicago.

American Institute of Electrical Engineers—New York, Feb. 14-16. F. L. Hutchinson, 33 West 39th St., New York.

American Electric Railway Association—Washington, D. C., Feb. 15-16. J. W. Welsh, 8 W. 40th St., New York.

American Institute of Mining and Metallurgical Engineers—New York, Feb 19-21.

American Physical Society—New York, Feb 24; Washington, April 21. D. C. Miller, Case School of Applied Science, Cleveland.

National Electric Light Association—New York, June 4-8. M. H. Aylesworth, 29 West 39th St., New York.

Electric Power Club—Hot Springs, Va., June 11-14. S. N. Clarkson, Kirby Bldg., Cleveland.

Pacific Coast Electrical Association—San Francisco, June 19-22. S. H. Taylor, 527 Rialto Bldg., San Francisco.

# Recent Court Decisions

**"Danger" Signs Not Sufficient to Absolve Maintainer of Defectively Insulated High-Voltage Wires.**—Sustaining a verdict of $30,000 damages awarded in Clumfoot vs. St. Clair Tunnel Company to the plaintiff, an expressman who while engaged in his ordinary work slipped and came into contact with an imperfectly insulated 3,300-volt wire in the St. Clair Tunnel, the Supreme Court of Michigan held that the case rightly went to the jury and that "danger" signs and the victim's knowledge of the nature of his surroundings did not absolve the company from liability in the maintenance of a dangerous instrumentality. (190 N. W. 759.)*

**Power of Court Over California Commission's Orders.**—In Brewer et al. vs. Railroad Commission of California the Supreme Court of California, deciding that the plaintiff (a water company) was a public utility, declared that, in view of the court's limited power of review, an order of the commission fixing rates cannot be set aside on certiorari because of an error in rulings on evidence, unless this constitutes an entire exclusion of admissible evidence on one side touching the essential issue, amounting to a denial of due process of law, and so ousting the commission from jurisdiction. Such, the court held, cannot be said to be the case where the main substance of that evidence was before the commission in the form of a record of evidence presented in earlier proceedings involving the same issues. (210 Pac. 511.)

**Powers of Maryland Commission.**—In Benson vs. Maloy an injunction was sought to prevent the abandonment of a street railway line on the authorization of the Maryland Public Service Commission. The Court of Appeals of Maryland, denying the appeal, thus construed the law covering the power of the commission: "It is true that the Public Service Commission, acting under a specially conferred grant of power by the Legislature, exercises only a limited jurisdiction, and where a jurisdiction is so limited it will be strictly construed. The construction to be given, however, must be as far as possible such as to carry out the legislative intent, not to thwart it nor to render its exercise or inability to exercise meaningless and absurd. The argument of the appellant is that an abandonment of a franchise once exercised can only be brought about by a repeal by the Legislature, but how would the Legislature be able to act intelligently in a case like the present? The suggestion is that the allegations of the petition must first go before the Public Service Commission in order that the facts upon which it is based may be found by that body, that such findings shall then be certified to the Legislature, and the franchise, or at least some part of it, repealed, and then such repeal go back to the Public Service Commission. The enumeration of these steps will show the absurdity of any such construction, because if the franchise, or any part of it, is repealed, there is nothing for the commission to act upon. On the other hand, if an effect can be given to the act of 1914 which will plainly carry out the legislative intent without involving any absurdity, that should manifestly be done." (118 At. 852.)

*The left-hand numbers refer to the volume and the right-hand numbers to the page of the National Reporter System.

**Negligence of Manufacturing Company in Leaving Packing Blocks in Transformer and of Central-Station Company in Not Removing Them Questions for Jury.**—Sider vs. General Electric Company and Niagara Falls Power Company was one of the suits for damages growing out of the death of thirteen men in a tower of the Niagara Falls company at Tonawanda, N. Y., on Oct. 31, 1920. The Appellate Division of the New York Supreme Court has confirmed an order of the trial term setting aside a jury verdict of $21,200 as excessive, because of the death of the plaintiff, the sole statutory beneficiary of the victim of the accident, but sustaining the jury in finding for the plaintiff. From this order both the plaintiff and the two defendant companies had appealed, the latter claiming that the verdict should have been set aside on other grounds. The claim for damages was based on the allegations that the manufacturing company had negligently, without proper notice to the central-station company, left packing blocks in transformers which it had sold to the latter, thus making the transformers liable to short circuit, and that the purchaser was also negligent in not making a proper inspection and test of the transformers before putting them into use. The General Electric Company contended that there was no evidence that the presence of the packing blocks caused the circuit and that, even if there had been, the accident was due to the negligence of the power company in failing to remove them. The Supreme Court held that the issue of negligence in both these regards was properly submitted to the jury, declaring that a manufacturer of electric current transformers, knowing that they were to be used to measure a powerful current of electricity, and that to use them with packing blocks left therein would create a very dangerous situation, was called on to exercise care commensurate with the danger, and that where an electric power company purchasing new transformers to measure a powerful current could have turned on a small current at first and increased it gradually, thereby testing the transformers, as was its custom in certain cases, but did not do so, and a short circuit resulted, it was a question of fact for the determination of the jury whether it used care in inspecting and testing them before turning on the full power. (197 N. Y. S. 98.)

# Commission Rulings

**Special Contracts—Cost of Service.**—While asserting that three industrial companies which applied for lower rates from the Southern Sierras Power Company were entitled to a modification of the tariff now charged, the California Railroad Commission reiterated its view that rates set forth in special contracts cannot be upheld by the commission without permitting discrimination, which the law prohibits. It denied the petitioners' contention that rates should be based on cost of service, holding that, however important, this is not the only determining factor. The consumers' own testimony, the commission asserted, showed that in their case the value and not the cost of service is in reality the dominating consideration.

**Protest from Telephone Company Against Radiophone Service Overruled.**—The Midland Telephone Company protested to the Utah Public Utilities Commission against an application made to that body for permission to operate a radio-telephonic system to provide mutual means of communication for a number of towns and cities which were not interconnected by wire. In granting the application the commission said that the only question to be considered was the necessity of such a service and whether it would serve the convenience of the public. Objections that the enterprise could not be made a success and that such a service would cause damage and inconvenience to a proposed telephone line were held not to be well taken.

**Valuation Based on Historic Cost.**—In support of the historical reproduction-cost basis as the controlling factor in rate proceedings, the California Railroad Commission said, in the course of its finding in the Pacific Gas & Electric valuation (ELECTRICAL WORLD, Jan. 6, p. 56): "Estimated reasonable historical cost is not the only factor that should be considered in arriving at a proper basis of rates, but we believe it must be the controlling factor, provided resulting rates are within the constitutional limitations. For ten years this commission has followed such a policy, and under that policy utility companies have prospered and are now on a sounder financial basis than they were ten years ago. At the same time, many of the rates they charge are lower today than ten years ago, and considering the state as a whole, but few commodities are as close to pre-war prices as electricity. Careful consideration and reconsideration of the question by succeeding members of the commission has uniformly resulted in the conclusion that this policy is sound, and, what is perhaps more convincing, it has satisfactorily stood the test of time and the extreme conditions that have prevailed in the past few years."

# Men of the Industry

Changes in Personnel
Accomplishments, Responsibilities, Honors, Appointments and Activities of Men Engaged in all Branches of the Electrical Industry

## J. T. Whittlesey Appointed to California Commission

James T. Whittlesey, prominent consulting engineer of San Francisco, has been appointed to a two-year term as commissioner on the California State Railroad Commission. After his graduation from Yale he was with the Thomson-Houston Electric Company from 1889 to 1890. He then went to New York as consulting engineer, and

J. T. WHITTLESEY

in 1892 he entered the service of the Brooklyn street railroad, where he spent four years in the motor department. During the succeeding two years he was chief engineer of the Brooklyn Rapid Transit Company. In 1898 he became superintendent of the Stephenson Car Company of New Jersey. For three years following 1900 he was chief engineer of the United Electric Company of New Jersey and following this held the same position with the Public Service Corporation of New Jersey. In 1912 he removed to California and was retained by the Spreckels interests of San Francisco to advise them on utility matters. During the past five years he has been director of the Pacific Coast branch of the Engineering Business Exchange, with offices in San Francisco. He is a member of the A. I. E. E., A. S. M. E. and American Electrochemical Society.

**Philip Harrington** has been appointed chief electrical engineer of the Sanitary District of Chicago. After graduation from the Armour Institute of Technology in 1906 Mr. Harrington joined the engineering department of the Sanitary District. He advanced to the post of assistant chief engineer and has had charge of the electrical and of the hydraulic, canal and other departments. His new appointment is part of a plan for the reorganization of the engineering department being carried out by E. J. Kelly, recently elected chief engineer.

**Eugene A. Yates**, chief engineer of the Alabama Power Company in the construction of Lock 12 and in all projects since the completion of the locks, was last week appointed general manager of the company, according to an announcement made by Thomas W. Martin, president. He succeeds W. N. Walmsley, who has retired owing to ill health. Mr. Walmsley is at present in South America, but on his return will continue to be a vice-president.

## J. M. Graves General Manager of Duquesne Company

James M. Graves, assistant general manager of the Duquesne Light Company for more than two years, has been appointed general manager of the company to succeed C. S. Cook, recently made vice-president. Mr. Graves was born at Lexington, Ky., in 1878 and was graduated as mechanical engineer from the University of Kentucky in 1900. In 1903 he became assistant to W. A. Shoreman, chief engineer of the Allegheny County Light Company, and later assistant superintendent of the power stations of the Duquesne Light Company. In 1906 he was made superintendent of power plants, a position he occupied until July 1, 1920, when he was made assistant general manager.

## M. F. Riley Heads Potomac Public Service Company

M. F. Riley, who resigned the presidency of the Birmingham Water Works Company to become president of the Potomac Public Service Company of Maryland, as was announced in the Jan. 6 issue of the ELECTRICAL WORLD, is an experienced public utility executive, having been actively connected with the American Water Works & Electric Company's properties for more than twenty-five years. Mr. Riley was educated in Pittsburgh and began his thirty-five years' experience in public utility operation with the Braddock Gas & Light Company of that city. Thereafter for several years Mr. Riley was associated with the American Water Works & Guarantee Company in the general inspection of its waterworks properties. For a period of ten years he had charge of the waterworks property at Little Rock, Ark. For several years prior to 1919 he was associated with the American Water Works & Electric Company in the management and operation of its water properties, and in 1919 he was elected president and manager of the largest properties of that group, among others those of Birmingham and Chattanooga.

Mr. Riley's success as a utility officer and operator is due not only to his long experience and knowledge of business but also to his sense of fairness and his constant purpose to have the public utilities in his charge make the largest possible contribution to the welfare and prosperity of the communities which they serve.

## Dr. Fuller Joins General Electric

Dr. Leonard F. Fuller, one of the most prominent radio engineers in the country, has accepted a radio engineering appointment with the General Electric Company at Schenectady, N. Y., and will take up his duties there as soon as work in California under his

L. F. FULLER

direction shall have been completed. He was for seven years with the Federal Telegraph Company, and particularly as chief engineer of that company during the war did important development work on the high-power magnetic arc transmitters which the United States Navy now uses for all transoceanic work. In this capacity he was also charged with executive duties and personally represented the company in negotiations on technical matters with the Navy Department at Washington. Stations designed and built under his direction are used for transmission over some of the longest distances spanned by radio communication.

With C. B. Kennedy, he formed a partnership under the name of the Colin B. Kennedy Company and has been active in the development of the line of radio receiving instruments bearing that name. For several years he has done radio consultation work in the East as well as on the Pacific Coast, and recently he was retained by some of the large power companies of the West to develop and install complete radio telephone transmitting and receiving systems, using 200-mile, high-voltage power lines as carriers. In recognition of his research and development work in radio he received the Morris Liebmann prize for 1919.

## G. E. Cullinan Appointed General Sales Manager

George E. Cullinan, who has recently been appointed general sales manager of the Western Electric Company, brings to his new office a background of very broad experience. He entered the employ of the Western Electric Company in 1901 on his graduation from Williams College, and for several years he was in the New York office. In 1907 he was sent to St. Louis and was manager there from 1909 to 1918, going then to Chicago as the central district manager with supervision over and responsibility for the Chicago, Detroit, Minneapolis, St. Paul, Duluth, Omaha, Indianapolis, Louisville, Cincinnati, Columbus and Cleveland branch houses.

G. E. CULLINAN

Mr. Cullinan brings to his new work a particular fitness because of his broad contact with the national problems of sales and distribution. He is gifted with a genial personality and the ability to make and hold friends.

Mr. Cullinan was born in Geneseo, N. Y., 1878. He is a member of the executive committee of the Chicago Chamber of Commerce and a director of one of the Chicago banks.

## Society for Electrical Development Increases Staff

Albert Kapteyn joined the staff of the Society for Electrical Development at the close of 1922. His work with the Westinghouse Machine and Air-Brake companies, supplemented by considerable experience in export work, especially fits him for the making of original studies and the preparation of booklets. W. W. Ayre, another new appointee, has been with the McGraw-Hill Company, the advertising department of the Western Electric Company and the Tucker Advertising Agency and was more recently managing editor of the Publishers' Autocaster Service in New York. Mrs. Harriett C. Emmons has been added to the staff to assist in organizing and fostering home economics work. W. S. Sands has also allied himself with the society.

**Norman Perry** of the Indianapolis Light & Heat Company has been elected president of the Electric Appliance League of Indianapolis.

**R. U. Mussley**, formerly superintendent at Bellingham for the Puget Sound Light & Power Company, has been made manager of the properties which were purchased by that company from the Washington Coast Utilities Company.

**Clarence T. Ward**, office attorney and secretary of the Idaho Power Company and the Boise Valley Traction Company for four and a half years, has resigned, and will open offices in Boise for the general practice of law. A. J. Priest, graduate of the University of Idaho law school, has succeeded Mr. Ward.

**F. R. Wadleigh** has been designated by the President to succeed Conrad E. Spens as federal Fuel Distributor. Mr. Wadleigh has been chief lieutenant to Mr. Spens throughout the latter's administration. He also is continuing to fill the position of chief of the coal commodity division of the Department of Commerce.

## Dr. F. C. Brown Made Acting Director of Bureau of Standards

Dr. Fay C. Brown, assistant director of the Bureau of Standards, was recently designated by Secretary of Commerce Hoover as the acting director of the bureau to conduct its work until a director shall have been chosen. In addition to his administrative duties in connection with the Bureau of Standards, Dr. Brown has done a great deal of research work, including special studies in thermionics and optical work, and he has made an intensive study of the electrical and mechanical properties of selenium and selenium crystals. Dr. Brown was born in Washington, Ohio, in 1881 and was graduated from the University of Indiana in 1903. He did graduate work at the University of Illinois, the University of Chicago and at Princeton. He became an instructor in physics and engineering at the University of Illinois and later joined the faculty of the University of Iowa. When the United States entered the war he was assigned to the Ordnance Department of the army and placed in charge of

F. C. BROWN

the testing and ballistic work on airplane bombs. While in the military service he attained the rank of major. At the end of the war Dr. Brown had the opportunity to choose between the professorship of physics at the University of Iowa and the position of assistant director of the Bureau of Standards. He accepted the latter post, where he has been engaged continuously since.

# Obituary

**Walter F. Brown**, general traffic manager of the Mountain States Telephone & Telegraph Company, Denver, died of pneumonia on Jan. 17, after a few days' illness. Mr. Brown, who was elected president of the Colorado Public Service Association last fall, became identified with the Bell Telephone System in New York City in 1893, and several years afterward he was transferred to Colorado.

**Jacob S. McFerren**, prominent banker and manufacturer of Hoopeston, Ill., died Jan. 7, at Chandler, Ariz., where he had gone to spend the winter months. Mr. McFerren was prominently identified with the canning industries of Hoopeston and also with the lumber interests of the South. He, with A. H. Trego, installed the electric lighting plant in Hoopeston, since absorbed into the Central Illinois Public Service Company. He also introduced the telephone business into Hoopeston.

**H. G. McConnaughty**, who had recently been associated with the Edison Electric Illuminating Company of Boston, died of heart failure on Sunday, Jan. 21, after a long illness. During the war Mr. McConnaughty acted as an assistant on the national fuel board. He was at one time exhibit director of the American Electric Railway Association and subsequently of the National Electric Light Association.

**Arthur M. Beveridge**, for the past four and one-half years New England district manager of the Eureka Vacuum Cleaner Company, with headquarters at Boston, died Jan. 10 after a short illness. Mr. Beveridge was one of the ablest men in the appliance sales field in the East and had a host of friends in New England central-station and retailing circles. He was a member of the Merchandising Bureau of the New England Division, National Electric Light Association.

## Pros and Cons of Buying Spare Parts*

### What the Local Foundry Has to Offer as Compared with the Distant Manufacturer of the Equipment

By C. E. Harrison
Manager Service Department
American Engineering Company, Philadelphia

AN IMPORTANT part of a manufacturer's service to the industries which he supplies with equipment is the provision for prompt shipment of spare parts upon receipt of orders from users. The practice sometimes adopted of ordering parts from local sources other than the original manufacturer is susceptible to objections from the manufacturer's standpoint, although arguments in favor of local buying are also available. Let us analyze this matter from the point of view of the mechanical-stoker user and manufacturer in relation to the supply of spare parts.

There are five points in favor of the local foundry:

1. *Local Relations.*—Business, political and personal relations can only be offset by good service and salesmanship.

2. *Lower Price per Pound.*—This will as a rule only apply to some of the easily made and weighty parts and usually those parts that do not require machine work.

3. *Saving in Freight.*—This is a direct saving and presents an unanswerable argument.

4. *Quicker Delivery on Small Orders.*—We must grant the fact that in an emergency, a local foundry can make a small part in less time than a duplicate can be received from a service station, provided that a mold can be made from the piece itself or that a pattern is at hand.

5. *Opportunity to Make Changes.*—Almost every stoker operator has at some time the desire to change a part and can very readily do this when having his parts made locally.

Against these there are nine points in favor of purchase from the original manufacturer:

1. *Incentive.* — Aside from the monetary remuneration, the manufacturer's continued success depends to a great extent on the field reports on his equipment. It is therefore necessary that these reports be as favorable as possible, and to this end the very best value and service must go with his sales of spare parts.

2. *Service.*—It is so self-evident that the manufacturer is in a far better position to render service than is the local foundry that further comment is unnecessary.

3. *Better Material.*—The manufacturer is in a position to determine the best material for the requirements of stoker service. He also is in a position to use this material, for he pours a sufficient quantity. The local foundry, on the contrary, must run a general all-around mixture, and as it is competing on a price basis without a constant demand, this means spot iron with its high sulphur or phosphorus content and larger portion of scrap than is advisable.

4. *Interchangeability.* — This best can be assured when replacement parts are made from the same patterns as the original. Even then it requires constant inspection and numerous changes and adjustment to keep the product uniform. Only those who have followed quantity production can realize the difficulty of maintaining a constantly uniform and interchangeable part. Machine molding by eliminating the personal equation materially assists in securing the desired result. Gages, jigs, fixtures and all other aids to uniform production can be afforded only by the manufacturer.

5. *Improvements.*—Only the constant user of parts service secures the benefit of improvements. The man making his own parts remains in ignorance of the advances that have been made. Even if these are called to his attention, he may be unable to change over owing to large stocks on hand or the prohibitive cost of pattern or method changes.

6. *Stock-keeping Costs.* — These will vary between 10 and 20 per cent. This difference is made up of factors such as interest on investment, labor, hauling, light, heat, power, stationery, space charges, depreciation of market value, depreciation due to age and depreciation due to advancement of the art rendering stock parts obsolete. When the original manufacturer renders good service by shipping promptly and by the establishing of local service stations, this cost can be kept down materially—in some cases to one-fourth the cost experienced when purchasing parts locally, for the foundry making parts must regard the work as temporary and used only to fill in during slack times. It, therefore, invariably requires a great deal of time to fill the average order and seldom, if ever, maintains a stock. The original manufacturer can maintain a stock to protect amply five hundred plants at a much lower cost than those five hundred plants could carry an individual stock affording the same protection.

7. *Benefit of Experiments.*—The original manufacturer with the resources at his command and data from hundreds of plants has the ability and competition provides the motive to be constantly striving to better his product.

8. *Quantity Manufacture.* — A phrase to conjure with—the basis of American business. It means not only lower costs, but a uniform and better product, for on this basis only can the maker warrant the expenditure to insure a uniform and better product. It permits the purchase of quantities of materials on rigid specifications and makes it possible to see that these specifications

*From a paper on "Service," presented at the convention of the Stoker Manufacturers' Association at New London.

have been met, to employ manufacturing methods and special tools that turn out a product within a tolerance impossible to attain by job-shop methods, and to afford the purchase and use of limit gages and inspections that insure the shipment of a product in absolute accordance with the original design.

9. *Most Value for Dollar.*—The cheapest is practically never the best. It is built down to a price rather than up to a standard. Cast iron is not cast iron any more than coal is coal or oil is oil.

Why not consider the cost of lost production due to shutdown, extra boiler hours off the line, extra installation costs and the multitude of extra cost items occasioned by the failure of locally made parts? One such failure will cost more than can be saved in a year's purchases.

The original manufacturer has every reason to encourage such analysis and can rest assured that, if fairly made, it will demonstrate the purchase of original parts to return to the purchaser the most value per dollar spent.

# Radio—A Pacific Coast Analysis

**How the Jobber Has Come Into the Picture—The Problem of the Department Store—The Present Inadequacy of Broadcasting in the Far West**

ALMOST every electrical dealer in each community now carries radio equipment. Down Main Street is a barber shop which handles it as a side line; the music stores all feature it, and at least two department stores have special sections devoted to it. Then, of course, there are seven or eight radio specialty shops, all the hardware stores, two cigar stores and a grocery shop.

This is the retail side of the story. Following it back a little further, one finds something like fifteen jobbing houses in various lines distributing the goods wholesale, four or five of them in the electrical field, an equal number of hardware jobbers, automotive jobbers, music jobbers, one or two radio jobbers, some of whom have retail departments, one or two dealers who have jobbing departments, several manufacturers who have every variety of department, and, as always, the department store.

As for manufacturers, if there is an idle machine shop, sewing-machine factory, garage or shipyard in the country which is not manufacturing some radio part, it is not on this section of the coast. Aside from the "bootleggers," there are also the legitimate manufacturers who are not infringing on anybody's patent and who have some measure of financial responsibility.

### The Advent of the Jobber

Until six months ago there were comparatively few wholesale channels for radio equipment in this Far Western country. Much of the business was by mail order. The few large retail concerns which were first in the field took practically the entire manufacturer's output, and it was a simple matter for him to deal direct with them and either to pass by other business which sought to enter the field or to accept it upon due financial investigation. But the business has been in the process of growing overnight from a laboratory experiment to a national sport. The popular demand enticed everybody into it, and the manufacturer, who started to deal with all alike upon a one-price, small-discount basis, was forced to realize that he needed a jobber's service. In the unforeseen hurry of the emergency he took what was at hand, and the radio dealer-jobber and jobber-dealer came into existence.

More recently the electric jobbing houses and hardware jobbing houses of established reputation have taken over these lines, and the tendency is more and more for the manufacturer to take advantage of these standard channels of distribution. The jobber's service is a financial one as well as a local merchandising and warehousing one, and it is a great advantage to the manufacturer to have the wholesaling of his product in the hands of financially well-established concerns.

Discounts are no longer the sore point that they were and the tendency is for the manufacturer, under the pressure of a slower market, to allow for a reasonable wholesale margin. Fixed policies are probably not to be expected until the market has worked itself into something like stability.

Within the wholesale group itself are policies still awaiting settlement. Some have accepted one manufacturer's line only, on the theory that they handle only one line of other types of electrical equipment. Other firms have departed from this principle in handling radio goods and are prepared to furnish almost every make of equipment which is on the market.

One aspect of the situation which is a thorn in the side of all concerned is the participation of the department store in the game under present conditions. It means the ruin of the market for the small dealer, who often pays more for his goods to the wholesaler than the sale price at which they are offered over the department-store counter.

### Department Store Problem

There are seemingly two methods of escape from this predicament—one the hope that the department store can be persuaded to play the game along the lines which have been shown to be sane merchandising practice, the other that the standard manufacturers will look upon these channels as outlawed and, by allowing no special margins, leave the department store exclusive rights to such lines as it is able to acquire upon other terms. The more hopeful effort, however, is directed toward the possibility of bringing the department store into co-operation with all other interests in the field. The tentative program outlined at the recent meeting of the advisory committee of the California Electrical Co-operative Campaign by which membership in that body will be open to all in the electrical merchandising business who subscribe to its tenets offers an opportunity of interesting the department store in the general "betterment-of-the-industry" movement, which perhaps promises more than any other existing tendency.

The greatest difficulty with the radio business on the Pacific Coast at the present time is the broadcasting situation. In the major Eastern cities and in certain other localities in the Middle West and in the South adequate broadcasting centers have been established where the power back of the station insures clear-cut signals and the character of the entertainment is maintained at a high level. There is no such satisfactory situation on the Pacific Coast. The publicity advantages of broadcasting have attracted many, and there are some sixty-odd centers

established, many of them with capacities so small that they cannot be heard clearly even in their own communities. A victrola and a selection of jazz records complete the equipment, with results which offer little attraction to any one but the amateur experimenter interested in the scientific novelty.

The Western industry is fully alive to the need for immediate improvement, and local interests are endeavoring to bring it about. The answer to all of these problems lies in the adoption of sound merchandising principles in every department of radio merchandising and the clearing up of the distribution situation. The present troubles of the radio business lie not with radio but with business, and the sooner this is realized and policies determined, not by the exigencies of the moment but by careful consideration of the future, the sooner will they cease to be a thing to worry about.

# Business Conditions

A Survey of Important Developments in the Electrical Market Including Data on Production, the Sales Outlook, Credits, Exports, the Metals and Other Conditions Affecting Cost, Supply and Demand

## Demand for Signal Apparatus Is Improving

Without any spectacular features, the demand for signal apparatus is improving decidedly as compared with a year ago, and distributors of this class of equipment are busy with sales to owners of new buildings in many parts of the country. Schoolhouse construction is responsible for a healthy portion of this trade, but new apartment houses, residences and changes in manufacturing and mercantile establishments in the interest of greater efficiency are reflected in recent orders. Manufacturers are able to make good deliveries in this line, as a result of long-established coordination of raw material supply and plant facilities, but a good deal of effort has to be expended upon securing steel products which enter into signal apparatus, as in many other lines utilizing this class of raw material. In a representative manufacturing plant deliveries of signal equipment can be made in three weeks from receipt of order. Prices are firm and have shown no tendency to change for some months.

## Conduit Boxes in Easy Supply

Despite the difficulties reported in some sections of the country in securing rigid conduit for jobbers' stocks, the supply of conduit boxes on hand at the beginning of this week was reported as highly satisfactory. The relatively small number of these outfits used in connection with any particular wiring job as compared with the length of pipe required has long been a factor permitting the maintenance of adequate stocks in distributors' hands. The fluctuations in the demand for pipe which have been noted during the past year or two have been correspondingly "dampened" by the time they have reached the conduit-box bins. At present the increase in building trade activities in different parts of the country is stimulating a healthy demand for boxes. Prices are firm and tend to follow the general movement of steel-product quotations, with more or less lag behind the active changes on account of the relatively staple stocks noted above.

## Electric Furnace Business Showing Activity

Considerable increased activity is reported for the electric furnace field.

The Electric Furnace Company, Salem, Ohio, announces that it has recently sold to the Columbia Tool Steel Company, Chicago Heights, two 100-kw. annealing furnaces. These furnaces are especially adapted to handle long bars of tool steel in boxes, with the temperature under automatic control. Other recent installations of interest are as follows: One for the Auto Strop Safety Razor Company, New York City, which consists of two furnaces adapted for heating lead baths through which razor-blade steel is drawn for treatment.

Hadfields, Ltd., of Sheffield, England, are installing a 360-kw. car-type electric furnace for the heat treatment of manganese steel castings.

The Metal & Thermit Company has purchased another furnace for its East Chicago plant, a duplicate of one made over a year ago, excepting as to size, the new unit being of 250 kw. capacity. This furnace will be used for special treatment of oxides, which are supported on a double firebrick hearth.

Besides the above-listed heating furnaces there have been additional installations made for the Buick Motor Company of Flint, Mich., of a third furnace for melting brass; for the Ohio Injector Company, Wadsworth, Ohio, of a 105-kw. brass-melting furnace; a 75-kw. furnace for melting brass for the Hammond Brass Works, Hammond, Ind.; a 75-kw. brass-melting furnace for the American Stove Company at Bedford, Ohio, and another furnace with special automatic control has just been shipped to the American Stove Company's Cleveland plant for the calorizing of stove chimneys.

## Switch Sales Are Reported 50 per Cent Heavier

Present sales of inclosed switches are running approximately 50 per cent greater than they were twelve months ago. According to one manufacturer in the Middle West deliveries are not very good and the outlook for the coming three months is not encouraging.

In giving his opinion of the business in switches for the next six months of the year, another manufacturer, also in the Middle West, says: "We feel that business for the next six months will be better than it was for the first six months of last year, but we do not anticipate any great increase. Our opinion is based on the fact that there is going to be a great deal more industrial building during the first half of 1923 than there was during the first half of 1922 and a great increase in the use of the standardized service switch.

The switch business in Canada has also increased greatly during the last six months, but conditions are not healthy. According to a manufacturer of Toronto, Ontario, manufacturers apparently are fighting for business to keep their factories going. It has resulted in a great decrease in price with little prospect of early betterment. There are really more manufacturers in the business than there is business to be had. The outlook for the next six months is fairly good. This assumption is based on the number of building permits that have been taken out since the first of the year, and the program as a whole seems to be fairly extensive compared with the two former years.

## The Metal Market

**Copper at 14.62½ Cents—European Sales Are Quiet—Lead Supply Continues Low**

Copper prices have been shaded so that now the quotation of 14.62½ cents, delivered, prevails. Although the tense European situation has not yet had any direct influence on the market, it is evident that producers are somewhat worried over the outlook for German purchases of copper as an important factor in the export trade. European sales of copper have been quiet, England remaining practically out of the market. The consolidation of Anaconda and Chile Copper, as last officially announced, has not had any stimulating results on prices, probably because the amalgamation had been known and discounted by the trade for several weeks. The new arrangement does not alter the copper situation, as it neither adds to nor subtracts from the amount of metal that is available for consumption. A sale of a good-sized lot of copper for delivery through the second half of the year at 14.75 cents, delivered, was an interesting feature of the week. This is said to be one of the largest sales of copper since the war, estimated to be more than 36,500,000 lb.

The official contract price of the American Smelting & Refining Company for lead continues at 7.50 cents per

pound, New York. The shortage in lead continues. A measure of its acuteness is to be found in the great variation to be observed in the prices quoted for lead not only in the New York market but in that at St. Louis. In New York by far the greatest amount of lead was sold at 7.50 cents, although quotations have been as high as 8 cents. One large producer sold merely a handful of lead during the week as his stocks are exhausted and he has made all the commitments he cares to for the time being.

NEW YORK METAL MARKET PRICES

| | Jan. 17, 1923 Cents per Pound | Jan. 24, 1923 Cents per Pound |
|---|---|---|
| Copper | | |
| Electrolytic | 14.75 | 14.62½ |
| Lead, Am. S. & R. price | 7.40 | 7.50 |
| Antimony | 6.35 | 6.75 |
| Nickel, ingot | 36.00 | 36.00 |
| Zinc, spot | 7.00 | 7.00 |
| Tin Straits | 38.87½ | 38.62½ |
| Aluminum, 98 to 99 per cent | 23.00 | 23.00 |

## Collections in St. Paul and Minneapolis Very Slow

Collections in the St. Paul and Minneapolis territory are very poor, according to several manufacturers and jobbers. Minneapolis reports that the amount of its cash business generally has grown to large proportions, while St. Paul credit men say that a very large percentage of retail business is also for cash. The whole territory suffered heavily last fall from the car shortage. Large crops of perishable products, mostly potatoes, rotted away for lack of cars. This condition had a deadening effect on collections, and accordingly extensions were not granted. Outstanding obligations were covered by notes and other forms of security, and rural business was put on a cash basis.

## Sales of Canadian Fixtures Active, with Firm Prices

Prices of Canadian fixtures during last year remained quite steady. There were no changes of any consequence, although there were of course a few fluctuations. Canadian manufacturers do not look for any great change in prices during the coming year, and, if any, they believe the trend will be slightly to increase prices.

During 1922 deliveries of Canadian fixtures were a little slower on the whole when compared to the deliveries during 1921 and 1920. It is the opinion of a fixture manufacturer in Hamilton, Ont., that supplies will be able to keep up with the demand of 1923 owing to improved conditions in transportation of raw materials.

A leading manufacturer of fixtures in Canada states that his sales during the last half of 1922 were considerably better than during the first period of that year.

Indications are that business will be fairly brisk during the next six months because of large construction programs.

# The Week in Trade

**Prices When Quoted Are Those Reported at the Opening of Business on Monday of This Week for Points West of the Mississippi River and on Tuesday for All Eastern Points**

CONSTRUCTION programs throughout the United States indicate an unusually heavy amount of business for manufacturers of all electrical material entering into new buildings both residential and industrial. Brief summaries of activities in leading cities of the country report greater activity by central-station companies in the purchase of material for line extension and repair work. High-tension business in Chicago remains brisk and manufacturers are kept busy supplying certain large orders. Because of continued winter construction conduit boxes are in steady demand, with firm prices and normal stocks. A slight falling off in the demand for meters is noted. Radio buying is said to be on a firmer basis because purchasers are now showing a growing tendency to buy complete sets rather than scattered parts. Among other general features of the week are a change to lower stocks of wire, firmer conduit prices, a steady call for fuses and a slight falling off in the demand for motors.

**New York** Manufacturers and jobbers report an improvement in business. All wire and other materials entering into new construction are moving in satisfactory volume. Inventories generally are completed and orders from retailers are reported to be conservative and of wholesome character. Demand for motors is slower, stocks are normal and the price trend is firm. Meters continue slow. Central-station purchasing shows a little improvement. The appliance market is without feature and is not expected to take on any growth until spring. A turn in the radio market is for complete sets built by skilled engineers in preference to many parts, which when assembled by the average amateur, guided by inadequate instructions, are inefficient and bulky. Prices generally are firm.

**Chicago** Jobbers report business steadily climbing with increase in number of January building permits. New construction requires a steady volume of wiring materials, and wire prices have an upward tendency. Conduit supplies, especially in the smaller cities, are still low. High-tension manufacturers are busy. One company sold one 1,500-kva., 14,000-volt substation for the Middle West and two 600-kva., 33,000-volt substations for the Southwest. Another firm handled an order for 4,000-volt substation equipment for a Middle Western utility. A steady volume of high-tension fuses is flowing out from another concern.

**Boston** Business is less brisk, but the underlying tone is excellent. Deliveries are giving considerable trouble, and a severe shortage of rigid conduit was reported Monday, with tendencies toward stiffer pricing on filling orders. Manufacturing is progressing well in New England, and jobbers are buying appliances to overcome the shortage experienced at the end of the year. Building operations are well sustained, and favorable rates for money are encouraging the consideration of many new projects. Cotton and rubber prices rose to new peaks last week and copper tended toward weaker quotations. Central-station business continues to gain, as do traction earnings, and the demand for telephone service is remarkably active.

**Atlanta** The spirit of optimism which ushered in the new year becomes more evident every day, and one hears that 1923 will be a record year. Municipal improvements in Atlanta under the bond issue of last spring have finally got well under way, and this has resulted in a high percentage of employment among the artisan class as well as in the ranks of common labor. This is reflected in the improvement of retail sales in this city. Good sales are reported by electrical jobbers and dealers, despite the usual after-Christmas lull.

**Pittsburgh** Jobbers are finishing inventories and again are placing orders for stock. Jobbers and their salemen generally are optimistic as to future business. The steel industry is steady, although production could be increased to a great extent if the car shortage were eliminated. Weather-proof wire advanced slightly last week. Rubber-covered is firm. One manufacturer of armored cable has made an advance and others are expected to do likewise in the near future. Low stocks of pole-line hardware have been somewhat relieved by the opening of another plant in this territory by one of the largest manufacturers. The demand for radio shows a slight increase and seems to be settling down to a merchandising position. Among the features of the week is the change to lower stocks of wire, firmer prices for conduit, steady call for fuses with increasing prices, and a falling off in the demand for motors.

**St. Louis** Records of building permits for last year indicate that construction work in St. Louis exceeded that done in the year 1921 by approximately $10,000,000, which is an increase of more than 50 per cent. The construction work for manufacturers and other shops during this period shows an increase of about $1,000,000, more

# Demand, Supply and Price Trend of Eighteen Commodities as Sold in Fifteen Cities

**than 85 per cent higher than during the previous year. The first three weeks of 1923 have been marked by great enthusiasm among the electrical wholesalers and retailers. The better business experienced in the latter part of 1922 is continuing, and prospects for the year are very bright. There is an absence of speculative purchasing by retailers, and continued replenishing of depleted stocks indicates a healthy business condition.**

## Cleveland

Orders of the week were of the nature to indicate that dealers were rounding out stocks in anticipation of an active spring. Dealers are "shopping around," and while prices are firm in the main, no advances are evident. Manufacturers report only a mediocre week in sales, but jobbers review it as satisfactory. Credits are easier, but deliveries are lengthened somewhat by shipping difficulties. Industrial equipment was more active, with particular strength in motors. Conduit boxes are in good demand, but orders are promptly filled and firm prices prevail. Appliances generally are suffering a post-holiday depression, although washers are selling in fair volume.

## New Orleans

Business during the week has shown a noticeable improvement. A feature of the week has been the change in demand for wire from slow to active. Prices of armored cable are said to be increasing. Demand for transformers has changed to a steady gait, and stocks generally are normal with firm prices. Porcelain stocks are again normal and firm prices prevail. Business in switches is somewhat slower than last week as demand has changed from active to steady, stocks are normal and prices generally are firm. Motor stocks also are improved.

## St. Paul-Minneapolis

Twin Cities business changed little from the even strides of last week, although orders are slightly smaller in St. Paul. A greater demand by the central stations for equipment to be used in extensions and repairs is reported. Radio buying continues active. Appliance business is slow, and some dealers expect price declines. House wiring is noticeably slower. Fixture demand remains active. Jobbers plan large spring campaigns. Fixtures are more active than last week. The price of conduit is more firm, although stocks are low. Demand for meters has changed from an active condition to a steady one.

**Salt Lake City** A four-million-dollar bond issue has been sold by the Columbia Steel Company for erection of plants in Utah. This is believed to be the beginning of extensive coal and iron developments in this section of the Intermountain West. The National Wool Growers' Association has just finished a convention here, and the wool and mutton industries were reported to be in excellent condition. Most growers are said to be well on the way toward recuperation. Statistics just compiled show a million-dollar increase in building in Salt Lake City in 1922 over 1921. A larger gain is forecast for 1923. Jobbers and retailers report business rather slow for this time of the year. Collections are improving steadily.

**Denver** A program of continued building indicates an early demand for a wage increase by all building trades. It is stated the electrical union will ask for an increase of one dollar a day above the present rate of \$8 for eight hours. No action has been taken by any of the master contractors. Some jobbers believe that if an increase in wages is granted, along with the increasing costs of other materials, prosperity in this section will be somewhat affected. Most inventories are over and stocks are being added to. Central-station buying is active.

**San Francisco** Business in building industry continues at a high rate, but store sales have fallen off. Electrical orders from the railroads are excellent and will increase considerably when large constructive programs of various lines commence within the next few months. Southern Pacific has authorized the expenditure of \$12,000,000 for new equipment alone. The year's combination of bumper crops and car shortages when transportation facilities were needed most caused considerable loss to fruit growers. Radio sales have gained considerably since the opening here of a large new station, which is said to have cost over \$20,000. Conduit box prices have recently increased about 10 per cent. Five thousand electric ranges will be sold during the present year, it is estimated.

**Portland-Seattle** Jobbing business is active for this time of year. Conduit, safety switches and wiring devices apparently are moving more freely than other lines. General opinion is that prospects for a good business year are excellent. Inquiries at present are most active from lumber mills and railroads. Many buildings are planned for early construction in cities throughout this section. Conduit boxes are in steady demand, with orders averaging from 100 to 200 boxes each. Cooking appliances are moving more slowly since the holidays, but a recovery is expected by early spring. There is little demand for signal apparatus in this section and heavy orders are few.

# Activities of the Trade

Devoted to News of the
Manufacturer, Jobber, Agent, Contractor and Dealer, Including Important Orders and Contracts for Apparatus and Equipment

## Rauch & Lang Receive Order for More Electric Taxis

The Rauch & Lang Company, Chicopee Falls, Mass., reports an increased demand for taxicabs, a line undertaken by this concern last year in addition to the manufacture of electric vehicles for ordinary passenger use. The Electrotaxi Company of New York, which has a fleet of eight Rauch & Lang electric taxis, has ordered ten more for early delivery. Aside from taxicabs, the company reports that its business is 25 per cent better than a year ago.

## Results of Geier Sales Contest

The idea of the electric cleaner as a holiday gift was the keynote of the successful Royal sales contest, results of which have just been announced by the P. A. Geier Company. The thirty-three winners were widely distributed throughout the country. The first prize of \$500 went to Alexander Mueller of Los Angeles, and second prize, \$450, to Raymond M. Uber, Philadelphia.

## Record-Size Frequency-Changer Set Ordered from Westinghouse

The Brooklyn Edison Company has recently purchased from the Westinghouse Electric & Manufacturing Company a frequency changer set of 35,000 kva. capacity for installation in its Gold Street station. The set is larger than any frequency-changer set now in service in the United States and has over-all dimensions, including the direct-connected exciter, of approximately 47½ ft. length, 22 ft. width and 15 ft. height. It is expected that the set will be in operation by November, 1923.

The set, which operates at 300 r.p.m., will connect the company's 25-cycle and 60-cycle systems, transforming energy from 13,800 volts, three-phase, 60-cycle, to either 6,600 volts or 11,400 volts, three-phase, 25-cycle. The 60-cycle end of the set is connected directly to an auto-transformer, through which the voltage is stepped up from 13,800 to 27,600. At this latter end a tie line, running underground in three-phase lead-covered cables, will connect the set with the power house which the Brooklyn Edison Company is erecting at Hudson Avenue.

The set is arranged for starting from either end. For the 60-cycle end starting taps are provided on the auto-transformer, and for the 25-cycle end it is proposed to connect the set directly to a generator in the station while the latter is at rest and to bring both the generator and the frequency-changer set up to speed together. No starting motor is provided. Excitation for both ends of the set is obtained from a common exciter of 300 kw. capacity. Hand regulation will be used for both ends of the changer.

## Pacific Coast Jobber Announces Largest "Ad" Campaign in West

The Pacific States Electric Company, one of the largest electrical jobbers on the Pacific Coast, with branches in all large Western cities, has announced an advertising program for 1923 to promote its "Check Seal" campaign, which will be the largest advertising campaign ever put on by a concern of any kind in the West. The "Check Seal" slogan, standing for higher standards in electrical contracting, had its inception in Los Angeles in September, 1921, and proved so successful there that it was carried to all of the large cities of the West.

The plans for 1923 call for extensive newspaper advertising and billboards throughout California, Oregon and Washington. The program consists of two full-page and eight 1,000-line newspaper advertisements, to be alternated with the billboard displays throughout the year. The two full-page advertisements feature the "Check Seal" standards of installation in relation to power development. The other eight advertisements feature the "Check Seal" as a guide to standard electrical materials and qualified electrical contracting service in both industrial and domestic installations. In addition to 415 poster panels in full color, nine de luxe illuminated billboards will broadcast the story and direct public attention to "Check Seal" contractors.

## Sprague to Campaign Against Misuse of Its Trademark

In order to correct the misuse of the trademark "BX," the Sprague Electric Works of the General Electric Company, 527 West Thirty-fourth Street, New York City, manufacturers of steel-armored conductors, will soon start a campaign to curb this practice. In a statement to trade publications this company states:

"Steel-armored conductors were first introduced to the trade by the Sprague Electric Works under the trademark 'BX' more than twenty-five years ago. In a short time this trademark had become universally known, and by the time the first competitive make of armored conductor appeared on the market 'BX' had become synonymous with armored conductor or cable. The title 'BX' was loosely applied to any

make of armored conductor, and the misuse of the Sprague trademark gradually became general.

"In an endeavor to correct this condition, the Sprague Electric Works are carrying on a campaign of education. One measure adopted is the use of an orange and blue tag which will be attached to every coil and will distinguish 'BX' from other makes.

"'BX' is the registered trademark of the Sprague Electric Works and cannot be legally applied to armored conductors of any other make."

# What Anaconda-Chile Copper Merger Means

A special meeting of the stockholders of the Anaconda Copper Mining Company has been called to meet at Anaconda, Mont., Feb. 26, for the purpose chiefly of completing the acquisition of the Chile Copper Company, notice of which appeared in last week's issue. So extensive is the field of the activities of the Anaconda Copper Mining Company that it possesses not only the greatest capacity in the production of copper, but through its rolling-mills department and the American Brass Company it is the premier manufacturer of copper and brass products in the world. The company's reduction works at Anaconda have a normal output amounting to 13 per cent of the copper produced in the United States and about 9 per cent of the world's total production. A modern refinery at Great Falls, Mont., has an average annual capacity of 216,000,000 lb., while a refinery at Perth Amboy, N. J., has an annual capacity of 450,000,000 lb. The rod and wire mill at Great Falls turns out annually 90,000,000 lb. of manufactured copper, while its electrolytic-zinc plant at Great Falls is the largest of its kind in the world.

A year ago the Anaconda Copper Mining Company acquired the stock of the American Brass Company, which gave the Anaconda Copper Mining Company a definite outlet through which its metals found their way directly to the various industries. The American Brass Company now produces at the rate of 450,000,000 lb. per annum, and its consumption of copper, together with the requirements of the Anaconda Company's own fabricating plants, is in excess of the present copper production of the Anaconda Copper Mining Company and the Chile Copper Company. The Chile Copper Company, the control of which has just been acquired by the Anaconda Copper Mining Company, possesses the most extensive and one of the most valuable of the known bodies of copper ore in the world. The mines of the company are in the Province of Antofagasta in Chile and enjoy many natural advantages, including proximity to ocean transportation, adequate supply of labor and immense tonnage near the surface. The mines are equipped with electric and steam shovels capable of moving 43,000 tons or more a day. A modern power plant is established at Tocopilla, from which a 100,000-volt, three-phase, 50-cycle, 87-mile transmission line runs to a plant at Chuquicamata. The Chile Copper Company is the lowest-cost large-scale producer of copper in the world. Its present production is at the rate of 180,000,000 lb. of copper per annum, and extensions now under way provide for increasing that production to a rate of 225,000,000 lb. per annum by spring.

The purposes of the consolidation were explained to a representative of the ELECTRICAL WORLD by Cornelius F. Kelley, president of the Anaconda company, at its office in New York. It was stated that electrical manufacture and transmission and telegraphic and telephonic communication absorb nearly 60 per cent of the copper output and that the Anaconda Copper Mining Company does not sell any of its production except in manufactured form in this country.

### INFLUENCE OF THE WAR

"Copper production has been very greatly affected by the war and its aftermath," said Mr. Kelley. "In 1913 the world's production of copper was 2,188,000,000 lb., and in 1917 the world's production had increased to 3,138,000,000 lb., owing to the artificial demands created by the war. On Jan. 1, 1919, the producers held stocks of 839,000,000 lb., and there was held by the allied governments at least another billion pounds of virgin metal and two billion pounds of available scrap accumulated during the intensive manufacture of war plants, all of which was dumped on the market during the past three years at prices below the cost of current production. The beginning of 1922 found the industry still carrying burdensome stocks, the accumulation of which had compelled the suspension of nearly all American mines in the spring of 1921. In the eleven months of 1922, for which accurate data are available, war stocks had been reduced 496,872,000 lb., or at the average rate of 45,170,000 lb. a month. Production during that time has increased to an average of 156,000,000 lb. a month, bringing the average consumption of primary copper to over 200,000,000 lb. a month, which, while it does not indicate the full measure of consumption in 1922, indicates the exhaustion of the large volume of secondary copper and a return of normal consumption, particularly in the United States. A comparison of the percentages in the price of copper with that of other basic mineral production shows that from the year 1917 to 1923, with the single exception of pig iron, all were selling at a higher level during 1921, as compared with their respective pre-war prices, than copper reached at any time excepting the year 1917. Pig iron in 1921 was selling at approximately the same increase over the pre-war price that copper reached in 1918, while copper on the contrary was selling for 20 per cent below its pre-war price.

"As a result the Anaconda Copper Mining Company, despite all the improvements made to increase the efficiency in economy and production, was obliged during the past two years to pass the payment of dividends to stockholders. In 1921 the company showed a large loss due to shutdown and the reduction of its inventories to market prices. Not only was the cost of copper during 1921 and 1922 below the pre-war level, but the cost of labor, transportation, fuel, taxes and supplies had greatly increased, and these items constitute approximately 80 per cent of the total cost of producing copper. By reason of a long-term contract with the Montana Power Company electricity was the only item of cost which remained unchanged. The rapid growth of the brass and copper manufacturing business, coupled with the continued high level of production cost in the United States, caused the Anaconda Copper Mining Company to seek an immediate supply of cheaper copper than it is possible to obtain in the United States today. Hence the purchase of the Chile Copper Company. That company, because of the character of its copper ore and other favorable circumstances, can deliver copper at a less cost than can the Anaconda Copper Mining Company, and in addition the freight rate to New York is less than one-third of the rail rate from Butte to New York, which is $16.50 a ton."

There was no indication that the consolidation would have any effect on the present price of copper, although the thought was very freely expressed that the Anaconda Copper Mining Company is now in a better position to stabilize the market. It was pointed out that the present price of copper is less than the average for the twenty-year period prior to the war.

## Sign Manufacturers' Exhibit in New York City Next Week

Electrical sign and electrical advertising device manufacturers will hold an exhibition of their products in the Irving Place showroom of the New York Edison Company during the week beginning Jan. 29, it is announced by that company. In the showroom will be large signs in operation, smaller signs of the type used for window and counter display, directional signs, advertising novelties, and interesting mechanical exhibits showing the controlling apparatus which regulates the sign.

The American Brass Products Company, with general offices at 2302 Woolworth Building, New York City, announces change in its name to the United States Brass Products Company. The management and business will be continued in the same manner as in the past.

## Foreign Trade Notes

PROPOSED ELECTRICAL DEVELOPMENTS IN MORAVIA, CZECHOSLOVAKIA.—Four companies, it is reported, have been organized in Moravia for the purpose of a systematic electrification of the country. A special section has been allotted to each company. The plans include utilizing the water power of the river Dyje, between Freinstyn and Znojme. To provide the necessary funds for the project the Moravian government has decided to issue a 4½ per cent loan of 30,000,000 kronen in communal bonds of the Moravian Mortgage and Agrarian Bank.

PROPOSED WATER-POWER DEVELOPMENTS IN CZECHOSLOVAKIA. — In an effort to improve the employment situation in Czechoslovakia the Ministry of Public Works, according to *Commerce Reports*, has decided to start preliminary work on several public undertakings, including five hydraulic stations in Bohemia, one in Moravia and one in Slovakia, at an expense of 72,000,000 Czechoslovakian crowns ($2,333,000 at present exchange). In addition, seven new dams have been planned, involving a total expenditure of 609,000,000 crowns ($18,879,000), and nineteen other hydraulic stations have been proposed.

"ANNALES DES POSTES, TELEGRAPHES ET TELEPHONES" TO BE ISSUED MONTHLY.—This technical bulletin, which the French government has published for several years and which has been so far appearing bimonthly, will in the future be issued monthly, with no change in subscription price. The publication is edited by the Librairie de l'Enseignement Technique, 3 Rue Thénard, Paris.

HYDRO-ELECTRIC DEVELOPMENTS PLANNED IN IRELAND.—Following investigations into the water-power resources of the country by the Irish Commission of Inquiry, *Commerce Reports* states, the Irish Power Syndicate, Ltd., has been organized with headquarters at 28 Molesworth Street, Dublin. The company, which plans to utilize a portion of the water power of the Liffey River, has applied to the Ministry of Industry and Commerce of the Irish government for a special order to enable it to take necessary steps to acquire sites for power stations and rights of way for transmission lines. It is estimated that 8,300 hp. can be developed on the six available sites on the Liffey River.

## Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number.

Purchase or agency is desired in Italy (No. 5,066) for surveying instruments and accessories and medical and surgical instruments, including the latest electrical accessories and novelties for household use.

Purchase and agency is desired in the Netherlands (No. 5,097) for wireless-telephone supplies.

An agency is desired in Sweden (No. 5,131) for all kinds of electrical articles, measuring instruments, cables and wires, electric lamps, current breakers, heating and cooking apparatus, motors, electrical apparatus for medical purposes, etc.

Purchase is desired in Spain (No. 5,149) for refrigerating machinery for small ice plants.

POSSIBLE DEMAND FOR ELECTRIC SIGNS IN SWITZERLAND.—While considerable electrical apparatus and equipment is manufactured in Switzerland there has been little local development of electric signs, according to *Commerce Reports*. The larger cities, it would seem, would offer opportunities for the installation of electric signs.

POSSIBLE DEMAND FOR PORTABLE ELECTRIC PLANTS IN BLUEFIELDS, NICARAGUA.—According to Consul William W. Heard, Bluefields, Nicaragua, Central America, there is a possible demand for portable electric plants driven by gasoline engines. The principal lighting system used in most of the stores and dwellings is the acetylene generator, which owing to climatic conditions is subject to considerable deterioration. Some of the gas plants now in use will soon have to be replaced, and it is probable that electric plants will be used.

POSSIBLE MARKET FOR ELECTRIC WATER HEATERS IN SWITZERLAND. —As electricity is plentiful and comparatively cheap, Consul Thornwell Haynes, Berne, Switzerland, states that there is seemingly in that district and throughout Switzerland a market for electric heaters which will quickly produce hot or boiling water, especially heaters that can be attached to any water faucet whereby hot or cold water can be obtained immediately, operated either on direct or alternating current.

## New Apparatus and Publications

SAFETY SWITCHES. — The Mutual Electric & Machine Company, Detroit, has placed on the market a new "Bull Dog" safety meter-starting switch.

LABORATORY POTENTIOMETER. — The Queen-Gray Company, 70 West Johnson Street, Philadelphia, has brought out a laboratory potentiometer, combining the advantages of the high-resistance and low-resistance types.

ELECTRIC WASHING MACHINE.—An electric clothes washer designed particularly for use in apartment houses has been brought out by the Gillespie-Eden Corporation, Paterson, N. J.

ELECTRIC FAN.—A small fan "Aero," operated by a fractional-horsepower motor for supplying a positive circulation of air to a hot-air furnace, has been developed by the Buffalo Forge Company, 490 Broadway, Buffalo, N. Y.

ELECTRIC FAN.—A 10-in. fan finished in ivory-tinted enamel with nickel-plated trimmings has been placed on the market by the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa. An illustrated booklet entitled "What Fans Are For," which shows the many ways in which a fan can be used, has been issued by the company.

MAGNETOS.—The American Bosch Magneto Corporation, Springfield, Mass., has developed a new type of "Bosch" magneto, known as type "AT." This instrument is waterproof and made for use with large four-cylinder and six-cylinder engines.

BRUSH EQUIPMENT. — The National Carbon Company, Inc., Thompson Avenue and Orten Street, Long Island City, N. Y., has issued a supplement to its catalog No. 37, describing its electrographitic brush—259—for the direct-current side of synchronous converters, and the Ringsdorff ET-10 metal graphite brush for the alternating-current side.

VARIABLE-SPEED TRANSMISSION.— "The Driscoll Variable Speed Transmission" is the title of a booklet distributed by the Driscoll Transmission Corporation, 416 West Thirty-third Street, New York City, describing the "Driscoll" device for control and transmission of mechanical energy.

CONDENSERS. — The Elliott Company, Jeannette, Pa., has published a new catalog, C-1, covering the Elliott-Ehrhart condensers, in jet, barometric and surface types. It also describes the Elliott-Ehrhart air ejectors, types "A," "B" and "C," and other products of the company.

## New Incorporations

THE SOUTH MISSOURI POWER COMPANY, Greenfield, Mo., has been incorporated with a capital stock of $100,000 by C. L. Ward, Buford Adams and E. Nelson. The company proposes to construct and operate electric light, water, power and heating plants and distributing systems, etc.

THE MARSHFIELD (MO.) ELECTRIC LIGHT & POWER COMPANY has been incorporated by T. F. Bowdern, L. A. Reynolds and others. The company is capitalized at $25,000 and proposes to operate an electric light plant.

THE VALLEY ELECTRIC & ICE COMPANY, San Antonio, Tex., has been chartered with a capital stock of $200,000 by R. W. Morrison, A. C. Prucha and H. C. Leohr.

THE GRAFTON (VT.) LIGHT & POWER COMPANY has been incorporated by Justin C. Tay, Grafton; Edward L. Walker, Bellows Falls, and Fred M. Prouty, Grafton. The company is capitalized at $10,000 and proposes to erect a transmission line from Saxtons River to Grafton and to distribute electricity, and also to deal in electrical supplies.

# Construction News

**Projects, Plans, Bids and Contracts, Contemplated or Under Way**

## New England States

BOSTON, MASS. — The Supply Officer, Boston Navy Yard, will purchase 1,100 hand flashlights. (N.S.A.F.Req. 212.)

HOLYOKE, MASS. — Extensions to the municipal electric plant, involving an expenditure of about $400,000, are under consideration by the Municipal Gas and Electric Department. John J. Kirkpatrick is manager.

WORCESTER, MASS.—The New England Power Company plans to erect a high-tension transmission line from Sherman, Vt., through Greenfield to Millbury, a distance of 75 miles, where a station will be erected. It is also proposed to build a transmission line from Sherman to Pittsfield. The New England company is building a large hydro-electric plant on the Deerfield River, near Whitingham, Vt.

NEW MILFORD, CONN. — Work has started on the foundation for the initial units of the proposed new local electric generating plant of the Connecticut Light & Power Company, Waterbury, to cost about $750,000.

SEYMOUR, CONN. — Preparations are being made by the Connecticut Light & Power Company, Waterbury, for improvements in the Seymour district, to include the rebuilding of the local substation, installation of new switching equipment and rearrangement of the distribution lines in Seymour, and also the erection of an additional transmission line between Naugatuck and Seymour and reconstruction of the existing line. The cost of the entire work is estimated at about $30,000. W. T. Pratt, Naugatuck, is district manager.

## Middle Atlantic States

BUFFALO, N. Y.—Plans are being prepared for the installation of electric lighting fixtures at the Broadway Auditorium, to cost about $30,000. The work will be done by the municipality, with Commissioner Meahl in charge.

CHENANGO BRIDGE, N. Y.—An electrically operated pumping plant will be installed in connection with local waterworks to be built by the County Board of Supervisors, Binghamton, to cost about $115,000.

COEYMANS, N. Y.—The Atlantic Light & Power Company has petitioned the Public Service Commission for permission to extend its system to the town of Bethlehem for the purpose of supplying electricity to the railroad yards of the New York Central system.

DEFERIET, N. Y.—The St. Regis Paper Company is planning to erect a wood-grinding plant at Deferiet, which will be equipped with electrically driven machinery. Power requirements, it is stated, will be about 15,000 hp.

NEW YORK, N. Y.—Bids will be received by the New York Central Railroad Company until Feb. 2 for railway motors and multiple-unit control equipment (Serial contract No. 3-1923). C. S. White, 466 Lexington Avenue, is purchasing agent.

PHILADELPHIA, N. Y.—At a recent election it was voted to install meters throughout the entire municipal electric lighting system in the town and surrounding territory. Warner Hubbard is manager of the municipal plant.

ROCHESTER, N. Y.—Extensions will be made to power station No. 3 of the Rochester Gas & Electric Corporation to provide space for switching apparatus and a new electric boiler. The cost is estimated at about $400,000.

TROY, N. Y.—The Rensselaer Polytechnic Institute will soon ask for bids for the erection of a three-story addition to the electrical laboratory, 50 ft. x 70 ft. Lawlor & Haase, 15 West Thirty-eighth Street, New York, are architects.

WATERTOWN, N. Y.—The Power Corporation of New York, Inc., has issued $1,000,000 in capital stock, part of the proceeds to be used for extensions and improve-

ments. The company is affiliated with the Northern New York Utilities, Inc.

WEST HENRIETTA, N. Y.—The Rochester (N. Y.) Gas & Electric Company has petitioned the Public Service Commission for permission to extend its lighting and power system into this town.

BRANCHVILLE, N. J.—The Branchville Electric Power, Water & Lighting Company has been ordered by the Board of Public Utility Commissioners to make improvements to its system. Electric meters will be installed for all consumers, replacing the present flat-rate system. Charles H. Crismah is owner.

BURLINGTON, N. J.—The Public Service Corporation plans to increase the output of its plant to 37,500 kw.

CAMDEN, N. J. — The Public Service Electric Company has contracted with the Philadelphia Electric Company for power for its South Jersey system. Three submarine cables will be laid under the Delaware River, with line connection at Camden. The Public Service company has plans for a generating plant addition, to cost about $1,000,000, to be carried out in connection with an improvement program estimated at $25,000,000.

MORRISTOWN, N. J.—The property of the Morris & Somerset Electric Company has been acquired by A. E. Fitkin & Company, 141 Broadway, New York. Extensions and improvements are contemplated.

STEWARTSVILLE, N. J. — The Greenwich Township Committee is preparing plans for the installation of a local lighting system.

WOODBURY, N. J.—The Woodbury Ice & Power Company plans to build a one-story power plant and an ice factory.

CHAMBERSBURG, PA.—D. P. Minick will build a power house in connection with proposed ice and cold-storage plant at 147 East Queen Street. John Crowe, Hartman Building, York, Pa., is architect and engineer.

DELTA, PA.—The properties of the Delta Electric Light Company and the Delta Water Power Company have been acquired by the Susquehanna Power Company, which proposes to build a dam across the Susquehanna River at Conowingo, Md., to furnish power for a large electric plant. J. A. Schriever, Bel Air, Md., is interested in the Susquehanna company.

HYNDMAN, PA.—The property of the Hyndman Electric Light, Heat & Power Company has been acquired by the American Water Works & Electric Company, 50 Broad Street, New York. It has also purchased the Deal Power Company, Cooks Mills, near Hyndman. Extensions and improvements will be made in the system.

PITTSBURGH, PA. — Bids will be received by the Board of Education, 1326 Fulton Building, until Feb. 1 for the installation of electrical equipment at the Peabody high school addition, including motors, mechanical fans, etc. George W. Gerwig is secretary.

PITTSBURGH, PA.—Receivers for the Pittsburgh Railways Company have been authorized to make improvements, including the installation of new equipment at substations, feeder lines, and cables, etc., to cost $211,300. W. D. George, S. L. Tone and C. A. Fagan are receivers.

SALISBURY, MD. — Plans are being arranged for the installation of an ornamental street-lighting system on Division and Main Streets, in the business district. F. H. Dryden, city engineer.

NEW WINDSOR, MD. — Improvements will be made in the local municipal power plant and system, including the installation of additional equipment.

BLUEFIELD, W. VA.—The Appalachian Power Company contemplates the installation of an additional generating unit at its steam-power station at Glenlyn, Va., to cost about $1,800,000. The work will include an addition to power house and installation of one 20,000-kw. steam turbine and four boilers with auxiliary equipment, etc. Viele, Blackwell & Buck, 49 Wall Street, New York City, are engineers and contractors.

KENOVA, W. VA. — The Consolidated Light, Heat & Power Company, Huntington, will make extensions in its local power plant, increasing the capacity by about 15,000 kw.

NORFOLK, VA.—Bids will be received by the Bureau of Supplies and Accounts, Washington, D. C., until Feb. 6 for busbar supports, cable terminals and cable racks (Schedule 444); also for 1,200 ft. telephone cable and miscellaneous single copper cable (Schedule 445).

WASHINGTON, D. C.—Bids will be received by the Chief of Air Service, United States Army, until Jan. 29 for 50 switch panels (Circular 23-111).

WASHINGTON, D. C.—Bids will be received by the Chief Signal Officer, United States Army, until Feb. 8 for 350 telephone transmitters and mouthpieces (Circular P.R. 13145-B-99 CP).

WASHINGTON, D. C.—The Bureau of Yards and Docks, Navy Department, Washington, D. C., will soon call for bids for the installation of electric traveling cranes at the Puget Sound Navy Yard under Specification 4,755.

WASHINGTON, D. C. — Arrangements are being made by the United States Shipping Board, Washington, for an appropriation of from $5,000,000 to $6,000,000 for remodeling twenty-three post-war American passenger vessels and a number of merchant steamers. The work will include the installation of new electric generators, electric lighting sets, engine and pumping machinery, condensers, etc.

## North Central States

DETROIT, MICH.—The Père Marquette Railroad Company, Union Station, contemplates building a power house in connection with its proposed engine terminal at West Jefferson and Twenty-first Streets, to cost about $1,000,000.

CLEVELAND, OHIO.—The installation of two additional 1,400-hp. boilers in the municipal electric light plant this year is under consideration. The cost is estimated at about $250,000. C. G. Beckwith is superintendent of the lighting department.

COVINGTON, OHIO. — The Buckeye Light & Power Company is negotiating for the purchase of the property of the Stillwater Valley Electric Company, West Milton. Extensions and improvements will be made.

MARTINS FERRY, OHIO. — Plans are being prepared for construction of a pumping station to be equipped with two 4,000,000-gal. pumps, ash-handling equipment and electric generating station, to cost about $450,000. The J. N. Chester Engineering Company, Union Building, Pittsburgh, is engineer.

PHILO, OHIO.—The Ohio Power Company will soon commence work on its proposed local generating plant. Two generating units each of 35,000 kw. will be installed.

TIFFIN, OHIO.—An ordinance has been passed authorizing the present overhead wires to be placed in underground conduits.

CROWN POINT, IND.—A power house will be built in connection with the proposed County Tuberculosis Sanitarium, about 2 miles from the city, to cost about $350,000. Karl D. Norris, Calumet Building, East Chicago, Ind., is architect.

FORT WAYNE, IND.—Bids will be received by the Board of Public Works until Feb. 12 for one 3,000-kw. turbo-generator, switchboard apparatus and one surface condenser.

LOGANSPORT, IND. — The Northern Indiana Power Company, Kokomo, which recently acquired the property of the Logansport Utilities Company, has started work on the erection of a new power plant, to cost about $500,000. The equipment will include two 1,000-kw. turbines, three 565-hp. boilers, pump house and filter plant, etc.

PENDLETON, IND.—A power plant will be installed at the new Indiana Reformatory to be built here, to cost, with equipment, $175,000. A distributing system will be erected at a cost of $75,000. The committee, composed of Joseph E. Henning, John O'Neil and J. W. Nash, Indianapolis, has applied for an appropriation for this work.

CHICAGO, ILL. — A one-story power plant will be erected at the new home to be built on Ridge Avenue by the Guardian Angel, German Catholic Orphan Society, 2001 Devon Avenue, at a cost of $250,000. Herman J. Gaul, 111 West Washington Street, is architect.

NEW BADEN, ILL. — The Southern Illinois Light & Power Company, Hillsboro, has acquired the local municipal plant and will furnish service in the future from its 33,000-volt transmission line. The local power plant will be discontinued.

WAUKEGAN, ILL. — Plans have been completed by the Public Service Company of Northern Illinois, 72 Adams Street, Chicago, for the initial unit of its proposed new local power plant, to cost about $3,000,000.

ALGOMA, WIS. — The City Council is considering the question of equipping the waterworks pumping station with electrically driven pumps.

GREEN BAY, WIS. — The Wisconsin Public Service Commission contemplates extending its transmission line from High Falls to Wausaukee, Amberg and Middle Inlet, a distance of about 25 miles. The cost is estimated at about $42,000.

GREEN BAY, WIS. — Plans are being prepared by the Wisconsin Public Service Corporation for extensions to its plants in Oshkosh, Sheboygan and Marinette, Wis., and in Michigan. It has recently acquired a power site at Chaldron Falls on the Peshtigo River where an 11,000-hp. plant will be erected, at a cost of $1,000,000.

STEVENS POINT, WIS.—The Consolidated Water Power & Paper Company, Wisconsin Rapids, is considering an additional water-power development in Stevens Point.

OSKALOOSA, IOWA.—The City Council is preparing plans for a municipal hydro-electric plant at Harvey, to cost about $375,000. Burns & McDonald, Interstate Building, Kansas City, Mo., are engineers.

JASPER, MO. — The proposal to issue $32,000 in bonds for the construction of a municipal electric light and power plant will be submitted to the voters.

SPICKARDSVILLE, MO. — The Trenton (Mo.) Gas & Electric Company has been granted a franchise to erect a transmission line from Trenton to Spickardsville and install a distributing system here. A loan of $15,000, it is said, is available.

TRENTON, MO.—The proposed extensions and improvements to the municipal waterworks include the installation of electrically operated pumps. The cost is estimated at about $175,000. The Burns & McDonnell Engineering Company, Interstate Building, Kansas City, Mo., is engineer.

## Southern States

HICKORY, N. C.—Water rights on the Catawba River below Horseford Shoals have been acquired by Joseph B. Elliott, which will be utilized for a hydro-electric development.

MORGANTOWN, N. C. — Improvements will be made to the street-lighting system, to cost about $9,000.

SPARTANBURG, S. C. — The Pacific Mills Company, Lawrence, Mass., will build a power house in connection with its proposed local textile plant, to cost about $1,500,000.

MILLTOWN, GA. — The Lanier County Power Company, recently organized, plans to build a power plant at the foot of Lake Irma, to cost about $300 000. The company is headed by F. E. Hatch.

ANNA MARIA, FLA.—H. W. Ralston contemplates the installation of an electric plant on Anna Maria Beach.

ARCADIA, FLA.—Plans are under way for the construction of a municipal light and power plant in Arcadia.

McINTOSH, FLA.—The McIntosh Utilities Company is planning to establish an electric light plant in McIntosh. S. H. Gaitskill is president.

BIRMINGHAM, ALA. — The Alabama Power Company plans to erect a substation in Leeds at a cost of $1,500,000 to distribute energy generated at the Mitchell Dam and Lock 12 to the Birmingham district. A 50-mile, 110,000-volt transmission line will be erected from Lock 12 to the Leeds station. Another transmission line will connect Mitchell Dam with Lock 12 and the Leeds substation with Birmingham.

FLORENCE, ALA.—Bids will be received by the United States Engineer Office until Feb. 12 for one electric 937-kva. generator, 937.5 kva., with exciter, for use at Sheffield, Ala.

MOBILE, ALA. — The Great Southern Roofing Corporation, recently organized, will build a power house in connection with its proposed local factory. William D. Martin is secretary and treasurer.

CHATTANOOGA, TENN.—The Tennessee Electric Power Company contemplates extensions and improvements during 1923, including the construction of a 120,000-volt steel-tower transmission line to Lindale, connecting with the system of the Georgia Railway & Power Company. The cost of the work is estimated at about $2,450,000.

GULFPORT, MISS. — The Bureau of Yards and Docks, Navy Department, Washington, D. C., will soon take bids for the installation of electric lighting systems in the buildings to be erected at the veterans' hospital, with power circuits and telephone conduit, power-house equipment, piping, etc. (Specification 4774).

PARAGOULD, ARK.—The City Council has granted a franchise to R. W. Meriwether and H. W. Woosley to construct and operate an electric light and power system.

SMACKOVER, ARK.—The Pan-American Petroleum & Transport Company, 120 Broadway, New York City, has acquired 120 acres in the new Smackover (Ark.) oil field and plans to build at once a storage and distributing plant, consisting of twenty-two steel tanks of 80,000 barrels each, power house, pumping plant, machine shop and other buildings. Edward L. Doheny is chairman of the board.

BOGALUSA, LA.—The Bogalusa Power Company will build an electric power plant in connection with extensions to its mill, to cost about $1,000,000. James L. Carey, 208 North Laramie Avenue, Chicago, is engineer.

RAYNE, LA.—Bonds to the amount of $125,000 have been voted by Acadia Parish for extensions to lighting and water systems. J. B. McCrary & Company, Third National Bank Building, Atlanta, Ga., are engineers.

LAHOMA, OKLA.—An electric transmission line will be erected from Drummond to Lahoma, about 8 miles, for local service, to cost about $12,000.

AMARILLO, TEX.—The installation of electrically operating pumping machinery at the municipal waterworks is under consideration.

BRECKENRIDGE, TEX. — The Great Texas Oil & Refining Company will install electric power equipment in connection with a local refinery, now in course of construction, to cost about $1,200,000.

HOUSTON, TEX.—The South Texas Cold Storage & Warehouse Company will install electric power equipment in its proposed ice and cold-storage plant near the Main Street viaduct, to cost about $1,000,000.

## Pacific and Mountain States

EVERETT, WASH.—The Delta Electric & Water Company contemplates erecting transmission and distributing lines in different parts of Snobomish County. A franchise has been asked.

KETTLE FALLS, WASH.—The Washington Water Power Company, Spokane, contemplates building a hydro-electric plant at Kettle Falls, to cost about $3,000,000.

LOS ANGELES, CAL.—An ordinance has been passed authorizing the installation of ornamental lamps on Sixth Street and on Palos Verdes Street in the San Pedro Harbor district.

PASADENA, CAL.—Bids will be received by the City Clerk until Feb. 9 for one 10,000-kw., 2,400-volt, steam turbo-generator unit, one jet condenser and one surface condenser and circulating pump for the Municipal Light Department.

REDLANDS, CAL.—The Southern California Edison Company will install an ornamental lighting system to replace present lamps on all city streets.

SACRAMENTO, CAL.—Plans are being prepared for a municipal hydro-electric plant at Silver Creek. Albert Givan is city engineer.

SAN PEDRO, CAL.—The installation of new street lamps on Pacific Avenue is under consideration.

SAN YSIDRO, CAL.—Plans are being considered for the establishment of a new lighting district in this section. J. M. McLees, clerk San Diego County, San Diego, is in charge.

TAFT, CAL. — Plans for the proposed ornamental system in the business district provide for seventy-one lamp standards. Bids will soon be called.

GRANGEVILLE, IDAHO.—The Grangeville Electric Light & Power Company has secured a site at Bruce's Eddy, where it proposes to build a hydro-electric plant.

PEACH SPRINGS, ARIZ.—The Colorado River Engineering & Development Company has been granted permission by the State Water Commission to build a hydro-electric plant on the Colorado River on Diamond Creek, near Peach Springs. The plant will have an ultimate capacity of 200,000 hp. and will cost about $25,000,000. James B. Girard, Phoenix, is engineer.

PHOENIX, ARIZ.—Bids will be received by the Salt River Valley Water Users' Association, Phoenix, until Feb. 5 for one 10,000-hp. turbine, one 7,500,-kva. generator, 25 cycles, 2,300 volts, for installation in power house at the Roosevelt dam. The cost is estimated at from $130,000 to $140,000. H. Lawson is superintendent of power.

DENVER, COL.—Arrangements are being made by the Denver Gas & Electric Company and the Western Light & Power Company, Boulder, both controlled by the Cities Service Company, for the construction of a large steam-driven electric generating plant about 4 miles south of Boulder. Four million dollars will be spent at once on a development, the initial installation in which will generate 12,000 hp. The present plans provide for a development of 120,000 hp., to cost with transmission system about $12,000,000.

DOVE CREEK, COL.—An electric lighting plant, it is said, will be installed in the new hotel to be erected by George E. Haney. It will be of sufficient size to furnish service for the entire community.

LAMAR, COL.—Plans for the proposed ornamental lighting system call for eighty standards. Contract for cable and regulators have been awarded. Bids for standards, tops and other equipment will soon be called for. J. E. Todd is superintendent of the municipal electric plant.

FARMINGTON, N. M. — The Western Colorado Power Company, Durango, it is understood, contemplates erecting a new high-tension transmission line from Denver to Farmington.

LOVELAND, N. M.—A movement has been started by the city officials for rebuilding the local electric light plant. Service has been discontinued for several months.

## Canada

BURQUITLAM, B. C.—The Council has asked the British Columbia Electric Railway Company, Vancouver, to submit an estimate of cost for the installation of a lighting service in Burquitlam.

BRANDON, MAN.—The Rennie Engineering Company, Winnipeg, has submitted a proposition to the City Council for the installation of a municipal electric power plant, to cost about $850,000. The proposal calls for gas-engine-driven generators.

ST. JOHN, N. B.—Preliminary plans have been completed for the proposed municipal Hydro substation. Tenders for construction of same, it is understood, will soon be called for.

PORT CREDIT, ONT.—Improvements to the municipal electric lighting system are under consideration by the Town Council.

# Electrical Patents

Announced by U. S. Patent Office

(Issued Jan. 2, 1923)

1,440,952. DYNAMO-ELECTRIC MACHINE; V. G. Apple, Dayton, Ohio. App. filed June 11, 1920. Windings impregnated with phenolic condensation product while in liquid state.

1,441,002. MEANS OF GROUNDING ELECTRICAL PILOTING CABLES; H. W. Kitchin, Washington, D. C. App. filed Jan. 29, 1921. By turning back on cable and electrically connecting conductor with armor.

1,441,025. CONDUCTOR-BAR HOLDER; H. F. Raab, Johnstown, Pa. App. filed Sept. 20, 1922. Means for holding conductors for electric cranes.

1,441,029. TRANSMITTER FOR TELEPHONY; H. J. Round, London, England. App. filed March 31, 1920. Transmitter used with thermionic generators in which direct current causes continuous waves to be generated while alternating current causes amplitude of these waves to be varied.

1,441,037. PROCESS OF BAKING CARBON ELECTRODES; C. W. Söderberg, Christiania, Norway. App. filed Dec. 4, 1917.

1,441,054. OUTLET BOX; J. Barry, Brooklyn, N. Y. App. filed Oct. 12, 1920.

1,441,087. WIRING SYSTEM; J. W. Hill, Salt Lake City, Utah. App. filed April 6, 1921. Transmitting circuit of wireless telegraphy.

1,441,131. ELECTRICALLY HEATED KETTLE AND THE LIKE; W. W. Soutter, Birmingham, England. App. filed Dec. 22, 1921.

1,441,150. INCANDESCENT ELECTRIC LAMP; W. D. Hawley, Syracuse, N. Y. App. filed June 10, 1920.

1,441,160. DENTAL X-RAY PACKAGE; Rochester, N. Y. App. filed May 15, 1920. Wrapper for film.

1,441,193. ELECTRIC CIRCUIT MAKING AND BREAKING DEVICE; C. W. Wyman, Claremont, N. H. App. filed Sept. 1, 1916. To prevent explosions where circuit is broken in gaseous regions.

(Issued Jan. 9, 1923)

15,524 and 15,525 (reissue). SYSTEM OF CONTROL; N. W. Storer, Pittsburgh, Pa. App. filed April 12, 1921. Successive groupings of railway motors form a non-geometrical series to provide several speed ranges.

1,441,200. COUPLING; W. G. Allan, Toronto, Ontario, Can. App. filed Feb. 3, 1920. Insulated coupling for metal tubes entering electrolytic cells.

1,441,233. LOW-VOLTAGE ATTACHMENT; M. McCright, Cincinnati, Ohio. App. filed Oct. 30, 1919. Pilot brush on direct-current commutator for charging batteries direct.

1,441,247. COMBINED LAMP AND BELL; C. Shiono, Los Angeles, Cal. App. filed Sept. 20, 1921. For bicycles and motorcycles.

1,441,270. TRANSMISSION SYSTEM; L. Espenschied, Hollis, N. Y. App. filed Sept. 26, 1919. Several messages sent over telephone wires by using different carrier frequencies.

1,441,289. CURRENT-COLLECTING HEAD; E. S. Lincoln, Mansfield, Ohio. App. filed Jan. 7, 1922. Means for conducting a heavy current from one to the other of two relatively moving parts.

1,441,310. MOTOR CONTROL; W. G. Thomas, New York, N. Y. App. filed April 21, 1920. Method of electrically locking rotors of two alternating-current motors.

1,441,398. ELECTRIC SWITCH; W. A. Chryst, Dayton, Ohio. App. filed May 22, 1920. Controls automobile ignition apparatus and lighting system.

1,441,399. ELECTRICAL RESISTANCE; W. Clark, London, England. App. filed April 3, 1921. Wheatstone bridge with visual indication of resistance in each branch.

1,441,408. METHOD OF AND APPARATUS FOR ELECTROLYZING LIQUID; H. H. Dow, T. Griswold, Jr., and E. O. Barstow, Midland, Mich. App. filed Aug. 12, 1915. Method for equalizing height of liquid in cells.

1,441,421. SEWING-MACHINE-MOTOR CONTROL; F. F. Hillix, Cleveland, Ohio. App. filed Sept. 14, 1921. Operated by lateral movement of foot or knee.

1,441,422. SEWING-MACHINE-MOTOR CONTROL; F. F. Hillix, Cleveland, Ohio. App. filed March 30, 1922. Controlled by lateral movement of foot or knee.

1,441,426. ELECTRICAL RECTIFIER AND POLE CHANGER; W. Kaisling, Chicago, Ill. App. filed April 12, 1918. Automatic auxiliary telephone-ringing equipment operated from batteries.

1,441,427. POLARITY INDICATOR; W. Kaisling, Chicago, Ill. App. filed Aug. 7, 1918. To show whether storage battery is charging or discharging.

1,441,429. ALTERNATING-CURRENT INDUCTION MOTOR; J. F. Kelly, Troy, N. Y. App. filed July 21, 1916. Two-phase motor can also operate as single-phase split-type motor.

1,441,436. JIG FOR USE IN ASSEMBLING AND ELECTRICALLY WELDING TOGETHER THE PARTS OF AUTOMOBILE BODIES AND OTHER STRUCTURES; J. Ledwinka, Philadelphia, Pa. App. filed March 15, 1921.

1,441,443. ELECTRODE CLAMPING DEVICE FOR ELECTRIC WELDING MACHINES; J. W. Meadowcroft, Philadelphia, Pa. App. filed Aug. 16, 1921. Device for releasably locking or clamping electrodes in machine.

1,441,451. IGNITION SYSTEM; W. W. Riedel, Dayton, Ohio. App. filed Jan. 8, 1921. Electrically ignited fuel burner for combustion engines.

1,441,460. SELF-COOLED ELECTRIC MOTOR; A. G. Sutcliffe, Chicago, Ill. App. filed Jan. 21, 1922. For motors used on direct-driven fans and blowers.

1,441,479. PROCESS FOR MAKING AN ALLOY-ING ALLOY; W. Bennett, Wellington, N. Z. App. filed Sept. 8, 1922. Made directly from the ores.

1,441,482. SPEED CONTROL OF DIRECT-CURRENT MOTORS; F. A. Byles, Schenectady, N. Y. App. filed Aug. 30, 1920. Vibratory regulator holds speed of motor constant.

1,441,500. TROLLEY RETRIEVER; G. E. Harpham, Los Angeles, Cal. App. filed May 16, 1918. Mechanism for lowering pole when connducting wheel leaves feed wire.

1,441,532. ELECTRICAL APPARATUS; P. R. Fortin, Schenectady, N. Y. App. filed July 1, 1920. Devices for varying the inductance of radio circuits.

1,441,546. REGULATION OF ELECTRIC CIRCUITS; L. W. Thompson, Schenectady, N. Y. App. filed Aug. 27, 1919. Voltage regulator for electric machine.

1,441,567. ELECTRODE; C. G. Fink, Yonkers, N. Y. App. filed Feb. 18, 1921. Insoluble anode for electrodeposition of copper from electrolytes containing chlorides and nitrates.

1,441,568. ELECTRODEPOSITION OF COPPER; C. G. Fink, Yonkers, N. Y. App. filed March 10, 1921. From copper sulphate electrolytes containing iron and copper sulphate.

1,441,610. ELECTRIC HEATING AND COOKING; W. B. Topp, Melbourne, Victoria, Australia. App. filed Jan. 16, 1922. Electrodes in water vaporize liquid to heat receptacle.

# Business Facts for Electrical Men

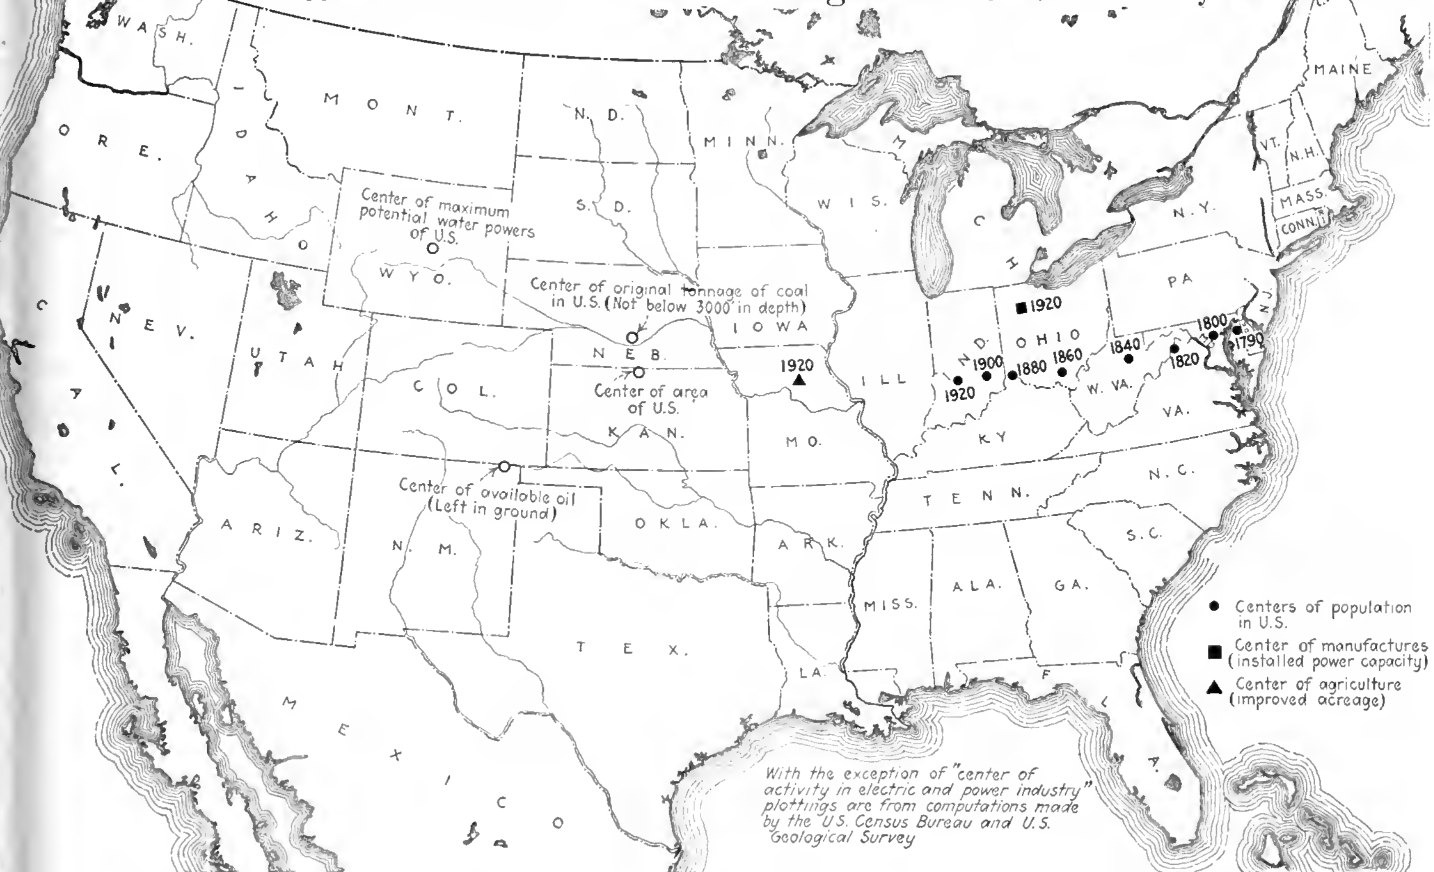
## Westward Trend of the Electric Light and Power Industry



### Location of Center of Population in United States

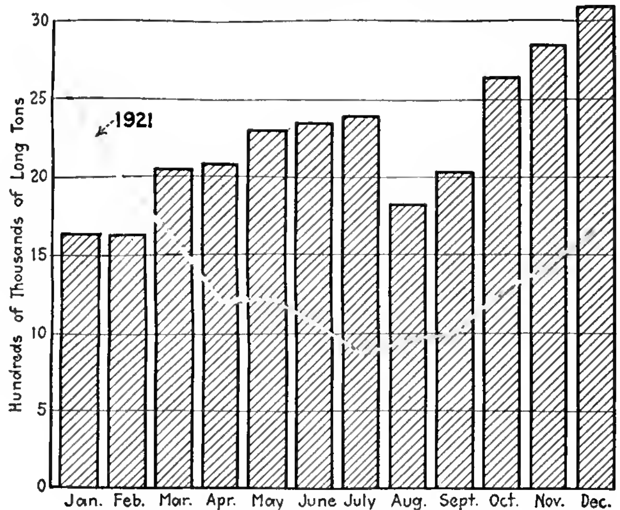
Computed by U. S. Census Bureau

| *Year* | *Latitude* | *Longitude* |
|---|---|---|
| 1790 | 39° 15′ | 76° 11′ |
| 1800 | 39° 16′ | 76° 57′ |
| 1820 | 39° 06′ | 78° 33′ |
| 1840 | 39° 02′ | 80° 18′ |
| 1860 | 39° 01′ | 82° 48′ |
| 1880 | 39° 04′ | 84° 40′ |
| 1900 | 39° 10′ | 85° 48′ |
| 1920 | 39° 10′ | 86° 43′ |

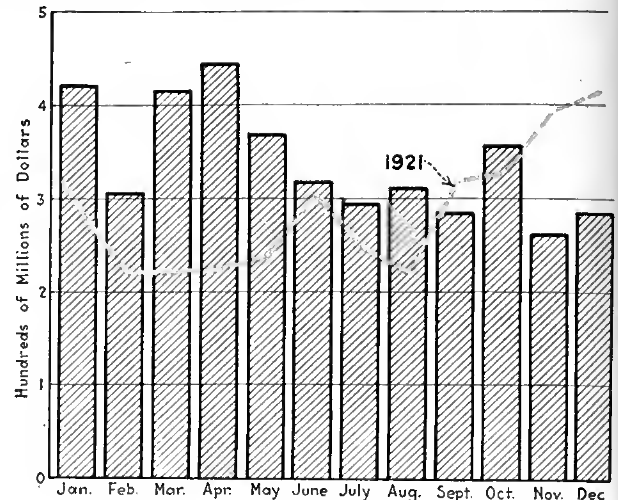
## "Go West, Young Man"

WHEN Horace Greeley in a personal letter advised a young friend that the West offered him the largest opportunities for success, he foretold the westward trend of American industry. Each decade has witnessed the centers of our population, agriculture and manufactures move further and further westward from their point of origin, the borders of the Atlantic. It is but natural, therefore, that the center of activity in the central-station industry should also follow this general trend. But this industry has exhibited a much greater acceleration in movement than the population or the other primary industries of the country. Originating in New York City in 1882, the center of activity in the central-station industry quickly jumped westward. In 1907 it was in Indiana, and in 1921 it had advanced into Illinois and was in Champaign County, about 3 miles northwest of Urbana, or 116 miles south of Chicago. This center is at present many miles west of the center of population and manufactures, an excellent testimony to the rapid electrical development and optimism of the commonwealths of the Far West.

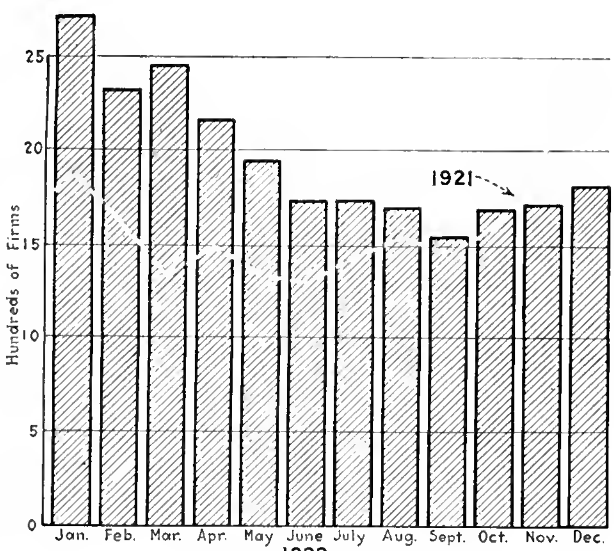
# How the Primary Industries are Trending



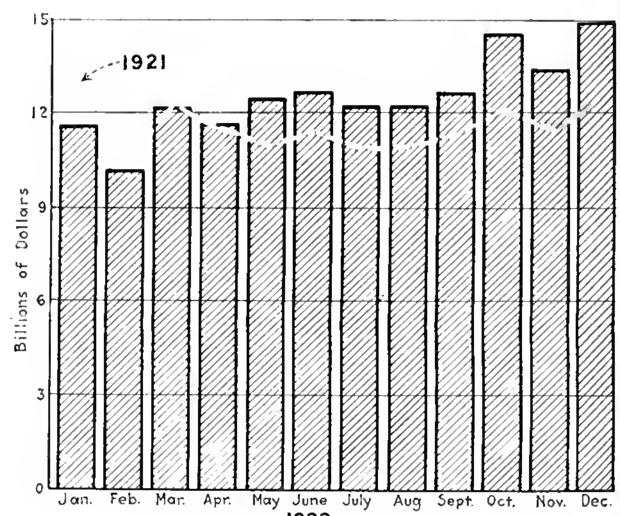
1922
Pig-Iron Production



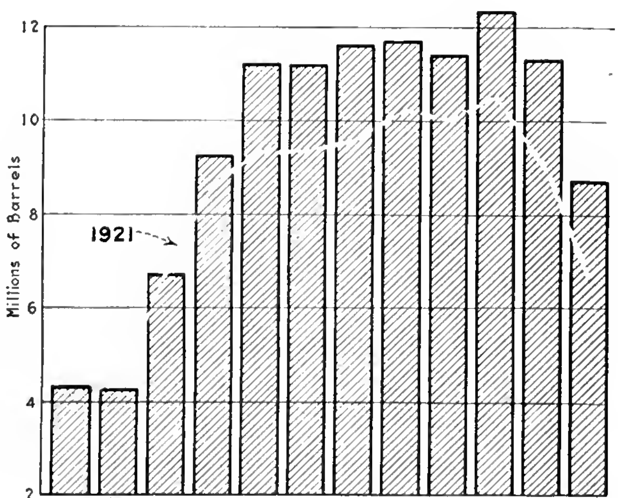
1922
Total Bond Sales, New York Stock Exchange



1922
Business Failures



1922
Bank Clearings
(Outside of New York City)



1922
Portland Cement Production

## Pig-Iron Production Indicates Prosperity Ahead

PIG-IRON production, which is considered by many prominent economists and statisticians to be a fair barometer of general business conditions, showed a remarkable recovery during 1922. The iron and steel industry was from 60 to 70 per cent more active than in 1921, but was less active than in the boom year of 1920. Last December, however, pig-iron production touched the high point of the year and appeared to be well on its way to new high figures for the industry. Unfilled orders of the United States Steel Corporation rose about 60 per cent during 1922.

The number of business failures during the past year was 27 per cent larger than 1921 and exceeded any previous year since 1915. The amount of defaulted liabilities exceeded the large defaults in 1921 by 5 per cent. But it is encouraging to note that the number of failures steadily declined during the year and during November and December was less than those reported for the same months of 1921.

# Farm Power as an Issue

SOMETHING like six and a half million families are engaged in agriculture on the farms of the United States. The farm is a factory as well as a home and the use of power is almost continuous. Practically one-third of the entire population of the country are therefore looking to the day when electric service will be made as available to them for universal use as it has been in the industrial workshops of our cities.

For the farmer knows that adequate electric power will bring to him the greatest contribution to farm efficiency since the introduction of the self-binder. Not even the gasoline tractor can challenge it.

ACCORDING to the United States Census of 1920, there are at present in use on the farms of America 19,767,161 horses, 5,432,391 mules, 246,083 gasoline tractors and 139,169 motor trucks, which represent on a conservative estimate 25,000,000 primary horsepower. In addition, there are 2,146,362 passenger automobiles and a countless number of steam tractors, stationary gas and steam engines, windmills and electric motors. Each of these prime movers, including the automobile, is an essential unit in the farm power plant under present conditions. Therefore, the total primary horsepower engaged in agriculture exceeds the 29,504,792 primary horsepower used in the manufactures of the country by a considerable amount.

Farm-management studies show that the cost of power and machinery represents from 30 to 50 per cent of the present expense of farm operation. Annually from 50 hp.-hr. to 60 hp.-hr. per crop acre is required to produce the crops of this country over the 503,073,007 acres under cultivation. In the neighborhood of one-third of this gigantic load is admirably adapted to the use of electric power. The farmer is impatiently waiting for the expansion of urban electric systems so that they will reach out into the country and assist him with his burden.

WHEN more than one-third of the people of the country are needing and clamoring for an organized public utility service which the other two-thirds are enjoying, the time has passed when the utility man can profitably discuss whether or not the service shall be given. It has become entirely a question of how it can be done. The farm needs power. The farm home also suffers for want of all those comforts which electricity brings and which have become so prominent a feature of the public service which the central station renders. And the entire country is affected by these conditions. Therefore the problem is to find as speedily as may be the way to carry central-station service to the farm on a basis profitable both to the seller and the user of the power.

The American Farm Bureau Federation and the N. E. L. A. rural lines committee are at work endeavoring to find a method of reconciling the agricultural and the engineering difficulties and thus making possible this great economic development. They realize that electric power will bring a more fundamental revolution in farm life and a saving of waste in food production greater even than the coming of the motor car has wrought, and they are sensible of the urgency of their responsibility. Meanwhile the executives of utility companies are under obligation to familiarize themselves individually with the needs and opportunities of their own neighborhoods, so that when a practical farm service policy is finally perfected they may be ready to apply it intelligently in the service of the surrounding farming country that must look to them for more and better power.

# Orin B. Coldwell

*An engineer of note and an executive of broad experience who is a recognized leader in electrical activities in the Northwest.*

ABOUT 1892, when the electrical industry was still in its pioneer state, O. B. Coldwell, then a high-school boy in Oregon, entered the shops of the Willamette Falls Electric Company, working on arc lamps, meter testing, transformer and armature winding. With a short interval for further education, he has been associated with the electrical industry in the Pacific Northwest ever since. At the present time he is vice-president of the Portland Railway, Light & Power Company in charge of light and power. He is also a recent vice-president of the A. I. E. E. for that district and prominent in the N. E. L. A.

The foundation for this achievement was laid at the time he served as repairman, groundman, lineman, inspector and troubleman, following all this up by a year or two of service as station wireman and operator. About this time he began to think of the need for more knowledge, and the fall of 1897 saw him entered as a student in Stanford University, where he remained for three years. In 1900 he entered Cornell, from which university he was graduated in electrical engineering in 1902.

Upon his return to Portland he resumed work with the Portland General Electric Company and became assistant superintendent of that company. Later he became general superintendent of the light and power department of the Portland Railway, Light & Power Company. Since that time he has become vice-president of the company, maintaining control over the power end of the business. He has, besides, played a very prominent part in the Northwest Electric Light and Power Association ever since its beginning.

Not the least of Mr. Coldwell's contributions to the industry has been in the engineering and economic development of his district. It is under his direction that the work on the present 75,000-kw. Oak Grove project of the Portland Railway, Light & Power Company is going forward. In spite of his standing as an engineer, however, his major work has been along executive lines. He has demonstrated exceptional ability in drawing about him and holding a group of competent and loyal subordinates, and their harmonious co-operation with one another has unquestionably been due largely to Mr. Coldwell's organizing ability. He has a tremendous capacity for work, is filled with nervous energy and has a consuming hatred for red tape. To his clear engineering analysis, combined with executive ability and a way of "getting things done," the electrical industry, and particularly the electrical industry of the Pacific Northwest section of the country, owes much.

# Editorial Comment

Electrical World, February 3, 1923

Volume 81 Number 5

## Prevalence of Dangerously Low Rates

THE data on central-station output and income that were published in the first issue of the year show in a very remarkable manner the cheapening of electric service due to improvements in the art and to increase in facilities. In fact, the showing is so striking as to give rise to certain misgivings over the rates charged to large users of energy. With a central-station output of approximately fifty billion kilowatt-hours and a gross income of one billion dollars, the average rate for the energy sold during 1922 was thus two cents a kilowatt-hour. For domestic energy the rate was considerably higher than that, indicating that the rate to large power users is becoming precariously low. Even with energy generated from water power there is a serious question as to whether the exceedingly low rates for large power users are justifiable on competitive or any other grounds. The margin is becoming entirely too meager for proper sustenance. Prices for all other commodities have gone skyward whereas the electrical industry has strained every effort and taken advantage of every discovery of science to keep the cost of its output down. The public, or at least the large power user, has derived more benefit from this effort than has the industry, and it would be well for the latter to take thought for its own safety as well as for its obligations to the general masses of the public.

## The Tax-Exempt Security Amendment Has Started, but Needs Help

WITH a rocky road ahead and with many barriers to surmount, the proposed amendment to the United States Constitution designed to prohibit further issues of tax-exempt securities was started on its way last week by the affirmative vote of the House of Representatives. For this much those interested in seeing that investment funds are devoted to constructive and reproductive enterprises should be thankful, but more vigorous action is needed in the future than has been necessary in the past. For the further the amendment travels on its way through Senate, White House and thirty-six legislatures the more determined will be the opposition to its passage. The Senate committee has referred the amendment to a sub-committee, and there is activity in various places all over the country aimed against this bill. Fundamentally the debate is whether to do away with the higher surtaxes on incomes or to do away with the tax-exempt security.

Recently Garet Garrett in the *Saturday Evening Post* and Prof. E. R. A. Seligman in the New York *Times* have made convincing analyses to show the positive public good which would result from passage of the amendment in addition to the cessation of the harm which the present system entails. Answers to these and similar defenses of the proposed amendment have for the most part failed to meet the fundamental issues.

Public utility men, engineers and all others in the electrical industry are usually accustomed to face facts and possess the ability to look ahead and not at immediate expediencies. They are in a most advantageous position to see and foresee the evils of the present combination of tax-exempt securities and the graduated income tax, and they will fail in their duty to their industry and to the general social welfare if they neglect study of this question and action upon it. This is not a minor matter.

## Possible Consumption of Electricity in Agriculture

FIFTY kilowatt-hours per acre per annum as a practical agricultural use of electrical energy sounds like a fairy tale in the light of the present state of development in America. Nevertheless, it is a serious estimate made for British farms, according to a paper presented before the Institution of Electrical Engineers by R. Borlase Matthews. This paper affords food for thought that must not be missed by central-station men in the United States. The author has had the good fortune to have an experimental laboratory in the form of a 600-acre farm that has given him actual experience in carrying out not only the minor farmstead operations but the major operations of plowing and harvesting. It has also enabled him to try out some operations such as hay curing that seem, in the light of our practice, rather reasonable.

The processes employed in this work are still in an experimental stage, Mr. Matthews declared frankly, but his conclusions leave no doubt as to his belief that electrical energy is destined to play an important part in British agriculture. Competition with the rest of the agricultural world, high railway rates, labor costs and high taxation are facts just as disagreeable to the American farmer as to his British colleague. Profit to the American farmer in the past has come from appreciation in land values rather than from farm operation. The day of cheap land is past, and the American farmer is in a position where profitable farm operation is a vital question. Cheap mechanical power and better mechanical equipment are factors just as important to him as to the British or continental farmer.

It may be that the estimate put by Mr. Matthews on the possible uses of energy is out of all reason, but the realization of one-half the figure would be double the fondest dreams of the most optimistic central-station man in the American field. Anyway, it would be probably ten times the present average usage outside the irrigation field. There is nothing in the methods suggested for plowing by Mr. Matthews that is at all out of line with developments in other fields. For example, the suggested use of cables for plowing is at least comparable with their use in mine work, and as a matter of fact steam rigs of this kind are in use. The real question is how the equipment can be reduced in cost to make it practical for average farm use and make the cost of the operations lower than when carried out in any other way. The account of British

practice deserves careful consideration in this country and ought to stir up research work in American agricultural experiment stations.

## No Man Can Long Hold Back the Progress of the Industry

A CONTRACTOR in a New England city wrote in the other day in regard to a "home electric" demonstration which he was organizing. He said: "This will be the first 'home electric' ever exhibited in this locality, . . . We are alone in the project as it seemed too great a task to get the lighting company and the other contractors to agree on essentials. . . . We will not solicit sales of any kind and will hope to reap our reward in publicity and future business." What a picture that statement portrays!

The "home electric" has proved itself the most effective method ever devised for demonstrating to large numbers of people the uses of electricity in the modern home. In city after city the central-station company has got behind the idea and with the co-operation of the local contractors and dealers made it a family affair. More than eighty such homes were exhibited last year to an average attendance of twenty thousand people. The central station is ever the greatest beneficiary, and it would seem that it would be hard to find any executive of any light and power company anywhere who would not eagerly grasp the opportunity to do wheelhorse work in the organization of such a "home electric" urged by a local contractor, and do it without quibbling.

It simply proves again that the electrical industry will wait for no man. The central station is the mother of the local electrical family. It should inspire, encourage and support all local work that has as its objective the promotion of the electrical idea. But where the manager sleeps in a corner, blind to the vision of opportunity which his industry holds out to him, some other man inevitably will come some day to raise the banner and carry it forward. In the meantime how much time is lost for all!

## Another Step in Inductive Co-ordination

THE latest report of the joint committee representing the National Electric Light Association and the American Telephone & Telegraph Company adds to the statement of principles covered in the two previous reports an account of approved practices in the construction and operation of both signal and power systems. For the first time since the issuance of the rules of the California Railroad Commission there is now available a set of principles and rules governing inductive interference which cannot be called one-sided. The practices included in the new report cover both those applicable to signal systems and those applicable to supply systems, as did the principles covered in the report made before the Atlantic City convention of the N. E. L. A. last May.

Undoubtedly many will find fault with the new report because certain things are left uncovered and others may not seem to be adequately covered; but the document is in the nature of a progress rather than a final report, and preparations have already been made for research and development which will shed light on subjects that the committee frankly states have not been covered for lack of sufficient data. The important fact that should be recognized is that the committee, after much hard work, has made generally available material on which the practical handling of relations between signal and power systems can be carried out. It represents the best the engineering talent of both industries knows. It is therefore the duty of every man who must face such problems to familiarize himself with the reports of the joint committee and to get behind the principles and practices unreservedly. Only by enthusiastic acceptance and intelligent application can the improvements needed be ascertained. The committee is entitled to the whole-hearted support of the entire electrical industry and, more than that, to honest, constructive criticism based on use and designed to improve the practices on both sides so that the public will have the best signal and power services that can be given.

## Evaporator Systems Prove Economical

OPERATING results show that evaporator systems for feed-water "make-up" are successful competitors of water-treating plants. This is true particularly where boilers are operated at high ratings and where electrically driven auxiliaries are used. The capital and operating charges with either system are about equal, but indications point to a reduction in the cost of evaporators which will give the advantage to them. There are other benefits, such as better make-up, reduction in the frequency of "blow-downs" and production of fewer concentrates in the boilers. Room remains, however, for improvement in evaporator operation. Too stiff piping may cause air leakage, and for good results the water they contain must be maintained at the proper level. Neither system will remedy condenser leakage —this is best done by providing treating arrangements for each main unit.

Successful evaporator installations have been made on the basis of the evaporator having little effect on the amount of steam that can be bled from the main units or exhausted from the house turbines. With a low-pressure evaporator and single-stage bleeding sufficient capacity can be obtained, but the recent trend toward multistage bleeding introduces complications. With multistage bleeding it is difficult to get sufficient temperature head, considering the amount of available condensate, to absorb the heat in the vapor from the evaporator, and it is difficult too to get sufficient evaporator capacity. If high-pressure evaporators are used, the temperature of the feed water will be raised, which may so reduce the recovery from the economizers as appreciably to lower the station thermal efficiency.

The great advantages of the evaporator systems lie, as already intimated, in the reduction both of concentrates and of the frequency of blowdowns. The blowdowns affect the station economy, and more and more it is realized that in many stations concentrates are a source of trouble. They are detrimental to piping and valves, clog the superheaters and cause trouble in the turbine blades and condensers. Experience in the use of evaporators shows instances where with a blow-down only once in two weeks the amount of concentrates is very low.

Results from the existing installations point to a more extensive use of evaporators and warrant their serious consideration by power-station designers, even though their comparatively recent entry into the game handicaps their acceptance by conservative engineers.

### More Investigation Needed Before Porosity Tests Will Be Conclusive

SOME very interesting porosity tests were described and discussed last August at the Vancouver convention of the American Institute of Electrical Engineers. They deserve careful attention from engineers. The authors, C. C. Farr and H. E. R. Philpott, start with the assumption, quite generally accepted, that many insulator troubles are due to porosity in manufacture and that an accelerated porosity test is highly important. They kept unbroken insulator sections or disks in an aqueous solution of fuchsin dye, at pressures as high as 2,000 lb. per square inch, for several days at a time, thus apparently obtaining the same penetration of moisture as would require perhaps months or years in actual service. They seem to have proved to their satisfaction that insulators which stood such a "soaking" test without appreciable penetration also withstood a subsequent high-voltage test, and vice versa. We seem to have here a promising criterion, both for the maker and the user, of the service to be expected from an insulator.

Of course, penetration tests for porcelain, with and without liquid pressure, have been employed before and are in regular use in some research laboratories in this country, but the assurance of the authors that such a test is conclusive will require further and careful studies. Incidentally, this test again brings to mind the possibility of improving a newly finished insulator before moisture has penetrated into it. An impregnation with some light oil or with molten paraffin (as already suggested by E. E. F. Creighton) under high pressure should seal the pores for a subsequent entry of moisture and thus prolong the useful life of the insulator.

### The Coming of the Neon Lamp

FROM time to time a great deal has been heard about small neon lamps being put on the market and becoming fairly common in Europe. In this country they have so far been conspicuous mainly by their absence, but they are beginning to appear and may take their place among the regular lighting devices used for special rather than for general purposes. The brief report on some of these lamps, as tested in this country, printed last week is, therefore, a timely one.

Of course, the neon tube as a spectacular lighting "stunt" had, through the energy of M. Claude, been made known in Europe before the war, but these early tubes were of fairly high voltage and did not have a normal place in central-station activities. The lamps referred to by A. Palme in the last issue are designed for 220-volt circuits, alternating or direct current, this voltage being a usual one in foreign distribution systems. The lamps are likely to be used mainly for advertising and similar purposes, it being possible to obtain a letter-shaped lamp working at an expenditure of not more than 2 watts or 3 watts per letter in the smaller sizes and giving the characteristic neon glow of vivid orange with the faint violet fringe about the electrodes due to a small amount of more refrangible light. The effect is characteristic and pleasing. These lamps may also find useful functions as fuse and switch indicators, polarity testers, and for similar purposes for which it is not now easy to get a lamp of really small size suited to the ordinary distribution voltages. In the United States a night lamp of this type has been adapted to work on 110 volts alternating current, giving a small fraction of a candlepower for an expenditure of energy of less than 2 watts.

Altogether, it would appear that the neon lamp is likely to have a real place in auxiliary service. The actual efficiency is low, the specific consumption of the small lamps here described being about 10 watts or 15 watts per candlepower, but where the only requirement is a very small amount of light for purposes that cannot really be considered within the scope of illumination high efficiency is not important, while the need of a lamp of very low power on circuits operated at the ordinary distributing voltages is a real one.

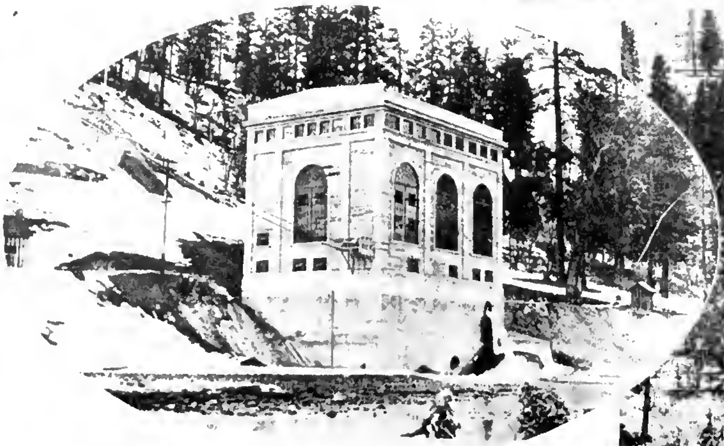
### Another New Electron Tube

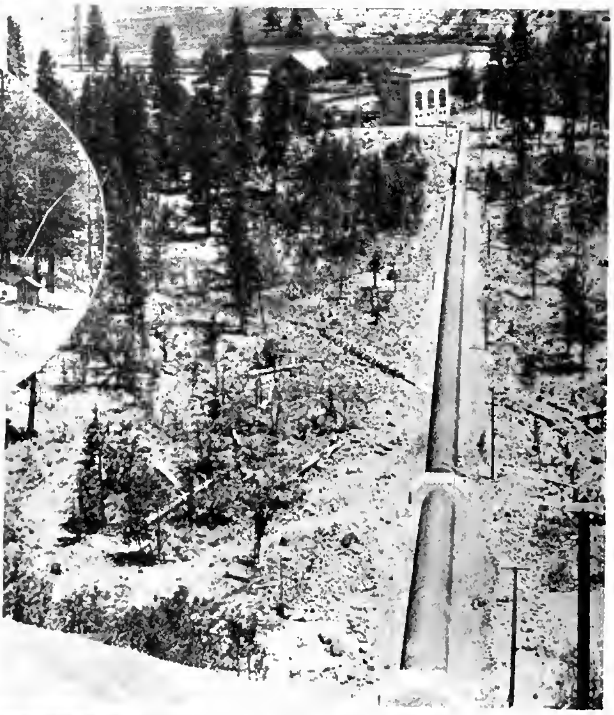
THE development of the three-electrode tube presents a striking example of the dependence of applied science upon research in the field of pure science. The unsymmetrical conductivity of the residual gas in the bulb of the carbon incandescent lamp was noticed by Edison years ago, and this was followed by the discovery by Fleming of the valve action of hot filaments. But it was many years before the work of Thompson, Townsend, Richardson and others on the conductivity of gases and the emission of ions from hot bodies laid the real foundation for the De Forest audion and the subsequent development which is still under way and which really marks a new era in scientific and engineering achievement.

As this careful laboratory study has proceeded hand in hand with the observations of practice, not only have new possibilities been discovered but the limitations of the principles involved have also been laid bare. Power tubes of larger and larger capacity are appearing, but at the same time, when used as detectors, conductivity and sensitivity are seriously limited by space charge and the shape of the current characteristic. The operation of the best-known type of tube depends entirely on the electron emission from the hot filament. But it was soon realized that the conducting properties of gas at low pressures could also be used. Moreover, the control of the filament emission may be accomplished by means of the magnetic field, as well as by the grid potential. Various combinations of these principles have led to a variety of tubes, principally for use in the radio field.

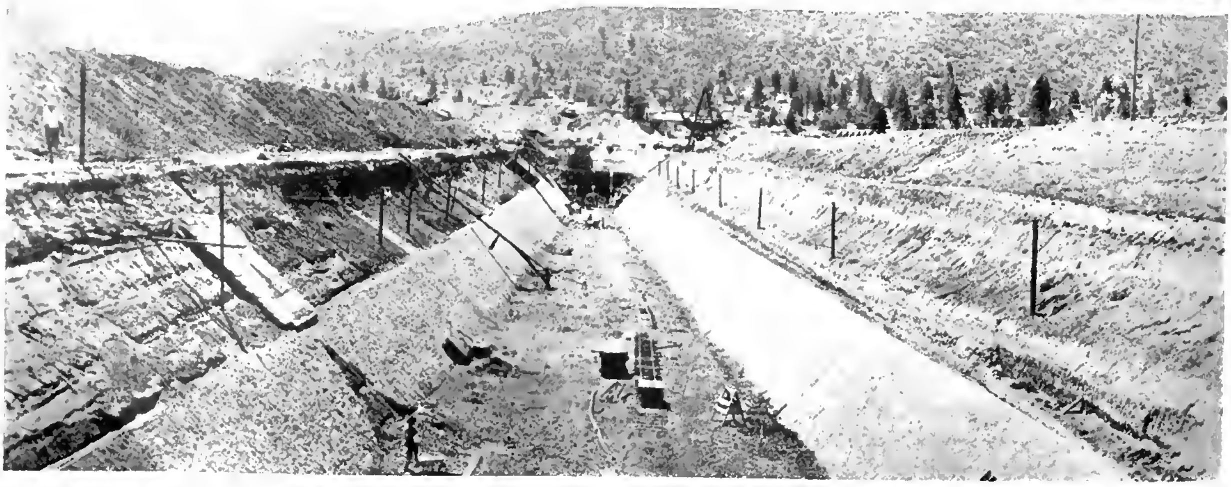
It is readily seen that with two different sources of ions in the same tube, and both under control, it should be possible to alter the form of the characteristics to meet particular needs. The use of this principle is indicated in a new tube described by H. P. Donle at a recent meeting of the Institute of Radio Engineers. Moreover, in this tube a further new source of ionization, the vapor of pure metallic sodium, is used. The tube has the usual hot cathode filament and a so-called "collector" instead of a grid, but the plate is replaced by a pool of metallic sodium which is also heated by the filament current, through the wall of the tube. Greatly increased sensitivity as a detector and other desirable characteristics are claimed by the author, who, however, does not attempt an explanation of the principles underlying its properties. Sodium vapor is known to be readily ionized in electric fields of relatively low intensity, and apparently it is this property in conjunction with control of the filament electron emission which permits the performance shown.

## Pit River Basin Development Furnishes 100,000 Hp. Now and Ultimately Will Furnish 500,000 Hp.





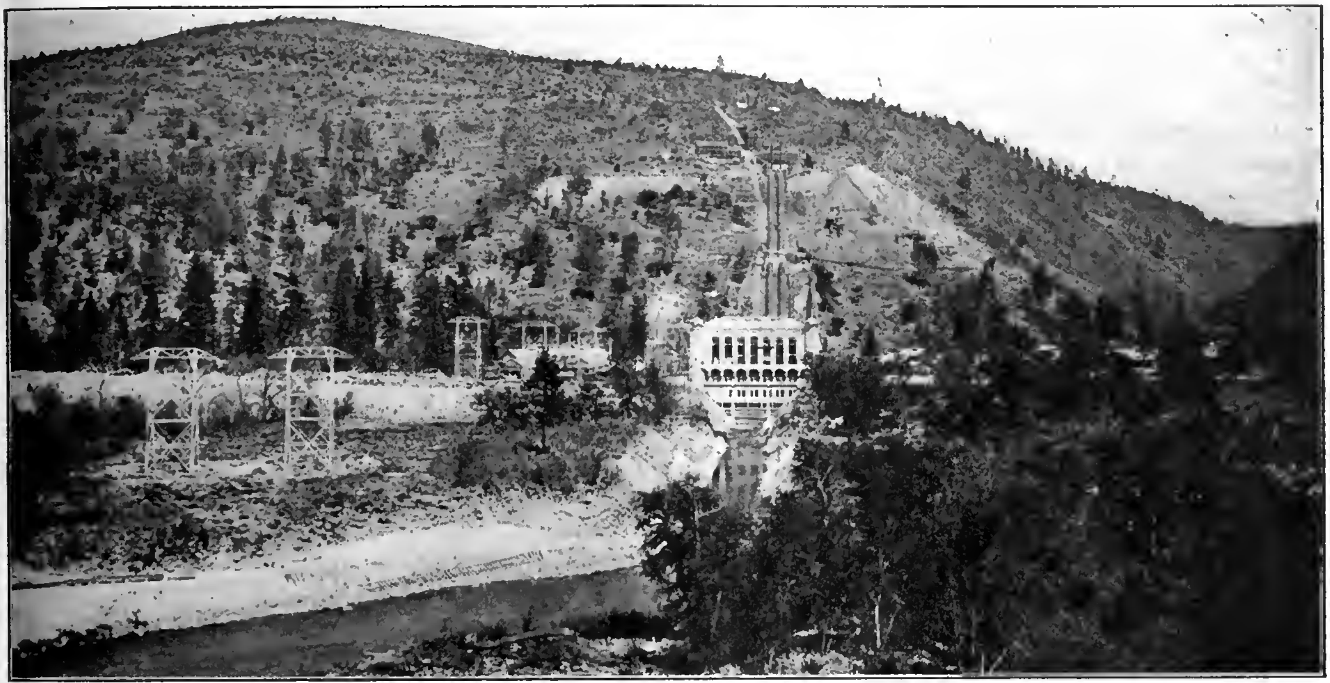
POWER stations will be located at several points in the basin and the energy will supply the San Francisco Bay district over a 220,000-volt transmission line. Views are shown of several existing developments: At the top a view of the head works and intake dam for Pit No. 1 plant is shown; in the center are the two power houses on Hat River which transmit their energy to Pit No. 1 plant at 60,000 volts; at the bottom is the open canal construction for Pit No. 1 plant.



# Pit River Power Developments—Part II

An Analysis of the Power Possibilities of This System and a Description of the Plants at Hat Creek and Pit River Utilized in Its Development—Ultimate Possibilities Amount to 500,000 Hp.

By FRANK G. BAUM* and S. BARFOED†



POWER HOUSE NO. 1 ON PIT RIVER AND THE 220,000-VOLT TRANSMISSION LINE

AMONG several important water-power developments carried out in California recently, one, the initial step in harnessing Pit River, has just been completed by the Mount Shasta Power Corporation, a subsidiary of the Pacific Gas & Electric Company. This first step forms a complete unit, composed of three power plants of 95,000 kva. capacity, a transmission line of 200 miles for 220 kv., and a substation for 100,000 kva. at the end of the line. Power conditions in this region are most unusual.

### WATER AND POWER CONDITIONS IN PIT RIVER BASIN

The Pit River basin in northeastern California is part of one of the largest lava fields in the world, its southern end being marked by the north fork of the Feather River, its northern end extending into Canada.‡ This immense lava field has completely covered the original country.

According to geologists, northeastern California was an area of low elevation (an extension of the Sacramento Valley into the Willamette Valley) after the Coast Range and the Sierras were formed. Then came the lower Cascade Range, which extends from Washington to Oregon into northeastern California, its southern line lying roughly along the north fork of the Feather River, and closed the gap between the Coast Range and the Sierras. The southern extremity of the Cascade Range thus formed a dam—in fact, a series of dams—across the outlet of what was the extension of the Sacramento Valley into northeastern California and formed the Pit River basin, covering an area of about 5,000 square miles. Similar small lava dams have later been formed across several of the branch streams of the Pit, namely, Fall River, Rising River, Crystal Lake and Burney Creek.

The precipitation on this immense lava plateau largely sinks through the lava and, being cut off by direct outflow by the lava flows across the old stream channels, is stored in lava-covered storage basins, emerging in very large springs, almost perfectly regulated. Such, roughly, is the explanation of the remarkable water conditions of the Pit River basin, on which about 80 per cent of the low flow of the Sacramento River at Red Bluff depends.

What probably has happened in the Pit River basin, formed by the inflow of the Cascade Range, as explained above, is illustrated in a small way by Burney Creek. A lava flow across the old stream bed lifted it more than a hundred feet, which has resulted in forming Burney Falls. At the falls a spring of about 160 cu.ft. a second rises or comes through the lava layers with almost constant regulation. This amount of water is more than is used by all the San Francisco Bay cities combined. The elevation of the stream bed by the lava flow probably once formed a lake many

*Consulting hydro-electric engineer, San Francisco. †Chief engineer for F. G. Baum.

‡The Pit River, like the Columbia, has cut through the range of mountains called the Cascades.

miles in area. This area has since been filled in by lava débris and now forms a valley, being much larger, however, than the valley that is commonly called Burney Valley. The underground storage basin formed by the lava flow across the stream bed gives us the regulated waters of Burney Falls.

In the Pit River basin, about 8 miles east of Burney Falls, there is a similar spring at Crystal Lake, near Cassel, giving about the same quantity of water as Burney Spring. At Rising River, about 3 miles above Crystal Lake, another spring of about 350 cu.ft. a second rises, and Fall River, about 20 miles to the north, is formed by similar springs, giving an almost perfectly regulated flow close to 1,500 cu.ft. a second. Fall River is the most remarkable river formed by springs of which we have knowledge. The four springs mentioned total about 2,300 cu.ft. a second, and other springs in the basin raise the total for Pit River above Peck's bridge to about 2,500 cu.ft. a second. Pit River, formed mainly by the above springs, has its source east of the summit of the Cascades and has cut its way through the range to the Sacramento Valley.

The total economic power drop available is more than 2,000 ft., and we have therefore possible dependable power developments on the Pit River close to 500,000 hp. constant. This power it is planned to take to the San Francisco Bay region, the initial step now being in operation. The power output could be practically constant, as storage sites are available to make up the summer deficiency of about 10 per cent, which is largely due to irrigation and evaporation. The water supply of the Pit and its branches is for power purposes the most continuous contained by any stream known. This stream also furnishes underground water storage for the irrigation of the Sacramento Valley lands of more than 1,000,000 acre-feet per year.

These spring-fed streams therefore demand a different solution in their development from that demanded by most other streams in California. There will be no large storage reservoirs with costly dams, and only very moderate floods occur. Such floods as do occur come chiefly from the upper reaches of the Pit, where the character of the watershed changes. The maximum flood before the inflow of Fall River is about 30,000 cu.ft. per second.

The three first developments utilize water from tributaries only, and these streams are without floods as the term is ordinarily understood, their water surface varying only from a few inches to half a foot during a season. There is little surface run-off on these tributaries, as rain and melted snow at once sink into the porous lava, find underground channels and come to the surface at some place where a tighter basaltic flow or other deposit forms a dam across the old stream channels or canyons.

TABLE II—EQUIPMENT INSTALLED

| Plant | Main Turbines: Maximum Hp. | Speed, R.P.M. | Draft Tube | Main Generators: Kva. | P.F. | Voltage | No. | Total Kva. |
|---|---|---|---|---|---|---|---|---|
| Hat Creek No. 1 | 15,000 | 225 | Straight and flaring | 12,500 | 0.8 | 6,600 | 1 | 15,000 |
| Hat Creek No. 2 | 15,000 | 225 | Straight and flaring | 12,500 | 0.8 | 6,600 | 1 | 15,000 |
| Pit River No. 1 | 40,000 | 257 | Hydraueone | 35,000 | 0.9 | 11,000 | 2 | 70,000 |

The tributaries utilized in these first developments are Fall River and Hat Creek. These two streams furnish the major part of the low-water flow of the Pit. (See map on page 266.)

Fall River is only 15 miles long from its spring source to the Pit and comes from the north, rising in the upper end of Fall River Valley, formerly a large lake. It enters the Pit over a 55-ft. fall. The combined streams have cut their way through the Mount Lassen volcanic ridge, forming a gorge with nearly vertical walls where the successive eruptions show in cross-section like a layer cake.

Hat Creek enters about 8 miles below, coming from the south. The upper reaches drain the north slope of Mount Lassen. The real flow of Hat Creek comes from Rising River, 6 miles upstream from the mouth, and from Crystal Lake, 3 miles upstream. (See map for series of plants that it is proposed to develop on Pit River.)

### Hat Creek and Pit River No. 1 Developments

The total drop utilized at Hat Creek is a little more than 400 ft., split by nature into two heads of about 200 ft. each, and 2½ miles apart. The topography is such that they could not have been combined, and the water from Crystal Lake and other springs could not have been utilized through the conduit.

The power developed is not fed directly to the transmission line to the bay region, but is sent over a 60,000-volt line to Pit River plant No. 1, where it is stepped down to 11,000 volts, and over the 11,000-volt bus system to the 220,000-volt transformers and to the line for transmission to the San Francisco Bay district.

The name of the plant known as Pit River No. 1 is due to the fact that the power house is on the Pit, although it utilizes Fall River water. A tunnel pierces the intervening ridge, as shown on map. The 220,000-volt transmission line starts here, and the plant is an energy center for four plants, Hat Creek Nos. 1 and 2

TABLE I—HYDRAULIC STRUCTURES

| Plant | Diversion Dam: Kind | Maximum Height, Ft. | Length, Ft. | Conduit: Kind | Cross-Section | Length, Ft. | Maximum Capacity, Sec.-Ft. | Head, Ft. | Pipe Pressure: Kind | No. | Diameter | Length, Ft. |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Hat Creek No. 1 | Rock-filled timber crib | 7 | 211 | Unlined canal | 17-ft. bottom width, 9.5 ft. deep, side slopes 1½:1. | 2,750 | 600 | 215 | Riveted steel | 1 | 10 ft. to 8 ft. | 1,650 |
| Hat Creek No. 2 | Rock-filled crib and piles | 16 | 460 | Timber flume | 7 ft. x 16 ft., 3 in. | 4,700 | 800 | 194 | Riveted steel | 1 | 10 ft. to 8 ft. | 400 |
| Pit River No. 1 | Concrete | 15 | 600 | Lined canal and tunnel | 50-ft. to 22-ft. bottom width, 10 ft. to 25 ft. deep. | 1,100 | | | Riveted and welded steel | 2 | 10 ft. 9 in. to 9 ft. | 330 |
| | | | | | Horseshoe 154 sq.ft. (equal to 14 ft. diameter). | 10,160 | 1,800 | 454 | | | 9 ft. to 8 ft. | 1,140 |

and Pit River Nos. 1 and 2, of which Pit River No. 2 is yet to be built. The principal facts concerning these plants are given in Tables I and II, and their location is indicated in the map.

It is thought that the electrical features of these plants will be of greater interest to the readers of the ELECTRICAL WORLD than the hydraulic feature, and the former will therefore be described at greater length.

### Equipment of Hat Creek Plants

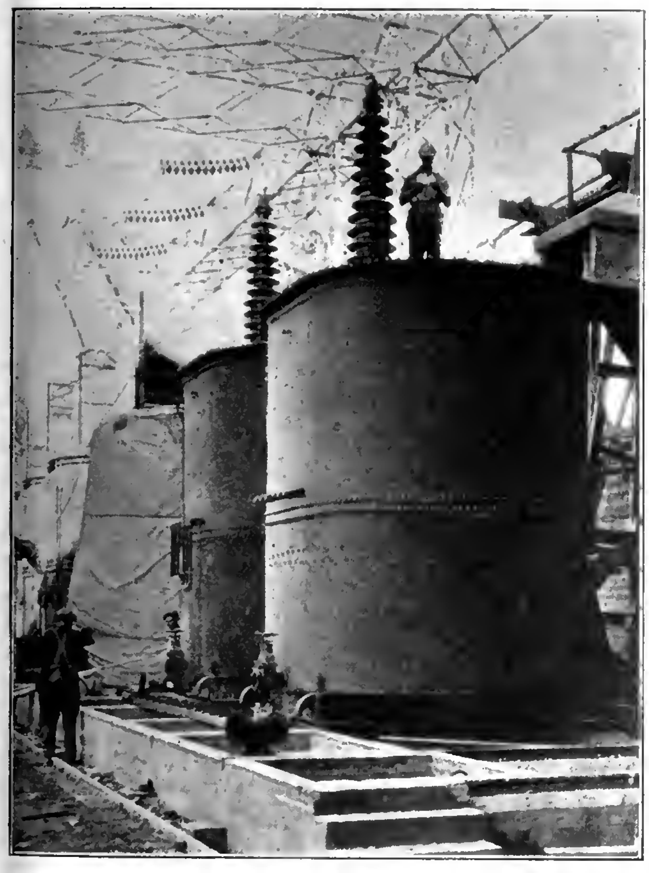
As stated previously, the power from Hat Creek plants Nos. 1 and 2 is transmitted to Pit River No. 1 over a 60,000-volt double-circuit tower line about 3½ miles long. This course was taken so that 60,000 volts would be available for distribution and also to reduce to a minimum the trouble from atmospheric disturbances, thus placing reliance on the step-up and step-down transformers rather than exposing the 11,000-volt generator windings, if the transmission was at generator voltage.

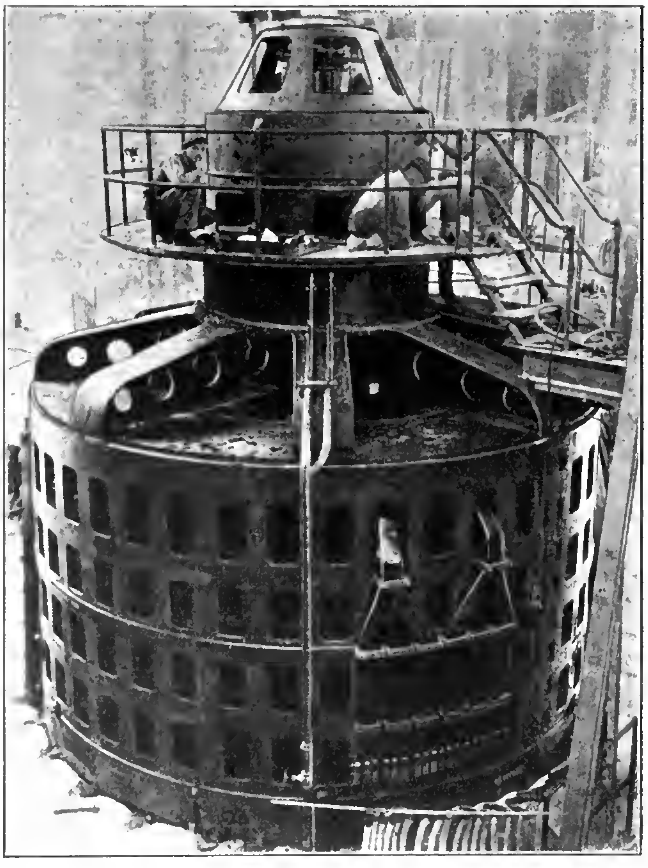
The equipment in the two Hat Creek plants is identical, although there will be considerable difference in the kilowatt-hour outputs. When conditions warrant it will be possible by the use of pondage on Rising River to increase the peak capacity of Hat Creek Nos. 1 and 2 so as to utilize the equipment more fully.

The main units are vertical-shaft, one in each station, with exciters separately driven by double-nozzle impulse wheels. Owing to the constant flow characteristic of the stream, there is very little fluctuation permitted in the load, a load-limiting device on the governors preventing an overdraft. There is no governor on the exciter wheels, but control of the nozzle setting is had from the switchboard through two small motors and a gear train mounted directly on the nozzle body, one for each needle. There is nothing new in the switching equipment of the Hat Creek plants, and as is now common the generators are protected against internal trouble by balanced relays, the neutral of the windings having been leaded out for the purpose and being also solidly grounded. The three-and-one-half-mile 60,000-volt double-circuit line is relayed to trip out on insulator flashovers selectively. One bank of transformers serves at each station to step up from 6,600 volts to 60,000 volts. At Pit River No. 1 the voltage is stepped down through one bank to 11,000 volts, which is the low-tension bus voltage at this plant.

### Equipment of Pit River Plant

The Pit River plant has attracted more attention on account of the 220,000-volt transmission line starting here. Since the bulk of the market for Pit River power will be in the large district around San Francisco Bay, it was necessary to transmit a little over 200 miles to the first substation and eventually 275 miles to the second substation. Economically this could best be done at 220,000 volts.





VIEW OF THE 220,000-VOLT, 16,666-KVA. TRANSFORMERS AND 30,000-KVA. GENERATOR USED IN PIT NO. 1

Such a line imposes at once certain conditions to be fulfilled by the generator equipment, which is that it must be of sufficient capacity to handle the charging current not alone from a kilovolt-ampere standpoint, but also as regards self-excitation due to the charging current at light load furnishing magnetizing power. The field excitation for this condition is reduced to a minimum by cutting in resistance in series with the field automatically. The generator is then capable of supplying 90 per cent of its full-load current at zero power factor leading, with a terminal voltage of about 82 per cent of normal. The two machines in Pit No. 1 are

rated at 35,000 kva. with 90 per cent power factor lagging, 11,000 volts.

The selection of switching equipment had reference to the total amount of ultimate generating capacity which can be concentrated on the 11,000-volt bus. This ultimate rating is 115,000 kva. The double-bus system is used.

### Simplicity Controlled Design

The controlling idea in laying out the switching equipment was to avoid the necessity of building several stories to house it. Simplicity controlled the designs. Accordingly all heavy low-tension switches are arranged on the generator-floor level in an adjoining and separate low part of the building, extending to the rear and forming a T with the main generator room. (See Part I, issue of Jan. 27.)

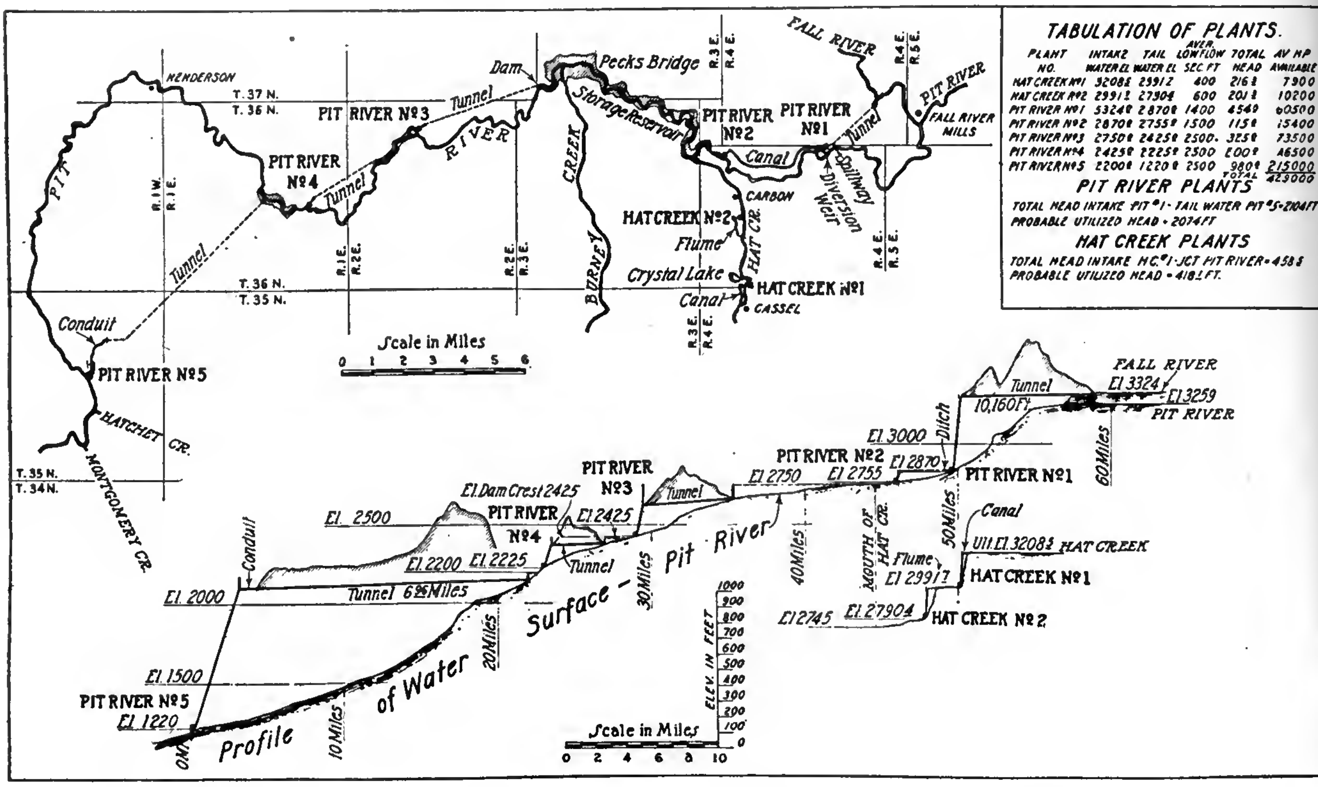
All high-tension switch equipment is installed out of doors, also at generator-floor level. Thus all heavy equipment may be trucked under a crane in the generator room with a minimum of rigging.

The control board, instrument and relay board, exciter board and station-service boards are in the generator room on an elevated platform 13½ ft. above the floor, all housed in a neat glass-covered canopy giving miximum light and keeping out dust and noise. The generator-field rheostats are installed below this platform between the generators.

The voltages in this station are: Ultimate high tension, 220,000; low-tension or generator voltage, 11,000; auxiliary power equipment, 440 (motors); lighting, 110, alternating or direct current; excitation, 250; battery for control circuits, 125.

The exciters are mounted on top of the vertical generators, and each is of 225 kw. capacity. A spare of the same rating is arranged to be driven by an impulse wheel or by an induction motor which is mounted on the same shaft.

There are two banks of three transformers, each with one spare unit. The high-tension voltages which may be obtained from them are 125,000, 175,000 and 220,000. Experience is to be gained from operation at all three voltages successively, but it is thought that in less than a year full voltage will be used all the time. The connection is star high-tension, delta low-tension. On the high-tension side the connections are single-terminal, taken out through a weatherproof condenser bushing. The other end of this winding is grounded through a current transformer mounted on the cover plate of the transformer casing. Relay protection is had through this current transformer and bushing transformers on the high-tension oil switches.



PLAN AND PROFILE OF THE CONTEMPLATED 400,000-KVA. DEVELOPMENT ON PIT RIVER

Cooling water is taken from the penstocks through a tank half way up the hill reducing the pressure. A rather complete oil-handling outfit is provided for storing, handling and filtering. The tank system consists of three 10,000-gal. tanks, placed in the open, in a reinforced concrete valut, below general ground level, so that new oil as well as oil from transformers and switches will flow to them by gravity. A complete yet simple piping system connects the tanks with the apparatus, and the connections are such that any mixing of the different oils can be prevented.

### Switching Equipment

The 220-volt switching equipment is installed out of doors. The oil circuit breakers are equipped with a bypass arrangement whereby any of them may be taken out of service for repair or inspection. The bypass is provided by a combination of three air-break disconnecting switches mounted on a structural steel framework surrounding the breaker, the whole combination

forming a distinct unit. The air breaks open in a plane parallel with the conductors with one or two gaps in series. Contacts and metal projections are covered with corona shields.

At present the total number of oil breakers installed is three, one in each line and a tie breaker. There is space provided for adding two more on the transformer side. Two air-break disconnecting switches will take their place now and will later be used in the bypass arrangement when the full equipment of breakers has been installed. The total number of breakers then will be five. These breakers serve two 220,000-volt lines and two banks of transformers which are of 50,000 kva. rating each.

### Double Bus Used on Low Tension

The low-tension switching system is operated at 11,000 volts, with a double bus. The main equipment consists of fourteen oil circuit breakers with their disconnecting switches, all mounted in concrete cellwork. Here also are mounted the necessary current and potential transformers, with the exception of the current transformers in the ground leads of the generators, which are mounted near the machines. The potential transformer fuses with limiting resistors and disconnecting switches are mounted similarly to the main disconnecting switches.

The oil circuit breakers are of the heaviest type available at time of purchase. The current-carrying capacity varies according to the service. These breakers are: For Hat Creek Nos. 1 and 2, incoming lines, four, rated at 2,000 amp.; for transformers and outgoing lines, four, 3,000 amp.; for generators, four, 2,000 amp.; for station power and exciter transformers, two, 400 amp. The disconnecting switches which are used to isolate these breakers have corresponding current capacities.

The double bus extends overhead between switch groups, each phase being in a concrete cell. The switch groups are mounted two and two, with a passage between each group and disconnecting switches to the rear of each breaker. This arrangement prevents a wrong set of disconnecting switches being opened. The three doors for each set of these switches open together by a single mechanism with only one lock. Indicating lamps are also provided.

To place all of the equipment at generator-floor level, the breakers are what is known as back-connected; that is, the terminals of the breakers are brought out at the rear above floor level. Usually these types of breakers are bottom-connected, requiring a different mounting from the one adopted. The direct current needed for actuating the motor-operated breakers is supplied by a storage battery having an instantaneous discharge current of about 500 amp. at 125 volts.

A motor-generator charging set is provided for this battery and installed on the switchboard gallery. The battery also furnishes energy for operation of high-tension solenoid-actuated breakers, generator-field circuit switches, emergency lighting, etc.

As at Hat Creek the neutral of the generator is brought out for balanced relay protection. In addition, if a fault develops in the generator winding, the balanced relays operate to actuate the governor to close the turbine gates in order that the energy fed into the faulty winding may be reduced as quickly as possible. A latch is also tripped in the operating levers which control the air-discharge dampers, shutting off the ventilating air as much as possible. The machines are also equipped with powerful air-operated brakes which are able to stop any unit very quickly.

VIEW OF SURGE CHAMBER FOR PIT RIVER NO. 1 WHILE UNDER CONSTRUCTION AND IN ACTUAL OPERATION

The water turbines were furnished by the Allis-Chalmers Manufacturing Company, the guarantee being 40,000 hp., but they give about 44,000 hp. Official tests have not yet been made. The generators were also furnished by Allis-Chalmers. The step-up 220-kv. transformers were furnished by the Westinghouse Electric & Manufacturing Company, and this company also furnished the high-tension switches. The switchboard and low-tension switch equipment was furnished by the General Electric Company.

The tunnel and canal contract was let to F. Rolandi of San Francisco. All other contractors assumed a wet tunnel in bidding, but, as predicted by the engineer, the tunnel proved perfectly dry. The engineering designs from the intakes for the water conduits clear through to the 110,000-volt busbars at the Vaca substation were handled by S. Barfoed, chief engineer for F. G. Baum. The result is one of the best pieces of hydro-electric design work in the world, considering the variety of the problems, the magnitude of the work and the money involved. The principles controlling were simplicity of layout to meet the conditions, and the use of a few high-class designers, rather than a large number of draftsmen, has resulted in a piece of hydro-electric work of which all are proud.

# Uses of Electrical Energy in Agriculture

## Electrification of Plowing, Harvesting and Other Farm Operations Can Develop Annual Energy Consumption Exceeding 50 Kw.-Hr. per Acre for 150-Acre to 600-Acre Farms, According to British Experience

ASSERTING that experience on the European Continent shows the annual consumption of electricity in farm buildings alone to be proportional to the size of the whole farm and to average 10 kw.-hr. an acre, R. Borlase Matthews, in a paper presented in Great Britain before the Institution of Electrical Engineers, estimates that the probable energy consumption on a well-equipped farm should total 44 kw.-hr. per acre of arable land for plowing, cultivation, electroculture, electric silage, harvesting, etc. The figures in question were worked out from a study made by the author of results attained on the continent and in England and from experience in the operation of a 600-acre farm of his own. He concluded that, as in all other industry, the successful solution of the application of electricity to farming is not merely a matter of belting a standard motor to existing machinery. The conditions and circumstances of farming are peculiar to the industry, and not the least of the problems is the fact of limited seasonal use of much of the machinery, coupled with the further fact that a large portion of the labor available is prejudiced against and unused to machinery in any form. The author's opinion is that in the future the use of electricity in the operation of farms will be essential from the points of view both of cutting down the total cost of labor and power and of obtaining an increased output. If the efficiency of farming is to be improved, a change from present methods is imperative, and Mr. Matthews maintains that an increased efficiency, including circumvention of adverse weather conditions, is easily obtainable by using electrical energy.

While the main or transmission circuits may be at any potential over 50 kv. in Europe, the distribution is becoming standard at 10 kv., three-phase, 50 cycles. The final voltage for farm supply is 380 volts for three-phase motors and 220 volts for lighting. The distribution circuits are four-wire, the fourth wire being the neutral from which the single-phase lighting circuit is obtained in connection with one of the phase wires. The useful minimum size of transformers is 50 kva. From this transformer distribution lines can be conveniently run in any direction for a distance not exceeding 2,500 yd. (2.3 km.). In Denmark on this class of service a conductor corresponding to No. 4 A.W.G. is used, and on the heavier loads a wire corresponding to No. 2 may be employed. To compensate for the line drop, motors rated at 10 to 15 per cent lower voltage than the normal line voltage are used. The same rate difficulties experienced in the United States seem to plague the central-station men of Great Britain and the continent.

Milking machines, water pumps, cream separators and other dairy equipment, electric light, electricity to stimulate the production of eggs, incubator heating, household appliances and other smaller fields for the use of electricity seem to have had about the same consideration as in the United States. Electroculture and the use of electrical energy for the major operations have received greater attention both in England and on the continent than has been the case in the United States, and while the developments are admittedly in the experimental stage, some very interesting things that are worthy of attention in this country are described.

Plowing by the use of electrical energy has received a considerable amount of attention. Mr. Matthews gives consideration to five methods. The first is that in which the storage battery is used, and this method is dismissed with the remark that the equipment is too heavy, packs the land excessively and cannot be used on soft ground. The plow with a trailing supply cable provides a heavy piece of equipment with a cable winding gear that is unsatisfactory and a great deal of wear on the trailing cable itself. The third method involves an electrically hauled plow on the Fowler steam system, the fourth one with a modified Fowler system employing a single cable-winding device, and the last an outfit based on the "Roundabout" or Howard steam system. The characteristics of the last three systems are shown in Figs. 1, 2 and 3.

The objection to the double-haulage Fowler system is the cost of equipment. Motors rated at 80 hp. to 100 hp. are required. The system compromising between the Fowler and the Howard systems is characterized as the most practicable for ordinary farms. The outlay for the straight Howard equipment is reasonable, the power required is from 12 hp. to 60 hp., and anchorage difficulties are not nearly so great as in the Fowler system. The tackle comprises a single electric motor with two haulage rope drums, either of which can be driven by the motor while the other pays out the cable. The haulage cable is arranged to follow around the sides of the field, and at two corners anchored angle pulleys are provided. Cable pulley wagons are anchored at the other corners of the field. The plow is hauled from one anchor wagon to the other, and when turned for the next set of furrows the anchor cable on the wagon next the plow is slacked off so that the wagon moves ahead the width of these furrows.

Some data on energy requirements and the amount of land plowed per hour at different furrow depths are given in the table. These data are taken from experiments with an electric haulage set of considerably

ENERGY REQUIRED FOR PLOWING PREVIOUSLY CULTIVATED SOIL AND WORK PER HOUR WITH ELECTRICALLY DRIVEN PLOWING SET

Made by the Société Générale Agricole. This set works on the Fowler system. A 50-hp. gas engine provides the means of moving the set, which uses a 100-hp. electric motor and 1,100 yd. of trailing supply cable for 5,000-volt service.

| Depth of Furrow In. | Work per hour, Acres | Consumption, Kw.-hr. per Acre |
|---|---|---|
| 6 | 2.5 to 2.75 | 14 |
| From 8½ to 10 | 1.87 | 18 |
| 10 plus 6 of subsoiling | 1.25 to 1.38 | 36 to 40 |

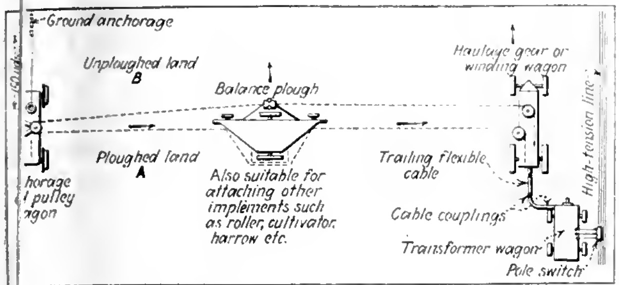


FIG. 1—ARRANGEMENT OF ELECTRIC PLOW SET ON THE FOWLER STEAM-PLOW SYSTEM

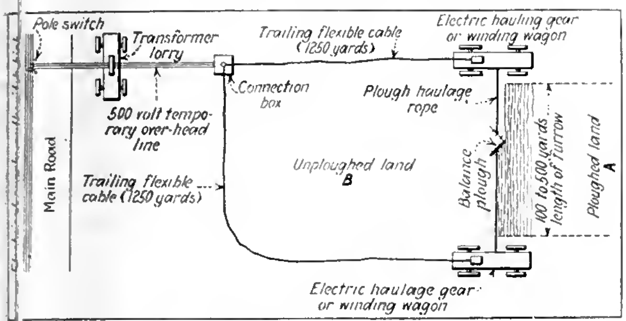

FIG. 2—MODIFICATION OF FOWLER SYSTEM WHICH USES ONE CABLE

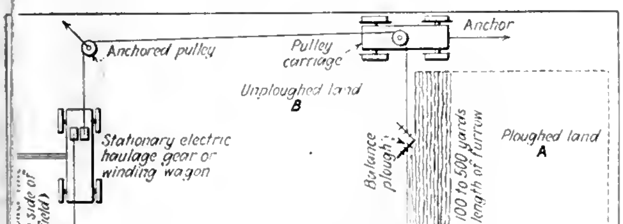

FIG. 3—ELECTRIC PLOW ON THE ROUNDABOUT OR HOWARD SINGLE-CABLE SYSTEM

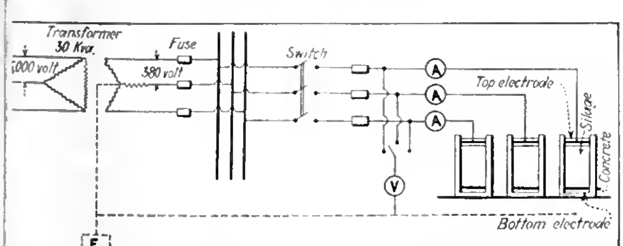
This is said to be the most practicable for use under British m conditions.



3. 4—ELECTRIC PREPARATION OF SILAGE CLAIMED TO PROVIDE A BETTER PRODUCT

Nearly 100 installations of this kind are said to be in use in rmany.

'eater capacity made by the Société Générale Agricole. he energy requirements are dependent on the resistice of the soil being plowed. On such sets as illustrated eeds of 3 ft. (0.9 m.) and 5 ft. (1.6 m.) per second e provided, and by a change of gears 4 ft. and 7 ft. 1.3 m. and 2.1 m.) per second can be had. The praccal furrow length even on very large fields rarely cceeds 450 yd. (381 m.). A large haulage set will ow 19 acres to 20 acres (7.7 hectares to 8 hectares) r day.

"Unfortunately," Mr. Matthews remarks, "the problem of electric plowing is not merely a matter of solving electrical difficulties. It involves also a careful consideration of the design of the implements to be employed. Though agriculture is such an ancient art, or perhaps because of this, the scientific principles of the design of even such features as plowshares do not seem to have been so carefully investigated or mathematically analyzed as they should have been." The use of the best possible mechanical design, including ball bearings, is recommended for all equipment, and special attention should be paid to foolproof equipment requiring the minimum of skilled attention.

Electric drive of harvesting equipment seems to be of the partial type, the machines being hauled by a tractor which also carries a small generator to supply a motor of approximately 1½ hp. driving the cutting and binding parts of the harvester. The constant speed of these parts, owing to their being independent of the speed at which the harvester must be drawn, is said to make for better handling of crops, particularly those that are down and badly tangled. With electric motor drive it is claimed that crops can be cut at a rate about one-third greater than normal with ordinary equipment. Mr. Matthews says that the combined harvesting and threshing machines used in America (known in the West as "combines") cannot be used in Great Britain owing to the need of curing the grain before threshing because of climatic conditions. To overcome this difficulty some experiments have been conducted in the effort to cure and dry the grain with the air from electrically driven fans. The combined machine is essentially one that should be electrically driven. Experiments which have been made with the electrically driven thresher seem to indicate a labor saving.

The English practice in threshing involves more farmyard and less field work than in the United States, and therefore American practice may involve more difficulty in getting a supply of energy. Motors of about 12½ hp. seem to fit this character of work. Mention is made of equipment supplied by English manufacturers for which threshing operations are carried out in two stages, the first leaving an uncleaned grain for farm use and the second cleaning and preparing all the grain for market. For this work a 5-hp. motor is sufficient for each operation.

An interesting development in the preparation of silage is outlined by Mr. Matthews. Each silo is equipped with a grounded electrode at the bottom and a live electrode which can by placed on top of the green stuff stored in the silo. Germany already has nearly one hundred examples of such silos. Ten tons of fodder are said to require between 130 kw.-hr. and 200 kw.-hr., and the time for treatment in a silo varies from twenty-four to forty-eight hours. Better preservation of the silage due to the arrest of harmful bacterial action is claimed.

In making hay artificial curing is carried out by running a wooden duct into the base of the stack and air from an electrically driven fan under water pressure of 2½ in. is blown into the stack. The rate of drying is inversely proportional to the amount of moisture in the air. The artificially dried hay is said to look better, has a better aroma and the food value is held to be better because of prevention of high temperatures in natural curing that destroy food values and may even set the stack on fire. In connection with this form of use of electrical energy it is recommended

that measures for curing fruit, vegetables and other products be made. In this way a more economical installation can be obtained, and many things that would otherwise be wasted can be made useful.

Regarding the farm load factor Mr. Matthews says: "A somewhat difficult query has been put forward asking for the probable load factors of a 300-acre and a 600-acre farm. . . . Different farmers will have different ideas as to the most suitable equipment for their work. On an intelligently equipped farm a load factor of 33 per cent may be anticipated." For dairy, mixed and arable land farms he gives load factors of 13, 15 and 31 per cent respectively for the farm only. With the addition of farmhouse lighting, cooking and part heating he raises the figures to 24, 25 and 33 per cent, respectively.

"Since the size of farms in any neighborhood varies considerably," Mr. Matthews observes, "it is useless to make the assumption that if a 600-acre farm has a demand of 25 kw. the central-station demand would be 25 kw. per square mile. In any event the supply undertaking would run its lines along the route of the maximum demand, and continental experience shows this practice to be advantageous in units of 50 kw. Further, farms cannot be considered apart from rural industries and the varied demands of even small villages in the same neighborhood."

Reference has been made to the difficulty of arranging the distribution system on a farm, more especially for the field work. This is not so troublesome as might at first be anticipated, the author of the paper says. Since each stationary plowing gear has to be brought into only one corner of the field it is merely necessary to bring the distribution lines within reach of the plow flexible electric cable, which is usually over 100 yd. in length. However, on the continent, to economize in copper, the posts and insulators are installed permanently and the copper lines are moved about as required. The author has one transmission line crossing his farm (of 600 acres) and has planned one other line at right angles to this. He hopes that this simple arrangement will be sufficient for all the farm field requirements.

Since a large amount of power is used on a farm in the course of a year, it is a very serious question what form of power should be employed. In England the horse is in universal use, aided nowadays very largely by the oil tractor and steam plow. It is improbable that the horse will entirely disappear, though he is a costly animal to keep. At Greater Felcourt Farm in 1919, without any overhead charges, the cost per horse, including a part of the driver's time, worked out at £147 (about $715). This compares with the figures of well-known agricultural writers, Fream and Parkside. Electricity at 2 shillings (48 cents normally) per kilowatt-hour would have been far cheaper than horses for work to which it would have been applicable. On a small farm where an electric supply is available one horse should suffice, and on a 600-acre farm the number should not exceed two or three, Mr. Matthews thinks. He himself keeps three horses on his 600-acre farm and hopes shortly to reduce this number to two.

Mr. Matthews goes on to say: "It is not a sound principle to reduce the number of men; rather, the object of each farm should be to increase the output and profits by farming more intensively. It has already been stated that nine-tenths of the farms in this country [Great Britain] compete in growing products with the world, hence their fortunes must vary with the rest of the world. Therefore, it is very important that, in spite of high taxation, high railway rates and high costs, the output should be a maximum at a minimum cost. Cheap and suitable power will, in the future, render considerable assistance in this direction, and experience shows that a great deal of this power should be electrical. . . . The farmer is not going to use electricity because he loves it, but because he finds it will do the work he requires more cheaply, more effectively and more quickly. . . . One speaker in the discussion referred to the necessity of going over the land eight times with horses for the preliminary cultivation work, but with mechanical power five or six times suffices. This alone means a considerable saving of time and cost. The so-called handy little oil engine (already obsolete on continental farms) has been advocated as a substitute for the electric motor, but the author knows, to his cost, a great deal about such engines. In a farm laborer's hands they are not nearly so convenient as the manufacturers' catalogs would appear to suggest. In the course of a year the total time taken in tinkering with such engines, the cost of repair parts and the loss of time in getting work done, etc., amount to quite a serious figure. . . . While the British farmer is far ahead of his continental neighbors in animal breeding and pasturing, he is far behind in intensive agriculture and the use of electricity. Enormous scope still exists for improving farming by attention to important details. It will be easier for the farmer to take up improved methods if at the same time he makes use of what to him is a new power, because it facilitates the handling of his very conservative men, as the author has discovered in many instances."

### WHERE AMERICAN CONDITIONS DIFFER

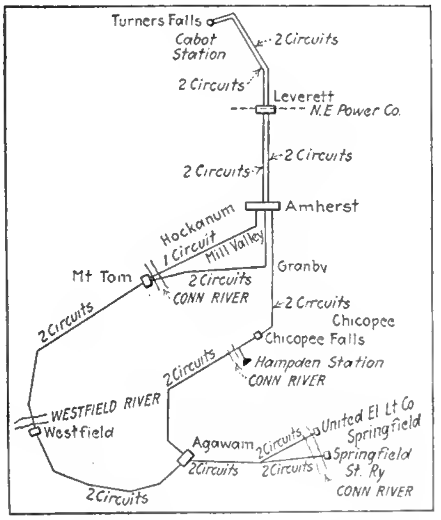
In quoting the above figures on the cost of the horse it should be borne in mind that they are undoubtedly very much out of line for American conditions. Depending on what part of the country is considered, the cost of the horse in the United States seems to be between $100 and $200 per year, and in sections where pasturage is cheap the cost will be below $100. These figures are only approximate and for comparison with the figures given should be added to the cost of the driver. The point of the remarks so far as American conditions are concerned lies in the lines of investigation indicated. This applies to all of the data covered briefly in this article, since methods and conditions are such that direct application of the methods of using electricity on European farms might lead to serious error.

The outstanding fact is that electrical energy has been used in operations that have seemed the last to be considered in the United States. In the paper quoted, an estimate of 50 kw.-hr. per acre per annum has been made for farm use of electrical energy. The farms talked about are from 150 acres to 600 acres in size. Irrigation is not a factor. For American farms that are comparable one must look to the Middle West or the Eastern States. At present the data available seem to indicate a consumption on these farms of only 1 kw.-hr. to 5 kw.-hr. per acre annually, with the latter figure a very unusual one. Of course, there are some farms where greater use of electrical energy may be found, but it is for special purposes. That there should exist such a discrepancy between the British estimate of 50 kw.-hr. per acre and the present American use of less than 5 kw.-hr. gives food for thought.

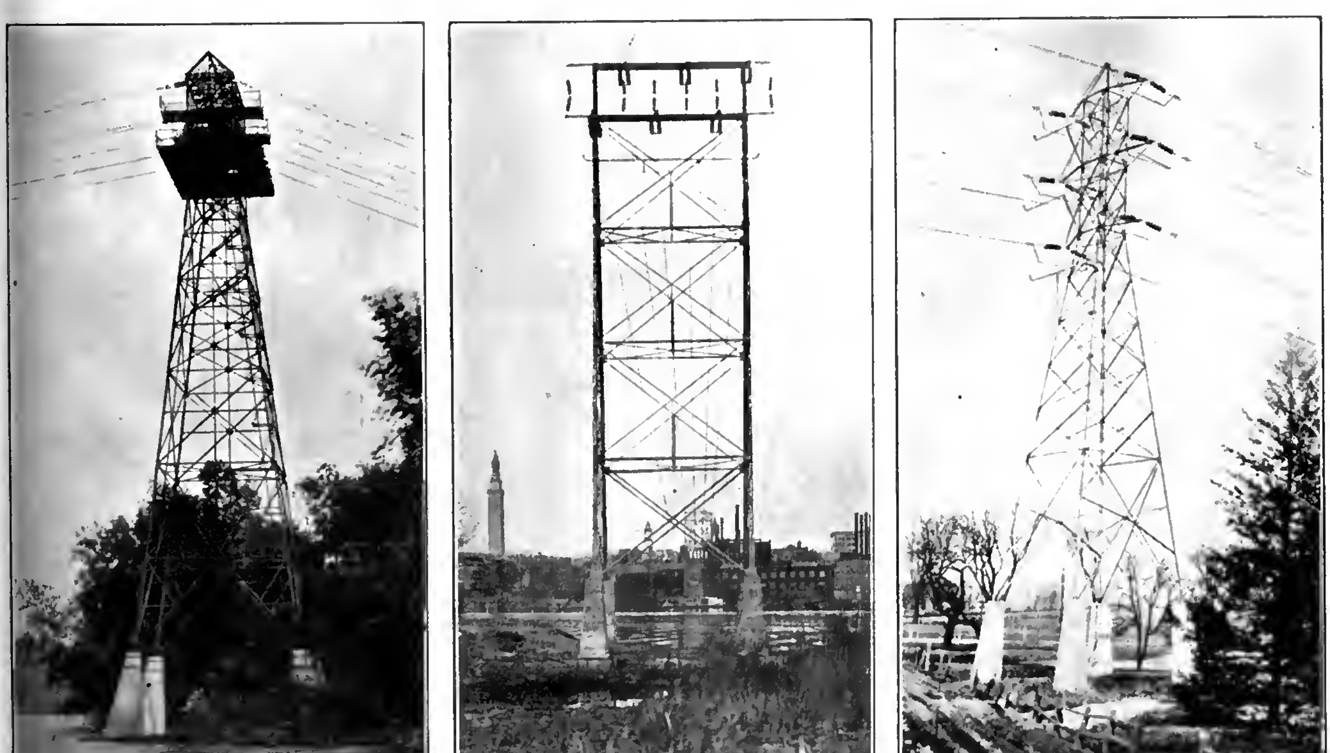
# Cost of Transmission Lines

**General and Price Data on the 78-Mile System of the Turners Falls Power & Electric Company, Which Connects Turners Falls with Springfield, Mass., and Serves the Connecticut Valley from Both Steam and Hydro-Electric Plants**

A COMPREHENSIVE summary of the investment cost of the 66,000-volt transmission lines of the Turners Falls (Mass.) Power & Electric Company, one of the largest transmission organizations of New England, was completed not long since in connection with a security issue for which authorization was asked from the Massachusetts Department of Public Utilities. The company operates hydro-electric and steam generating plants in the central Connecticut Valley and is interconnected with the New England Power Company and the United Electric Light Company systems. A line is at present under construction between the Connecticut Valley and the Berkshire Hills district centering in Pittsfield, Mass., but the costs presented herewith cover only those lines completed and in operation in the Connecticut Valley. Through the courtesy of the company the photographs accompanying the data printed here have been furnished to give the reader an idea of the types of construction adopted in the development of the system. The first line was built during 1910 to furnish a connection between Turners Falls and the Mount Tom steam plant via Amherst, the line between Turners Falls and Amherst at that time being a 22,000-volt wooden-pole line. This new line was built for 66,000 volts, but was operated until 1913 at 22,000 volts. The primary cause for its construction was a mill load in Easthampton, near Mount Tom. The second line was built between Turners Falls and Springfield in 1912 and 1913, the Springfield district being the only available market at the time for the sale of the output of the company's No. 1 plant in Turners Falls. The third line was built between Turners Falls and Amherst in 1916 by the company. This line was constructed as a first step toward furnishing transmission capacity equal to the entire hydro-electric development. This line was originally built with two circuits to Leverett (the point of interconnection with the New England Power Company) and one from there to Amherst, but had



LINE DIAGRAM OF TURNERS FALLS POWER & ELECTRIC COMPANY, SHOWING LOCATION OF LINES (NOT TO SCALE)



LEFT—A RIVER-CROSSING TOWER ON THE AMHERST-SPRINGFIELD LINE. CENTER—A DOUBLE-CIRCUIT RIVER-CROSSING TOWER IN SPRINGFIELD. RIGHT—TOWER RAISED ON CONCRETE PIERS ON A RAILROAD CROSSING ON THE CHICOPEE-SPRINGFIELD LINE

hardly been put into operation before load conditions warranted the completion of the other circuit, as well as the addition of one circuit from Granby to Mount Tom, this circuit being tapped off the Turners-Springfield line at Granby.

The fourth line was built between Amherst and Granby by the company in 1917, one circuit being run at that time. The load in the Springfield district had by this time increased sufficiently to require improved regulation, and this circuit relieved the load carried by the Granby-Mount Tom line from the Turners-Springfield line south of Amherst.

Soon after the completion of this line negotiations were under way to care for the Springfield Street Railway Company's load, which required additional circuits from Amherst to Springfield. Estimates from surveys showed that a line built by way of Westfield to Agawam would not call for a greater investment than to build over the right-of-way already owned by way of Chicopee, and the fact that a line via Westfield gave a complete loop system from Amherst, together with the advantages of having a 66,000-volt line into the Westfield section, made this routing much more desirable.

The section from Mount Tom to Westfield and Agawam was started in 1917, and at the same time an additional circuit was added from Amherst to Granby and from Granby to Mount Tom. During 1917-1918 an extension was built from the Turners-Springfield line between Agawam and Springfield to the Margaret Street Station of the Springfield street railway; also, a tap from the Turners-Springfield line in Chicopee was made to the Hampden Steam Plant.

The line between Turners Falls and Amherst consists of a single line of towers with two circuits of No. 1/0 seven-strand copper and one ⅜-in. seven-strand galvanized-iron ground wire. The towers are four-post galvanized-steel Millikens, 75 ft. 6 in. in height, with a spread at the base of approximately 17 ft. The cross-arms are spaced vertically 10 ft.

The line between Turners Falls and Amherst consists of the same general type of towers as the above

TABLE I—GENERAL DATA ON TRANSMISSION LINES

| | Turners Falls-Springfield | Mount Tom via Mill Valley | Mount Tom via Granby | Agawam via Mount Tom |

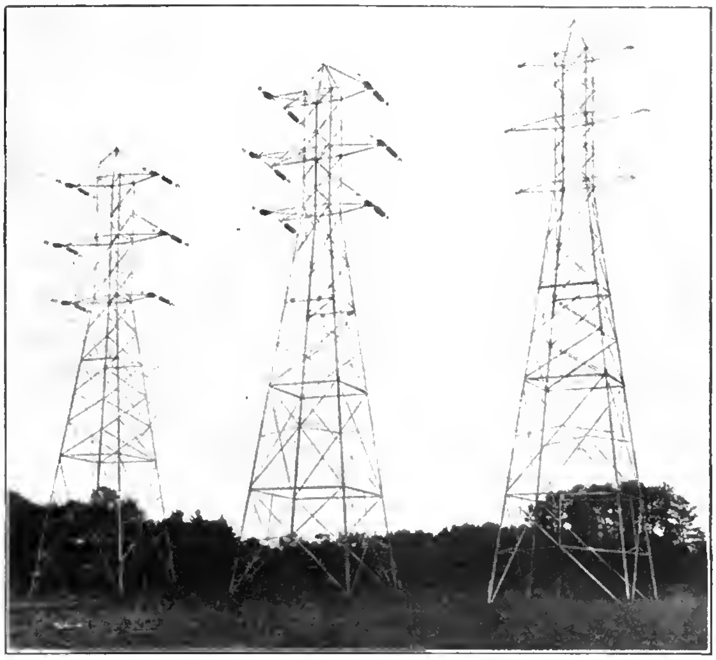
| Total cost of special footings | 51,421.74 | | 7,866.40 | 109,568.40 |
| Cost per railroad-crossing tower, including footing | 987.62 | | 891.25 | 1,946.22 |
| Cost per river crossing, complete | 27,655.00 | | ......... | 25,448.48 |
| Coat per yard, special footings | 38.58 | | 30.55 | 46.15 |
| **Summary of Lines:** | | | | |
| Standard | $607,359.34 | $60,812.70 | $43,232.39 | $268,150.76 |
| Special | 183,769.38 | ......... | 26,660.74 | 164,357.82 |
| Total | $791,128.72 | $60,812.70 | $69,893.13 | $432,508.58 |

* General items: general foreman, preliminary work, permits, interest, insurance and taxes, dead time, stock clerks, field office, timekeepers, stock sheds, blacksmith shops, accidents, repair of fences, cleaning up, making topographic maps, guying, reports, inspection, excess freight and express, danger signs.

Note:—Both special and standard construction included in standard construction figures on the Amherst-Mount Tom line. This line was constructed before the present organization had anything to do with this system, so no records are available for detail costs.

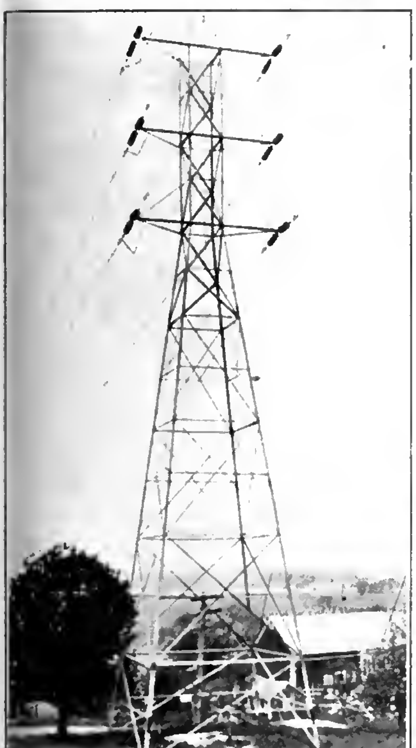
line, with two circuits of No. 2/0 seven-strand copper wire and $\frac{3}{8}$-in. seven-strand galvanized-iron ground wire and two $\frac{1}{4}$-in. seven-strand galvanized-iron telephone wires.

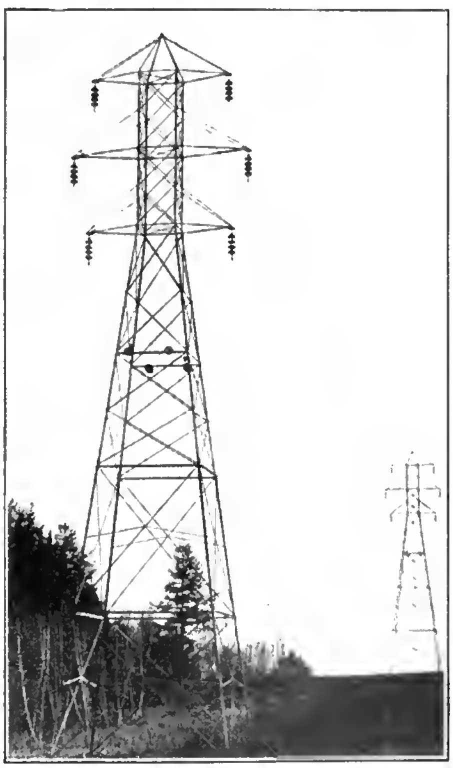
The line between Amherst and Springfield is built of Milliken four-post galvanized-steel towers, similar in design to the above, but with an arm spacing of 9 ft. and a total height over all of 72 ft. 6 in., with a spread at the base of approximately 16 ft. 6 in. On this line are three river crossings. These towers were designed by J. R. Wor-

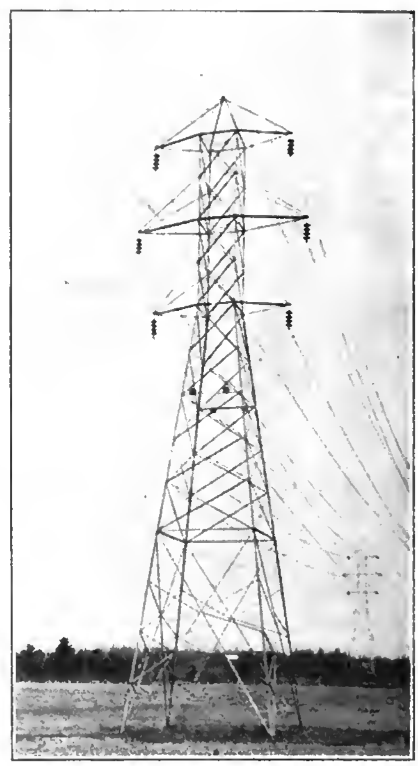


sists principally of Milliken standard four-post 75-ft. 6-in. galvanized-iron towers. There is a section along the south side of the Holyoke Range which is built of four-post "Aërmotor" towers, the general dimensions of which are the same as those of the Milliken type. On this line is considerable special construction through what is known as "Hockanum Meadows," as well as river crossings.

As a help to explaining the variation in the costs of different types of line, the company has tabulated the amount of







TYPES OF TOWERS USED IN LINE CONSTRUCTION

Top—Standard construction on the Mount Tom-Agawam Line. Left—"Aërmotor" towers are used on the Springfield-Mount Tom line via Granby. Center—Towers on the southgoing lines from Amherst. Right—Standard towers on the Turners Falls-Amherst lines.

cester & Company, Boston, and were furnished and erected by the Eastern Bridge & Structural Company, Worcester, Mass.

The line via Mill Valley between Amherst and Mount Tom consists of a single line of single-circuit, galvanized-steel four-post towers furnished by the U. S. Wind Engine & Pump Company, and it carries three No. 2 seven-strand copper wires, one $\frac{3}{8}$-in. seven-strand galvanized-iron ground wire and two $\frac{1}{4}$-in. seven-strand galvanized-iron telephone wires. In this line there is also a river crossing, built of special towers designed and furnished by the U. S. Wind Engine & Pump Company. The line between Amherst and Agawam con-

each kind of land through which it was necessary to purchase a right-of-way. This to some extent should explain the difference in cost between two rights-of-way, but the human element and the fact that rights for other lines may have been purchased in the same vicinity are more important factors, perhaps, than the actual value of the land itself.

In construction work the company was able to arrive at closer units of cost, the important factors in comparison being unit costs of material, rate of wages, type of digging, accessibility to line, proximity of freight yards to line, contour of land, amount of timber to be cut, time of year construction was carried on, size

of transmission wire, labor-housing conditions and special construction, such as concrete footings, railroad crossings, river crossings, switching towers, etc. By giving careful consideration to the variation of these items in different lines the comparative cost can be accurately determined.

As a matter of general information, there are given in Table III a few unit costs of work which represent a fair average of cost of several lines similar in construction to those covered by the tables.

## New Production Records During December

INDEX figures upon which the "ELECTRICAL WORLD Barometer of Business Conditions in the Electrical Industry" is based indicate that new high activity records were set within the industry during December. Data issued by the Department of Commerce indicate that a new record since 1920 was established in pig-iron production, an industry which is regarded by many prominent economists and statisticians as the best barometer of general business conditions. Other outstanding activities during December were a larger output of coal and coke, very heavy car loadings and the largest volume of retail sales ever recorded. The large production of fabricated steel bears cut the statement made in these columns last month that the seasonal decline in general construction had failed to materialize.

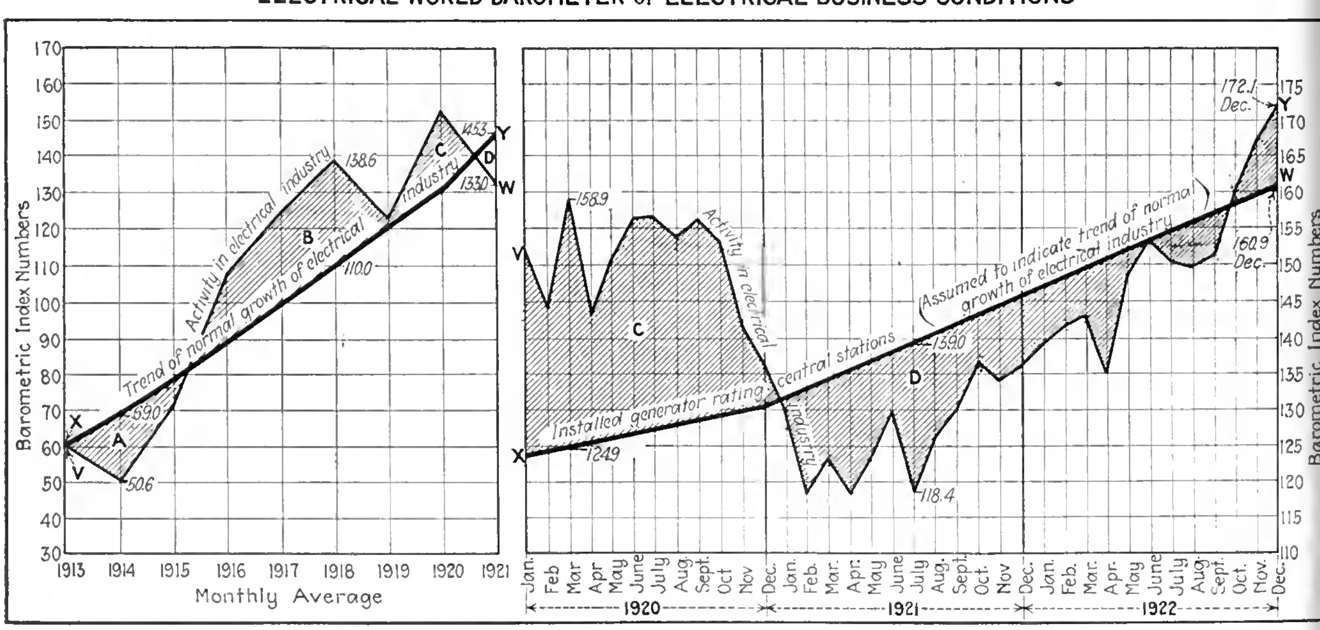
The "ELECTRICAL WORLD Barometer" indicates that in the month of December business conditions in the electrical industry, taken as a whole, continued to show the monthly improvement which started in September. The basic data indicates an increase of 5.0 points on the barometer scale as compared with November. The electrical industry as a whole in December was operating at 11.2 points or per cent above what would have been the point of seasonal demand if growth in the industry had been normal. In November it was operating at 7.7 points or per cent above the point of normal demand.

The year 1922 witnessed some remarkable changes in the activity within the industry. In January the industry was operating at about 8 per cent below the point of normal demand, whereas at the end of the year it was operating at 11.2 per cent above the point of normal demand. It must not be forgotten, also, that during this twelve-month period the normal productivity of the industry had increased about 10 per cent in order to supply the increased demand for energy, machinery and apparatus.

In its review of general business conditions the Harvard University Committee on Economic Research has the following to say:

"The business improvement inaugurated early in 1922 continued during the last month of the year. The rise of the business curve of our index chart has been substantial and persistent. The maintenance of this upward movement has evidenced the soundness of basic conditions and the strength of the favorable economic forces. At the opening of 1923 these forces are still operative. We forecast, therefore, further increase of wholesale commodity prices and continued expansion of business activity during the first half of 1923, with a strong probability that the upward swing will continue during the second half of the year."

ELECTRICAL WORLD BAROMETER OF ELECTRICAL BUSINESS CONDITIONS



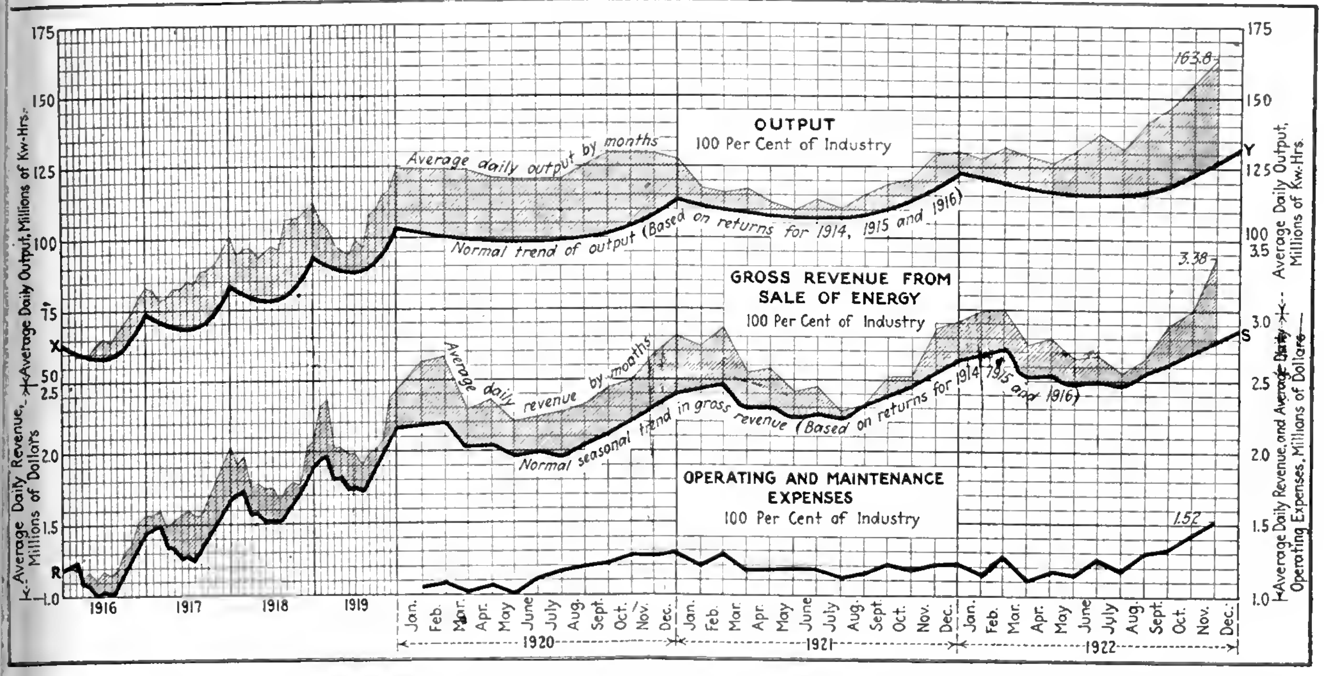
### THE BASIS FOR THE "ELECTRICAL WORLD BAROMETER"

By the "electrical industry" is meant the electric light and power branch, the electrical manufacturing branch and the electrical merchandising branch, taken as a group. The chart is not believed to be barometric for these branches as units.

By reason of their large influence on activity within the electrical industry the following nine primary industries have been adopted as a basis for the "activity curve" of the electrical industry: Active cotton spindles, pig-iron production, bituminous-coal production, copper production, newsprint-paper production, passenger automobile production, truck automobile production, yellow-pine lumber production and Portland cement production.

Activity in each of these basic industries referred to its own normal growth curve is found, and then this index of activity is applied to the electrical industry in proportion to the influence of the particular basic industry on the electrical industry. The estimated horsepower of the motors installed in the plants of the various basic industries has been taken as a basis for weighting the industries in their influence on the electrical industry. In weighting the lumber and Portland cement industries the large domestic load of the electric light and power branch and the sale of domestic apparatus have been taken into consideration. Applying these weights to the activity in each basic industry, adding the totals and dividing by the total of the weights gives the activity in the electrical industry referred to the "trend of normal growth of the electrical industry."

The line showing the "trend of normal growth of the electrical industry" is based upon the rating of the active installed generators of the central stations of the country. Further details concerning the development of the "Barometer" will be gladly furnished upon request.



# Record Output and Revenue in November

## Output for November Totaled 4,915,000,000 Kw.-Hr., an Increase of 23.1 per Cent for the Twelvemonth Period—Average Daily Revenue Exceeded $100,000,000

FOUR new records were hung up by the electric light and power industry during November. Reports for the month received by the ELECTRICAL WORLD for electric generating and distributing companies representing 81 per cent of the installed generator rating of the country indicate that the average daily output was 163,813,000 kw.-hr. This exceeded the previous record made during October by 9,323,000 kw.-hr. In addition, the total output for the month of November was 4,915,000,000 kw.-hr., which exceeded the former high monthly figure set during October by 130,000,000 kw.-hr. and the output reported for November, 1921, by 23.1 per cent. The second set of record figures reported by the industry for the month of November is to be found in the revenue received from the sale of energy. The average daily revenue from the sale of energy during November was $3,380,000, which exceeded the previous record, made during February, 1922, by $353,000. In addition, for the first time in the history of the industry the total gross revenue for the month exceeded one hundred million dollars, the exact figures being $101,400,000, which exceeds the previous record, made during October, 1922, by $8,100,000.

Expressing the financial phase of the returns in terms of the operating ratio, or ratio of operating expenses to the gross revenue from the sale of energy, shows that financially the industry is very close to the position it occupied this time last year. The operating ratio reported for November by companies having steam plants only, taken in the aggregate, was 50.4 per cent against 50.2 per cent for November of last year. It is encouraging to notice that the operating ratio has decreased from 56.6 per cent in August, or by about 6.2 per cent. Such a decrease in the operating ratio between winter and summer months is to be expected, however, on account of the relatively higher percentage of low-revenue industrial energy sold during the summer months. During the past fall this was overcome to some degree by the higher price of coal subsequent to the strike. If the normal trend of past years is followed, the operating ratio should continue to decrease and the lowest point should be reached during December or January, when the high revenue load is at its peak. However, if the price of coal decreases in the spring, it may be that the operating ratio will decrease further, notwithstanding the curtailment in domestic lighting requirements which occurs as summer approaches.

A final government report indicates general advances

TABLE I—CENTRAL STATION RETURNS FOR THREE MONTHS

| Mos. | Percentage of Installed Ratings Represented | Kw.-Hr. Output (Companies Reporting) | | | Percentage of Installed Ratings Represented | Revenue from the Sale of Energy (Companies Reporting) | | |

in production, transportation and distribution during November. One of the outstanding facts is that the usual seasonal decline in building contracts failed to materialize in November. Expansion of employment throughout the nation was the greatest since January, large gains being reported in the iron and steel industry, tobacco, textiles, and metal products other than iron and steel. These favorable industrial data, taken in conjunction with the fact that the advancing season called for largely increased consumption of electrical energy for electric lighting purposes, explains very clearly the record figures quoted above.

Every section of the country except the Mountain and Pacific States reported material gains in output over October. The largest gain was reported from the Atlantic States. The slight decrease reported by the Mountain and Pacific States was undoubtedly due to the decrease of irrigation requirements with the advancing season.

## Hydro-Electric Plant Within the Arctic Circle

THE unusual size of generating sets used in the Norwegian state power house on the Glomfjord, 30 miles above the Arctic circle, together with a number of unique features of the general station layout, attract considerable interest. According to G. Troeltsch in the *Elektrotechnische Zeitschrift*,* this development has a watershed of 96 square miles, yielding on an average 88 cu.ft. of water per second. Several large lakes into which a group of glaciers discharge serve as a natural water-storage reservoir, totaling 18,356,000,000 cu.ft., or about 70 per cent of the yearly water flow. A 9,050-ft. pressure tunnel of 192-sq.ft. cross-section delivers the water to the collecting bay, from which two high-pressure penstocks lead down to the power house at the seacoast, representing a head of 1,542 ft. These pipe lines taper from 6½ ft. top diameter to 4.6 ft. at the lower end. They are built up of welded-steel pipe lengths riveted together. For topographical reasons it was necessary to lay about two-thirds of the penstock in one direction and the rest of it at an angle of almost 90 deg. to the first run. At the upper end of each of the penstocks three independently operating closing gates are installed to minimize the danger of flooding the power house in case of failure of the pipe lines.

*E. T. Z., Nov. 9 and 23, 1922.

The foundation of the power house provides for six sets of turbines, but the present superstructure will house only four. The turbines are of the Pelton double-runner type, built by Voith, with a rating of 25,000 hp. for two of the units and 27,500 hp. for the third, all to operate at 300 r.p.m. The runners of the larger unit measure 11 ft. in diameter and have each twenty buckets 2 ft. in width. The waterwheel rotor weighs complete with the shaft 35 tons. The water jets from the two nozzles are 10 in. in diameter. Double regulation with needle and jet deflectors is provided, being operated by a double-piston "servo-motor," for which the pressure is derived from two independent sources. One oil pump is belted to the main turbine shaft, and a second pump is driven by a small Pelton wheel. Tests made on the turbine at the power house showed a highest efficiency of 88.2 per cent and an increase in speed of 8.8 per cent when a load of 23,000 hp. was disconnected.

The direct-coupled three-phase generators, built by the Almänna Svenska, are rated for 20,000 kva. at 80 per cent power factor, 25 cycles, 15,000 volts and 300 r.p.m., but are guaranteed to withstand a permanent overload of 2,000 kva. The machines are completely inclosed and are ventilated by two fans made of fins attached to each end of the rotor. The over-all diameter of the large generator is 22 ft. The complete machine weighs 225 tons, of which 95 tons are rotating.

The entire stator rests on a number of rollers in the bottom of the generator pit, so that in case a coil section burns out in the lower part of the stator that part can be turned upward for easy repair. The rotor is built up of six steel disks, to which are fastened ten poles. The main generator bearings are water-cooled. To each of the three bearings of a set a small hand pump is connected to force oil under the heavy shaft of the machine before it is started. An exciter is directly connected to the generator shaft.

As the center of energy consumption is only about three miles from the power house, the 15,000-volt generator voltage is used directly as transmission voltage. Two three-phase lines of 240-sq.mm. copper carry the entire output of the power house. For a distance of 1 mile they run through a tunnel along the seacoast, and then outdoors for 2 miles more on very attractively built reinforced-concrete towers.

The cost of constructing this station with its present capacity of 77,500 hp. was $5,600,000, or $72.50 per installed horsepower.

# Keep Public Contacts from Sparking—III

### A Few More Suggestions Pointing to Opportunities Where Central-Station Executives May Develop Policies that Will Prevent Small Points of Friction and Improve the Standard of the Public Service

By E. L. MILLIKEN
*Stone & Webster Management Division*
*Assistant Manager Blackstone Valley Gas & Electric Company, Woonsocket, R. I.*

MUCH has been written of late on the subject of educating certain classes of central-station employees who are in particularly close touch with the consumer. Less stress has been laid on the importance of the managers and executives of companies setting an example for these employees, not only in their own dealings with the public, but in their relations with the employees.

The force of a good example is just as much needed in our public relations work as it is in any other phase of human endeavor. Proper and courteous treatment of employees by company officials is bound to be reflected in similar treatment of the public by these employees. The pyramid is not complete unless there is an apex as well as a base. As a matter of fact, the relation of most employees to the management and executive staff is a dual one. They are consumers as well as employees, and as today, under state regulation, they rarely receive preferential rates, their status as consumers is on a par with that of all other consumers. So proper public relations, like charity, must begin at home. This thought is stressed in order that the points in the following paragraphs may be understood to apply to the entire organization of a public utility.

*Employees' Attitude When Buying in Local Stores*—Purchasing from local merchants by employees may well be fostered in an unobtrusive, diplomatic way. Local merchants, particularly in the smaller cities and towns, feel that they are entitled to at least a fair portion of the trade of the employees of the local central station.

#### ENCOURAGE EMPLOYEE BUYING

The official family of a utility may help wonderfully in this respect. Yet the good may be nullified if they make deprecatory statements as to a merchant's goods or compare his prices with what they can get elsewhere. They do not have to buy from him if they do not so choose, neither do such complaints ever help them, and their attitude many times reflects unfavorably on public sentiment regarding the company.

*Family Affairs*—The attitude of the family of a central-station official, and especially of a manager, may do much harm to the company. His wife or his children may offset all that he may do to improve his company's standing in a community. His happy relations with the men of the community may be brought to naught or diminished in value if his family, working through their families, creates a negative impression.

*General Social and Business Intercourse*—Seldom does a central-station official make an enemy without that enemy some day being in a position where he can refuse to do the company a favor or give it additional business. The converse is true as regards making friends. The pigeons always come home to roost.

A central-station manager particularly cannot afford outwardly at least to condemn, disparage or discredit any person or movement. On the other hand, he can well afford to boost each and every legitimate civic movement and praise and make friends with every citizen. The dollar of the central station's income knows no sex, no creed, no nationality and no political faith.

*Passive Resentment*—We have heard much of the "passive resistance" policy of the followers of Gandhi in India. From this we may well learn a lesson. The central-station company which becomes lulled into complacency because of lack of complaints may well become suspicious. No matter how good the service rendered, there is always an underlying sentiment in the community which, for lack of a better term, we will call "passive resentment." This is antagonism to the company unexpressed either to it or even to other consumers. It is the nursing of grudges many times of long standing. Its particular danger lies in the fact that those consumers who entertain the feeling have been unable to get satisfaction from the company and have given up in disgust. This sentiment can only be unearthed by a constant broadening of the service policy and by having company officials and employees keep their ears close to the ground.

#### WOMEN CAN CREATE FAVORABLE SENTIMENT

The "greater service" policy of the Southern California Edison Company points one way in which such sentiment can be reached and negatived. Another way is for the central station to send around women to do house-to-house repair service. Possibly in this latter way, on account of using woman representatives, more complete information is acquired about passive resentment. These women seem to get closer to the housewife, and she tells them more freely her troubles. The sentiment of business men and all civic bodies may be favorable to a company, but that company is not strong in the community unless the sentiment in the homes of its consumers is likewise favorable.

*Studying Buying Impulses*—In order best to understand the public we serve and to increase our gross earnings to the maximum possible, we should study the impulses which prompt people to buy various classes of commodities, including our own service. After having become familiar with these we should, so far as possible, cater to them.

Too often we take it for granted that all people are convinced of the need for our service. This is not true, and there is a large portion of the public who have yet to be shown wherein our service can benefit them. We should find out what it is that people want in the line of service and then try to show them wherein our own service supplies their wants.

Various statements have been made in recent months commenting on the number of people who have bought automobiles as compared with the ones who have had their homes wired. Not much effort seems to have been made to fathom why a given family makes various sacrifices in order to buy and run an automobile. By studying this question it is very possible that we shall be able to produce arguments which we can use to induce people to make a somewhat smaller sacrifice than is required to buy an automobile and have their homes wired.

*Study Mercantile Practices*—The writer not long ago sat in a store sipping one of those concoctions made popular by the Eighteenth Amendment. The proprietor of this particular store had a reputation not altogether to be envied as regards his relations with other men, yet his business was prosperous and growing. Observation at the time showed that whatever his qualities were which resulted in lack of favor in the eyes of his fellow business men these qualities did not enter into his relations with his customers. His clerks were uniformly attentive and courteous to each and every customer, regardless of his or her station. The proprietor was at the front of the store, and while he did not make sales directly he had a pleasant word for nearly all his customers before they left.

### Study Business Methods of Small Dealers

This experience, so opposite from what had been expected, caused me to wonder if we could not profit in our industry by actually studying the business methods of the successful small retailer. As far as residential lighting is concerned, the central station is a retailer, and it is only the nature of the business, the great need for and value of the commodity sold—gas or electric service—that results in an unusually large number of consumers and makes the central station a larger industry than the small retailer.

The relations with the individual consumer are, or at least should be, no different from those of the grocer, the baker or the shoe dealer. Therefore study of the business methods of the small stores should be productive of good, if but to show in some instances things not to be done.

*Advising Customers Regarding Appliances*—The natural zeal which all good salesmen show in selling lighting or heating appliances sometimes leads to strained relations with purchasers. This is more particularly true of those appliances which are naturally large consumers. The indiscriminate sale of room heaters or hot-water heaters is decidedly inadvisable. In the case of hot-water heaters, particularly of the automatic type, not alone is the first cost of the appliance considerable, but likewise the increase in the customer's bill. Unless he is thoroughly advised as to the cost of operating the appliance, it will invariably give rise to complaint on his part.

Many times this results in the company having to take back the appliance, but it cannot take back—and in fact it is very difficult to overcome—the distrust engendered in the customer's mind by the whole transaction. It would be better not to sell such appliances than to have this result.

Salesmen should be made to understand that the sale of an appliance by the company is not completed with his making out the order for delivery or with the customer's payment in full for the appliance. They should be educated to the point of view that the appliance is only finally sold when the customer is satisfied with the service which the appliance renders and with the expense to him of such service.

There is only one way to forestall conditions arising such as those above outlined, and that is a careful study on the part of the sales organization of the adaptation of the various types of the more expensively operated appliances to the needs of the various classes of customers. The sales department must know all of the characteristics of these various types and the cost to operate under various conditions. Then only are the salesmen properly equipped to sell these appliances in such a manner that they will stay sold.

*Instruction in the Schools*—We all know the difficulty of educating the present generation to an understanding of the gas or electric meter. There is no excuse however, for permitting the next generation to be unfamiliar with the principles of the meters and how to read them. This is best accomplished through the physics classes in the high schools. Some of the modern physics textbooks already devote some space to the reading of meter dials, and some even go so far as to illustrate the meters.

The trend of modern physics instruction seems to be towards practicability, and most instructors on the subject will be only too glad to have presented to their laboratories some modern house meters with glass cases. If they are properly approached, the chances are that they will allow the company to send a representative to talk to the physics classes on the construction and reading of meters whenever this subject is reached in the courses. In this way the consumers of tomorrow can be made to understand the accuracy of the meter and learn how to read it.

What is true of meters is likewise true of domestic appliances. The central station in any territory may well make it a point to see that the domestic science laboratories in the schools in its territory are equipped with standard gas and electric appliances, such as electric ranges, vacuum cleaners, electric flatirons and washing machines. There would seem to be no better place to teach the housewives of tomorrow the benefits of gas or electric service than at that formative period of life when they are receiving instruction in the public schools.

### Help School Courses

The study of optics, which comes under the general consideration given to "light" in the physics courses, offers another field for valuable work in the schools. Hitherto considerable time has been spent on the study of various optical problems which the student rarely encounters in his every-day life after leaving school. If a presentation is made to the school laboratories of some of the new portable luminometers, the physics instructors, when they come to the subject of "light," will have the means of teaching their students practical illumination problems. If we can by this means bring before the children of the country the importance of proper and scientific illumination in the schools, in their homes and in factories, the entire plane of artificial illumination will be raised, with a very evident favorable effect on the electric lighting industry.

*Telling the Story*—In their efforts to improve public and consumer relations, there is nothing to be gained by central stations "hiding their light under a bushel," and there is everything to lose. Advise the public

when you cut out application cards, when you adopt a liberal policy as regards rebates, when you instruct your employees on this and that movement to better the service. The public will respond and assist your employees in carrying out this policy.

*Giving Credit Where Credit Is Due*—To give to an employee or group of employees credit for some particular accomplishment in connection with the company's business has a very favorable effect on public sentiment. Such action on the part of the executives of the company always becomes known in the community eventually. The organization which has the reputation of giving credit where credit is due is bound to stand in a favorable light. The effect is favorable primarily on the employees, because they feel that those higher up along the line are watching their efforts.

There is nothing new in these paragraphs. The conditions of which they treat have existed since the earliest days of the industry. In some instances remedies have been applied, and in others it yet remains for them to be applied. The instances quoted are not theoretical, but are the results of actual experience and observation. The remedies suggested have proved successful in attaining the ends sought.

# Lamp-Socket Standardization

**International Agreement on Receptacle Dimensions Takes Precedence Over Lamp-Base Gage—Conference of Manufacturers to Be Called**

AS PUBLISHED in the ELECTRICAL WORLD of Dec. 2, the International Electrotechnical Commission met at Geneva, Switzerland, Nov. 20-25. Among the subjects taken up for consideration was the standardization of lamp bases and sockets. Delegates from France, Holland, Germany, Great Britain, the United States and Italy came prepared for action on the matter and as a result of their deliberations it can be confidently said that international agreement on lamp and socket dimensions is fairly well assured.

The printed report of the lamp committee of the Association of Edison Illuminating Companies and the sub-committee of the standardization committee of the American Institute of Electrical Engineers showed that the Americans had delved more deeply and exhaustively into the subject than any of the other delegates, and for that reason the fundamental facts in their report served as the basis of the discussion. At the outset it was agreed to consider only standard lamps with screw bases, leaving candelabra and miniature lamps as well as lamps with bayonet bases to come up for discussion and action at some other time. It developed that the screw base is used all over the world except in France, England and certain French and English colonies, where lamps with bayonet bases predominate.

The main general question considered at a preliminary meeting on Nov. 24 was whether to standardize the lamp base first or the lamp socket. The English delegates were inclined to favor the former, while the American delegates favored the latter and in this were suported by the Germans. The reason advanced was that the socket is the permanent or long-lived investment and piece of apparatus, so that it was logical to make that part of the combination standard and uniform, after which lamp-base standardization would immediately and automatically follow.

The chief difference between American and European practice rests in the depth of thread, the German lamp possessing a deeper thread than the American lamp. It was explained by the German delegates that a deeper thread was resorted to in order to eliminate trouble which had been experienced from lamps falling out of sockets. While incandescent electric lamp manufacture in Europe is concentrated in the hands of a few manufacturers, sockets and receptacles are made in many small factories and machine shops without standard gages, dies or jigs, so that the sockets are not so uniform as the lamps. German manufacturers of lamps had hoped that by deepening the lamp thread they would force the adoption of a deeper thread in the sockets.

### AMERICA FAVORS SOCKET STANDARDIZATION

At the formal meeting of the committee it was proposed by the American delegates that an effort be made to standardize a universal socket which the data at hand indicated would be substantially of the same dimensions as the standard American socket. There was some discussion over the name to be given this standard, objection being made to the use of the word "American." The words "universal" and "Edison" were proposed as alternatives, but no formal recommendation was made. The European makers expressed themselves as being willing to adopt and use the American socket as standard if it could be demonstrated that in practice there is no possibility of trouble in regard to the fit of the European-base lamp in the socket.

Inasmuch as some of the delegates could not commit themselves to any fixed set of dimensions without consultation with manufacturers of the metal parts, definite action could not be taken at that time. An agreement was reached, however, on the following points:

1. That effort should be concentrated on the standardization of a universal type of socket.

2. That through the good offices of representatives of the manufacturers present the questions of fact which had been raised at the meeting shall be subjected to inquiry by a group of manufacturing experts of interested countries, and that this group shall meet in Europe for the purpose of discussing the actual manufacturing dimensions and tolerances which are requisite in such a universal socket.

3. That this group of manufacturing experts shall report its findings to the national committees represented at the meeting and to the central office of the I. E. C. for general distribution.

4. That subsequently a meeting of this I. E. C. advisory committee shall be called, preferably about the middle of 1923, the time and place to be at the discretion of the central office. The suggestion was made that this meeting be held preferably at The Hague, in Holland, in the month of May or early in June, depending upon the completion of the work of the manufacturing experts. The work acomplished by the manufacturing experts will be reviewed at the proposed meeting of the I. E. C. advisory committee, at which as wide a representation as possible is suggested.

At the conference were Dr. C. O. Mailloux, president I. E. C.; C. le Maistre, secretary, and Percy Good, assistant secretary. The French delegate was C. Zetter, the Dutch delegate Dr. G. Holst, and the German delegation comprised Dr. H. Remane and Dr. Hermani. The British were represented by S. W. Attwell and E. G. Batt. The American delegation comprised Clayton Sharp, M. D. Cooper, S. E. Doane and F. V. Magalhaes. Italy was represented by Signor Clerici.

A Place Set Apart for Suggestions, Comments and Criticisms, to Which All Men of the Electrical Industry Are Cordially Invited to Contribute

### Fears Reaction of European Chaos on America

*To the Editors of the* ELECTRICAL WORLD:

As a result of a short business trip to Europe I have been so impressed by the uncertain conditions abroad that I cannot help believing our country will and must be affected to a great extent by what is happening in the Old World. I have made inquiries from many different sources and to my surprise I have always received the same answer. The people over there do not expect war, but they all fear that something is going to happen which may be worse than a war. In some countries there is a tendency to throw the governments over, and in others legislation is threatened which is destructive of capital and will undoubtedly throttle enterprise. Even the little Republic of Switzerland, which was saved from the horrors of war and has a currency almost on a par with our dollar, is going through a serious crisis in the way of legislation which is headed in the direction of communism. If the chaos in Europe grows greater, there is no telling what will happen, and I cannot help but fear that if Europe "blows up" the explosion will be badly felt in this country.

ARNOLD PFAU.

Allis-Chalmers Manufacturing Company,
Milwaukee, Wis

### Paper-Pillar Switch Insulation

*To the Editors of the* ELECTRICAL WORLD:

The interesting article in your issue of Jan. 13 by Clifford N. Anderson, entitled "Hydraulic Power-Plant Practice in Northern Europe," has brought to my mind some facts with reference to our practice here in the United States, particularly with reference to extra-high-voltage disconnecting switches and circuit breakers.

Mr. Anderson's article illustrates 100,000-volt disconnecting switches with paper-pillar insulators. It may interest your readers to know that a considerable number of paper-pillar-insulated disconnecting switches were supplied ten years ago to the Big Creek system of California for the 150,000-volt power-plant and substation equipment. These have given entirely successful and reliable service on this system, which is now operated by the Southern California Edison Company. The design of the switching equipment was carried out under the supervision of the writer, and the following data thereon may be of further interest.

In appearance the switches were practically the same as those illustrated, but they were equipped with somewhat larger "static shields" or "brush-discharge rings" than the paper-tube or pillar diameter. They were also equipped with corresponding brush-discharge rings at the base of the tubes or pillars to control better the distribution of the static field relative to the supporting structure. Air clearance between static shields, either between pillars or to ground, was approximately 4 feet.

It was during the development of the details for these switches and the oil circuit breakers for corresponding applications, as well as the details for the 132,000-volt and 110,000-volt applications made in the five years prior to 1912, that the advantages of proper static-field distribution both in air and in oil were demonstrated.

It is, moreover, interesting to note that the design of this 150,000-volt apparatus contemplated and the tests demonstrated its adequacy to withstand 500,000 volts at 60 cycles, based on three times 165,000 normal voltage to ground.

J. N. MAHONEY,
Consulting Engineer.

Brooklyn, N. Y.

### Meter Maintenance on Scattered Systems

*To the Editors of the* ELECTRICAL WORLD:

I note with great interest an article on "Meter Maintenance on Scattered Systems" written by H. M. Johnson in the ELECTRICAL WORLD of Oct. 28 last. It occurs to the writer that Mr. Johnson is following a wise course in the method of testing large power meters that he employs. However, I am of the opinion that tests are made more often than necessary. Of course, where the consumption is large and expense of testing kept down to a minimum, the ratio of expense to income would largely control such a test. I am pleased to observe that an over-all test is made, as this is the practice of most Pacific Coast companies and has been for several years.

The company with which the writer is connected does not remove meters to relag for power factor. This is done by the use of a phase-shifting transformer made by J. C. Albert of Los Angeles. The test blocks used are satisfactory, but it would seem that a double switching arrangement would be more advisable as it would eliminate the possibilitiy of the tester coming in contact with high voltage while making connections. A scheme has been worked out by using two sets of cutouts and a pole-top switch. The switch is locked open under normal conditions. We have found that outdoor current and potential transformers are more flexible and less expensive than self-contained metering outfits for primary voltage.

The arrangement of test instruments and equipment is worked out very well, and Mr. Johnson should be commended highly for the system which he describes.

W. H. TALBOTT,
Superintendent Electric Meter Department.

San Diego, Cal.

### Water Resistance and Temperature

*To the Editors of the* ELECTRICAL WORLD:

In an article on electric boilers in the ELECTRICAL WORLD of Dec. 2, 1922, page 1211, the statement is made with reference to water resistance: "To this comes the very decided increase of resistance with increasing temperature." I have always found a decrease of resistance, the boiler current increasing quite rapidly as the water heats up. There is also a decrease of resistance due to concentration of impurities as the water evaporates, so the final resistance will be very much less than that of the feed water.

LOUIS E. MCCOY.

St. Maurice Lumber Company,
Three Rivers, Quebec.

[We agree that the above correction should be made. As a general principle water resistance decreases with an increase in temperature and we do not know of any impurities that might be present in sufficient quantity with negative temperature coefficients to offset this condition.—EDITORS.]

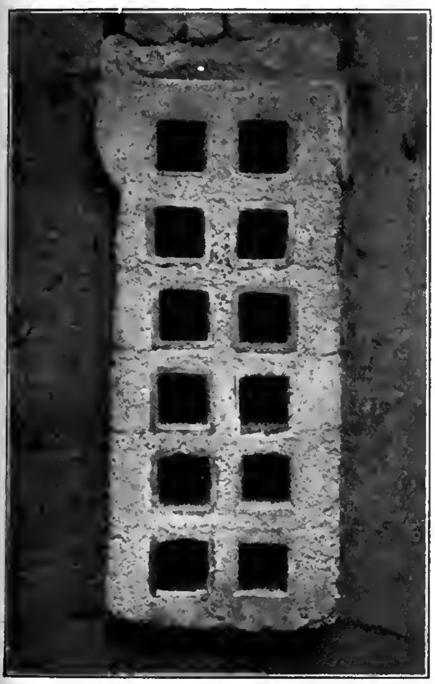
Installation, Operation, Maintenance, Test and Repair of Generation and Distribution Equipment, and Methods of Economically Utilizing Electric Service in Large Industrial Plants

## Gaining Speed in Laying Tile Conduit

IN THE past two years a number of subway lines have been constructed in Kansas City with vitrified-clay conduit $4\frac{1}{2}$ in. and 4 in. square, consisting of eight, ten and twelve ducts. The ducts were laid with $1\frac{1}{2}$-in. separation, filled with a mixture consisting of one part Portland cement, three parts sharp sand and five parts $\frac{1}{2}$-in. rock. When using this thick layer of concrete between ducts it was necessary to allow the concrete to set from eight to twelve hours before each successive layer was laid. It was found that if a second layer were laid on soft concrete there was considerable settling of the duct, throwing joints out of line.

The method of laying was to paint both sides of the tile with paint and wrap 3-in. muslin around one end, painting the muslin thoroughly on the outside. This work was done on top of the trench by the helper and handed down to the layer, who painted the tile and the outside of the tape. There was no other fastening used to hold the tape—the paint drying very rapidly and making a comparatively firm joint. A 48-in. x $3\frac{3}{4}$-in. square mandrel made of hard maple was drawn through each duct as the layer advanced, the mandrels being drawn ahead.

The manufacturer furnished this duct with a $\frac{7}{8}$-in. wall in the $4\frac{1}{2}$-in. duct and a $\frac{3}{4}$-in. wall in the 4-in. tile duct. The outside of tile was grooved, which has been the general plan in making tile duct. The manufacturer was asked to eliminate these grooves and make the outside plain. Considering the method of painting the tile and using the muslin for making joints tight, it was felt necessary to have a plain surface to eliminate the chance of cement or water leaking into joints during construction. There was thus a saving of time, as it was very simple to paint the smooth surface and insure tight joints. This change was made by the manufacturer and proved successful.



SUBWAY LINES CONSTRUCTED IN KANSAS CITY WITH VITRIFIED CONDUIT

Right—Built-up-in-the-trench method ready for concrete. The joints are staggered and painted tape laid over the ends ready for the next joint.
Center—Built-up method employed experimentally on a ten-duct line.
Left—A twelve-duct conduit built by the layer method ready for the construction of the concrete manhole.

The problem of waiting for concrete to set as each successive layer was laid presented itself in cases where crossings were made under railroad tracks or in places where soil was difficult to hold in place. To speed up the work, the "built-up" method was employed, using concrete separators 6 in. wide by 12 in. long and $1\frac{1}{2}$ in. thick. These were placed at each joint, laying two joints on each separation and staggering them approximately 2 in. When the eight, ten or twelve ducts were built up, sloppy concrete was poured from a wheelbarrow into a convex steel trough or chute, causing the concrete to flow to the sides of the trench and drain from the sides toward the conduit. In other words, the concrete flowed from the sides and bottom of the trench between the layers of duct, filling all voids. This is an improvement over the old method of dumping concrete on top of duct, which left voids between and at the bottom of duct line. While the concrete was being poured a long-handled tamper with a steel blade 10 in. wide, 20 in. long and $\frac{3}{16}$ in. thick was used continuously, with an up-and-down motion, causing suction and helping to fill voids in the concrete.

A test section of conduit, consisting of ten ducts which were built up in the regular way, is shown in one of the illustrations. After setting for seven days the bank was

torn down. No voids whatever were found. In another photograph the "built-up" method with part of the work concreted and back-filling work in progress is shown. It is approximately 12 ft. to the bottom of the trench on account of the fill-in at railroad tracks. In the third picture is shown a completed twelve-way subway line of 4½-in. duct. This is at the entrance to a manhole which has been excavated and is ready for the construction of the manhole walls.

# Extracts from Operating Code

BY FIELD EDITOR ELECTRICAL WORLD
New York, N. Y.

## Detailed Instructions for Boiler-Room Force

AMONG the principal points to consider in the operation of the boiler room of a power plant are these: Maintaining proper amount of water in boilers, evenly loading all units, protection of brick lining and stoker bearings, blowing down boilers to remove light contents from surface of water which tend to produce foaming, and blowing the main blow-off valves to remove sludge and scale-forming material that may be in the water.

The reasons for operating boilers at or near the same rating are as follows: (1) Greater reliability in following load variations, as the same increase in load can be taken up more rapidly and with less damage to the fires if the increase is made on a large number of boilers at moderate rating than it can when only a few are operating at a very high rating. For the same reason it is much easier for the operator to control boiler-feed water, prevent safety valves from blowing, control blowers and dampers, etc. (2) Trouble on any one boiler, necessitating taking it off from the line, can more easily be handled with boilers at same rating than if they were at different ratings. (3) Better efficiency of the boiler room as a whole is obtained. (4) The clinkers stick less in fires that are operated at low ratings. (5) The maintenance cost of furnace parts and outside stoker parts is greater on boilers that are operated at high rating than on boilers operated at medium ratings.

The actual operating code used by the Philadelphia Electric Company in the general operation of the boiler room follows:

1. After assuming responsibility for the shift, the boiler operator or water tender must not leave the boiler-room floor under any consideration without notifying the shift superintendent or boiler engineer, or, in the event that he has a stoker operator under him who is capable of tending water, he may notify this man that he is to take responsible charge. In any event the water tender or boiler operator must not leave the floor in time of trouble or impending trouble.

2. Maintain proper amount of water in each boiler when steaming.

3. All boilers should be operated at or near the same rating.

4. Draft and stoker speed should be set according to previously determined instructions.

5. Always maintain the draft over the fire as stated on the chart used for this purpose. Exception is made to this only for a short time in the case of dumps in stations where there is no means of putting air on the extension grates.

6. All extension grate dampers should be opened according to the general instructions of the boiler engineer.

7. Fires should be inspected by the water tender or boiler operator from the front, side and rear doors from time to time to determine their condition. This should be done by the aid of colored glasses made for this purpose.

8. When dumping time approaches all fires must be inspected, and those fires which have good coal on the dump plates must be burned down in the rear before dumping. If there is so much coke on the dump plates that it is impossible to burn it down properly, this coke should be winged back on the fire with a bar.

Where extension grates are installed, the rear of the fire may be burned down by opening the extension grate dampers. Where these are not installed, the rear boiler damper should be opened wider than usual.

9. Dump each fire as rapidly as possible, but allow sufficient time between boilers so that the steam pressure will not be affected.

10. With boilers equipped with clinker crushers, care must be taken to see that large clinkers do not form in such a position that they will not go through the rolls. This type of clinker should be hooked around with a bar so that its length is parallel with the clinker crusher.

The cinder in the crusher ash pit should be tested with the bar to determine if large clinkers are forming. The ash should be held at about half way up the long waterbacks and all the way up the short waterbacks.

11. Blow down the boiler from both the main and surface blow off (when provided) according to the instructions of the boiler engineer. The main "blow-down" should be made with the boiler banked if possible. The surface "blow-down" should be made while steaming.

12. The blow-off valves of the economizers should be operated according to instructions of the boiler engineer. Feed-water valves to economizers should be opened and valves to the boiler should be closed while blowing down the economizer.

13. The procedure in blowing down main blow-offs is as follows: (a) Open plug cocks with lever wrench; (b) open main blow-off valves slowly; (c) close main blow-off valves slowly, and (d) close plug cocks with lever wrench. While blowing down, the water tender should watch the level of the water in the gage glass.

14. The water tender should enter on a suitable boiler-room log sheet the number of hours each boiler was steaming, floating on the line, banked and out of service, the time of dumping, the number of hours the fans were in operation, and the reading of the stoker counters at midnight or at a predetermined time.

## Switching on Lines

TRANSMISSION and distribution lines above 6,000 volts are energized from the source end as a precaution against service interruptions. If a faulty line is put on at the generating station this line will trip out without causing any further disturbance. If, however, it is put on at the substation end, it may trip out the lines feeding the substation and cause the loss of the entire substation load. Likewise, where two lines feed an industrial consumer, if the second line is energized at the industrial load consumer's end and if it is faulty it may trip out the loaded line, causing the loss of his entire load; whereas if the second line were energized at the substation, the fault current would be a smaller proportion of the capacity of the substation lines and therefore less likely to cause interruption.

The instructions issued by the Philadelphia Electric Company covering switching on transmission and distribution lines are given in the following paragraphs:

1. All lines must be energized from the source end, whether originating at a generating-station bus or at a substation bus.

2. Operators must wait for a pilot light on an incoming line before paralleling, unless otherwise instructed by the load dispatcher. No lines shall be paralleled without first synchronizing, in stations where the bus may be energized from separate sources.

3. When a line is put back in service after an interruption, the operator should watch its ammeter closely, and if the load does not come on within three minutes, the load dispatcher must be notified.

## Field Testing of Insulators Essential to Good Service

"DESPITE the fact that insulator manufacturers are all turning out much better material than they were able to do several years ago, we as operating engineers still have to wipe out the old picture of restoring service as quickly as possible after a shutdown," declared J. H. Sturge, division superintendent Public Service Electric Company, New Jersey, before a recent meeting of the Boston Section of the A. I. E. E., discussing a paper by Frank C. Doble of the Doble Engineering Company, Boston, on "Insulator Testing Problems."

Mr. Sturge said: "Now the picture is that there must be no shutdown. This means that we must be able to locate defective insulators easily and safely without taking the line out of service." He pointed out that last year a line 50 miles long was tested by this method. The line was equipped with three-piece insulators and was connected grounded-Y and operated at 26,400 volts. Every pole was climbed with the line shut down, every insulator was examined, and every insulator showing visual defects such as hair-line cracks and chipped shells was removed before applying the Doble test. Two per cent of the total insulators were thus removed from the line after this visual inspection. The line was then put into service and gone over again with the Doble tester, with the result that 1 per cent of the insulators were indicated as defective. These insulators when removed to the laboratory were tested and all were found defective in fact. Mr. Sturge said that he would not adopt any other known method, such as the short-circuit method, because of lack of safety.

TESTING PIN-TYPE INSULATORS ON LIVE LINES

K. A. Hawley, Locke Insulator Corporation, Victor, N. Y., pointed out that there were about twenty-five million insulators in service in the United States and that some means for testing them in the field is very valuable. Insulators began to be put out twenty-five to thirty years ago, and a fair percentage of the early ones are still in use. The quality of insulators is being improved year by year. The causes of depreciation of insulators are, first, bursting due to internal stress; second, moisture absorption, due to porous porcelain. These two types of failure deserve separate consideration. When an insulator is on its way to complete failure, it constitutes a hazard to the system. An insulator which will not megger infinity is either cracking or leaking through absorption of water. A three-piece insulator in good condition should show better than 200,000 volts on puncture test, and a suspension type which flashes over at 90,000 volts would not be likely to puncture at a potential under 130,000 volts.

### Insulators Will Always Require Service Tests

Prof. D. C. Jackson of the Massachusetts Institute of Technology doubted whether the industry would ever reach the point where insulators would attain such perfection of design and manufacture as to require no tests in service. Tests will cost less than the interest on the cost of overinsulation of lines, buses, etc.

It was generally recognized in the discussion (1) that every transmission-line insulator should be tested in the field before being placed in service, (2) that every insulator in the field should be tested periodically, (3) that live-line testing is most satisfactory from the standpoint of cost and efficiency, and (4) that live-line testing apparatus should protect the operator from direct shock and protect the insulator under test from short circuit of its parts, reduction in leakage path and potential in excess of normal operating value.

A vital need of today is an agreement in the industry upon some standards to determine when an insulator is bad enough to warrant its removal from service.

## Mixed Culm and New Coal Keeps Up Service

BY COMBINING culm with freshly mined coal the Ohio Power Company was able to utilize its reserve of culm coal in maintaining service during the coal strike. This system of blending culm with the newly mined coal has been in operation for the past six years. By this method the average cost per ton of mixed coal burned was lower than the price of the coal obtained during the coal-strike period and burned alone. Although no comparative figures on the cost of plant operation have been completed, about 15 per cent more storage slack, or culm coal is required for the same steaming capacity that is obtained from freshly mined coal.

LOADING THE MIXED COAL BY BELT CONVEYOR

During the miners' strike a weekly maximum tonnage of 1,750 was loaded at Cambridge, the location of the culm piles, and shipped into Newark. To do this three gasoline tractors were employed, together with teams, and the total cost of loading operation was reduced 50 per cent compared with an all-team equipment. The illustration on the following page shows the tractor in use for reclaiming the slack coal.

In mixing this slack coal with the freshly mined the method used is that when the bunkers are filled one bucket of culm slack and then one bucket of freshly mined coal are placed into the bunkers at one time. While this does not give a uniform mixture, experience has shown that the desired results are obtained. An average heating value of this mixed coal is about 12,000 B.t.u. The only

objection in using culm is that the soot and dust become a nuisance, but by employing a balanced draft and keeping the coal sufficiently wet before it goes into the furnace troubles of this nature have been reduced about 50 per cent.

The company has about 100,000

GASOLINE TRACTOR LOWERS LOADING EXPENSE 50 PER CENT

tons of this slack coal in storage and has found it valuable in giving continuous uninterrupted service regardless of the market price of coal. E. T. WAGENHALS,

Ohio Power Company, Manager.
Newark, Ohio.

## Three-Phase Transformer Rating Standardized

STANDARD ratings for three-phase power transformers have been augmented recently by the Electric Power Club to include the range between 44,000 volts and 220,000 volts. These ratings have been adopted and became effective Jan. 1, 1923. The standard sizes, voltage ratings and taps of stepdown transformers for supplying lighting and power service as they now stand are given in the accompanying table.

The standard type of transformers for this class of service are self-cooled oil-immersed, water-cooled oil immersed, and air blast. The application of air-blast transformers is confined to systems where the voltage does not exceed 25,000. Standard frequencies are 25 cycles and 60 cycles. Standard sizes for oil-immersed self-cooled transformers in kilovolt-amperes continuous rating at 55 deg. C. rise are 300, 450, 600, 750, 1,000, 1,200, 1,500, 2,000, 2,500, 3,000, 3,750, 5,000 6,000, 7,500, 10,000, 15,000, 20,000, 25,000 and 30,000. For water-cooled oil-immersed or air-blast transformers the lowest rating is 750 kva., the sizes above this being the same as for the self-cooled type.

Transformers having low voltage rating of 230/460 are suitable for series or multiple service only. Standard three-phase step-down power transformers for supplying secondary distribution and having voltage ratings listed in the table will be designed for successful operation when excited on full winding at 5 per cent above their rated voltage. Standard three-phase step-down power transformers having voltage rating as given in the table are not suitable for supplying 4,000-volt distribution as such service would necessitate a "Y" connection on both high-voltage and low-voltage side simultaneously, and this connection might result in excessive stress in the winding due to harmonic voltages.

When a standard transformer is suitable for normal application to two voltage ratings, this flexibility will be definitely indicated on the nameplate, on the connection diagram or on a poster inside the transformer cover.

The standard ratings for three-phase distribution transformers in

THREE-PHASE POWER TRANSFORMERS FOR SUPPLYING LIGHTING AND POWER SERVICE

Voltage ratings shown in bold type are the normal voltage ratings of these lines and, unless otherwise specifically requested, manufacturers will offer guarantees covering electrical characteristics such as efficiency, regulation, etc., on these normal-voltage ratings only.

| 88,000 | 1,200 to 10,000 | 1,500 to 15,000 | **88,000Y** | 83,600 | 79,200 | ..to **2,300** or to **6,900** .or to **11,500**..or to **13,800** |
| 110,000 | 2,000 to 10,000 | 2,500 to 15,000 | **110,000Y** | 104,500 | 99,000 | ..to **2,300** .or to **6,900** .or to **11,500** .or to **13,800** |
| 132,000 | 2,500 to 10,000 | 3,000 to 15,000 | **132,000Y** | 125,400 | 118,800 | ..to **2,300** .or to **6,900** or to **11,500**..or to **13,800** |
| 154,000 | 3,000 to 10,000 | 3,750 to 16,000 | **154,000Y** | 146,300 | 138,600 | ..to **2,300** .or to **6,900** or to **11,500**..or to **13,800** |
| 220,000 | 3,750 to 10,000 | 5,000 to 15,000 | **220,000Y** | 209,000 | 198,000 | ..to **2,300** .or to **6,900**..or to **11,500**..or to **13,800** |

the 6,600, 11,000, 13,200, 22,000 and 33,000-volt classes have been modified to include two 5 per cent full-capacity taps in the high-voltage winding instead of one 10 per cent tap.

These standards will be incorporated in the next edition of the Electric Power Club Handbook.

FIELD EDITOR ELECTRICAL WORLD.
New York, N. Y.

## Rigid Transformer Supports Insure Reliable Service

IN SUPPLYING energy to industrial plants service entrances and transformers are frequently placed on walls, roofs or other exposed places, and mechanical strength in wiring supports is vital to continuous service. Four examples of recent installations designed with this requirement in mind are shown herewith. A transformer installation of unusual compactness and rigidity is shown in Fig. 1 of the illustration. The transformers are hung by metal straps from a horizontal angle iron bolted through the factory wall, the comparatively low-voltage primary leads being run at the top of the bank in rigid conduit, with short taps into the cases, appropriately drip-looped. The secondaries, running single-phase, are carried up the side of the building from one unit and into the factory direct from the other two. The weight of the transformer bank is further supported by a horizontal strap at the bottoms of the cases, with bolts into the pilasters and window casings as shown. The bank takes up little space outside the bays between pilasters, and the wiring is adequately safeguarded.

A transformer installation on an industrial plant roof is shown in Fig. 2, under construction. A simple frame of vertical and horizontal angle irons carries insulators at the top for an outdoor bus line, and at the intermediate height are secured tie rods and strain insulators by which an incoming three-phase circuit can be dead-ended and provide ample space for downward taps into the transformer casing. A convenient means of carrying various circuits over the cornice of an industrial building and downward toward the street for an overhead crossing is shown in Fig. 3. Here angle-iron bracing firmly attached to the building wall is equipped with insulators carried far enough out to provide a desired separation of circuits, clearing the wall satisfactorily and still accessible with reasonable care for future changes. In place of the unsightly runs of heavy cables and home-made wooden frames sometimes used in supplying energy to industrial establishments via the roof, the use of rigid conduit and junction boxes in Fig. 4 is of interest. The joints are copper-flashed to keep out moisture, and intermediate supports for the conduit run are in the form of rings attached to horizontal cross-bars carried on vertical pipe risers. The last are seated in foundation blocks fastened to the roof. Changes in direction are easily made at the junction boxes, and the whole installation has a "shipshape" appearance far from usual in industrial applications of electrical importance.

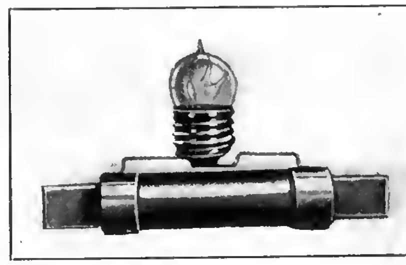
## Indicator for Blown Fuses Increases Production

INTERRUPTION to the chain of production, discouragement of speeding piece workers and opportunity for complaints and excuses caused by blown fuses can be completely avoided by those who will



TEST LAMP ON FUSE INDICATES WHEN FUSE HAS BLOWN

take the trouble to have small test lamps permanently installed on each fuse and a supply of proper fuses in readiness. Lamps in their sockets can be installed on the outside of fuse boxes and the wires run to the fuses within the box.

By this arrangement the test lamp is shunted by the fuse so that when the fuse blows the circuit is completed through the lamp and indicates the trouble. Lamps should be of low wattage and of the same voltage as the circuit on which they are to be used.

Because of the installation of these fuse indicators in one shop the improvement in morale has been very marked and the slight expense has been returned many times in increased production.

## Building Industrial Load

**Some Suggestions for the Commercial Man on Developing the Electric Light, Heat and Power Loads in Shops and Manufacturing Plants**

By J. W. Carpenter
A. E. Fitkin & Company, New York, N. Y.

Any central-station man who starts out to develop the industrial load of his company has three distinct opportunities in every place of business he may approach. He is able to offer modern lighting, power and industrial electric heating.

Each of these services is something which can be sold if the proper study is given to the development of demand and if the selling effort is maintained. The reward for the effort expended in securing this business is found in the substantial additions to gross income, the large increase in business through one contract that may equal several dozen residential contracts, and the satisfaction that comes with the knowledge that there has been a distinct step of progress by the new customer.

### Prerequisites for Developing Industrial Load

There are certain fundamentals in the development and negotiation of industrial load that must be followed carefully to insure continued success. The man closing the contract, whether he be property manager, visiting engineer or local salesman, must first study externally the situation on which he is to work. In this he must (1) grasp the general conditions of the business of the company, (2) know the personal fancies of the men with whom he deals, (3) find the particular need of the prospective customer for the service, (4) arouse advance interest on the part of the "prospect" by the use of letters and printed matter, (5) know of the recent developments in electric apparatus in order that he can recommend the newest types of equipment or the most advanced practices.

There is in addition to the foregoing one urgent caution. Negotiations should be started with the chief executive of the prospect company. Many times successful efforts have been made to convince plant engineers, foremen or superintendents of the advisability of adopting electric service, but the entire negotiation has fallen through when it is carried to the owner or general manager because he had not grasped the situation first. On the other hand, if the man at the top is approached first in an introductory way, he will be waiting for a report of the details which are worked out with his subordinates.

### Lighting

A man working on industrial business has much to offer. In the lighting field there is unlimited opportunity for load. Probably about 95 per cent of the factories and shops in this country need a completely new lighting installation. Commercial men can readily call to mind the inadequate lighting in many places in their own district where outlets are placed in haphazard fashion, lamps are too small and dust covers the fixtures. Such conditions are crying for attention. The industrial emergency during the war taught us that better and brighter light brings greater production and finer workmanship.

Any man who will take a few lamps under his arm can find places enough for their installation. It is a specific opportunity for the salesman in the central-station company or for the local contractors. Any manager who will convince just one local contractor of the profit he can obtain from rewiring and relamping industrial plants in his territory will find that the contractor, the central-station company and the customer will profit greatly.

In the power field there is large opportunity for increased business that calls for intelligent, diplomatic and persistent effort. The Electrical World for Jan. 6, 1923, tells us that the industrial field of the central station is only one-third developed. There are certain common methods of obtaining this load: (1) by gaining a foothold with an initial installation, (2) emergency service, (3) new building, or (4) complete conversion.

### Power and Heating

In the first of these the central station gets a small load by installing a motor or two and perhaps all of the lighting, owing to the overloaded condition of the isolated plant. This will lead, with good service and treatment, to the gradual acquirement of the entire load. In the second case a broken-down engine, a leaky boiler or a fire gives an energetic central station a chance to install one large motor for urgent power needs. Perhaps this will be used for only a short time, but the convenience of that electric drive will bring the entire load over with group or individual drive in a short time. In the third case—new building—it is comparatively easy to obtain the motor load.

By the use of manufacturers' data and the information prepared by the national electrical societies the isolated plant can be shown to be much more expensive in first cost and in operating costs. This is particularly true if sufficient weight is placed upon the cost of duplicate equipment needed in an isolated plant for continuous service. In the fourth case, complete conversion of a plant requires particularly the proper preliminary work, careful engineering and continuous follow-up. Rome wasn't built in a day, and a private plant cannot be converted overnight. Securing the power contract for a plant of from 100 hp. to 500 hp. after a year of negotiations is pretty good work. However, the economy and convenience of central-station service will conquer the most stubborn "prospect" if the story is brought to him often enough.

The newest field for development is industrial electric heating. Many electrical men know very little about it and do not appreciate its possibilities. Nevertheless, electric heating in industrial processes is growing by leaps and bounds. Paint drying, bread baking, japanning, core baking, heat treating, vitreous enameling, brass melting and steel refining are a few of the things accomplished electrically. All of these cannot be done so cheaply by electric heat as with some other sources of heat, when fuel cost alone is considered, but other economies in saving of material and improved quality of the product more than offset the difference in cost.

### Follow-Up Essential

Finally, the cardinal rule of the golfer, to "follow through," applies equally well to the central-station business. Quiet but persistent, polite but tenacious "follow-through" is needed until the contract for new business has been signed and forgotten by the customer who has learned to consider this service as an integral part of his operations.

## Servicing Electric Ranges

**Company Policy — Chief Causes of Trouble and Cost of Maintenance and Repair Work**

By A. H. Kruel

Assistant Superintendent Meter and Service Department, Portland (Ore.) Railway, Light & Power Company

ON NOV. 1, 1922, there were 1,475 electric ranges on the lines of the Portland Railway, Light & Power Company, and approximately 125 additional range sales had been booked, which would bring the total up to 1,600 at the end of the year. To keep these ranges in satisfactory operating condition the company has adopted a very liberal attitude in its repair service. The policy is to maintain each range connected—largely without cost to the customer for material or labor—indefinitely.

This service includes elements, plates, switches, thermostats, door springs and hinges, racks and pans. It also includes refinishing and painting of oven linings to a limited extent, but does not provide for new linings except when renewed within the year's guarantee of the manufacturer because of defectiveness. All other repairs are made for the cost of material only to the customer unless the range requires a general overhauling in the shop, for which a charge for both labor and material is made. The range service applies to all ranges, whether purchased through the company, the retailer or the competitive power company, as long as they are served by this company.

### Three Principal Causes of Trouble

The most common complaint from customers is that the plates or ovens do not heat. Aside from the heating elements being defective, this complaint is due to, first, the range being equipped with plates or oven

PORTLAND COMPANY'S ELECTRIC RANGE SERVICE CAR

elements designed for a higher voltage than that of the distribution system; second, low voltage on the range, which requires increased transformer capacity, and, third, defective thermostats on the ovens. Much emphasis is placed upon this third cause for low heat, because practically all range customers rely entirely upon the indicated heat as shown by the thermostat. Such a wide variation is shown in thermostats of the same make that consumers are advised by range service men to disregard the tables sent out with ranges for various cooking heats and to use their own judgment about the quantity of heat required. There seems yet to be designed the perfectly efficient and reliable thermostat. The greatest common defect of electric ranges is the short life of the heating element. Table I shows a classification of complaints

TABLE I—CLASSIFICATION OF RANGE COMPLAINTS

| Defects | Number |
|---|---|
| Coils and plates | 443 |
| Contacts | 116 |
| Door springs and hinges | 75 |
| Oven elements | 44 |
| Thermostats | 34 |
| Painting ovens | 33 |
| Switches | 26 |
| New linings | 17 |
| Shorts, grounds and miscellaneous calls | 365 |
| Total | 1,153 |

TABLE II—COST OF SERVICING ELECTRIC RANGES

| Year | Complaints | Average Ranges in Service | Complaints per Range | Material Cost per Range | Labor Cost per Range | Total Cost per Range |
|---|---|---|---|---|---|---|
| 1919 | 1,153 | 456 | 2.1 | $1.56 | $3.96 | $5.52 |
| 1920 | 1,506 | 701 | 2.1 | 3.34 | 4.54 | 7.88 |
| 1921 | 2,009 | 846 | 2.3 | 2.53 | 5.31 | 7.84 |

on service calls received during 1919. No summary has been made at a later date. Table II shows the costs of maintaining electric ranges for three years, not including 1922.

Two service automobiles, similar to the one shown in the accompanying illustration, equipped with a full stock of range parts are used in servicing ranges. In addition, a third machine takes care of new installations and also does service work when necessary. One of the two service machines can also make deliveries and installations when occasion demands. Five ranges have been delivered and installed in one day by one machine, and occasionally both machines have installed as high as nine ranges in one day. At present there are three range men with a helper to service and install ranges besides the one man (sometimes two) who burns off and sets up ranges for delivery from the shop. About six hundred new ranges were added to the system during 1922, and the indications are that this number will be exceeded in 1923.

## To Win the Confidence of the Public

THE Interstate Power Company of McGregor, Iowa, which serves a number of communities in southwestern Wisconsin and northeastern Iowa, has adopted a policy of taking the public into its confidence which is reacting in the company's favor. From time to time small properties have been purchased and added to the company's transmission system, which extends on both sides of the Mississippi River. While these different properties were in process of being interconnected it was not possible to render 100 per cent service. In some cases misunderstandings arose, and to clear away such difficulties and create good will for the company moderate advertising campaigns are being carried on in the towns served.

As new additions to the company's plant and property are made an-

nouncements are carried in all the newspapers published in the communities. For instance, when connection had been established with a new hydro-electric plant at Prairie du Sac, Wis., an announcement was made stating that this plant had become a part of the company's system and would give the territory another source of water power which would increase the reliability of the service. In one case an interruption to the service, caused when a house mover fouled the company's transmission line, was explained as follows:

### Why the Lights Went Out

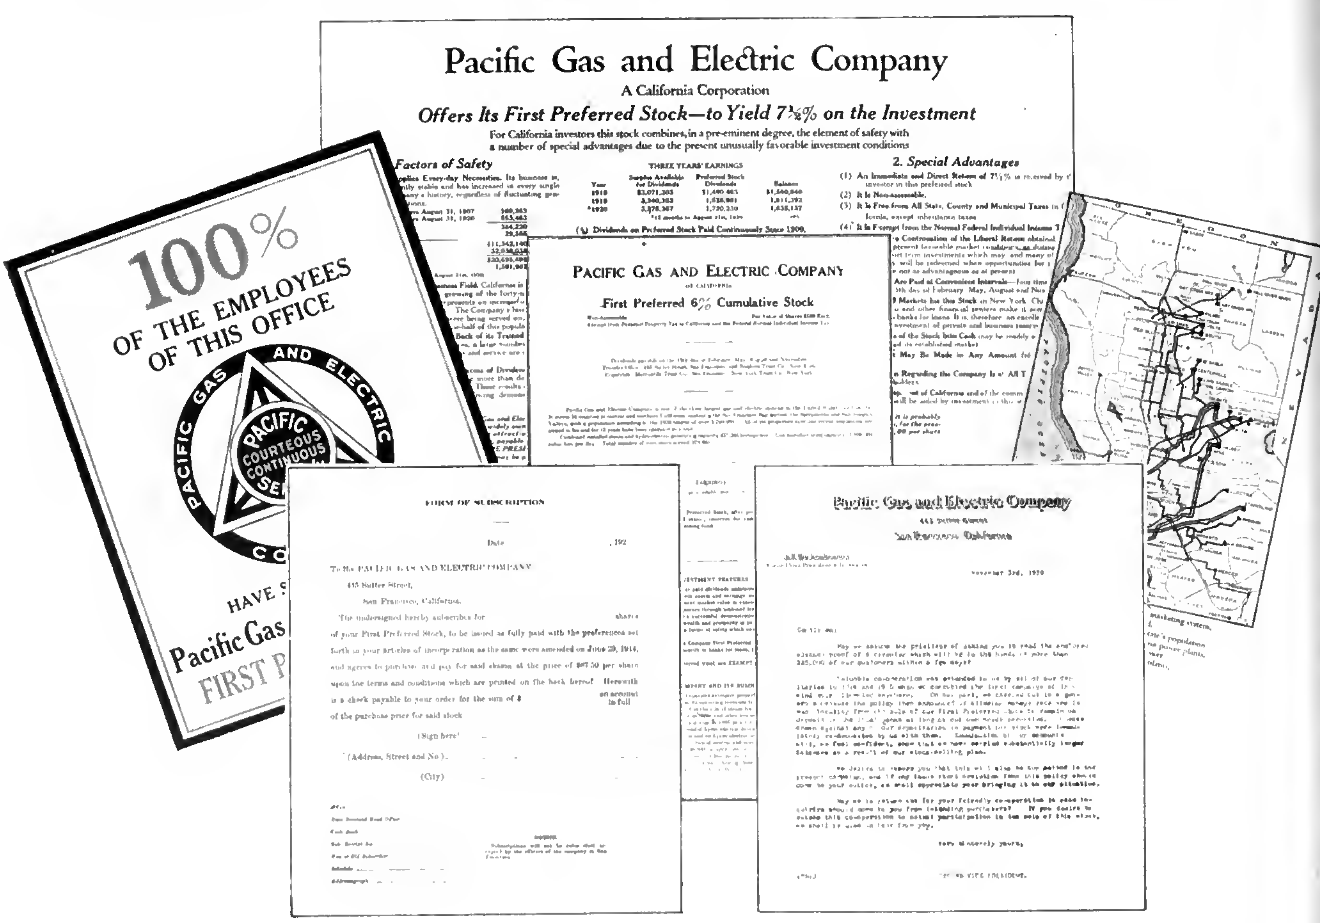
At 2:57 p. m. on Dec. 28 all of our towns from Platteville to Cresco suffered an interruption. This was due to a house mover in Boscobel, Wis., allowing a house which he was moving to become fouled in our transmission line. It was just luck that this house was not set on fire or some one injured. All towns suffered minor interruptions, and Boscobel was without service for two hours and a half.

If any one who has trees to trim or houses to move which will come near our lines will notify our local representatives or the general office at McGregor, we shall gladly have representatives on the job to prevent damage to property or interruptions to service.

In an effort to educate the public and win its confidence in another direction, the company is making use of a motion-picture machine. Last summer during a wild-life school for nature study which is conducted at McGregor every year the Interstate Power Company, to do its part toward making the gathering a success, rented a motion-picture projector, obtained several films which were appropriate to the work of the school and showed them at the evening meetings. The idea took so well with the public that other reels were shown at the request of the women's clubs and church organizations. It became so popular that the company purchased the projector and screen, which are now kept at its headquarters subject to call.

A photographer has been sent over all of the company's lines and has taken pictures of the transmission system, stations and scenes along the lines and in the towns served. One of the company's engineers is now making the rounds of the various communities served, showing the reels in the different motion-picture theaters. Invitations to prominent men and women are extended by the company's representative at each place, and the exhibition is very well received by the public. The company feels that it has been more than repaid for the trouble and expense of purchasing the machine and showing the pictures.

## Publicity Which Helped to Sell $35,000,000 of Stock to California Customers



When the Pacific Gas & Electric Company first opened its customer-ownership campaign in 1914 it adopted a definite policy of keeping its stock constantly in the mind both of the public and of its employees. This was accomplished through a well-planned program of newspaper advertising, reading notices, display cards and frequent bulletins to employees, all of whom at some time have acted as salesmen. Typical examples of the different forms of advertising used are shown above.

During the eight and one-half years of the campaign the volume of stock sold at any particular time has been in direct proportion to the amount of money which was being sent for advertising. Over the entire period, in which more than $35,000,000 of preferred stock has been sold, the advertising expense has averaged only 84 cents per share.

## Elimination of Red Tape Improves Service

VARIOUS steps toward making relations with the public smoother were described in a recent address before managers of Stone & Webster properties by Gardner Rogers, manager of the Blackstone Valley Gas & Electric Company, Pawtucket, R. I. During the past year many minor changes have been made in business methods, in an effort to eliminate red tape, complicated forms and everything appearing intricate or arbitrary in relations with the public. Representatives of the company have also endeavored to introduce a little extra courtesy in their dealings with customers.

To all new customers a courteous multigraphed letter is sent when their order for service has been taken. All customers who have registered trouble calls are called on the telephone to see if the trouble has been satisfactorily remedied, and if they cannot be reached in this way, a letter is written. A card is being sent to customers, accompanying their final bill, thanking them for their patronage and hoping for a further renewal of business relations.

### CUSTOMERS SHOULD "ORDER," NOT "APPLY" FOR, SERVICE

All signed orders for gas and electric service have been eliminated, and the management believes this is one of the biggest steps so far in the interest of good public relations. "A good while ago," said Mr. Rogers, "we came to the conclusion that when a customer wants to buy service he should be allowed to *order* rather than to request or apply for it. Either gas or electric service may now be secured on telephone order and wherever possible we set the meter immediately upon receipt of such an order, without waiting for credit to be established. If we find a deposit is needed, it is secured after the meter has been installed. We feel that this is a step in the direction of both quicker and more acceptable service.

"We have reduced considerably the number of deposits required and are now taking them only in case of customers who appear to indicate less than an even chance of prompt payment. We are taking only about half as many deposits per thousand new customers as we were doing a year ago, the present ratio being about one to eight."

The company has also started refunding old deposits to customers who have established their credit. This refunding is proceeding gradually. The money now held as deposits, divided by total customers, is $1 as against $1.26 two years ago.

## What Other Companies Are Doing

**Hartford, Conn.**—Less than two-tenths of 1 per cent of the 39,000 residential customers of the Hartford Electric Light Company requested the restoration of the former rate of 10 cents per kilowatt-hour after a year's trial of the company's new rate comprising an area charge plus 6 cents per kilowatt-hour. This rate went into effect in January, 1922. The company offered to rescind the new rate after twelve months' use in case of dissatisfaction, and as the year closed it published in the daily press form letter blanks addressed to the Mayor, in order to facilitate the filing of objections.

**Chicago, Ill.**—Subsidiary operating companies of the Middle West Utilities Company on Dec. 1, 1922, had a total of 394,706 customers, or an increase of 58,555, this representing a gain of 17.4 per cent in twelve months. Connected load of these companies on Dec. 1 was 333,890 kw., an increase in twelve months of 104,152 kw., or 24.3 per cent. Merchandise sales for the twelve months were $1,450,755, or a gain of 20 per cent over the previous twelve months.

**Tacoma, Wash.** — In the last year out of 847 employees of the Tacoma division of the Puget Sound Power & Light Company, 501 have purchased stock in the company. This, in connection with the previous sale of notes to employees and to the public, has been a factor in the improvement of public relations, according to a report presented before a recent convention of managers of companies operated by Stone & Webster, Inc.

**Lake Geneva, Wis.** — Forty-two employees of the Southern Wisconsin Electric Company received Christmas presents in the form of paid-up life-insurance policies of from $500 to $1,500, depending upon their length of service. The policies were taken out by the company under the "group" life-insurance plan and total in amount of insurance $36,000. Nine employees received policies for $1,500, two for $1,200, two for $1,000, six for $800, sixteen for $600, six for $500, and one a policy for $700. Every employee who had served with the company on or before June 30, 1922, received a policy for $500, those who had served a year and less than two years $600, two years and less than three years $700, three years and less than four years $800, four years and less than five years $1,000, and six years and more $1,500. The policies are so drawn that should an employee leave the service of the company he can continue the insurance by paying the premium himself.

**Salem, Mass.** — Before central-station service was introduced into the mills of the Naumkeag Steam Cotton Company, it was customary, as in many other engine-driven factories making textile goods, to shut down the plant annually for painting and repairs to machinery. In 1914 this establishment opened a new plant supplied with energy by the Salem Electric Lighting Company, and until the summer of 1922 no shutdowns were necessary for general overhauling. The argument for central-station service and the motor drive is obvious.

**Pawtucket, R. I.** — New power business to the amount of over 2,600 kw. was contracted for during 1922 by the Pawtucket division of the Blackstone Valley Gas & Electric Company, 2,160 kw. of this representing actual gain in power load. As a result of obtaining this business three steam engines and one oil engine were shut down and considerable inroads were made into the power load carried by three other private steam plants operating in the territory.

**Ann Arbor, Mich.**—Next Easter vacation at the University of Michigan the electric light and power men of Michigan will gather for a week of intensive study and demonstration of the principles of good wiring and installation and handling of meters. A short course has been designed to cover most of the demands for a high standard of service as required by the Michigan Public Utilities Commission in a recent general order. Those in charge of the course from the university department of engineering are Profs. B. F. Bailey, Joseph H. Cannon, H. H. Higbie and A. H. Lovell; for the Michigan Electric Light Association, Herbert Silvester, Ann Arbor, secretary; J. C. Langdell, A. S. Albright and Oscar Hauser, Detroit.

# Digest of Electrical Literature

Including Brief Abstracts of and References to Important Articles Appearing in the Scientific and Engineering Press from All Parts of the World

## Hydro-Electric Development and Steam Equipment

*An Ultimate 65,000-Kw. English Power Plant.*—The first 10,000-kw. turbo-generator unit for the new power plant at Leicester, England, has recently been placed in operation. While this amount of power is all that can be generated at this time, space is available for extension until a total capacity of 65,000 kw. is reached. An interesting feature of the station is the arrangement of the oil-break switches and other apparatus necessary for controlling the electrical output. The layout of the switching equipment in relation to the rest of the station is of the most up-to-date character.—*Electrician,* Dec. 15, 1922.

*Principles of Boiler Design.*—The leading principles involved in boiler design with special reference to economy are reviewed. The main points brought up are high furnace temperature effects, convection and velocity of gases, natural draft, air heaters, superheaters, economizers, high velocity of flames, reductions of furnace temperatures and oil burning.—*Engineer,* Dec. 22, 1922.

*Fuel Oil Versus Steam Engines for Small Power Plants.*—G. T. PRINCE.—Advantages of oil engines for municipal plants, experiences with Diesel engines and the high cost of coal affecting steam-engine operation are the main subjects discussed in this paper.—*Canadian Engineer,* Dec. 26, 1922.

## Generation, Control and Switching

*Operation and Control of Storage Batteries in Central Stations.*—A. FASTMAN. — Out-of-balance charging current should be minimized as far as possible, extent of charging should be limited, and floating charge should be avoided, while in addition observation of appearance of cells should play an important part during charging and observation of instruments should be practiced at all times, together with a careful regard to the working instruction card. If proper care and treatment are given to storage batteries and reliable judgment is cultivated by careful attention, depreciation can be avoided to a considerable extent.—*Electrical Review,* Dec. 22, 1922.

*Power Factor, Its Physical Meaning and Commercial Manipulation.*—W. G. H. CAM.—In discussing the question of power factor, the author first reviews the fundamental relations of electricity in order to create a background upon which to base his arguments. He then considers the advantages of keeping a plant power factor in the neighborhood of 100 per cent and describes the various methods by which this may be accomplished. — *Engineering Journal, (Canada)* January, 1923.

*Reducing Electrical Hazards in the Industrial Plant.*—Installation of modern types of inclosed and remote-controlled switches, the placing of all wires in conduits, the educating of employees to the understanding that every wire is to be considered "alive," and the prohibiting of all employees, except electricians engaged for that purpose, from operating or tampering with electrical equipment, have been the important factors in reducing electrical accidents and hazards in industrial plants. The practices of several companies in this regard are related.—*National Safety News,* January, 1923.

## Transmission, Substations and Distribution

*Electrical Developments at Liverpool.*—A new 12,500-kw. generator and an automatic substation have recently been placed in operation at Liverpool, England. The 500-kw. rotary-converter automatic substation is the first of its kind to be operated in England. The main features and details of the apparatus are described.—*Electrician,* Dec. 22, 1922.

*Economy of Transformer Connections.*—R. KORNFELD.—The author compares in this mathematical paper the relative advantages of operating (a) a bank of three single-phase transformers with a fourth single-phase unit as spare, (b) one three-phase transformer with an identical unit as spare, and (c) a bank of three single-phase transformers, operating in V in case of breakdown of one of the three units. The operation of (a) is 20 per cent cheaper than (c) but has 20 per cent higher losses. These losses can be materially reduced by operating in V-connection during periods of low loads. How far this can be carried out without too serious a distortion of the phase voltages resulting in an asymmetrical feeding of three-phase consumers is shown mathematically.—*Elektrotechnik und Maschinenbau,* Dec. 17, 1922.

*Causes of Transformer Failures.*—S. A. STIGANT.—The faults that most frequently occur in practice, and to which the discussion of the paper is devoted, may be classified as follows: (1) Breakdowns in the magnetic circuit, (2) breakdowns in the electrical conducting circuit, (3) breakdowns in the dielectric circuit, particularly in the oil and major insulation, and (4) miscellaneous structual breakdowns. A study of the records of modern transformer breakdowns over a period of years shows very conclusively that between 50 per cent and 80 per cent of the number of failures are due to short circuits between coils.—*Electrical Review,* Dec. 1 and 8, 1922.

## Units, Measurements and Instruments

*Determination of the Calorific Value of Liquid Fuels.*—H. MOSS and W. J. STERN. — Although accurate comparisons of the calorific values for different fuels may be found by the bomb calorimeter, the absolute values are not obtained with the same certainty. Investigations, explained in detail, have been carried on by the authors of several other methods. Experiments were made with gasoline, benzine, alcohol and paraffine oil at various rates of burning and with different water flows. The heat losses were examined and the accuracy of the instrument determined. —*Engineering,* Dec. 15, 1922.

*Recent Developments in Electric Clockworks.*—M. LAVET.—A large number of modern electric clocks are described and illustrated schematically, and their features are investigated mathematically. Many of the theoretically ingenious mechanisms do not show a good performance because of the unreliable operation of their auxiliary parts. The paper describes only self-maintained clocks, excluding so-called secondary clocks regulated from master clocks. — *Revue Générale de l'Electricité,* Dec. 2 and 9, 1922.

## Illumination

*Measurement of Light.* — J. W. WALSH.—The fundamental photometric magnitude from the point of view of visual measurement is, according to the author, brightness and not illumination. The photometric unit is one of luminous intensity or luminous flux. Of the two possible systems of definitions based on these respective magnitudes, that in which the unit is maintained seems preferable because it follows the natural order of mental conception. The relation between the flux unit of brightness (the lambert) and the intensity unit (the candle per square centimeter) is pointed out. — *Philosophical Magazine,* December, 1922.

## Motors and Control

*Motor Drives in Manufacturing Processes.* — R. TRAUTSCHOLD. — The modification of existing plants by changing from mechanical to electric drive will in nearly every case bring about results favoring the electric drive. Substituting a motor drive for a mechanical one for the average machine tool will as a rule entail no greater expenditure than will be returned by the economies obtained in one year's operation. The advantages of motor drive as pointed out by the author are reduced friction, flexibility, safety, and lighter building construction. — *Southern Engineer,* December, 1922.

*Automatic Plant for Village Lighting.*—A small engine-driven generator including a storage battery outfit has been used for lighting villages in England. The operation of this automatic generating unit is entirely controlled by voltage regulation, a detailed description of which is given.—*Electrical Times,* Dec. 7, 1922.

## Heat Applications and Material Handling

*Driving of Handling Machinery.*—H. BLYTH.—The supply of fuel to power plants and gas plants where the energy of the fuel is converted into either electricity or gas for distribution to consumers is best carried out by motor-equipped handling machinery. Typical coal-handling apparatus, such as the telpher system, belt conveyors and bucket conveyors, are described.—*Electrician,* Dec. 29, 1922.

*The Production of Carbon Black.*—J. J. JAKOWSKY.—The effects of several types of electrical discharges on natural gas has been studied in order to determine the fundamental factors underlying the reactions and their possible influence in the recovery of a greater part of the carbon content of natural gas than is now possible. Present commercial plants using natural gas recover from 0.8 lb. to 1.5 lb. of carbon black per 1,000 cu.ft. of gas consumed, or less than 5 per cent of the total carbon in the gas. Investigations, including apparatus set-up of the various methods so far used with natural gas, are summarized.—*Serial No. 2417 of the Bureau of Mines.*

## Electrophysics, Electrochemistry and Batteries

*Inspection of Ferrous Materials.*—E. A. ALLCUT.—Ferrous materials may be divided roughly into four classes, (1) rolled sections, such as bars, billets, and sheets; (2) tubes and drawn sections, (3) forgings, and (4) castings. Under these headings the author discusses characteristic defects, methods of identification, slag seams and piping, straightness, forging characteristics and various tests such as tensile and impact tests, blowholes, hard spots, etc. —*Canadian Engineer,* Dec. 5, 1922.

*Corrosion as Affecting the Metals Used in the Mechanical Arts.*—W. H. HATFIELD.—An interesting set of experiments which were conducted to decide upon the relative resistance of typical industrial metals to various corroding media are enumerated. An analysis of various metals which form the subject of experiment is given in tabular form. The mechanical properties, standard acid tests and corrosion tests of the metals are also given in this form.—*Engineer,* Dec. 15, 1922.

## Traction

*Electric Locomotives for Japanese Government.*—Two of the new locomotives for the Imperial Government Railways of Japan are considered. These are equipped with motors specially designed for narrow-gage track. They have high-speed circuit breakers and a new form of electropneumatic control, each feature being described briefly. The locomotives for this railway have been built for 1,500-volt direct-current operation.—*Electric Railway Journal,* Dec. 23, 1922.

*Diesel-Electric Railway Car.*—One of the first large Diesel locomotives built and run was the thermo locomotive delivered early in 1913 to the Prussian State Railways. This was a 1,000-hp. engine, giving train speeds up to 60 miles per hour. Since that time several engines have been built and have been in successful operation. The main part of the article is devoted to a description of an engine built for the Baden Nieg-erglat Section of the Swiss Federal Railways.—*Engineer,* Dec. 29, 1922.

*Automatic and Semi-Automatic Railway Signaling.*—H. S. PETCH.—The evolution of railway signaling to meet the demands of safety, and later of traffic capacity, has culminated in the modern automatic and semi-automatic systems. The track circuit, which forms the basis of all modern automatic signaling, is considered in this article, including its modifications to suit electrified lines. Apparatus controlled by track circuits is described, together with additional schemes for its safe operation. The article concludes with a description of some auxiliary apparatus designed to expedite traffic handling. — *Institution of (British) Electrical Engineers,* December, 1922.

## Telegraphy, Telephony, Radio and Signals

*Vacuum-Tube Amplification.*—S. E. ANDERSON.—For sensitivity the author claims that direct radio-frequency amplification should be used. One stage of radio-frequency amplification in a non-regenerative circuit gives about the same sensitivity as a first-class regenerative receiver. Two stages with good transformers will be about five times as sensitive as a simple regenerative circuit, and the regeneration in the amplifier will multiply this by about three. One additional stage of audio-frequency amplification will bring the weaker signals up to a more comfortable volume. Additional stages of audio-frequency amplification—never more than two—should be used only for operating a loud speaker, as they add nothing to the sensitivity of the receiver.—*Q. S. T.,* January, 1923.

*Telephonic Repeaters and Long-Distance Telephony.*—J. A. COOPER.—The paper reviews the development of long-distance telephony and shows the great improvements effected by the introduction of telephonic repeaters employing thermionic valves.—*Journal of Institution of (British) Electrical Engineers,* December, 1922.

## Miscellaneous

*Properties of Electrical Insulating Materials of the Laminated Phenol-Methylene Type.*—J. H. DELLINGER and J. L. PRESTON.—A comprehensive experimental research has been made upon the principal electrical and mechanical and a few other properties of the laminated phenolic materials. Measurements were made upon materials such as are furnished commercially by several manufacturers. The data collected have been arranged in such a manner as to be conveniently available for reference. A summary-comparison tabulation of the characteristic values of these properties of various materials is reproduced here. Average values for the various properties of laminated phenolic insulating materials are given regardless of grade, make or thickness. — *Technologic Paper No. 216 of the Bureau of Standards.*

CHARACTERISTIC VALUES OF PROPERTIES FOR SEVERAL INSULATING MATERIALS

| | Bakelite-Dilecto, Grade | | | Bakelite Micarta, Grade | | | Condensite Celoron, Grade | | Formica, Grade | | | |

# News of the Industry

**Chronicle of Important Events and General Activities, Announcements and Reports of Association Meetings, Court Decisions and Commission Rulings and News of Electrical Men**

## Birmingham Is to Rival Pittsburgh in Electric Power

The Alabama Power Company has started the construction of a substation at Leeds, Ala., which will cost in the neighborhood of $1,500,000 to complete. This station will distribute the power from Lock 12 and Mitchell Dam to the Birmingham district. When the power to be furnished through this station is available, together with the power furnished through the stations at Magella and Bessemer, 371,000 hp. will be provided for the industries of the Birmingham district, which will be the center of a power "loop" supplied from Jackson Shoals, Lock 12, Gadsden, Gorgas and Mitchell Dam.

The power at present available to Birmingham is put at 250,000 hp. Officials of the Alabama Power Company are responsible for the statement that when the station at Leeds shall have been completed Birmingham will exceed Pittsburgh in abundance and constancy of electrical power.

## N. E. L. A. Technical Committees Take Up Many Matters

With about two hundred men present from all over the country, the Technical Section committees of the National Electric Light Association were in session at headquarters in New York from Monday to Friday of this week.

Among the important questions before the committees is that of insurance as affecting plant apparatus, a matter which the electrical apparatus committee is considering in co-operation with the prime movers and insurance committees. The question of revision of the N. E. L. A. 1914 handbook on overhead-line construction is up for consideration by the overhead-line committee. It is hoped that the needed revision can be undertaken soon. The transition in power-plant practices to higher steam pressures is engaging the attention of the prime-movers committee, particularly with reference to materials that will successfully withstand the higher temperatures involved. The problems bound up in the trend toward use of extra-high-voltage cable are before the underground distribution committee.

Plans are under way to make a more effective distribution of the reports and other data coming from all the technical committees, and a satisfactory scheme has been evolved, announcement of which is expected in the near future.

On Tuesday evening Executive Manager Aylesworth addressed the members of the various committees at a general meeting. He emphasized the need of engineers directing their attention to the economic and political problems of the industry as well as those purely technical. A well-rounded consideration of all phases of the industry is needed, he held, to enable the engineer to accomplish his work to the best interests of the public and the utilities.

## Conference on Abbreviations and Symbols

The American Engineering Standards Committee has called a conference to consider the standardization of abbreviations and of the symbols used in engineering equations and formulas. The conference will meet in the board room of the American Society of Mechanical Engineers, Engineering Societies Building, New York City, at 10 a.m., Tuesday, Feb. 13. It will determine whether unification of engineering abbreviations and symbols should be undertaken and, if so, what the scope of such work should be and has been called in response to requests received from the American Institute of Electrical Engineers, the American Society of Mechanical Engineers and the Association of Edison Illuminating Companies. Because of the peculiar nature of the subject and the fact that some of the interested organizations will be unable to have representatives present, the Standards Committee has provided a questionnaire through which such organizations may send information by mail.

## Public Utility Commission for Texas Planned

A committee of officials of Texas municipalities has completed the draft of a public utilities bill for Texas, and this bill is now in the hands of members of the Legislature. The measure designates the Railroad Commission of Texas as the public utility commission of the state and increases the pay of its members $1,000 a year each. It provides a tax of one-half of 1 per cent of the gross receipts of the utilities to pay the expense of the commission and provides that any balance in this fund shall go into the state's revenues.

Texas has a "home rule" provision in its constitution, and this bill seeks to preserve to the home-rule cities all their present powers over their utilities while setting up state regulation also. Local utilities have the right to appeal to the Railroad Commission from decisions in the home-rule cities.

## House Passes Bill for the Control of Radio

The administration bill to regulate radio communication was passed by the House of Representatives on Wednesday of this week, and early action by the Senate is expected. Briefly, the bill provides that all operators of transmitting stations be licensed. All transmitting stations must be registered. A definite wave length will be assigned by the Secretary of Commerce to each, and the Secretary is to have broad authority to promulgate rules and regulations. Government stations are excepted from the licensing feature but agree to conform to the regulations when engaged in transmitting other than government business. Aliens cannot operate transmitting stations.

A section of the bill dealing with possible monopolies of the wireless business of the nation vests in the Secretary the power to refuse or revoke licenses where a monopoly is threatened.

The bill provides for an advisory committee consisting of men appointed by department heads, radio experts and amateurs, to keep abreast of development and the needs of the wireless industry. A provision for actual expenses of members of this committee when engaged in research work or such other duties as may be assigned them by the Secretary was stricken out.

## Consolidated Gas Issue Oversubscribed 300 per Cent

The recent offer by the Consolidated Gas Company of New York City—of which the New York Edison Company, the United Electric Light & Power Company and other electric utilities are subsidiaries—of $15,000,000 of preferred stock to customers and employees, under liberal terms, has been, officials of the company announce, oversubscribed by more than 300 per cent. In other words, nearly 58,000 subscribers applied for slightly more than $48,000,000.

Definite allotment of the full number of shares asked has been made to all who subscribed for from one to six shares. These 33,377 individuals received $4,347,650. Reductions in the number of shares allotted as compared with those subscribed for were made in all other cases, the proportionate amount of the reduction increasing as the number of shares desired increased. Employees of the Consolidated Gas Company and its affiliated companies subscribed for 52,751 shares, their average allotment being 3.21 shares, representing $2,637,550.

## Pacific Coast Men Prepare

**A. I. E. E. Committee Has Technical Program for Fall Convention Nearly Completed**

MEETING in San Francisco on Tuesday of this week, the convention committee of the American Institute of Electrical Engineers having in charge the annual Pacific Coast convention confirmed the tentative decision already announced to hold it at Del Monte, Cal., on Sept. 25 to 28. There will be three half-day technical sessions in the nature of symposiums covering nine outstanding problems now before the electrical industry. Seven of these subjects have been determined upon and are as follows: "Mechanical and Electrical Construction of Modern Power Transmission Lines," "Waterwheel Construction, Operating and Governing," "Experience of Manufacturing and Operating Engineers with Oil Switches," "Practice and Theory in High-Voltage Operation," "Operation of Group Power Sources with the Transformer Tertiary Winding in Operation," "Frequency Problems Arising with Extension of 60-Cycle Practice and Direct-Current Parallel Operation of 45-Cycle and 60-Cycle Power Groups," "Radio Communication Over Power Transmission Networks." The names of the leaders in these symposiums have not as yet been announced.

On Wednesday evening of the convention week the Edison medal will be formally awarded to Dr. R. A. Millikan, and on Thursday evening the formal convention banquet will be held. The afternoons of the convention week will be devoted to recreation in the historic setting of Del Monte and Monterey. On Friday afternoon a special train will leave for Hetch Hetchy, in the Yosemite Valley, when members and their guests will be shown the Moccasin Creek hydro-electric development and all the features of this water project of the city of San Francisco, which is designed to conserve water in the high Sierras and convey it 180 miles to San Francisco, developing 150,000 hp. en route as a by-product.

No stone will be left unturned to make this the most interesting and instructive convention of the Institute thus far held in the West. The convention committee consists of Harris J. Ryan (chairman), Robert Sibley (vice-chairman), R. A. Balzari, W. C. Heston, W. H. Hitchcock, W. P. L'Hommedieu, S. J. Lisberger, H. H. Millar, R. F. Monges and W. B. Sawyer, Jr.

## Service at Cost in Milwaukee

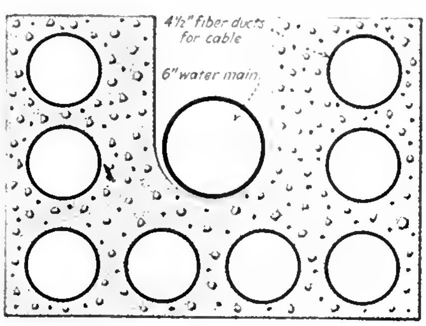
Service-at-cost operation of the electric light and street-railway public utility properties of the Milwaukee Electric Railway & Light Company in Milwaukee and the ultimate purchase of the property by the city are provided for in a contract which the public utilities committee expects to present to the City Council within the next two weeks, according to Fred S. Hunt, chairman of the committee. The contract must be ratified by the Council and authorized by a state law. Then the voters of the city must accept it. The value of the electric light and street railway properties will be fixed and the rate of return to the company agreed upon. The rates to be charged by the company will be fixed by the city, subject to appeal to the State Railroad Commission. Surplus revenues beyond the rate agreed upon will belong to the city.

Three methods are provided by which the city can acquire an interest in the property and ultimate ownership: By investing in the company's securities, by advancing money through a municipal mortgage and by applying the surplus revenues to purchase.

# Los Angeles to Install 35,000-Volt Cable

**Bureau of Power and Light Will Lay Seven Miles of Underground Conductor with This Rating for Substation Service in Downtown District**

SEVEN miles of 35,000-volt cable is to be installed by the Bureau of Power and Light of the city of Los Angeles between its central receiving substation No. 1 and substation No. 2, in the downtown business district, to relieve the badly overloaded condition of the cables now supplying the substations in the business section of the city. Three sections of cable, each 12,000 ft. long, will be installed. Two of these lengths will be of the belted type and the other of the Hochstadter type. Both types will be three-conductor, 400,000-circ.mil lead-covered cable. One of the noteworthy features of this cable is that the conductors will be sector-shape. Both types of cable will be paper-insulated, the thickness of insulation on the belted type being $\frac{33}{64}$ in. and that on the Hochstadter type $\frac{27}{64}$ in. The capacity of the two types will be 12,000 kw. and 15,000 kw. respectively.



CROSS-SECTION OF CONCRETE SUBWAY WITH 6-IN. MAIN IN CENTER

This installation will be watched with interest by engineers throughout the country because it will constitute the largest 35,000-volt underground cable installation in this country if not in the world. There is at present some 33,000-volt cable in operation, but very little cable working at 35,000 volts. For many years it was thought impossible to build cable for operation at pressures above approximately 19,000 volts, but recent successful installations have demonstrated that cables for operation at from 33,000 volts to 35,000 volts are feasible.

An ingenious method of installing the cable to dissipate the heat will be used. Fiber ducts 4½ in. in diameter will be cast in a U-shaped concrete block, and a 6-in. water main will be laid in this concrete trough, as shown in the accompanying illustration. Running water in this main will serve to dissipate the heat more rapidly. The manholes will be constructed with a concrete partition through the center, and four of the cables will pass through one-half of the manhole and four through the other. The water main will pass through the concrete partition. This concrete wall will be an effective fire barrier and will permit of the cables in one-half of the manhole being shut down while workmen are engaged, without danger of accident.

The first shipments of cable will begin to arrive soon, and the installation will be completed about June of this year. Only three cables will be installed at the present time, while the ultimate duct capacity will be eight cables. The cost of the immediate installation will be approximately $300,000.

## Tenney Interests to Manage Beverly Company

A controlling interest in the Beverly (Mass.) Gas & Electric Company has been acquired by Charles H. Tenney & Company of Boston, the negotiations having been conducted by John West of Macomber & West, engineers. The company will be managed by the Tenney organization, which also operates the adjacent northern Boston utilities serving the cities of Salem, Malden, Everett and Revere. The Beverly company operates a 1,500-kw. steam generating station which may later be interconnected with the large plant of the Salem company, the nucleus of electrical production in the territory named. A residential business of unusual value is included in the Beverly company's service, which covers a considerable portion of the famous Massachusetts North Shore.

## Yadkin River to Take Over Palmetto Properties

Announcement is made by P. A. Tillery, vice-president and general manager of the Yadkin River Power Company of Raleigh, N. C., to the effect that that company is about to acquire all the electric power and light properties now owned by the Palmetto Power & Light Company of Florence, S. C.

Since the organization of the Palmetto Power & Light Company in May, 1917, all of its capital stock has been owned by the Yadkin River Power Company and its properties have been operated under the general supervision of Mr. Tillery. The electric transmission lines of the two companies are also interconnected. Consequently the acquisition of the properties by the Yadkin River Power Company does not mean any change in ownership or in operating supervision. No changes in the personnel of the local managers in the communities served by the Palmetto Power & Light Company are expected to follow the change in ownership. The acquisition of the properties by the Yadkin River Power Company is for the purpose of facilitating the financing of the extensions to properties which are steadily being made.

# Telephony Over High-Tension Lines

### Westinghouse Electric & Manufacturing Company Tries Out "Wired Wireless" on 66,000-Volt System at Pittsburgh with Much Success

A SUCCESSFUL test of the transmission of radio waves over high-tension power lines was made on Jan. 11 by the Westinghouse Electric & Manufacturing Company before the radio sub-committee of the National Electric Light Association, a committee comprising representatives of some of the larger light and power companies of the United States. The test was carried out between experimental stations in the Colfax and Brunot's Island power stations of the Duquesne Light Company, about 30 miles apart, by engineers of both the manufacturing company and the power company. It was also demonstrated, according to observers, that this system could be used for remote control of all manner of apparatus.

For a long time the Westinghouse company has been working on a method of carrier-current control for use in central power stations and electric railways or other points using high-tension lines, and in this work the Duquesne Light Company has co-operated. Preliminary research on ordinary transmission lines and feeder circuits had indicated that the use of wired wireless was simple and effective on such lines. But when trying out the Duquesne company's lines it was found that its system was so complicated and extensive that many additional problems would have to be solved before it could be used for carrier current.

#### Unique Features of System

The demonstration, which was made in a small room of the power plant in Colfax where the committee had assembled, showed the feasibility of central-station companies carrying on telephone communication over high-tension lines, which, besides obviating inductive interference, would often save the expense of an additional right-of-way. The new system, which is unique in that it is duplex and operates as does the ordinary telephone, was demonstrated over a 66,000-volt line. When the telephone receiver is unhooked the transmitting station automatically starts up, allowing talk in both directions without any switching. This feature is entirely new in radio, as transmitting and receiving by other methods must be done by switching back and forth, because a station transmitting cannot receive messages. The calling or ringing of numbers is selective and operated by special selector keys which cause the bell to ring only at the station desired. This eliminates distracting code ringing and allows station operators to keep their minds on their work.

The improved system developed by the Westinghouse company has been carefully worked out by C. A. Boddie, radio engineer of the company, and its technical and economic features are now being analyzed by Mr. Boddie, assisted by M. W. Cooke of the Duquesne Light Company.

## "Farm Bloc" at Odds on the Muscle Shoals Bills

Lack of harmony among the members of the congressional "farm bloc" over the Muscle Shoals bills is reported from Washington. Some of its members resent the introduction by Representative Dickinson of Iowa of the bill already summarized in the Electrical World which provides for government ownership and operation of the properties over which there has been so much contention.

"I originally supported the Ford offer, but becoming convinced that it could not be accepted by Congress, I proposed the government corporation plan," said Mr. Dickinson. "I want action that will insure cheaper fertilizer to farmers. Since action on the Ford plan seemed impossible, I thought it time to suggest something else. If the Ford offer could be taken up soon and accepted by Congress, I would support it, but I do not want the whole question of disposing of Muscle Shoals postponed until December, 1923, or later. Many farm bloc members of the House will not vote for the Ford offer."

Representatives of the American Farm Bureau Corporation, which sticks by the Ford bill, now accuse Representative Dickinson of "trying to ride two horses." While some members of the farm bloc in the House, especially Southern Democrats, are standing by Mr. Ford, Senator Norris, who is numbered as one of the Senators supporting the farmers' movement, is quoting as saying that he knows of only two members who are supporting the Ford offer, outside of some Southern Democrats. These are Senators Capper (Kan.), chairman of the bloc, and Ladd (N. D.), a Non-Partisan League man. Senator Norris has proposed an appropriation of $2,000,000 for experimenting in the production of fertilizer at Nitrate Plant No. 1 to establish its possibilities.

## Bernard Baruch for Ford's Muscle Shoals Plan

Acceptance of Henry Ford's offer for Muscle Shoals, provided no better offer is available and conditioned on the actual production of nitrogen for fertilizer at the rate of 40,000 tons a year, is recommended in a special report made to the American Farm Bureau Federation by Bernard M. Baruch. A statement issued by Gray Silver, Washington representative of that federation, asserting that the Ford offer would make possible a reduction of three-fourths in the price of nitrogen used as fertilizer has been vigorously attacked by Senator Norris, chairman of the Senate committee on agriculture, who asserts that Mr. Silver is trying to deceive the farmers.

## Reorganization of American Public Utilities

A reorganization plan for the American Public Utilities Company, which controls the electric utilities operated by Kelsey, Brewer & Company of Grand Rapids, Mich., has been sent to stockholders. It provides for the elimination of the present 6 per cent preferred stock through its exchange into new prior preferred 7 per cent and 6 per cent participating preferred on the basis of three-tenths share of the prior preferred and eight-tenths share of the participating preferred for each share of the present 6 per cent preferred, with its right to accumulated dividends, and the dividend scrip or accrued dividend notes. Where the present holders of the 6 per cent preferred are not owners of scrip or dividend notes they will be required to pay $7.50 in addition to surrendering their stock for exchange.

The management announces payment of dividends beginning with April 1, 1923, on the new issues, provided that the plan is consummated. No change is contemplated in the common stock, of which $2,995,000 is outstanding, and no additional bonds are to be issued under the plan.

## Philadelphia Electric Company to Expand

Stockholders of the Philadelphia Electric Company will receive notice on Feb. 1 that at the annual meeting, which comes in April, they will be asked to approve an increase in the authorized capital stock from the present $65,000,000 to $100,000,000, of which it is proposed to issue an additional $10,000,000 of common stock. This new stock will

be offered for subscription at par pro rata to the holders of common stock, which will make the allotment from 33⅓ per cent as the maximum down to such lesser proportion as it may become by conversion of preferred stock into common in the meantime. There is a total of $15,000,000 8 per cent cumulative preferred, the holders of which have the privilege of converting share for share into common stock, upon which the dividend rate has been established at 8 per cent.

Only common-stock holders will have subscription rights to the prospective issue of new common stock, which is to finance expansion of the existing service facilities to include an increase in rating of 60,000 kw.

## Puget Sound Power & Light Takes Over North Coast

Purchase by the Puget Sound Power & Light Company of Seattle of additional electrical properties in western Washington, valued at approximately $3,500,000, was announced and control of the properties assumed on Jan. 20. The properties purchased were those of the North Coast Power Company, consisting of various power systems between Tenino, Wash., and Portland, Ore. The purchase includes the street-railway lines, the light and power plants at Kelso and Chehalis, the power line between Chehalis and Centralia, light and water plants at Tenino and Kalama, the electric railway, light and power plants at Vancouver, Wash., and the electric light and water plants at Hillsboro, Rainier, Beaverton and Forest Grove in Oregon.

This purchase, together with the purchase of the Washington Coast Utilities Company properties announced a short time ago, gives the Puget Sound Power & Light Company control of virtually all of the electrical properties in Western Washington except the Grays Harbor companies and the municipal plants of Seattle and Tacoma.

## Consumers' Power Expansion Projects

Preliminary plans for the 1923 power development of the Consumers' Power Company, Jackson, Mich., comprise a new 20,000-kw. plant at Zilwaukee and a new central-station heating plant at Grand Rapids. The Zilwaukee plant, to be built 5 miles north of Saginaw, will have an ultimate capacity of 60,000 kw. Construction plans call for Taylor stokers and a Green induced-draft system with B. & W. boilers to operate at 375 lb. per square inch steam pressure with 250 deg. F. superheat.

The central-station heating plant at Grand Rapids will, according to H. F. Eddy, mechanical engineer of the Consumers' Power Company, supply low-pressure steam with service at 2 lb. and high-pressure service at 50 lb. and 100 lb. per square inch for the downtown section of Grand Rapids. With a steam pressure of 350 lb. per square inch, 250 deg. F. superheat, operating non-condensing through a 1,500-kw. and a 3,000-kw. unit, sufficient steam will be obtainable to heat 600,000 sq.ft. to 1,000,000 sq.ft. of radiating surface. The European design will be adapted for chimney draft by installing the Venturi type of stack.

# January Financing Active

DURING the month of January stock, bond and note issues of electric light and power public utilities aggregated $71,451,000. This figure represents an increase of more than fifty million dollars over that reached the preceding month, December, 1922, and of more than twenty million over January's total a year ago. Of the total $33,445,000 was used as new capital, $5,739,000 for refunding outstanding securities and $32,267,000 for both refunding and capital expenditures. Of the twenty-five issues, an unusually large number, the highest single offering was the seventeen-million-dollar issue of the Laclede Gas Light Company. The financing was substantially of a long-term nature and the average rate of return yielded the investor was 6.08.

SECURITY ISSUES OF ELECTRIC SERVICE COMPANIES JANUARY

| Name of Company | Amount of Issue | Period | Class of Security | Purpose of Issue | Rate of Interest | Offered at | Per Cent Yield |
|---|---|---|---|---|---|---|---|
| Utah Power & Light Co. | $2,156,000 | Twenty-one-year | First mortgage gold bonds | To retire bonds | 5 | 91½ | 5.70 |
| Long Island Lighting Co. | 3,000,000 | Twenty-five-year | First refunding mortgage gold bonds, series A | To reimburse for acquisition of properties | 6 | 97½ | 6.20 |
| Ohio Power Co. | 2,000,000 | Twenty-nine-year | First and refunding mortgage gold bonds, series B | To provide funds for construction | 5 | 92 | 5.55 |
| United Light & Railways Co (Mich.) | 2,500,000 | Fifty-year | Gold debenture bonds, series A. | To retire notes | 6 | 90 | 6.70 |
| Old Dominion Power Co. (Va.) | 500,000 | Five-year | First mortgage collateral trust gold notes | .......... | 6½ | 99 | 6.75 |
| Keokuk Electric Co. | 400,000 | Two-and-one-half-year | Mortgage notes | To pay maturing bonds | 6 | 98½ | 6.65 |
| Laclede Gas Light Co., (Mo.) | 17,500,000 | Thirty-year | First mortgage collateral and refunding gold bonds, series C | To retire bonds and for general purposes | 5½ | 96.45 | 5.75 |
| Community Power & Light Co., (Ark.) | 725,000 | Fifteen-year | First mortgage collateral sinking fund gold bonds, series B | To provide funds for acquisition of property | 6½ | 97 | 6.80 |
| Detroit Edison Co. | 1,500,000 | Nine-year | Convertible debenture bonds | General corporate purposes | 6 | 104 | 5.95 |
| North Missouri Power Co. | 850,000 | Nineteen-year | First mortgage and refunding bonds | To provide funds for acquisition of properties and refunding | 6½ | 99 | 6.60 |
| Brooklyn Edison Co. | 15,000,000 | .......... | Capital stock | To reimburse company for expenditures, etc. | .. | Par | .... |
| Wisconsin-Minnesota Light & Pwr. Co. | 300,000 | Twenty-four-year | General and refunding mortgage gold bonds | .......... | 7 | 103 | 6.75 |
| American Public Service Co. (Ill.) | .. | Nineteen-year | First lien gold bonds | .......... | 6 | 93½ | 6.60 |
| Central Power & Light Co. | 3,000,000 | Twenty-nine-year | First lien and refunding gold bonds | To pay for properties and other purposes | 6½ | 97 | 6.75 |
| Denver Gas & Electric Light Co. | 383,000 | Twenty-eight-year | First and refunding mortgage sinking fund gold bonds of 1911 | .......... | 5 | 89 | .... |
| Indiana Electric Corp. | 4,500,000 | Twenty-four-year | First mortgage gold bonds, series A* | For additions and other purposes | 6 | 95½ | 6.37 |
| Oklahoma Gas & Electric Co. | 1,000,000 | Eighteen-year | First and refunding mortgage gold bonds, series B of 1921. | For payment of floating debt for extensions | 6 | 96 | 6.37 |
| Power Corporation of New York | 1,000,000 | .......... | Cumulative preferred stock | .......... | 7 | 98 | 7.15 |
| Western United Gas & Electric Co. (Ill.) | 570,000 | Three-year | Collateral gold notes | .......... | 6 | 99 | 6.25 |
| Memphis Power & Light Co. | 5,500,000 | Twenty-five-year | First and refunding mortgage gold bonds, series A | To provide funds for acquisitions | 5 | 89½ | 5.80 |
| Nebraska Power Co. | 1,000,000 | .......... | Cumulative preferred stock | .......... | 7 | 98½ | 7.10 |
| North Boston Lighting Properties | 1,500,000 | Three-year | Gold notes | .......... | 5½ | 99½ | 5.70 |
| Philadelphia Suburban Gas & Electric Co. | 650,000 | Forty-six-year | General mortgage gold bonds of 1919 | To reimburse for additions | 6 | 96 | 6.25 |

* Guaranteed principal and interest by Central Indiana Power Company.

## Appeals to Federal Courts

### Speakers at Meeting of Indiana Public Utility Association Oppose Resort to Them

THE folly of public ownership of utilities, the need for care in rushing into federal courts under the provisions of the Fourteenth Amendment in appealing from decisions of public service commissions, closer co-operation between utilities and the public, the labor situation and many other matters were discussed at the third annual meeting of the Indiana Public Utility Association, held in Indianapolis on Jan. 25.

At a noon luncheon Taylor Groninger, corporation counsel of Indianapolis, and Gov. Warren T. McCray of Indiana gave addresses. Mr. Groninger not so long ago was one of the leaders, under the supervision of Mayor Lew Shank, in seeking legislation to abolish the Indiana Public Service Commission. In his address he commended the work of the commission, but he insisted that state machinery should be used before resorting to the United States courts.

Governor McCray declared he was for the Public Service Commission law and would do all in his power to prevent any amendments to it which would in any way curtail the effectiveness of the work of the commission. He said he did not believe if it came to a real test that any legislature would do away with the commission.

DANGER IN CONSOLIDATIONS

James P. Goodrich, president of the National City Bank of Indianapolis and formerly Governor of the state, made an address at the afternoon session. "It is my opinion," he said, "that if the reins were thrown down and the public told there would be no opposition to repealing the service commission law, not one in ten would want it repealed." He believed, however, that there are elements of danger in large consolidations such as are being perfected now, and he, too, saw danger in too frequent appeals to the federal courts.

B. J. Mullaney, Chicago, director of the Committee of Public Utility Information, told of the experiences of utilities in Illinois with commission regulation. He brought out that in that state it is possible for any city to free itself from the workings of the law by popular vote and go back to the "home rule" system, but that, in spite of agitation, not a city in the state has done this yet.

G. B. Maxwell, former secretary of the Ohio Public Service Commission, said the public must be made to understand the necessity for new capital for extensions of service.

Arthur W. Brady, Howard Dill, T. E. Bohn, S. E. Mulholland and Harry Reid made short addresses.

Customer ownership as the real remedy for economic ills, and not government ownership, was championed by Edward N. Hurley of Chicago, former chairman of the United States Shipping Board, who declared that the electrical industry must provide as much power in the next seven years as it has produced in all its history. "It may seem strange," Mr. Hurley said, "that an industry which is providing 97 per cent of its magnificent service through plants privately owned and operated should feel required to take any serious thought about movements for public ownership, yet the fact remains that in some sections which are not receiving adequate service from their local lighting or street-railway companies and where misunderstandings have created bitterness there is a tendency to harken to those who urge public ownership.

"The federal government's ventures into the field of public management of industrial and public service enterprises demonstrated conclusively," Mr. Hurley went on, "that not more than 50 per cent personal efficiency can be obtained under such management. They demonstrated that not more than 50 per cent of personal interest in the work of the individual can be obtained under this system. I speak advisedly and out of full and intimate knowledge of the facts, and I do not hesitate to tell you that this average of 50 per cent gradually decreases the longer the individual manager or the individual employee continues in industrial service under public management."

C. L. Henry, head of the Indianapolis & Cincinnati Traction Company, was re-elected president. Other officers were elected as follows: Vice-presidents, S. E. Mulholland, Fort Wayne, head of the Northern Indiana Service Corporation, and F. J. Haas, Evansville, head of the Southern Indiana Gas & Electric Company; secretary, Marshall V. Robb, Clinton, an official of the Wabash Valley Electric Company, and treasurer, Charles C. Perry, Indianapolis, president of the Indianapolis Light & Heat Company.

## Smith Finds Hard Sledding for Water-Power Scheme

Governor Alfred E. Smith of New York had not up to the time the ELECTRICAL WORLD went to press sent to the legislature his special message on his plan to have the state itself develop and manage its water-power resources, though he had taken occasion more than once to reiterate his views. Strong opposition to this program of public ownership is certain to manifest itself. Already Paul A. Schoellkopf, president of the Niagara Falls Power Company, has notified the Governor that he is menacing the vested rights of that company.

The Governor has made it plain, however, that for the present he is not contemplating disturbing any private developments or taking any steps toward acquiring them for the state through condemnation proceedings in the exercise of the right of eminent domain. Immediate governmental activities will probably be confined to the plans already being carried out on the Mohawk River at Crescent Dam and Vischer Ferry.

A further complication is caused by the suit now pending in the United States Supreme Court, brought by the former Attorney General of New York, to have the federal water-power act declared an unconstitutional infringement of state rights. Opponents of Governor Smith's policy contend that if the decision goes against the state there will be very little horsepower that the state could develop—at the most 500,000 hp.—since all the chief sources not now in private hands will remain under federal control. On the other hand, should the state win its suit and proceed to acquire power sites on navigable and boundary streams it would confront an expenditure estimated at a billion dollars—a prohibitive sum.

## New York State Mayors Act on Water Power

Development of water power by the state is favored by the New York State Conference of Mayors, and its water-power committee has submitted reports of this nature to Governor Smith and the Legislature. The plan favored provides that the State Conservation Commission shall act as an agency of the state to acquire and to utilize the waters within the state and the boundary waters and to develop the water power and sell or lease it to municipalities. The commission would be empowered to purchase, lease or otherwise legally acquire any water power, developed or undeveloped, and any power plants of transmission lines. Water-power rights that have been materially developed could not be acquired under the proposed plan.

The commission also would be empowered to sell electrical energy to municipalities, individuals or corporations, or lease its plants, but it would have to give preference to municipalities. It would be authorized to establish electrical zones, and any municipality within one of these zones could contract for electrical power or energy. In selling the energy to the cities the commission would have to regulate it according to population. The commission would have control over rates, but these would be only sufficient to make the projects self-supporting.

## Dominion Defers Action on Deep Waterway

That the Canadian government is not disposed at this time to negotiate a treaty with the American government looking to the deepening of the St. Lawrence waterway to enable ocean-going steamers to reach the Great Lakes, with the incidental project of vast water-power development, has been reiterated from Ottawa. This utterance followed a report from there that Premier King had announced that the Dominion government would consider suggesting to Washington a conference to discuss the report of the Interna-

tional Joint Commission on the St. Lawrence deep-waterway and power scheme. The large outlay of money that would be involved is understood to be the primary reason why the Canadian government does not find it advisable to enter into a treaty in the immediate future.

At the State Department in Washington the statement was made that there had been no fresh correspondence between the United States and Canada on the subject.

## The Colorado River Pact

Everything points to the ultimate ratification of the water-power treaty negotiated by representatives of the seven states watered by the Colorado River and its tributaries who met in November at Santa Fé, N. M., under the presidency of Secretary of Commerce Hoover. Some opposition has, however, been reported from Arizona. The Utah State Legislature ratified the agreement on Monday of this week, and the ratifying act was promptly signed by Governor Mabey.

## Optimism at Convention of Wisconsin Contractors

The electrical contracting business will be better in 1923 than in 1922, when all previous records were broken, according to L. G. Ross, Superior, president of the Wisconsin Electragists' Association, which met at the Hotel Pfister, Milwaukee, on Jan. 24 for its sixth annual convention. Mr. Ross dwelt on the increasing demand for electrical appliances and comforts in the home.

One of the purposes of the convention, which was attended by 125 members, was carried out in the adoption of a resolution favoring a bill under which no electrical work in the state will be done except by licensed contractors, journeymen or superintendents.

Last year's officers were re-elected as follows: President, L. G. Ross, Superior; treasurer, J. L. Hacker, Sheboygan; secretary, H. M. Northrup, Milwaukee.

## Would Have Delaware Developed by Three States

Development of the upper Delaware River for power purposes and as a source of potable water by combined action on the part of New Jersey, New York and Pennsylvania is contemplated in a bill just introduced into the New Jersey Legislature. The bill provides for appointment by the Governor of three commissioners, who would have power to act with similar bodies from New York and Pennsylvania in the preparation of a report recommending a policy to be followed by the three states and the United States in the proposed development project.

"The vast and natural resources of the Delaware River for potable water supply purposes and for the development of water power hae lain dormant principally because it is an interstate boundary," says the explanatory statement attached to the bill. "The advantage of substituting hydro-electric development for high-priced fuel and the necessity of providing adequate water supplies for the increasing population and manufacturing development of the metropolitan section of New York, New Jersey and Pennsylvania all point to the necessity of the preparation of a comprehensive report made under the direction of a tri-state commission such as would be established by the passage of this act by the Legislature of New Jersey and similar acts by the Legislatures of New York and Pennsylvania."

## Holiday Illumination of Denver's Civic Center

The brilliantly illuminated scene shown below represents Denver's civic center as it appeared in the holiday season of a few weeks back. Each Christmas tree bore 2,000 lamps, all of which except the large lamp at the top gave either red or green light. Floodlighting was also used to good effect, as the picture shows. The photograph (a prize one) was taken by O. E. Lindevall, Ossen Photo Supply Company, Denver, and will be copyrighted.

BRILLIANT HOLIDAY ILLUMINATION OF THE CIVIC CENTER OF DENVER

## Southern Power Curtailment Program Soon Over

Another power curtailment program instituted at the request of the Southern Power Company among textile mills using its electric power, which went into effect on Wednesday of last week, was suspended on Friday. Lack of rainfall, which caused the request for the curtailment of the use of electric power, was relieved by snow and sleet.

## Another Indiana Commission Bill Introduced

A bill to take from the Indiana Public Service Commission jurisdiction over public utilities the property or operations of which are wholly within a city or within one county and confer the jurisdiction on city councils or boards of trustees of towns has been prepared for introduction in the Indiana Legislature. It would abolish by May 1 indeterminate permits that have been issued by the commission to take the place of surrendered franchises, and utilities operating wholly within a city or county would go back under the old franchise contracts, which would stand until legally repealed, modified or canceled. In the cases of utilities that have received indeterminate permits from the commission and did not have franchise contracts with cities, the indeterminate permits would continue for not more than one year after the date of enactment. Within that year such utilities and municipalities would enter into contracts, or, if they failed to reach an agreement, a city council or board of trustees could petition in the circuit or superior courts that rates and other terms be fixed by civil action. The measure provides that there be no appeal from the decision of the trial court.

In this connection an analysis of the operating costs of privately owned and municipal utilities compiled from their annual reports is interesting. It shows that the operating cost of the municipal plants is greater than that of the other class. The municipal utilities pay much more for coal than the private concerns. More also is paid for wages and salaries, which are to some degree mixed up with politics. Out of each \$100 of revenue received by electric utilities the privately owned plant spends \$71.61 for operating expenses whereas the municipal utility spends \$73.44.

## Two Views of Fusing Rule

**Lively Discussions at Chicago Meeting of Electrical Inspectors Over This and Other Matters**

A LIVELY discussion developed at the Thursday session of the Western Association of Electrical Inspectors in Chicago last week over the revision of Rule 23 d of the National Electrical Code, covering fuses for branch circuits. The rule as amended allows fusing of only the underground conductor of a two-wire circuit provided that the grounded conductor be identified in some unmistakable manner. A. L. Eustice of the Economy Fuse & Manufacturing Company raised the question of safety with such a practice when only one fuse in the underground conductor is used, advocating the use of two fuses in series. He showed a number of fuses which had been tested under short-circuit conditions, some with only one fuse and some with two fuses in series. In the discussion which ensued considerable difference of view developed, though it seemed to be the consensus of opinion that the new rule covers a practice that has been followed for a long time without serious results. The discussion was participated in by F. R. Daniel of Milwaukee, J. C. Forsyth of New York and Ben W. Clark of Detroit.

Another subject that aroused much interest was the new Rule 12 b, which calls for an approved weatherproof or rubber insulating cover between outside line wires having less than 5,000 volts between conductors. W. J. Canada called attention to the operating rule of utilities which calls for treatment of such conductors as bare wires because of the unreliability of the insulating materials, which must be subjected to all sorts of weather. Because of the danger involved in men placing unwarranted dependence upon the insulating values of such materials, Mr. Canada took a strong stand against the inclusion of this rule, which is really a restoration of one in the editions of the code previous to 1920. He was supported by F. R. Daniel, J. C. Martin and several others. W. S. Boyd argued for the rule as representing practice that utility companies have been following for a good many years. It was suggested that such a rule should not be included until a committee shall have carefully investigated the subject and determined a reasonable limit, if there is such, for wires on which insulation should be required. In the discussion several asserted that 5,000 volts is not a logical division point as experience has proved that insulating materials now available for conductors carrying up to 2,300 volts are unreliable.

### Recodification of Code

Dana Pierce, vice-president of the Underwriters' Laboratories of New York, made a report on the recodification of the code. He indicated the difficulty of getting an arrangement satisfactory to every one, particularly an arrangement that assembles all the material on any one subject in one place. To do this would require an enormous amount of repetition and would defeat the purpose to simplify the code. The arrangement proposed is to place all the material on general subjects at the beginning, following this with an arrangement of the material referring to specific subjects under these subjects in such a way that all the specific material on one subject will be together. This will provide for the fewest cross-references, but will necessitate a complete change in the form of the code.

In connection with the 15-amp. capacity limit in Rule 38 e 2, Ben. W. Clark offered an amendment which restricted the use of gas-filled lamps above 200 watts in boiler rooms. The new Rule 279, showing the number of conductors per conduit size, was altered to improve the ease of drawing wire through conduit without materially damaging the insulation. Opinion as to the number of No. 10 B. & S. wires which could be drawn through a ¾-in. conduit seemed to average four, depending upon the length of run.

Some confusion over the revised Rule 276, relative to the concealed extensions in fireproof construction, seemed to exist until Victor H. Tousley, Chicago, explained that it is for the use of oval cable laid next to the tile and plastered over. This avoids breaking the tile for "fishing in" the regular armored cable, thereby facilitating improved arrangements of fixtures; but these extensions are to terminate in the room where they originate.

A. P. Denton, Association of Electragists International, urged that all inspectors work together with the contractors with the view of assisting and interpreting the recent changes. To do this one of the most effective ways, he said, would be the use of diagrams or charts showing the new rules.

Registration for the convention, a report of the opening sessions of which was printed last week (page 237), totaled 162. The newly elected officers are: President, F. O. Evertz, Columbus, Ohio; first vice-president, W. B. Hubbell, Cincinnati; second vice-president, John Hoeveler, Madison, Wis.; secretary and treasurer, W. S. Boyd, Chicago. The 1923 members of the executive committee are James S. Mahan, K. W. Adkins, W. G. Kelly, W. P. Briggs, W. A. Haig and F. A. Barron.

## Electrical Exposition in St. Louis

The St. Louis Electrical Exposition will be held at the Coliseum from March 12 to 17 inclusive under the auspices of the St. Louis Electrical Board of Trade. It is expected that there will be about 150 exhibitors, consisting of both local and nationally known manufacturers and jobbers of electrical equipment as well as many allied industries. Almost all of the available space for exhibition purposes has been contracted for. This will be the first real electrical show to be held in St. Louis for a number of years.

## Brief News Notes

**Moncton, N. B., Soon to Have Hydro-Electricity.**—Moncton, New Brunswick, which expects to be connected with the hydro-electric station at Musquash, in that province, early in February, will be the first city in the Maritime Provinces of Canada to obtain power and light from a hydro-electric source. Arrangements have been made with the Moncton Tramway, Light & Power Company to distribute the energy in the city.

**Opposition to Public Service Commission in Missouri.**—A bill has been introduced in the Missouri House of Representatives by Frank R. Smith, representative from St. Louis, to curtail the power of the State Public Service Commission by taking away from it the right to abrogate contracts pertaining to fares and rates entered into between cities of more than 75,000 people and the public utility companies operating in them. Other political efforts are being made to abolish the commission or restrict its authority.

**Increase in Capital of Public Service Company of Northern Illinois Planned.**—Announcement has been made that the directors of the Public Service Company of Northern Illinois will recommend to the stockholders at the annual meeting on Feb. 26 that the authorized capitalization of the company be increased by the addition of 100,000 shares of no-par common stock and $5,000,000 of additional 6 per cent preferred stock. The company, which serves the territory in northeastern Illinois surrounding Chicago, is expanding rapidly to take care of the increased industrial activity in its district.

**Electrophysical Research in Arctic Circle.**—Donald B. MacMillan, Arctic explorer, expects to set out again for the Far North about the first of next July, this time to establish a permanent scientific station in the northern part of Labrador for the study of terrestrial magnetism and atmospheric electricity. At about 56 deg. north latitude Mr. MacMillan plans to establish two observatories on a running base line about 10 miles long, these observatories to be connected by telephone and each equipped with a moving-picture camera. The cameras will be focused on the same star and will photograph the same ray to determine the height of the aurora.

**New Testing Laboratory for Southern California.**—The Southern California Edison Company will soon begin the construction of a testing laboratory on its property at Alhambra, near Los Angeles. Here it will install high-tension testing equipment, a transformer test room, insulator testing pits, cranes for handling heavy machinery, a meter department and test room, a general warehouse and general shops. The buildings and equipment will cost more

than a million dollars. It is expected that the new premises will be ready the latter part of the coming summer.

**Proposed Bond Issue in St. Louis.**—A special bond issue election will be held in St. Louis on Feb. 9 to vote upon proposed indebtedness for municipal improvements. Two projected issues of interest to the electrical industry are that of $8,000,000 for the purchase and installation of equipment for an electric street-lighting system and that of $1,000,000 for the erection of a plant to provide light, heat and power to municipal buildings. The first of the two issues mentioned is subdivided as follows: For double lighting system along all major streets, $3,500,000; for installing electric lamps in place of gas lamps along all streets now lighted by gas, $3,000,000; for lighting all streets now unlighted, for electric lamps in new subdivisions as they are established, and for other future extensions, $1,500,000.

**Grand Falls (N. B.) Project.**—According to advices from St. John, N. B., the government of New Brunswick is planning to develop the hydro possibilities at Grand Falls, N. B., on the upper St. John River, at the boundary between the Canadian province and the State of Maine. Present plans are to spend about $800,000 in the development. The water-power privileges at Grand Falls are now under lease to the International Paper Company of New York City, but at the expiration of the lease in March the New Brunswick government, it is said, will not renew it, despite reports that the company desires to build a hydro-electric station at Grand Falls to supply cities and towns on both sides of the international boundary. The New Brunswick government has already issued bonds to pay for the Grand Falls project.

**Card-Indexing the Engineers**—As a part of the program of the War Department to work out plans which will enable it to make most effective use of man power in the event of an emergency, the American Association of Engineers is compiling information as to the qualifications of individual engineers. The association recently sent out what it terms an occupational study sheet. The individual engineer is asked to furnish specified information as to his skill, education, specialties and personal qualifications. The association is confining itself at the start to gathering information from highway engineers. Later it expects to undertake similar work among technical engineers on railroads and among electrical, mechanical and chemical engineers, probably in the order named.

**Farmers Fail to Get Large Sums for Wisconsin-Minnesota Right-of-Way.**—Awards in the condemnation proceedings of the Wisconsin-Minnesota Light & Power Company, at Chippewa Falls, Wis., have been filed by the land commission appointed to determine the value of the property of eight farmers who protested against the company's plans to route its proposed high-tension line on their land. The amounts granted are very much smaller than those asked by the property owners, who demanded sums up to $2,500 or more, claiming danger from the line and loss to the value of their farms. The basis for the settlement is close to that suggested by the power company. By it farm owners will receive sums varying from $98 to $515 as damages for property included in the right-of-way.

**Consolidation in Southern Texas.**—The Valley Electric & Ice Company of Brownsville, Tex., a subsidiary of the Central Power & Light Company, has been granted a charter and will take over the recently acquired holdings of the Morrison-McCall syndicate in a number of towns in the Lower Rio Grande Valley. Among the utilities to be absorbed are the ice, water and electric plants at McAllen; the Pharr Ice, Light & Power Company, which supplies Pharr, San Juan and Alamo; the Donna Light & Ice Company, supplying Donna and Weslaco, and the Mercedes Electric & Water Company. The company will also take over the Rio Grande Ice Company plants at Son Benito, Harlingen and Houston. The San Benito light plant, purchased some time ago by the Central Power Company, is still under the direct supervision of that company, but will be included in the list of plants to be merged in the new company.

**Hydro-Electric Developments in North Wales.**—The extensive scheme for distribution of hydro-electric power throughout north Wales as outlined by the British Electricity Commissioners last year promises to be one of the most noteworthy reorganizations under the electricity supply act. The hydro-electric generation and the high-tension transmission are to be undertaken by the North Wales Electric Power Company, which has already carried on fairly wide operations in north Wales. The controlling interest in this company is held by the Aluminium Corporation, and the main power output is taken by the corporation. This company is in a specially good position to supply power to the slate and granite quarries and other industries in the area and to give a bulk supply to many towns. A new dam at Cowlyd Lake increases the storage capacity of the lake from 700,000,000 gal. to 3,110,000,000 gal., so that the North Wales Power Company has at its disposal sufficient water power for many years.

**Mexico to Get More Power from Boquilla Dam.**—Important extensions of the power-transmission facilities of the Compãnia Agricola y de Fuerza Electrica del Conchos, formerly called the Mexican Northern Power Company, are to be made as a result of a renewal of the state concession for the operation of the hydro-electric plant and power transmission lines for a period of fifteen years. It is stated by T. G. Mackenzie, representative of the company, that a transmission line will be constructed within fifteen months from the plant at Boquilla, where the company has its great dam, to Camargo and Chihuahua. Other lines must be built during the life of the concession until all the towns and mining camps within a radius of two hundred miles of the plant are supplied with electrical energy. The company is already furnishing power and lights for the cities of Jiminez, Santa Rosalia and Parral and to a number of mining camps. The company is owned largely by financial interests of Toronto.

## Associations and Societies

**Safety Engineers to Meet.**—A joint meeting of the Engineering Section of the National Safety Council and the American Society of Safety Engineers will be held in New York City on Feb. 16. Electromechanical interlocks and electric contacts in elevators will be among the topics.

**Wisconsin Utilities Association.**—General plans have been announced for the meeting at the Hotel Pfister, Milwaukee, on March 22 and 23, of the Wisconsin Utilities Association, which is a consolidation of the former Wisconsin Electrical and Wisconsin Gas Associations, comprising sixty companies. There will be group meetings of executives, engineers, accountants and merchants.

---

### Coming Meetings of Electrical and Other Technical Societies

[A complete directory of electrical associations is published in the first issue of each volume. See Jan. 6 issue, page 78, for latest list.]

New Mexico Electrical Association—Albuquerque, Feb. 12-13. C. E. Twogood, Albuquerque, N. M.

Electrical Supply Jobbers' Association—Central Division, Chicago, Feb. 13-14; Atlantic Division, New York, Feb. 14; general meeting, Hot Springs, Va., May 21-25. Franklin Overbagh, 411 S. Clinton St., Chicago.

American Institute of Electrical Engineers—New York, Feb. 14-16. F. L. Hutchinson, 33 West 39th St., New York.

American Electric Railway Association—Washington, D. C., Feb. 15-16. J. W. Welsh, 8 West 40th St., New York.

American Institute of Mining and Metallurgical Engineers—New York, Feb. 19-21.

American Physical Society—New York, Feb. 24; Washington, April 21. D. C. Miller, Case School of Applied Science, Cleveland.

Pennsylvania State Association of Electrical Contractors and Dealers—Lancaster, Feb. 28.

Oklahoma Utilities Association—Oklahoma City, March 12-14. O. D. Hall, 1106 First National Bank Bldg., Oklahoma City

Southwestern Division, N. E. L. A.—Oklahoma City, March 14-16. S. J. Ballinger, San Antonio Public Service Co., San Antonio, Tex.

Illinois State Electric Association—Chicago, March 16-17. R. V. Prather, 305 Mine Workers' Bldg., Springfield, Ill.

Wisconsin Utilities Association—Milwaukee, March 22-23. John N. Cadby, 445 Washington Bldg., Madison.

Tri-State Water and Light Association—Birmingham, April 17-20.

American Electrochemical Society—New York, May 3-5. Colin G. Fink, Columbia University, New York.

Southwestern Public Service Association—Fort Worth, Tex., May 15-17. E. N. Wills, 403 Slaughter Bldg., Dallas, Tex.

American Society of Mechanical Engineers—Montreal, May 28-31.

National Electric Light Association—New York, June 4-8. M. H. Aylesworth, 29 West 39th St., New York.

Electric Power Club—Hot Springs, Va., June 11-14. S. N. Clarkson, Kirby Bldg., Cleveland.

Pacific Coast Electrical Association—San Francisco, June 19-22. S. H. Taylor, 527 Rialto Bldg., San Francisco.

# Recent Court Decisions

**What Constitutes a Public Utility?**—In annulling an order of the California Railroad Commission holding a certain water company to be a public utility (McCullagh vs. Commission) the Supreme Court of California said that the mere fact that the articles of incorporation empowered the company to exercise the right of eminent domain did not make the corporation a public utility where the power so reserved was never exercised. (210 Pac. 264.)*

**Refusal of Peremptory Instruction on Negligence Sustained.** — The Supreme Court of North Carolina, in Springs vs. Tallassee Power Company, has sustained the refusal of the lower court to instruct the jury to find for the defendant on the issues of negligence, contributory negligence and assumption of risk, holding that there was sufficient evidence for the plaintiff to justify the submission of the case for a jury verdict. The action was one for damages because of the death from contact with electricity of a workman engaged in painting one of the power company's towers. (114 S. E. 628.)

**Municipal Acquisition of Utility Property.** — In rendering its decision forbidding the city of Los Angeles to acquire by condemnation proceedings property rights of the Southern Sierras Power Company acquired by the latter from the Mono Power Company (Electrical World, Nov. 18, 1922, page 1118), the United States Circuit Court of Appeals said (Mono Power Company vs. City of Los Angeles): "The theory upon which a municipal corporation may condemn and appropriate to a public use the property of a private corporation engaged in serving such municipality or its inhabitants is that the private corporation is using its property for a public use for a profit and that the municipality has the right, in the interest of itself and its inhabitants, as an economical administrator of municipal affairs, to perform this public service itself and thus eliminate the profits of the private corporation. This is not the case. The defendant is not rendering any public service to the city of Los Angeles and does not propose to do so. Defendant's transmission and distributing lines do not extend into the city of Los Angeles, and it has not proposed so to extend them. The property of the defendant has been appropriated to the public use of other counties, municipalities, incorporated cities and towns and the inhabitants thereof, and not for the city of Los Angeles or its inhabitants." The court further expressed its inability to see how if by reason of the "public use" to which the defendant's property was under law appropriated defendant could not sell, lease or encumber its property without the authority of the state commission, this property could be condemned by another corporation in another county for a public use in that other county.

**Rate-Fixing Powers of Illinois Commission.** — In Illinois Bell Telephone Company vs. Illinois Commerce Commission it was sought to enjoin the commission from proceeding to prevent the enforcement of rates filed with it by the telephone company. The Supreme Court of Illinois found that while the commission has no authority to make rates for a public utility in the first instance, as that right lies with the utility, the commission, in order to prevent unjust discrimination, undue preferences and extortionate rates and charges, is charged with the duty of establishing just, reasonable and uniform rates, and in a hearing it is the commission's duty to establish the rates proposed, in whole or in part, or others in lieu thereof which it shall find to be just and reasonable. Where the commission ordered rates permanently canceled, but did not enter any finding as to whether they were reasonable or as to what would be reasonable rates, it was held that injunction would not lie to prevent the commission's interfering with the charging or collection of the scheduled rates, the remedy by mandamus being adequate to compel the performance of the duty imposed by the law. (137 N. E. 449.)

*The left-hand numbers refer to the volume and the right-hand numbers to the page of the National Reporter System.

# Commission Rulings

**New York Telephone Rates Revised.**—As the outcome of an inquiry concerning the rates of the New York Telephone Company conducted by the Public Service Commission of New York since November, 1921, affecting rates in all portions of the state, and also the case involving rates in New York City brought before the Public Service Commission, Second District, in 1920, the existing commission has handed down a final order revising rates and charges for telephone service throughout the state, effective March 1. The state-wide case was instituted by the present commission on its own motion. The New York City case was brought by the New York Telephone Company on a petition to increase exchange rates $16,000,000 in New York City. The order just issued provides for a revision of all rate schedules in New York City, effects decreases for small users estimated at $250,000, increases rates for large users to about $2,500,000, decreases flat rates in effect in Brooklyn by about $75,000, increases the long-haul interzone toll rates in Greater New York and makes a decrease in toll rates to suburban areas adjoining Greater New York, with consequent elimination of the federal tax on such messages, estimated to be $300,000. Complaints from about 135 up-state communities are adjusted. The valuation of the property of the New York Telephone Company is placed at $167,153,634 in Greater New York and at $68,531,357 in the rest of the state. On this valuation a 7 per cent return is allowed.

**Unprofitable Extensions Not Obligatory.**—The Connecticut Public Utilities Commission has denied a petition asking that the Danbury & Bethel Gas & Electric Light Company be forced to extend its transmission line 2,000 ft. for the benefit of the petitioners. The commission, regretting that it has not the legislative authority to permit another utility ready and able to supply the service to enter the territory, in which the one named has charter rights, nevertheless has asserted that an electric utility should not be required to extend service into a sparsely built-up community in which there are no prospects of development or growth of population in the near future and where the probable cost of extending the line, maintaining it and furnishing the required service would be greatly disproportionate to the probable return.

**Condemnation of Hasty Construction.**—The rivalry between the Eastern Wisconsin Electric Company and the Badger Public Service Company as to which should have the right to serve the town of Calumet (Electrical World, Dec. 2, page 1237) led to the following declaration by the Wisconsin Railroad Commission: "In deciding this case the commission has given no weight to the fact that actual construction of lines in this town has gone forward. It might be well, however, to indicate that the commission regards the attempt to secure or maintain advantage by hasty and uneconomical construction work while a matter is being litigated as inconsistent with the proper conception of the duties and obligations of a public utility. The law provides an orderly means for the settlement of territorial disputes, and any attempt to forestall such orderly procedure is bound to be futile in the long run."

**Linking Electric Plants.**—The modern tendency in the electric utility field toward linking together separately operated electric light and power companies for their mutual benefit and that of their customers was recognized by the Public Service Commission of Pennsylvania when it granted to the Metropolitan Edison Company permission to acquire control of a local power company by stock purchase, despite objections that existing contracts would be vitiated, rates increased and electrical energy diverted from the charter territory of the local company. It was shown that the consolidated company would have financial resources sufficient to develop and utilize a vast quantity of water power that was being wasted, and, declaring that "wherever practicable the utilization of water power is to be encouraged as a conservation measure," the commission refused to see anything wrong in the consolidation.

# Men of the Industry

Changes in Personnel
Accomplishments, Responsibilities, Honors, Appointments and Activities of Men Engaged in all Branches of the Electrical Industry

### Arthur W. Berresford Resigns

Arthur W. Berresford, vice-president of the Cutler-Hammer Manufacturing Company for more than fifteen years, has resigned his office owing to a need that he feels for rest from business pursuits. Mr. Berresford has long been a prominent figure in the electrical industry not only as one of the chief executives of the company which he has served for twenty-two years, but

A. W. BERRESFORD

also as an active partaker in association affairs. He began his professional career with two years of general engineering work. Then he became associated with the Riker Electric Company as designer and subsequently with the Ward Leonard Electric Company in charge of testing and designing work. In 1898, with two others, he purchased the assets of the Iron Clad Rheostat Company from the receiver in whose hands it was and formed the Iron Clad Resistance Company, of which he was made vice-president and manager. In 1900 this company was purchased by the Cutler-Hammer Manufacturing Company and he entered the engineering department. In 1901 he was made superintendent, in 1902 secretary and three years later general manager. It was in 1907 that he became vice-president as well as general manager. In May, 1920, Mr. Berresford was elected president of the American Institute of Electrical Engineers, having previously served as its vice-president and also as manager. Mr. Berresford has, besides, been president of the Electrical Manufacturers' Club, and during the war he was elected chairman of the General War Service Committee of the Electrical Manufacturing Industry and was as well chairman of the general war service committee of the Associated Manufacturers of Electrical Supplies. Mr. Berresford was born in Brooklyn, N. Y., in 1872 and is a graduate of Cornell University. He plans to devote time in the immediate future to work in the various associations of which he is a member.

### Alabama Power Company Appoints Division Managers

W. M. Stanley has been made manager of the eastern division of the Alabama Power Company, with offices at Anniston, Ala.; C. B. McManus has been made manager of the western division, with offices at Birmingham, and O. K. Seyforth has been made manager of the northern division, with headquarters at Huntsville.

### Tenney & Company Elect New Executives

Isaac S. Hall has been elected a vice-president of Charles H. Tenney & Company, Boston. Mr. Hall, who is a native of Stillwater, Minn., was educated at Yale University. He entered the bookkeeping department of the Malden (Mass.) Electric Company in 1909, later becoming cashier and assistant manager. From Malden he went to Boston as office manager for the Tenney organization and in 1920 was appointed auditor. Clifford E. Paige, formerly manager of the Worcester (Mass.) Gas Light Company, was also elected a vice-president of the company.

### Byllesby Organization Elects New Vice-Presidents

Halford Erickson has been elected a vice-president and director of the Byllesby Engineering & Management Corporation, in charge of operation of all subsidiary utility properties of the Standard Gas & Electric Company. Mr. Erickson for many years was a member of the Railroad Commission of Wisconsin, and for two years, 1915 and 1916, he was the chairman of that commission. For the last five years he has been vice-president of the Louisville Gas & Electric Company.

Announcement was made at the same time of the election of four new vice-presidents of H. M. Byllesby & Company, all of whom have had long experience with the companies composing the Byllesby organization. They are R. G. Hunt, Joseph H. Briggs, B. W. Lynch and M. A. Morrison. Mr. Hunt, who has been in the organization for nineteen years, has for the past seventeen years been assistant to the vice-president in charge of operation of the Byllesby Engineering & Management Corporation; Mr. Briggs, who has been with the organization for fourteen years, has for the last four years been manager of the bond department; Mr. Lynch, of eighteen years' service with the organization, was formerly general auditor, and Mr. Morrison, who has been in the corporation's service fourteen years, was assistant secretary and assistant treasurer.

### A. N. Kemp Resigns

A. N. Kemp, vice-president in charge of finance of the Southern California Edison Company, has resigned to accept the office of a senior vice-president of the California Bank of Los Angeles. Mr. Kemp has been associated directly with the Southern California Edison Company since the merger into that

A. N. KEMP

company of the Pacific Light & Power Corporation in 1917, having served with the latter company as treasurer and controller for many years prior to the consolidation of the two companies. His duties with both of these corporations have been directly in connection with the companies' financing and sale of their securities, and particularly, in directing the very extensive and successful activities of the Edison company in interesting its consumers and the public generally in becoming partners in the business.

By education Mr. Kemp is a banker. Although a native Californian, he spent several years in study and experience in Great Britain and New York, returning to California in 1905. His concentration of effort in the financial field has developed in him a remarkable grasp of the financial situation, which will be of great value to the institution with which he is now associated. His resignation became effective Feb. 1.

W. P. L'Hommedieu has been appointed manager of the newly organized central-station division of the San Francisco district office of the Westinghouse Electric & Manufacturing Company, with which office he has been connected for a number of years.

## P. W. Koch New President Chicago Electric Club

Paul W. Koch, who was recently made the president of the Electric Club of Chicago, served on the board of directors for three years and as vice-president during the past year. Mr. Koch became associated with the Chicago City Railways Company in 1907, where he served until 1910 as assistant division engineer of substations. He then became a salesman in 1911, after spending a year in development work for the Thomas J. Grier Company, manufacturer's agent for oil circuit breakers. It was in 1915 that he purchased this company, organizing it under the name of Electrical Sales Engineers, Inc. In 1919 the name of the organization was changed to Paul W. Koch & Company, and this firm has been functioning as manufacturers' agents ever since. The assumption by Mr. Koch of the president's chair brings to that office a man well versed in the aims of the club.

**Clyde H. Loughridge**, consulting electrical engineer, has opened offices in Cleveland, Ohio. Mr. Loughridge has had nineteen years' experience in electrical design and construction both as an electrical engineer and as an electrical contractor.

**William P. Creager**, chief engineer and a director of the Northern New York Utilities, Inc., has been elected a vice-president of the corporation. Mr. Creager is also vice-president and chief engineer of the Power Corporation of New York.

**H. C. Spoden**, formerly of Chicago and more recently with the Electric Lighting Supply Company and the Pacific States Electric Company of Los Angeles, is now assisting E. P. Markee, district manager of the Edison Lamp Works of the General Electric Company.

**W. W. Trench**, assistant secretary of the General Electric Company, has been appointed secretary of the various committees which will administer the Charles A. Coffin Foundation, the income from which is to be employed in making various awards for meritorious service in the electrical field.

**R. B. Harvey**, formerly connected with the Westinghouse company and the Litscher-Lite Corporation, has been appointed sales manager of the farm light and power division of the Matthews Engineering Company, Sandusky, Ohio. Mr. Harvey's experience covers all phases of the farm light and power business from manufacturing to sales.

**H. H. Walker**, president of the Electrical Contractors and Dealers' Association of Los Angeles and one of the leading electrical contractors of southern California, has been appointed representative on the advisory committee of the California Electric Co-operative Campaign by the Southern District, California State Association of Electrical Contractors and Dealers.

**H. B. Cannon**, formerly agent of the San Joaquin division of the Pacific Gas & Electric Company at Newman, Cal., has been made electrical superintendent on the North Bay division, with headquarters at Vallejo.

## New Manager of Alabama Power Has Had Wide Experience

Eugene A. Yates, who has been appointed general manager of the Alabama Power Company, as was announced in the Jan. 27 issue of the ELECTRICAL WORLD, has been for years in close touch with the development and growth of this company and other power companies in the South. Mr. Yates was

E. A. YATES

chief engineer of the company from 1912 to 1914 in the construction of Lock 12 and has been connected with the company as a consulting engineer since that time. From 1914 to 1918 he was vice-president and chief engineer of the T. A. Gillespie Company, contractor, New York City, in charge of construction work, involving dams, subway construction, bridges, etc. Since 1918 he has been engaged in consulting work in New York City, mainly along the lines of hydro-electric plants and power developments and studies, which included a study of power companies and power situations in the entire Southeast. Mr. Yates was born in Elizabeth, N. J., in 1880 and was graduated from Rutgers College in 1902.

**A. W. McConnell** of the Electric Construction Company has been elected president of the Little Rock (Ark.) Electric Club.

**H. W. Reed**, who recently was connected with Landers, Frary & Clark, is now connected with the Illinois Electric Company in Los Angeles.

**John Fordyce** of Butternut, Wis., has acquired a controlling interest in the Glidden Light, Power & Water Company, heretofore owned by Fred Boheim of Ashland. Mr. Fordyce is now president of the organization and John C. Kneifel has been installed as manager of the local plant.

**F. L. Hunt**, chief engineer of the Turners Falls Power & Electric Company, has been elected vice-president of the Engineering Society of Western Massachusetts.

**P. M. Duncan** has severed his connection with the Allis-Chalmers Manufacturing Company, Milwaukee, to accept a position as method engineer with the Western Electric Company, Hawthorne plant, Chicago.

**Robert G. Kittle** has resigned as sales manager of the Laundryette Sales Company to enter the New York office of the Benjamin Electric & Manufacturing Company, under Basil Kodjbanoff. Mr. Kittle has been connected with the electrical industry since 1907, when he entered the employ of the Adams-Bagnall Electric Company. He left that organization in 1916 to go with the Luminous Unit Company as district sales manager.

**F. D. Phillips**, who for twenty-two years has been actively connected with the electrical industry, has been appointed manager of the H. C. Roberts Electrical Supply Company of Syracuse, N. Y. His introduction to the industry was in 1900, when he accepted a position with the Electric Appliance Company of Chicago. In 1906 he removed to St. Louis to take charge of the city sales department of the Wesco Supply Company, and seven years later he was made general sales manager. Mr. Phillips became sales manager of the Central Telephone & Electric Company of St. Louis in 1916. Soon afterward he was elected vice-president of that company and in 1918 he became president. During the sixteen years that he was connected with the electrical industry in St. Louis he was particularly active in all its co-operative efforts, including the Jovian Order and the St. Louis Electrical Board of Trade.

# Obituary

**David Cochrane**, inventor of steam specialties, died on Wednesday, Jan. 24, at his home in Wissahickon, Philadelphia. Mr. Cochrane, who was seventy-three years of age, died of septic poisoning after an illness of about a week. He was born in Scotland and came to this country when he was thirty years of age. Soon after he arrived here he became connected with the Harrison Safety Boiler Works, which is now known as the H. S. B. W.-Cochrane Company.

**Robert Edes Chetwood**, who has been in charge of all engineering and development work of the Western Union Telegraph Company since 1913, died on Friday, Jan. 26, at his home in Elizabeth, N. J., after an illness of a few weeks. Previous to his association with the Western Union Company in 1910, Mr. Chetwood was connected with the engineering department of the American Telephone & Telegraph Company. He was born in Elizabeth and was a graduate of Lehigh University.

# Manufacturing and Markets

## Proper Marking of Nameplates*

**What This Accessory Means, for Example, on the Electric Motor—Abuses that Have Crept Into Its Use**

By Bernard Lester

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

No manufacturer of a complete piece of machinery for general use can conduct his business with any degree of permanent success without marking each of the individual units which he manufactures, with its capacity and principal characteristics, in a complete and honest fashion. If the manufacturer does not do this, he makes it difficult for the purchaser of the apparatus to use it intelligently, or he may at times even go so far as intentionally or unintentionally to misrepresent the actual characteristics of the apparatus.

Complete and correct nameplate marking is therefore of primary importance, and this is particularly true in the case of motors which are purchased and sold again in their original form or resold mounted upon some particular machine or appliance which the motor is intended to drive. In such instances the second party, who may not be so familiar as the manufacturer with characteristics of the motor, is usually involved, and unless the nameplate clearly defines the motor capacity and motor characteristics, there is much likelihood of misconception in some form.

In addition to the interest of the motor manufacturer, resale agent, machine manufacturer and user, there is also the interest of the central power station on whose circuits the motor is usually attached. The central station is distinctly interested, either from the point of view of revenue in the sale of energy or from the point of view of the motor characteristics which may affect the operation of his system or the safety of his customers. Horsepower rating is to some extent used as a measure of energy consumption, and we are all familiar with the central-station motor service rules adopted by the National Electric Light Association.

*A paper presented before the Electric Power Club, at its Asheville (N. C.) convention, Oct. 30, 1922.

### What Nameplates Are For

The principal uses of nameplate markings upon motors may be summarized briefly as follows:

1. To instruct the user or resale agent as to the correct operating character of the motor.

2. To furnish sufficient information for the successful connection of motor to the supply current.

3. To supply the user of the motor with information of identification for purposes of duplication or repair.

In addition to these factors, the individual marking of a motor with a serial number or some other form of individual identification is often used by the manufacturer of the driven appliance or machine to distinguish the identity of the complete driven unit. Motor serial numbers are therefore used to some extent, as the serial numbers of driven units and records are kept in this way by the manufacturer of the appliance.

In the case of standard fractional-horsepower alternating-current motors, the following nameplate markings have been adopted by the Electric Power Club as "recommended practice": (a) Manufacturer's type and frame designation; (b) horsepower output; (c) time rating; (d) temperature rise; (e) r.p.m. at full load; (f) frequency; (g) number of phases; (h) voltage; (i) full-load amperes.

In the interest of economy these nameplate markings should obviously be reduced to a minimum. At present they apply to motors from 0.05 hp. to 0.75 hp. Upon the small series-wound motors which are used for sewing machines, vacuum cleaners, electric drills and other appliances an elaborate marking such as this is probably entirely unnecessary. There seems to be no way, however, under present conditions of eliminating any of these items from the standardized line of fractional-horsepower motors unless some designation based on the Electric Power Club standard and recognized as such be substituted for the time rating and temperature rise. This, however, is a subject which should be seriously considered in the future in connection with fractional-horsepower motors. Perhaps the nameplate information itemized above may appear to some as being unnecessarily elaborate, but a careful analysis of each item will show that its elimination would cause considerable difficulty. Obviously a number of other characteristics could be added, but the effort should be toward simplification.

### Nameplate Abuses

In connection with the nameplate-marking situation certain abuses have arisen, and there has been on the part of the motor manufacturers a laxness of practice. These irregularities may be summarized as follows:

1. Incomplete nameplate marking.

2. Substitution of symbols for figures in the nameplate markings or other forms of designation.

3. Acquiescence in the practice of customers taking off nameplates and substituting therefore nameplates incompletely marked, incorrectly marked or both.

In regard to the matter of incomplete nameplate marking, motor manufacturers generally have been slow in adopting the practice recommended. This standard as a "recommended practice" was last revised over five years ago, so that there is probably little reason for any manufacturer not to adopt the present nameplate marking on his product.

In this connection an interesting analysis was made about two years

ago of the nameplate marking of all motors mounted on motor-driven appliances at a prominent electrical show. Obviously this did not include motors used in connection with vacuum cleaners, electric drills, etc., since the motor usually in such instances loses its identity. There were a total of thirty-two motor-driven appliances exhibited. Of these all but five appliances had nameplates incompletely marked. Only on five motor nameplates were the temperature rating and time rating marked, and on most of the nameplates no space was provided for such marking.

In some instances motor manufacturers have been induced to substitute for the horsepower some symbol or letter which has little or no meaning to the user of the machine. On some occasions the purpose of this has been to get around existing central-station rules. In addition to this some motor manufacturers have been induced by appliance manufacturers to increase or decrease the horsepower marking on the nameplate to enable the manufacturer to give the purchaser of the machine the impression that the machine is driven either by a large motor with reserve capacity or by a small motor which requires less energy than that ordinarily used to operate similar devices. These, of course, are "tricks of the trade" which simply start trouble and ultimately reflect on all motor manufacturers, as well as establishing practices among appliance manufacturers which are unethical and do not promote honest and stable business. The removal of nameplates by resale purchasers for the purpose of substituting a nameplate which in any way misrepresents the capacity or performance is certainly something which should be not only discouraged but discredited in every way possible.

### Built-in Machines

One of the most difficult situations which arise in connection with nameplate marking is in connection with special motors. Often motors of special characteristics are purchased and built directly into the driven appliance, so that it is impossible to detach them and use them as general-purpose motors. In such instances there does not seem to be any objection to special nameplate marking, provided that there is no misrepresentation, as the motor in these cases is called on only to operate the complete machine and its identity is tied up with the machine itself. Appliances will probably be built more and more with the motor an integral part of the driven appliance. Such a tendency will simplify problems in connection with nameplate marking.

Motor manufacturers are often called upon to furnish their motors with special nameplates which may include the name of the manufacturer of the resale motor-driven appliance upon which the motor is to be mounted. This practice is obviously an expensive one unless a large number of motors is involved, but as long as the nameplate expresses the characteristics and does not misrepresent there seems to be no logical objection to such a practice.

# Fighting the High Cost of Small Orders

**The Experience of One Manufacturer of Electrical Equipment in Penalizing Small Orders by Adding a Dollar to the Regular Price to Cover Loss**

By J. C. Belden
President Belden Manufacturing Company, Chicago

FOR the past two years competition in our line has been so keen that we have felt it necessary to investigate every possible avenue through which business might reach us which would result in a loss. We found among other things that we were receiving a great many orders, principally from jobbers, calling for a few ounces up to a few pounds of wire, many of these orders amounting to from 50 cents to $5.

We are organized to do a wholesale business. The average value of our orders should be about $100, and it is unless we take a lot of small orders that we should not take. We make a varied line of material, and in order to avoid costly mistakes it is absolutely necessary that each order be separately entered with a full description, and possibly reference to specifications, that will safeguard our factory from mistakes. We have ascertained that it costs about $1.62 each for all the paper work connected with putting an order into the factory, getting it out and billing it to the customer.

It is perfectly obvious that we could not enter an order under $5 at regular prices without incurring a loss. In addition, many of these fractional orders put up for jobbers at a few cents a pound profit, on which we incurred all the expense of preparation, and which in many cases we shipped direct to the customer, were billed out by the jobber at prices netting them a margin far exceeding our profit even before we deducted the special cost of handling a small quantity. We, therefore, determined to make an extra charge of $1 on every order under $5 and announced this program by sending the notice to our customers which is shown here.

RESULTS OF ADDING PENALIZING CHARGE TO SMALL ORDERS

| | Charged on Invoices as Small-Quantity Charge | Credited on Account Complaints |
|---|---|---|
| May | $212.00 | $31.00 |
| June | 234.00 | 20.00 |
| July | 138.00 | 19.00 |
| August | 163.00 | 17.00 |
| September | 116.00 | 7.00 |
| October | 112.00 | 18.00 |
| November | 140.00 | 9.00 |
| December | 97.00 | 2.00 |

IMPORTANT!

Beginning April 1, 1922, a Small Quantity Charge of $1.00 will be added to all orders amounting to less than $5.00 net, not including spool or prepaid transportation charges.
Our business is organized to manufacture and sell economically in large quantities. Owing to the large and diversified stocks carried we receive many small orders, which cannot be handled as cheaply as if organized to do a retail business.
We have accurately figured the cost of handling these orders, from the time they are entered until the goods leave the factory, and find that we must make this Small Quantity Charge, which makes up in part only the loss incurred on same.

Belden Manufacturing Co.,
Twenty-third Street and Western Avenue
CHICAGO

METHOD OF ANNOUNCING SMALL ORDER CHARGE

We gave our department managers authority to waive this charge to customers whose general business is such that we can afford to include the handling of such orders with their larger ones. But we have made some mistakes and made charges against customers who were entitled to receive this service as an accommodation. Some of our customers accept our position as a reasonable one,

Others, however, insist that it is the result of pure greed and that we are trying to gouge them. We have received a number of threats to cancel our name from the list entirely.

The accompanying table shows results since this policy was adopted.

It is somewhat difficult to draw exact conclusions from these figures, but we feel that while the money derived from this charge is inconsiderable, we have prevented the receipt of hundreds of small orders that would have cost us money to fill and, what is of much greater importance, would have clogged the wheels of the machinery that gives service on our big orders.

We believe that the jobber who is conscientiously trying to reduce the waste in the distribution of electrical goods should look upon this policy when adopted by a manufacturer with favor and endeavor to apply the same principle in his own selling in so far as possible. This has not generally been the case, however, in our experience.

# Business Conditions

**A Survey of Important Developments in the Electrical Market Including Data on Production, the Sales Outlook, Credits, Exports, the Metals and Other Conditions Affecting Cost, Supply and Demand**

## Dr. S. S. Wheeler Discusses the European Market

DR. S. S. Wheeler, president Crocker-Wheeler Company, who has just returned from Europe, where he was a delegate to the International Electrotechnical Conferences at Geneva, does not see much of a market in the near future for American electrical motors in Europe. "The European," he pointed out in an interview with a representative of the ELECTRICAL WORLD, "still insists on individual treatment and service in his every desire and need. It seems inbred in all continental Europeans, at least, to conduct themselves and their business on an individual basis—the antithesis of 'mass production.' Thus in their own manufacturing and also in their purchasing they look at things the same way."

Dr. Wheeler pointed out that there is not much production in France, a little more in England and practically none in Italy, but that Switzerland can produce enough heavy machinery for their needs and is willing to meet the individual wishes. The great variety of odd and unusual voltages in use is another deterrent to American manufacturers now selling successfully at a profit in some of the European markets. Italy, however, is going ahead fast on long-distance high-tension transmission construction, but, according to Dr. Semenza's statement to Dr. Wheeler, even with this large new development is not able to come to standard voltages because the new transmission lines are connected up with existing systems.

In addition to all this Dr. Wheeler points out that with the further conditions of the high-tariff wall around the United States and the depreciated currency in Europe, it does not look like much of an immediate market in Europe for American equipment, except for specialties which Switzerland cannot supply. On the other hand, lack of production in Europe should open even wider other world markets which Europe in pre-war days supplied so freely.

Speaking of business conditions in this country, Dr. Wheeler said that he expects sound progress to continue. His own company shows an activity of 100 per cent over two years ago at this time and 50 per cent over this time last year, with every evidence of continued increase in business demands.

## Road Conditions Hamper Farm Lighting-Set Sales

Sections of the country in the grip of severe winter weather are at present difficult territory for salesmen trying to cover such districts, road conditions hampering both travel and shipments of ordered equipment out of local stocks. The demand for farm lighting sets has held up remarkably well during the past few months. One representative field agent covering six states reports that the quota for his office sales was exceeded in December, ordinarily a dull month in this line, and the outlook for 1923 is excellent. Prices are firm at present, and it is believed that if a good volume of business is forthcoming in the next few months, fairly stable quotations will be in order.

## English Electrical Exports in 1922 Gained £17,000,000

The report of the British Board of Trade for December completes the figures for English exports and imports for 1922. The total British exports for the year were £720,496,426 against £703,399,542 in 1921 and £1,334,469,269 in 1920. Although the total fell far short in money value of 1920, yet there is a rise of £17,000,000 as compared with last year, and it has to be remembered that there has been a steady fall in values since 1920. Imports of all kinds were £1,003,918,124 against £1,085,500,061.

The December imports of electrical goods and apparatus were valued at £204,558 against £177,643 for November, and electrical machinery at £58,076 as compared with £72,539. The exports of electrical goods and apparatus were £7,306,578 and of electrical machinery £4,151,735, a grand total of £11,458,313. This compares with £17,779,092 in 1921 and £14,272,479 in 1920. In actual money value it will be seen there is a drop of £6,000,000 on last year, but how much of the drop is due to decreased values it is not easy to say. Another factor which entered more largely into the figures of 1921 than into those of the twelvemonth just closed is the effect of the sales of surplus stock. Much of the stock which accumulated during the closing period of the war and which was sold in the year 1921 must have gone out of the country.

Imports of electrical goods and machinery totaled £2,711,591 last year compared with £2,639,998 in 1921 and £3,157,964 in 1920.

## The Metal Market

**Domestic Copper Buying Is Strong at 14.87½ Cents—Sales for the Week Estimated at 30,000,000 Lb.**

Domestic copper buying is strong and the price has advanced to 14.87½ cents for deliveries to the end of June. Most inquiry is for February, March and April shipments, with a little also for May. Indications are that another buying movement has begun in earnest, and it is estimated that sales during last week totaled 30,000,000 lb. Foreign sales are improving. Domestic orders generally are known to be in large amounts.

NEW YORK METAL MARKET PRICES

| Copper | Jan. 24, 1923 Cents per Pound | Jan. 31, 1923 Cents per Pound |
|---|---|---|
| Electrolytic | 14.62½ | 14.87½ |
| Lead, Am. S. & R. price | 7.50 | 7.75 |
| Antimony | 6.75 | 7.00 |
| Nickel, ingot | 36.00 | 30.00 |
| Zinc, spot | 7.00 | 7.00 |
| Tin Straits | 38.62½ | 40.00 |
| Aluminum, 98 to 99 per cent | 23.00 | 23.00 |

### Copper and Brass Products

Copper, brass and bronze mills quote the following prices on brass and copper products:

Copper wire, 16.38 to 16.63 cents net, mill; brass wire, 19.5 to 21.5 cents; copper sheets, 22.25 cents; copper rods, 15.5 to 15.75 cents; brass rods, 17.25 to 21.38 cents; sheet brass, 19 to 20.63 cents.

**Commercial Inquiries.**—The Bureau of Foreign and Domestic Commerce answered 7,822 electrical inquiries during June, 1921, and July, 1922; 13,843 during July, 1922, and January, 1923, and 567 during the week ended Jan. 13. 1923.

# The Week in Trade

Prices When Quoted Are Those Reported at the Opening of Business on Monday of This Week for Points West of the Mississippi River and on Tuesday for All Eastern Points

VOLUME of orders received during the week indicates a steady demand for wire, conduit, armored cable and high-tension equipment. The amount of business being placed by the jobbers is heavier than for some time, and further indicates throughout the country that this year's business may be expected greatly to exceed that of 1922. Deliveries in New England and the Middle West are held up because of snow and storms, and salesmen in the rural districts are hindered by difficult travel. Business in materials for central-station extensions and interconnections promises to be fair. Prices generally are firm and stocks are improving.

**New York** Improvement in manufacturers' and jobbers' business continues; stocks are being improved each day and the volume of materials entering into new residences and commercial buildings is slightly larger. Conduit stocks are very low and there is little relief in sight. High-tension equipment for central stations has received some additional attention during the last few days, and the prospects for the spring are very bright. Prices generally are firm.

**Chicago** Although jobbers report a steady week of electrical trade, the main volume was not so brisk as the first three weeks of the year. Most jobbers consider this lull merely as a slight reaction to the excellent start of the year's business, and they do not express much apprehension for future trade. Building construction is constantly requiring a steady volume of wiring material, which is rapidly moved from dealers' shelves. Stocks are in good condition, since carry-overs for 1922 were greater than in 1921. Price trends on wire and conduit are still inclining upward. The lamp market is experiencing its regular active winter demand and supplies are still normal. High-tension apparatus is reported brisk. One company received an order for 66,000-volt outdoor substation equipment for New England. Another sold one 33,000-volt, 600-kw. substation for New England, two 44,000-volt, 1,500-kw. substation for the Northwest and three 22,000-volt, 300-kw. substations for the Middle West.

**Boston** Business holds up well despite a seasonal lull in heavy supply movement and appliance demand. Building activities are vigorously maintained. Jobbers are buying more for stock than for some time. Public utility earnings are gaining rapidly and house-wiring campaigns are meeting with striking success. Prices are firm except in wire, which is weakening as a result of local efforts to move accumulated stocks. Deliveries in northern New England are greatly handicapped by snow and ice, and sales representatives report travel as extremely difficult in the more remote interior sections. Throughout the trade in New England the expectation is that this year's business will be of surpassing volume. The outlook is favorable for increased purchase of transmission-line material in the near future for interconnection work.

**Atlanta** The past week witnessed a very severe sleet and wind storm throughout north Georgia and the western Carolinas, which resulted in considerable damage to telephone and telegraph lines and in somewhat less damage to distribution systems and high-tension transmission lines. Replacements made necessary by this damage should stimulate sales of pole-line material in the sections affected. Service has been restored, and all utilities report their conditions as nearly normal. Municipal activities in South Georgia and Florida are on the increase, manufacturers reporting very satisfactory business in generating equipment up to 100 kw. capacity. This will, of course, be reflected in the increased demand for construction materials in these sections. Electrical jobbers had anticipated a good season for air heaters, but, owing to the unusually mild weather to date, the volume of sales has been far below expectations. Good stocks are on hand. Stocks are being brought up to normal and satisfactory business is generally reported by all electrical jobbers and dealers.

**Cleveland** Industrial equipment orders dominated the week. Motors were not especially active, although inquiries were received for quotations on the larger types. Conduit sales have been in good volume and the demand for armored cable continues. Radio jobbers and dealers have enjoyed a favorable week and stocks are in good shape.

Storage-Battery sales are sluggish, radio dealers reporting a departure from their use in radio sets. Batteries for use in motor cars have received some slight stimulation with the placing of spring orders. The building program promises much activity for fixture dealers and central stations. Congestion continues to hamper deliveries, but with the railroads promising relief it is expected that traffic movements may be expedited within the week. Retail sales are satisfactory. Appliances particularly are selling without much apparent effort, and dealers forecast an unusual spring. Collections are fair.

**Pittsburgh** Prices generally are more settled, and fluctuations are less noticeable. Construction of residences and industrial building continues in fair volume. Wire is still selling actively with low stocks. The main difficulties which are troubling manufacturers and jobbers in this district are those induced by the conditions in the coal fields and the car shortage.

**St. Louis** Electrical jobbers report business for the month of January better than anticipated and considerably over the average for the past twelve months. One jobber reports the sale of 500 4,000-volt lightning arresters to a central station, and orders from salesmen on the road show a splendid demand for merchandise. The annual review of business in St. Louis for 1922 places the total volume during that period at $1,326,793,000, which is an increase of 10.4 per cent over that shown for the year 1921. An increase appears in almost all lines, but the greatest increase was shown by the electrical industry, which shows a total volume of $50,000,000 in 1922 against a volume of $35,000,000 in 1921, or an increase of 43 per cent.

**St. Paul-Minneapolis** The amount of orders during January is as heavy as in the average months of 1922. Some jobbers expected a slump. There seems to be plenty of money and some are planning big campaigns in the spring. Supply of small conduit is very short. Inquiries show big municipal and central-station business in spring. Demand is still big for radio. Prices show slight decline.

**New Orleans** January's electrical business is better than last year's and better than the average in January. Furthermore, the prospects for the entire year are considered remarkably good because of the large building activity in this city and section. A number of large structures have been begun or are about to be begun. The new electrical license law, which went into effect Jan. 1, is weeding out the inefficient contractors. New Orleans has been troubled with a very large number of these during the last few years.

**Denver** Jobbers report reasonably satisfactory business for first month of new year, with indications that late spring and summer will be record-breaking. Stop appliance sales, excepting flat irons are slow. A recent increase of $10 on most washing machines has not retarded sales, although demand is not so brisk as several months ago. New interest is being taken in sales of farm light and power plants through reasonable terms based on pre-war prices and certain allowances. Sales organizations for these plants are being reestablished in light of favorable prospective business. Credit conditions in agricultural communities are holding back this business

# Demand, Supply and Price Trend of Eighteen Commodities as Sold in Fifteen Cities

Explanation:
Demand: Steady, Slow or Active
Supply: Normal, Low or High
Price Trend: Firm, Decreasing or Increasing

Next Week Reports will include Radio, Rectifiers and Heaters

along with other staples. However, the outlook is an optimistic one with continued good weather and an extensive building campaign under way.

## Portland-Seattle

Electrical jobbing business for January has been very satisfactory. Seattle jobbers report business 100 per cent better than a year ago. There is a general feeling of optimism regarding prospects for the coming season. Reports from contractor-dealers, however, are more variable and generally not so optimistic. The lumber industry is particularly active at this time, and building is moving along in a very satisfactory manner. Copper wire has advanced 5 per cent during the week, and further advances are in prospect on all steel and iron products as well as copper. A slight advance is reported on glass insulators and loom is up 10 per cent. Shortage in conduit is still acute. Farm lighting plants are moving very slowly at this time and no marked improvement is expected before fall. The demand for electric tools is small, and jobbers have practically discontinued handling storage batteries except for radio work. The present market is primarily supplied by agents of the battery manufacturers.

## San Francisco

Export business, particularly with China and Mexico, showed remarkable improvement during January. Healthy buying conditions in the Bay Cities is reflected by San Francisco's response to its "community chest" drive. Lower prices on such staples as porcelain and boxes are evidence that 1923 promises to be stiffly competitive, reproducing in its turn the conditions which prevailed in the East several months ago. Cotton, copper and steel are firm, with every indication of advancing. Farm plants are slow, supply normal and prices firm. Most country agents apparently have drifted away to new fields because of poor prospects

## Salt Lake City

The development of railroad extensions, iron and coal projects and hotel facilities in southern Utah continues. This points to a steadily improving business in Utah and adjacent territory. The mild weather has passed and a spell of real winter now prevails. The effect has been to slow up retail trade. Electrical dealers are now giving much attention to pending washer campaigns scheduled to start early in March. There is a disposition to make more extensive preparations than has been the custom for several years past. Prices generally are firm.

# Activities of the Trade

Devoted to News of the
Manufacturer, Jobber, Agent, Contractor and Dealer, Including Important Orders and Contracts for Apparatus and Equipment

## American Engineering Acquires Standard Crane & Hoist

The American Engineering Company, Philadelphia, manufacturer of stokers and marine auxiliaries, announces that it has taken over the Standard Crane & Hoist Company and the patent and manufacturing rights to mono-rail electric hoists as manufactured by the latter named company.

The American Engineering Company has reorganized its No. 1 plant to accommodate the work of building and testing the hoists. H. S. Valentine, formerly chief engineer of the Standard Crane & Hoist Company, is directing sales and supervising manufacture of the hoists.

## Holslag Wins Welding Decision in Patent Office

A decision of the United States Patent Office issued recently and signed by the three examiners in chief affirms the priority of a welding machine invention to Claude J. Holslag of the Electric Arc Cutting & Welding Company, Newark, N. J., on all counts.

The patents refer to apparatus for and a method of using alternating current for arc welding by means of a transformer. The patents were issued June 3, 1919. The first decision in Mr. Holslag's favor was given in May, 1922, and the affirmation of that decision was rendered Jan. 12, 1923.

## Westinghouse's Order from Japan

The Tokyo Electric Light & Power Company, which supplies the city of Tokyo, Japan, with electrical energy, has recently placed with the Westinghouse Electric & Manufacturing Company a large order for generating and switching equipment to be used in extensions now being made to its system. The order covers switchboard, switching and generating equipment to be used in four of the Tokyo Electric Light Company's stations.

## Contractors Feature Convenience Outlets in Wiring Campaign

A co-operative house-wiring campaign under the auspices of the Malden (Mass.) Electric Company and the Malden-Everett-Melrose Association of Electrical Contractors has just been opened on the basis of emphasizing convenience outlets rather than the ordinary outlets for lighting service. For an initial payment of $2 on a contract guaranteeing a payment of $2 per month for eleven additional months, or $22 cash on completion of the work, the customer receives a wall outlet in the kitchen, a floor outlet in the dining room and another in the parlor, giving the opportunity to use a flatiron, floor lamp, toaster, vacuum cleaner or washing machine.

Return post-card folders describing the offer were mailed to 40,000 residential occupants at the beginning of the campaign Jan. 18, and thirty inquiries were reecived on the first day. Eight of these "leads" averaged service requests involving outlays of $100.

## Gifford-Wood Appointment

Directors of the Gifford-Wood Company, Hudson, N. Y., manufacturer of elevating and conveying machinery, have announced the appointment of Joseph A. Boucher to the position of sales manager. Mr. Boucher's first few years with Gifford-Wood were spent in the company's offices in Hudson, much of his time being devoted to engineering work. Eventually he joined the sales force and was assigned to the New York City office. He is now stationed in Hudson.

## Wakefield Brass Appointment

F. I. Wilson has recently joined the sales organization of the F. W. Wakefield Brass Company, Vermilion, Ohio, manufacturer of "Red Spot" hangers. Mr. Wilson was formerly with the appliance department of the Erner Electric Company, electrical jobber, Cleveland. He graduated from the University of Indiana in 1917.

## Hart & Hegeman Promotions

Monroe Guett, for some time factory manager of the Hart & Hegeman Manufacturing Company, Hartford, Conn., has been elected vice-president of this organization, retaining his former title also. Mr. Guett has been in the employ of this company for about thirty years. John R. Cook, who has been in the sales department for about seven years, has been appointed assistant sales manager, with headquarters at Hartford.

## American Wiremold Appoints New York Sales Manager

C. C. Sibley has been appointed district sales manager of the American Wiremold Company, Hartford, Conn., with headquarters at 27 East Tenth Street, New York City. Mr. Sibley will handle the company's business in northern New Jersey and the lower Hudson Valley in addition to the metropolitan area.

# Cleveland Electrical League's Program

The Electrical League of Cleveland has announced its plans for co-operative development work for the year 1923. This activity will be organized under four departments, specializing in the promotion of wiring, lighting, appliances, and industrial power and heat. According to the program:

The wiring section plans to distribute wiring suggestion booklets to all who take out permits for dwelling buildings, to encourage builders to bring plans to the league for expert advice on wiring and lighting the home, to maintain through a special representative, the point of contact with architects, house building contractors and wiring contractors, to endeavor to influence appliance manufacturers to distribute room plans like or similar to those prepared by the league, to continue the work started by the public information committee of compiling under one cover data and drawings which beyond any question of a doubt will result to the benefit of the entire industry, to encourage the installation of convenience outlets in old homes by the aid of a wider distribution of room plans and through editorial copy and display space in daily newspapers, and to co-operate with lighting section to improve lighting in all new buildings as well as buildings previously constructed.

The lighting section plans to conduct three store lighting exhibits, to employ a special lighting representative to conduct store lighting exhibits and to endeavor to influence architects and wiring contractors to provide for better lighting installations, to distribute lighting suggestion booklets to present and prospective home owners, who take out permit to erect dwelling building, to conduct a home lighting contest, to co-operate with builders of electrical homes, and to assist in promoting better lighting in offices, shops and factories.

The appliance section plans to conduct an eight weeks' campaign on the value of the clothes washed in the home, to conduct an eight weeks' campaign on the value of the vacuum cleaner in the home, to conduct an eight weeks' campaign on the value of the ironing machine in the home, to continue the services of a range representative to try to make each range owner a satisfied user, and to co-operate with the wiring committee in the distribution of room or home wiring plans that will prompt the installation of additional outlets in buildings which are to be constructed for the future use of electrical appliances.

The program for the industrial power and heating section has not been completed.

### Uehling Instrument Appoints New Jersey Representative

Announcement is made that Royal E. Terhune has been placed in charge of the northern New Jersey sales territory of the Uehling Instrument Company, Paterson, N. J., manufacturer of "$CO_2$ recorders" and other power-plant equipment. Mr. Terhune was formerly associated with the Uehling Laboratories and is therefore well qualified to co-operate with power-plant operators on the subject of power-plant economy.

### Edison Appliance Offices Moved

The New England district offices of the Edison Electric Appliance Company, Inc., have been moved to 99 Bedford Street, Boston. C. P. Myrick, district sales manager, states that increased business required the change and that in the new quarters double the former floor space is being occupied. Samples of all lines produced by this organization will be carried for display purposes at the new offices.

### Betts & Betts Sales Change

The Betts & Betts Corporation, 645 West Forty-third Street, New York City, manufacturer of refillable-fuse plugs, bell-ringing transformers, radio apparatus and motor-driven controllers, announces that H. O. Klug, whose appointment to the territory formerly covered by F. Maples, consisting of western Pennsylvania, Ohio, Michigan, eastern Indiana, northern Kentucky and West Virginia, was announced in the ELECTRICAL WORLD for Jan. 13, has resigned owing to illness in his family. He is succeeded in the position by William J. Gannan.

### States Company's Orders Gained 100 per Cent in 1922

A decided improvement in business was experienced during 1922 by the States Company, Hartford, Conn., according to H. J. Blakeslee, treasurer, who said that the demand for testing apparatus for both domestic and foreign use is increasing.

The total sales of the company were about 100 per cent better in 1922 than in 1921. Two and one-half times as many test tables were sold in 1922, and orders received during January maintain the recent improvement in this class of business.

Sales to Australia, Mexico, Canada and China feature the company's more recent foreign business. The winding department is being relocated near the main factory and the number of persons employed is about double the force required a year ago. A new automatic cut-out for series lighting circuits has lately been put into regular production, and the company is developing other apparatus to facilitate testing with special reference to portability. Sufficient orders for radio transformers are on the books to occupy the company until spring. The demand for phantom loads and other equipment used in meter testing in the field is also encouraging.

### Master Electric Company's New Building in Dayton, Ohio

The Master Electric Company, Dayton, Ohio, manufacturer of motors, has recently moved into its new offices and factory at First and Sears Streets, Dayton, Ohio, where greatly increased floor space, enlarged facilities and strengthened organization enable it to increase production in order to take care of its growing business.

NEW OFFICES AND FACTORY OF THE MASTER ELECTRIC COMPANY

**The Mine & Smelter Supply Company**, with branches in Denver, Salt Lake City and El Paso, has taken over the representation of the Wilson Welder & Metals Company, 132 King Street, New York City, for the States of Colorado, Utah, Nevada, Wyoming and New Mexico and for western Texas for Wilson plastic-arc welders and Wilson color-tipped welding metals.

**The Ledox Storage Battery Company**, 314 Bergen Street, Brooklyn, recently organized, has arranged for the construction of new works at 76 Fourth Avenue. Initial operations provide for the manufacture of plates and castings, with assembling department at the company plant, and other manufacture carried out under contract. Extensions in manufacturing facilities are planned. J. D. Moulton is president and O. W. Larson secretary and treasurer.

**The Westinghouse Lamp Company**, 165 Broadway, New York City, with plant at Bloomfield, N. J., has authorized Stone & Webster Inc., 147 Milk Street, Boston, engineers, to prepare plans for new works in the vicinity of the present factory, primarily for the manufacture of bases for incandescent lamps. They are estimated to cost $500,000, with machinery.

**The Western Electric Company** announces purchase of a tract of land comprising 55 acres on the Kearney Meadows in New Jersey, south of the Lincoln Highway, adjoining the large plants of the Federal Shipbuilding Company and the Ford Motor Company, having a frontage on the Passaic River of about 1,600 ft., upon which it will immediately begin the erection of factory buildings. It is the intention of the Western Electric Company to establish on this land an Eastern factory to supplement the manufacturing operation now carried on at its Hawthorne plant in Chicago.

**The Frank E. Wolcott Manufacturing Company**, Hartford, Conn., has secured a charter to manufacture electrical equipment and appliances, the authorized capital being $50,000. The incorporation is a continuance of the business previously conducted by Mr. Wolcott. At present part of the work is let out to contract.

**James. A. Condon, Inc.**, has taken over the business formerly conducted at Third and Arch Streets, Philadelphia, by Howard W. Read. The new company, which will specialize in steam, electrical and contractors' equipment, is headed by James A. Condon, who for twenty-one years was with Frank Toomey, Inc. The company has a warehouse at 1114 Frankford Avenue.

**The Electrical Dealers' Supply Company**, 162 West Randolph Street, Chicago, manufacturer of electrical fixtures and equipment, has awarded a contract for a three-story-and-basement plant, 100 ft. x 200 ft., to cost $250,000, including equipment. Simon Frankel is president of the company.

**The Allis-Chalmers Manufacturing Company, Inc.**, Milwaukee, Wis., announces that its board of directors has declared a dividend of $1 per share on the common stock, payable Feb. 15, 1923, to common-stock holders of record at the close of business Jan. 24, 1923.

## Foreign Trade Notes

HYDRO-ELECTRIC DEVELOPMENT IN NEW ZEALAND.—Proposed hydro-electric developments in New Zealand, according to a schedule drawn up, *Commerce Reports* states, involve a total expenditure of £12,902,000, covering a period of ten years, reaching a maximum of £2,023,000 in 1925. It has been necessary to postpone for a couple of years the commencement of the main works at Lake Waikaremoana, owing to financial conditions in New Zealand, and to hold over a number of the smaller developments in the South Island until power boards have been appointed to handle the question of distribution. Transmission lines and projects to be developed will be pushed ahead in order to make the supply of electricity as general as possible up to the capacity of the headworks at each site. The mains from Lake Coleridge will be extended into Otago and North Canterbury, and those from Mangahao will reach to Wanganui and Napier. These are in addition to lines already under construction.

AUTOMATIC PREPAYMENT TELEPHONES TO BE INSTALLED IN FRANCE.—The French administration of posts and telegraphs, according to *Commerce Reports*, has awarded a contract to a company, recently organized, for the installation of an automatic system. This company, which controls the rights of the so-called taxiphone for France, is to receive the exclusive concession for twenty years to establish and operate in France telephone booths fitted with automatic prepayment telephones. The company plans ultimately to extend its operations to all parts of the republic, but for the present it will install only about one thousand stations. The name and address of the company which has received the contract may be obtained upon application to the Electrical Equipment Division of the Bureau of Foreign and Domestic Commerce, Washington, D. C., or any of its district offices.

## Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number.

Purchase is desired in South Africa (No. 5,155) of a rotary wheel for cutting cotton, to be operated on alternating current at 200 volts.

An agency is desired in Spain (No. 5,179) for electrical machinery, pumps, ventilators, etc.

Purchase and exclusive agency is desired in Spain (No. 5,183) for miscellaneous electrical supplies for installations in homes or offices, motors up to 20 hp. or 25 hp., wire, incandescent bulbs and electrical novelties.

Purchase and agency is desired in Poland (No. 5,190) for electrical goods, machinery, supplies and apparatus.

Purchase or agency is desired in Chile (No. 5,193) for transmitting and receiving radio apparatus suitable for various distances up to several hundred miles.

An agency is desired in South Africa (No. 5,209) for railway and industrial equipment, electric meters and other machinery suitable for the South African market.

An agency is desired in Poland (No. 5,225) for electric generators, motors and current-measuring apparatus, copper wire and cable of all sizes, supplies for electrical installations, telephone and telegraph apparatus, electric fire-alarm and burglar-alarm systems and parts, and electric railway block signals.

EQUIPMENT FOR MORWELL (AUSTRALIA) POWER SCHEME.—Tenders will be received by the State Electricity Commission of Victoria, Melbourne, Australia, until April 28 for transformers and spares (Specification No. 23/9), for the Morwell power scheme. Tenders will also be received until March 15 for motors, starters and isolating switches (Specification 23/7), for the Morwell power scheme. R. Liddelow is secretary.

DEMAND FOR SMALL ELECTRIC LIGHT PLANTS IN PORTUGUESE EAST AFRICA.—In spite of the intense business depression prevailing throughout Portuguese East Africa and its hinterland of the Eastern Transvaal and Rhodesia, Consul Cecil M. P. Cross, Lourenço Marques, states that there is a moderate demand for small electric lighting plants suitable for farmhouses. Practically all of these in use are of American manufacture. A strong potential demand exists throughout Portuguese East Africa, as only the cities of Beira and Lourenço Marques have central electric plants. Cheaper plants operated by kerosene or some cheap fuel would better meet the requirements of the markets, owing to the high price of gasoline. The two distributing centers are Beira and Lourenço Marques.

## New Apparatus and Publications

CENTRIFUGAL PUMPS.—The De Laval Steam Turbine Company, Trenton, N. J., is distributing a bulletin and instruction manual describing and illustrating the "De Laval" type "F" small single-stage centrifugal pumps.

RADIO HORN.—The Bristol Company, Waterbury, Conn., has placed on the market a new "loud speaker" horn, known as "Audiphone, Jr.," which is used for radio receiving.

ARC WELDING.—The Electric Arc Cutting & Welding Company, Newark, N. J., has developed a new device for direct-current arc welding.

BENCH DRILL.—A new "Dunmore" portable sensitive bench drill has recently been placed on the market by the Wisconsin Electric Company, Racine, Wis.

ELECTRIC FANS.—The Century Electric Company, 1,827 Pine Street, St. Louis, has brought out a new induction-type single-speed, alternating-current fan, in 9-in. and 12-in. sizes. Bulletin No. 32 issued by the company describes and illustrates its alternating-current and direct-current fans.

PRESSURE PIPE.—Catalog No. 22 issued by the American Spiral Pipe Works, Chicago, Ill., describes and illustrates the "Taylor's" spiral-riveted pressure pipe.

RADIO APPARATUS.—The Whiteland Manufacturing Corporation, Washington Avenue from Sixth to Seventh Avenue, Long Island City, N. Y., is distributing two leaflets describing the "Whiteland" loud-speaking radio apparatus and loud-speaking telephone equipment.

RADIO HORNS.—The Betts & Betts Corporation, 645 West Forty-third Street, New York City, is distributing a leaflet describing its fiber radio horn.

ACCESSORY FOR TESTING MICROSCOPE STANDS.—An interference accessory for testing microscope stands and fine adjustments has been developed by Adam Hilger, Ltd., 75a Camden Road, London, N.W.1.

LIGHTING FIXTURES.—The National X-Ray Reflector Company, 235 West Jackson Boulevard, is distributing serial No. 401, which calls attention to the use of the "Curtis Adapter" for indirect lighting without ceiling fixtures.

SHOW-WINDOW LIGHTING.—The National X-Ray Reflector Company, 235 West Jackson Boulevard, Chicago, has issued serial No. 402, covering its No. 33 show-window floodlight.

OIL CIRCUIT BREAKERS.—A new line of circuit breakers, type F-10, designed primarily for industrial applications, such as textile, cement and flour mills and in mines, has been placed on the market by the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

FUSE PLUG.—A new fuse plug, "H & H," of the renewable-fuse type has been placed on the market by the Hart & Hegeman Manufacturing Company, Hartford, Conn.

## New Incorporations

THE SOUTH GEORGIA PUBLIC SERVICE COMPANY, Albany, Ga., has been incorporated with a capital stock of $10,000, with privilege of increasing it to $3,000,000. The company proposes to secure electricity from the plant of the Georgia-Alabama Power Company on the Flint River, above Albany, which it proposes to distribute in Tifton and neighboring cities.

THE MARTHASVILLE (MO.) ELECTRIC LIGHT & POWER COMPANY has been incorporated with a capital stock of $4,000 to generate and distribute electricity and to deal in electrical supplies, etc. The incorporators are F. H. Suhre, H. W. Duebbert, E. H. Koch, O. F. Dickmann and R. H. Morhaus.

# Construction News

**Projects, Plans, Bids and Contracts, Contemplated or Under Way**

## New England States

PORTLAND, ME.—The Cumberland County Power & Light Company is considering changing its system in Portland from direct to alternating current.

BOSTON, MASS.—The North Boston Lighting Properties, 201 Devonshire Street, has issued $1,500,000, part of the proceeds to be used for extensions and improvements to its plants and systems at Malden, Everett and vicinity.

PITTSFIELD, MASS.—The Pittsfield Electric Company contemplates building a pipe line from its Silver Lake power plant to the center of the city in the spring, to continue the heating service which it has been furnishing to the business blocks in North Street. The cost is estimated at $70,000.

SALEM, MASS.—Electric power equipment will be installed in the ice and cold-storage plant to be erected by a new company now being organized by P. A. Sweeney, 246 Essex Street, to cost about $150,000.

UXBRIDGE, MASS.—The Uxbridge Worsted Company is planning to build a new power plant. The equipment will include two 500-kw. turbo-generating units and 1,500 hp. in boilers. George P. Carver, Inc., Boston, industrial engineer, will design and construct the plant.

PROVIDENCE, R. I.—The annual report of the Metropolitan Park Commission presented to the General Assembly contains a recommendation that funds be appropriated for lighting the Barrington Parkway in East Providence with electricity.

NEW MILFORD, CONN.—Electric equipment will be installed in the proposed refrigerating and packing plant to be erected by the Confederated Abattoirs Corporation, to cost about $90,000.

## Middle Atlantic States

GOUVERNEUR, N. Y.—The Oswegatchie Light & Power Company is considering the installation of a 600-hp. engine for use in case of emergencies.

LE ROY, N. Y.—The Genesee Light & Power Company, Batavia, has acquired the property of the Le Roy Hydraulic, Electric & Gas Company. A transmission line will be erected from Batavia and extensions made in the local system.

MADRID, N. Y.—The St. Lawrence Transmission Company, Potsdam, has applied to the Public Service Commission for permission to establish an electric plant in Madrid.

NEW YORK, N. Y.—The Navy Purchasing Officer, South and Whitehall Streets, has received authority to purchase 144 porcelain post insulators (N. S. A. req. 112) and 110 storage-battery testing outfits (N. S. A. req. 453).

PLATTSBURGH, N. Y.—The Lake Champlain Pulp & Paper Company has acquired a site on the Saranac River near here, where it contemplates building a hydro-electric plant to cost about $75,000. It is estimated that about 1,500 hp. can be developed.

POTSDAM, N. Y.—The St. Lawrence Transmission Company has petitioned the Public Service Commission for permission to extend its transmission line from Potsdam to Gouverneur.

CHATHAM, N. J.—The installation of electrically operated pumping machinery at the municipal waterworks is under consideration. Extensions will be made in the lighting system on North Summit Avenue.

MEYERSDALE, PA.—Plans are being prepared by the Meyersdale Electric Light, Heat & Power Company for extensions to its power house, including the installation of new equipment.

NOXEN, PA.—The Noxen Electric Company, recently organized, plans to install a local system.

PHILADELPHIA, PA.—The Quaker City Rubber Company, Milnor and Comly Streets, will build a one-story power house at its plant.

PHILADELPHIA, PA.—The Art Loom Rug Company, Mascher and Westmoreland Streets, will erect a power house at its plant, to cost about $50,000.

PHILADELPHIA, PA.—The Beswick & Clay Company, Twenty-sixth and Callowhill Streets, will build a one-story power house in connection with extensions to its plant. M. Ward Easby, 1814 Chestnut Street, is engineer.

PHILADELPHIA, PA.—Bids will be received by the Department of Wharves, Docks and Ferries, Room 211, Municipal Pier, No. 4, until Feb. 9, for electric wiring and other work at the Girard Pier, No. 3, North Delaware River.

PHILADELPHIA, PA.—The Philadelphia Electric Company has called for bids for the erection of a substation at Trenton Avenue and Somerset Street. Plans are being arranged for an increase in capital from $65,000,000 to $100,000,000, part of the proceeds to be used for extensions.

PITTSBURGH, PA.—The West Penn Power Company has authorized plans for the initial unit of its proposed hydro-electric plant on the Monongahela River, Cheat River Valley, W. Va., to have a capacity of 50,000 hp. The cost is estimated at $3,500,000.

SCRANTON, PA.—Plans are under consideration by the Scranton Commercial Association for the installation of an ornamental lighting system on Wyoming Avenue between Lackawanna Avenue and Green Ridge Street.

SELLERSVILLE, PA.—The Pennsylvania Power & Light Company has acquired property of the Excelsior Light & Power Company. Extensions are contemplated.

BALTIMORE, MD.—The Washington, Baltimore & Annapolis Electric Railway Company is planning to supply electricity for lamps and motors in a number of small villages along its lines. This service will be furnished by the Annapolis Public Utilities Company, a subsidiary. The railway company is negotiating for the purchase of the municipal electric plant at Laurel.

CLARKSBURG, W. VA.—The Clarksburg Gas & Electric Company is negotiating with the Council for the installation of an electric lighting system in the Glen Elk section.

COLLINSDALE, W. VA.—The Paint Creek Mining Company plans to rebuild its power house and tipple, recently destroyed by fire.

GRAFTON, W. VA.—Plans are being prepared for the installation of a street-lighting system on Main Street.

LOGAN, W. VA.—Contract has been awarded by the Kentucky & West Virginia Power Company to the Foundation Company, New York City, for an addition to its power plant. A steel-tower transmission line will be erected from Logan to Hazard, Ky., 125 miles long. The cost of the work is estimated at about $800,000.

HARRISONBURG, VA.—Plans are considered for the installation of another 500-hp. unit at the municipal auxiliary steam-operated electric plant now in course of construction.

NORFOLK, VA.—The Virginian Railway is considering plans for the electrification of 16 miles of mountain roads, to cost about $500,000.

WINCHESTER, VA.—The Northern Virginia Power Company has petitioned the State Highway Commission for permission to extend its transmission lines along the Shenandoah Valley turnpike from Stephens City to Strasburg.

## North Central States

DETROIT, MICH.—Plans for a new group of buildings to be erected by the board of directors of the Sacred Heart Seminary, 1219 Washington Boulevard, provide for a two-story power house, 64 ft. x 147 ft. The cost of the entire work is estimated at $500,000.

DETROIT, MICH.—The Public Lighting Commission is preparing plans for the erection of a municipal power plant at Morrell Street and the Detroit River and for a substation in this section. Smith, Hinchman & Grylls, 800 Marquette Building, are architects.

CLEVELAND, OHIO. — Arrangements have been made whereby the Cleveland Electric Illuminating Company will supply the Northern Ohio Traction & Light Company, Akron, with additional energy to be distributed in Akron and nearby towns. Provision is also made for an interchange of power. The project will involve an expenditure of about $700,000 and will include the erection of a high-tension transmission line to connect the two cities. The Cleveland company will erect the line to the Cuyahoga County line and the Northern Ohio company from this point to its plant in South Akron. An additional transformer station will be erected at the Akron plant. Additional generating equipment will be installed at the Cleveland plant, increasing the output from 208,000 kw. to 263,000 kw. The system when complete will connect Cleveland with Toledo on the west, Pittsburgh on the east and Mansfield, Zanesville and Bridgeport on the south.

MAYSVILLE, KY.—The Maysville Public Service Company contemplates extensions and improvements to its plant and system.

INDIANAPOLIS, IND.—Plans are under way for the construction of a central power house for service at the James Whitcomb Riley Hospital, Indiana University of Medicine and the Robert W. Long Hospital, to cost about $275,000. The State Executive Committee is in charge.

SULLIVAN, IND.—The Vigo Mining Company, Ross Dispensary Building, Terre Haute, contemplates the erection of a power plant here, to cost about $75,000. The Shourds-Stoner Company, Tribune Building, Terre Haute, are architects.

BLOOMINGTON, ILL.—The installation of an ornamental lighting system on South Main Street from Mill Street to Highland Park is under consideration.

ELBURN, ILL.—Extension will be made to the municipal power plant, to cost about $25,000. Alford, Burdick & Housch, 8 South Dearborn Street, Chicago, are engineers.

EVANSTON, ILL.—Steps have been taken by the merchants on Davis Street to install an ornamental lighting system on that thoroughfare.

FREEPORT, ILL.—Plans are being prepared by the Arcade Manufacturing Company for a new power house and woodshop and plant alterations, to cost about $60,000.

GILLESPIE, ILL.—Arrangements are being made by the Southern Illinois Light & Power Company for extensive improvements to its local system.

McLEANSBORO, ILL.—Plans are being prepared for construction of water-works system, including an impounding reservoir, filter plant, several miles of pipe line, new engines and generators. W. A. Fuller, Railway Exchange Building, St. Louis, is engineer.

FORT ATKINSON, WIS.—The Fort Atkinson Canning Company is planning to build a new canning factory, including power plant and other buildings, to cost about $100,000. Bids, it is understood, have been asked for the work.

JANESVILLE, WIS.—The Board of Public Works has awarded a contract to the Janesville Electric Company for the installation of ornamental street lamps on South Main and South Jackson Streets.

MANITOWOC, WIS.—Plans are under consideration by the Wisconsin Public Service Corporation for the rearrangement of its lines to enable it to improve its lighting and power service in towns of Manitowoc and Calumet Counties. The proposed plans include the establishment of a substation at Valders and extensions of its line to Collins to furnish service there; also the erection of a new transmission line between Manitowoc and Chilton.

MILWAUKEE, WIS.—Extensions to the street-lighting system, to cost about $100,000, are under consideration. G. Staal is city engineer.

OSHKOSH, WIS.—The Badger Lumber & Manufacturing Company has started work on a new plant to replace the factory and power house recently destroyed by fire. The plant will cost about $150,000 and will be equipped throughout with motor-driven machinery.

ADA, MINN.—Bonds to the amount of $28,000 have been voted for the installation of a new electric distribution system.

SIOUX CITY, IOWA.—The installation of a new street-lighting system in the downtown district is under consideration. L. Hintgen is city engineer.

PARIS, MO.—Extensions and improvements will be made in the municipal power house and a city-owned ice manufacturing plant established. W. B. Rollins & Company, 521 Railway Exchange Building, Kansas City, are architects.

ST. LOUIS, MO.—The Light & Development Company of St. Louis has purchased a site of about fourteen acres in the Columbia bottoms adjacent to the Mississippi River in North St. Louis as a tentative location for a power house to be operated in conjunction with and supplementary to the power plant of the Cupples Station Light, Heat & Power Company, a subsidiary of the former company.

BROCK, NEB.—Bonds to the amount of $6,500 have been voted for the purpose of securing electricity from the Nebraska City Utilities Company.

CHESTER, NEB.—Bids will be received by the village clerk until Feb. 7 for changing the system of the municipal electric plant from direct to alternating current. The Prince-Nixon Engineering Company, Peters Trust Building, Omaha, is engineer.

LINCOLN, NEB.—The Lincoln City Hospital Association, it is reported, is receiving bids for the construction of a hospital and power house at Seventeenth and Sewel Streets. Davis & Wilson, Security Building, are architects. J. L. Teeters, 1812 D Street, is chairman of association.

BALDWIN, KAN.—The installation of an improved street-lighting system is under consideration by local business men.

EMPORIA, KAN.—The Kansas Electric Power Company will make extensions and improvements to its generating plant, including the installation of additional equipment. Horner & Wyatt, 306 McMillen Building, Kansas City, Mo., are engineers.

PITTSBURG, KAN.—Bids will be received by Leonard Boyd, city clerk, until Feb. 7 for an electrically operated pumping plant to be used in connection with new sewage-disposal works. Black & Veatch, Mutual Building, Kansas City, Mo., are engineers.

PRATT, KAN.—The installation of a new boiler in the municipal electric plant is under consideration.

## Southern States

RALIEGH, N. C.—The Yadkin River Power Company has issued $4,000,000 in bonds, part of the proceeds to be used for the purchase of the property of the Palmetto Power & Light Company and for proposed extensions and improvements.

WHITEVILLE, N. C.—Bids will be received by the Council until Feb. 9 for equipment for the municipal electric plant, to include one 90-kva. and two 150-kva. generators, direct-connected to "uniflow" engine; three-panel switchboard, exciter and auxiliary equipment; also, at the same time, for alternate estimates for Diesel engines. J. B. McCrary, Atlanta, Ga., is engineer.

CLEVELAND, GA.—O. C. Bell is organizing a company to construct and operate a local power plant for commercial service. Robert & Company, Atlanta, are engineers.

FORT LAUDERDALE, FLA.—The Carmichael Development Company plans to install an electric system for commercial street-lighting service on a 700-acre tract now being developed for residential purposes.

CHATTANOOGA, TENN. — The Casey-Hedges Company will install electric power equipment at its new boiler and tank manufacturing plant, to cost about $200,000.

RICHARD CITY, TENN. — The Dixie Portland Cement Company, Chattanooga, will install motors and other electric power equipment in connection with extensions and improvements, to cost $250,000.

CHILDERSBURG, ALA.—The Alabama Power Company has been granted a franchise to install a distributing system here.

RUSSELLVILLE, ALA. — Bonds to the amount of $24,000 have been issued for extensions and improvements to the municipal light and water plant.

SHEFFIELD, ALA.—Plans for the proposed new local cement manufacturing plant to be built by a company now being organized by Samuel W. Kendall, Meridian, Miss., include a power plant. The cost is estimated at $1,000,000.

WIGGINS, MISS.—The Finkbine Lumber Company contemplates the construction of a power house in connection with rebuilding its lumber plant, recently destroyed by fire, causing a loss of about $500,000.

ARKADELPHIA, ARK.—The Arkansas Power Company is making arrangements for an issue of $500,000 in bonds for extensions and improvements.

EL DORADO, ARK. — The Arkansas Light & Power Company has started work on the erection of a high-tension transmission line to Smackover, to cost about $95,000.

EL DORADO, ARK.—The Evans-Thwing Refining Company, 624 Finance Building, Kansas City, Mo., will install electric power equipment at its proposed local oil-refining plant, to cost about $500,000.

KETCHUM, OKLA.—The Grand River Hydro-Electric Power Company contemplates the construction of a hydro-electric plant on the Grand River, with initial capacity of about 17,000 hp.

ABILENE, TEX.—Plans are being considered by the West Texas Utilities Com-

pany for extensions to its main power station and system.

CLARKSVILLE, TEX. — Electrically operated machinery and other equipment will be installed in connection with extensions to the municipal waterworks system.

SAN ANTONIO, TEX.—The Valley Electric Company, recently organized, will take over the plants at McAllen, San Juan, Alamo, Donna and Mercedes. The company is a subsidiary of the Central Texas Company.

## Pacific and Mountain States

MANSON, WASH. — The Washington Water Power Company will install and operate a distributing system here. Power will be secured from the proposed transmission line to Lake Chelan.

RIVERSIDE, WASH. — The Riverside Irrigation District, which plans to establish an irrigation project covering 4,000 acres of land, has authorized an issue of $450,000 in bonds. A hydro-electric plant will be built on the Okanogan River at McLaughlin Canyon to furnish power to operate the pumping system. N. Aall, Riverside, is engineer.

SEATTLE, WASH. — Bids will be received by the Board of Public Works until Feb. 9 for electrical equipment for the North substation of the municipal Skagit River development.

TACOMA, WASH.—The Puget Sound Power & Light Company has been granted a franchise to erect and operate electric transmission lines in a large district in Pierce County, including Puyallup.

FRESNO, CAL.—The San Joaquin Light & Power Corporation will erect a substation at Orange and California Avenues, to cost about $102,000, to replace an existing plant. Plans are being prepared for the construction of a hydro-electric plant on the Kings River and a 22-mile transmission line to the site from Piedra, to cost about $175,000.

HUNTINGTON, CAL.—The installation of an ornamental lighting system on Ocean Boulevard, a distance of 3 miles, is under consideration by the Board of City Trustees.

LONG BEACH, CAL.—The Southern California Edison Company contemplates the erection of a transformer station at the intersection of Pine and Locust Streets, to cost about $250,000.

LOS ANGELES, CAL. — The Southern Pacific Railroad Company, San Francisco, will build a power plant in connection with its new shops and terminal on the San Fernando Road, to cost about $1,000,000.

OAKLAND, CAL.—Bids will be received by George B. McDougall, chief of division of architecture, Forum Building, Sacramento, until Feb. 15 for construction of an employees' cottage, women's shop building, power house and recreation building for the Industrial Home for Adult Blind, Oakland.

SAN FRANCISCO, CAL.—Electric power equipment and a substation will be installed at the plant to be erected at South San Francisco by the Metal & Thermit Corporation, 120 Broadway, New York, and Swift Street, San Francisco, to cost about $1,500,000.

SANTA ANA, CAL. — Plans are being prepared for the installation of a fire-alarm system.

ADAIR, IDAHO.—The Smith River Light & Power Company, recently organized, is planning to erect a power plant on the Smith River. The proposed plant will be driven by Diesel engines. C. Romander is general manager.

TOMBSTONE, ARIZ. — The installation of a municipal electric plant is under consideration.

## Canada

GRAND FALLS, N. B.—The International Paper Company, 30 Broad Street, New York, contemplates the construction of a hydro-electric plant in connection with a new local paper mill, to cost about $500,000.

BRIDGEBURG, ONT.—The installation of an electric light and power system in Bridgeburg, to cost about $50,000, is under consideration. It is proposed to secure energy from the Hydro-Electric system at Stevensville, 8 miles distant.

NORTH BAY, ONT.—The French River Power and Development Association has been organized in connection with a proposition to develop the power resources of French River. D. Barker, North Bay, is chairman.

ORILLIA, ONT.—The Water, Light and Power Commission contemplates extending the municipal electric lighting system to Victoria Point and Grape Island.

# Electrical Patents

**Announced by U. S. Patent Office**

(Issued Jan. 9, 1923)

1,441,640. SHUNT CONNECTION; R. B. Taylor, Cleveland, Ohio. App. filed March 28, 1922. Connecting shunts or cables to the brushes of electric machines.

1,441,685. ELECTRIC ARC SOLDERING; E. H. Jones, London, England. App. filed Sept. 18, 1918. Electrode covered with suitable material to prevent excessive oxidation.

1,441,686. METAL ELECTRODE USED IN DEPOSITING AND SOLDERING BY THE ELECTRIC ARC; E. H. Jones, London, England. App. filed Sept. 18, 1918. Base-metal electrode covered with nickel or other suitable coating.

1,441,687. ELECTRIC ARC SOLDERING; E. H. Jones, London, England. App. filed July 16, 1919. Electrode of base material covered with carbon.

1,441,688. ELECTRODE AND WELDING AND LIKE ROD USED IN SOLDERING AND DEPOSITING METALS; E. H. Jones, London, England. App. filed Feb. 18, 1920. Formed of rods of different materials.

1,441,755. TROLLEY-WHEEL MOUNT; T. Sanders, Kingman, Ind. App. filed July 5, 1922.

1,441,791. TELEPHONE SYSTEM; H. M. Friendly, Portland, Ore. App. filed June 11, 1917. Enables party calling from a central exchange telephone to obtain access over a trunk line to stations in a private automatic exchange.

1,441,792. ELECTRIC ACCUMULATOR; W. O. Garbutt, Gloucester, England. App. filed June 19, 1922. Method of desulphating battery plates.

1,441,801. TERMINAL; F. G. Guenther and W. C. Grabau, Seattle, Wash. App. filed Dec. 6, 1920. Moisture-proof housing for covering connection between battery and cable.

1,441,822. FLASHLIGHT; E. R. Barany, New York, and W. S. Pritchard, Mount Vernon, N. Y. App. filed Sept. 14, 1921. Light beam carefully focused.

1,441,872. AUDIBLE SIGNAL DEVICE OF THE VIBRATORY DIAPHRAGM TYPE; J. F. Monnot and E. T. Cook, London, England. App. filed June 24, 1919. Operated by racket and motor.

1,441,877. DIRECTION SIGNAL; P. W. Padden and O. C. Reynolds, Maumee, Ohio. App. filed Nov. 5, 1920. For automobiles.

1,441,883. FLASHLIGHT; J. T. Roffy, Brooklyn, N. Y. App. filed Jan. 2, 1920. Guard around lens to prevent breakage.

1,441,884. FLASHLIGHT; J. T. Roffy, Brooklyn, N. Y. App. filed Jan. 3, 1920. General diffused illumination.

1,441,902. INTERMITTENT ELECTRIC LIGHT FLASHER; E. M. Bailey, Albion, Ill. App. filed July 10, 1920. Operated by pendulum of clock.

1,441,988. WIRELESS-WAVE DETECTOR; E. P. Lindner, Indianapolis, Ind. App. filed Dec. 18, 1920. Carborundum detector.

1,442,013. LAMP RECEPTACLE; G. B. Thomas, Bridgeport, Conn. App. filed June 3, 1918. Cleat receptacles.

1,442,027. CHAIR FOR X-RAY WORK; R. Levenson, New York, N. Y. App. filed July 28, 1921. Means for accurate positioning and supporting of patient's head.

1,442,031. METHOD OF SUSPENDING ELECTRODES; C. E. Söderberg, Christiania, Norway. App. filed Jan. 27, 1920. Electrodes baked in furnace in which they are used.

1,442,033. METHOD OF OPERATING ELECTRIC FURNACES; M. O. Sem and Einar Lund, Christiania, Norway. App. filed Oct. 22, 1921. Charging fuel to furnace through hollow electrode.

(Issued Jan. 16, 1923)

1,442,041. GRINDER REGULATION SYSTEM; C. A. Boddie, Pittsburgh, Pa. App. filed Sept. 11, 1920. Control of hydraulic pressure employed to force material into pulp grinder.

1,442,042. GRINDER REGULATOR SYSTEM; C. A. Boddie, Pittsburgh, Pa. App. filed Sept. 11, 1920. Load-control apparatus for pulp grinders.

1,442,048. ELECTRIC WATER HEATING APPARATUS; H. W. Christian, Detroit, Mich. App. filed Aug. 25, 1921. Thermostatic mechanism regulates temperature of water.

1,442,050. ELECTRIC REGULATION; J. L. Creveling, White Plains, N. Y. App. filed March 7, 1917. Voltage regulator for generators.

1,442,053. CONTROL SYSTEM; R. E. De Camp, Wilkinsburg, Pa. App. filed May 12, 1919. Motor-starting resistance automatically cut out.

1,442,064. REMOTE CONTROL FOR INDICATORS; O. E. Groshall, Salt Lake City, Utah. App. filed Jan. 21, 1920. Auxiliary cash-register indicators.

1,442,082. PARTY-LINE TELEPHONE SYSTEM; T. G. Martin, Chicago, Ill. App. filed July 20, 1905. Complete automatic system.

1,442,085. MAXIMUM-DEMAND METER; W. G. Mylius, Wilkinsburg, Pa. App. filed May 13, 1918. Integrated periodic demand.

1,442,086. AUTOMATIC TELEPHONE SYSTEM; F. Newforth, Jr., Norwood, Ohio. App. filed Sept. 18, 1914. Measured-service reverse-battery telephone system.

1,442,109. ELECTRIC RANGE; A. W. Walker, Malden, Mass. App. filed June 2, 1921. Current carrying and controlling apparatus readily accessible.

1,442,130. TELEPHONE SYSTEM; H. D. Currier, Chicago, Ill. App. filed July 18, 1918. Filters out all low-frequency currents.

1,442,131. ELECTROMAGNETIC GOVERNOR; C. W. Dake, Chicago, Ill. App. filed Aug. 20, 1919. Governor for turbo-generator sets.

1,442,146. MODULATING AND TRANSMITTING SYSTEM; R. A. Heising, East Orange, N. J. App. filed April 13, 1918. Radio-sending apparatus.

1,442,147. PRODUCTION OF MODULATED FREQUENCY OSCILLATIONS; R. A. Heising, East Orange, N. J. App. filed Nov. 17, 1916. Methods for producing modulated high-frequency oscillations.

1,442,202. ELECTRICAL SYSTEM; R. J. Wensley, Edgewood Park, Pa. App. filed March 14, 1918. Automatic starting and stopping of rotary converter.

1,442,238. ELECTROLYTIC APPARATUS; A. K. Smith, Cleveland, Ohio. App. filed July 29, 1922. Overvoltage prevented by coating electrodes with a nickel oxide.

1,442,243. PROCESS FOR CLEANING SCALE FROM METALS; G. A. Avery and F. Bamblett, Detroit, Mich. App. filed March 23, 1922. Material subjected to current in solution of mineral acid.

1,442,273. TROLLEY; W. T. Hill, York Harbor, Me. App. filed June 15, 1922. Wheel attachment to prevent contact from leaving wire.

1,442,284. ELECTRIC CONNECTOR; J. A. McKay, New York, N. Y. App. filed Feb. 21, 1920. Several types of plugs may be used with outlet box.

1,442,288. ELECTRIC SIGNALING SYSTEM; W. C. Neahr, Denver, Col. App. filed Dec. 17, 1918. Semaphore for railroad crossings.

1,442,310. TIME-LIMIT, CURRENT-LIMIT CONTROL FOR ELECTRIC MOTORS; L. W. Thompson, Schenectady, N. Y. App. filed Aug. 11, 1920. Starting and stopping control for motors.

1,442,320. SYSTEM OF ELECTRICAL DISTRIBUTION; E. Beuer and W. A. Turbayne, Niagara Falls, N. Y. App. filed Sept. 14, 1917. Voltage regulator for variable-speed generator for charging batteries.

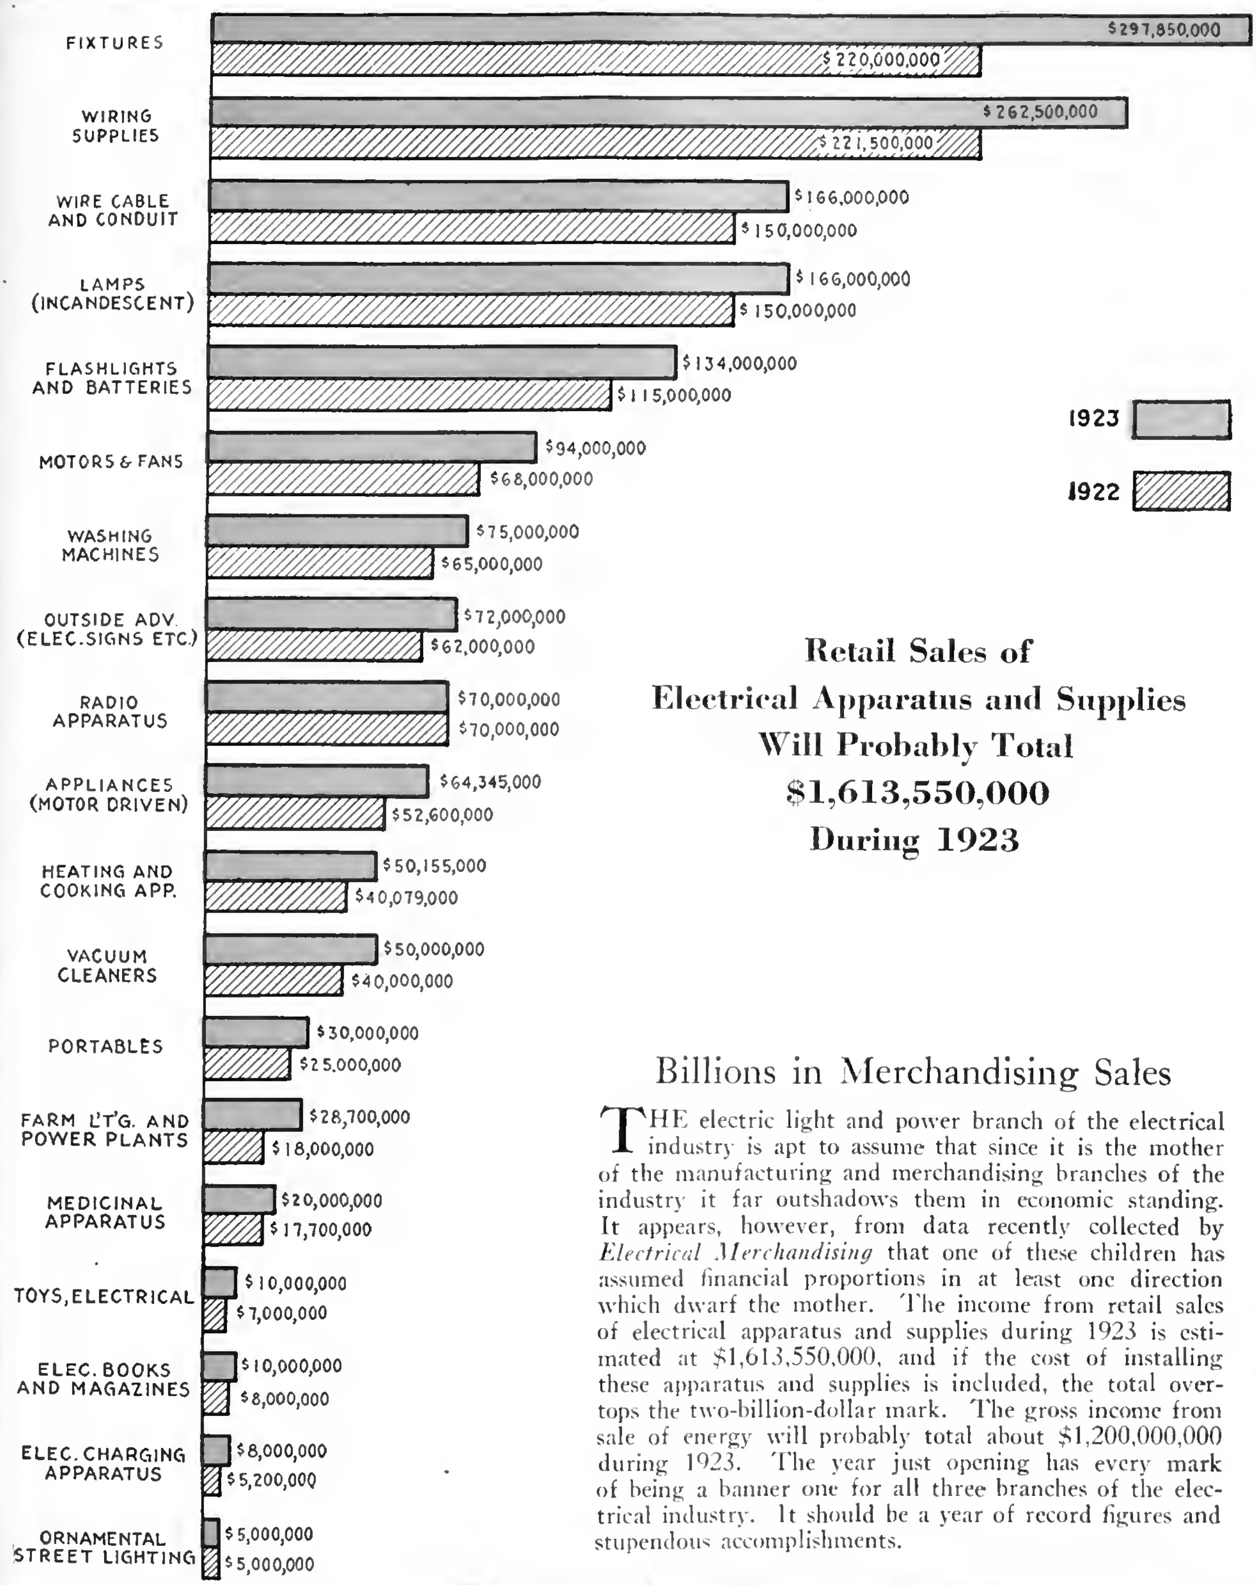
1,442,460. CURRENT-CONTROLLING MEANS FOR ELECTRIC CIRCUITS; G. A. Anderegg, Oak Park, Ill. App. filed June 30, 1917. Reactor for transmission lines.

# Business Facts for Electrical Men

Selected Statistics Presented Graphically for
the Use of All Interested in Analyzing the
Trend of the Electrical Business



**Retail Sales of Electrical Apparatus and Supplies Will Probably Total $1,613,550,000 During 1923**

## Billions in Merchandising Sales

THE electric light and power branch of the electrical industry is apt to assume that since it is the mother of the manufacturing and merchandising branches of the industry it far outshadows them in economic standing. It appears, however, from data recently collected by *Electrical Merchandising* that one of these children has assumed financial proportions in at least one direction which dwarf the mother. The income from retail sales of electrical apparatus and supplies during 1923 is estimated at $1,613,550,000, and if the cost of installing these apparatus and supplies is included, the total overtops the two-billion-dollar mark. The gross income from sale of energy will probably total about $1,200,000,000 during 1923. The year just opening has every mark of being a banner one for all three branches of the electrical industry. It should be a year of record figures and stupendous accomplishments.

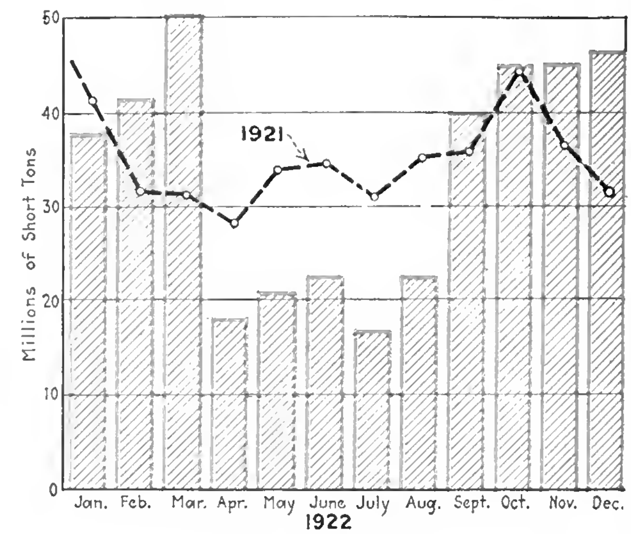
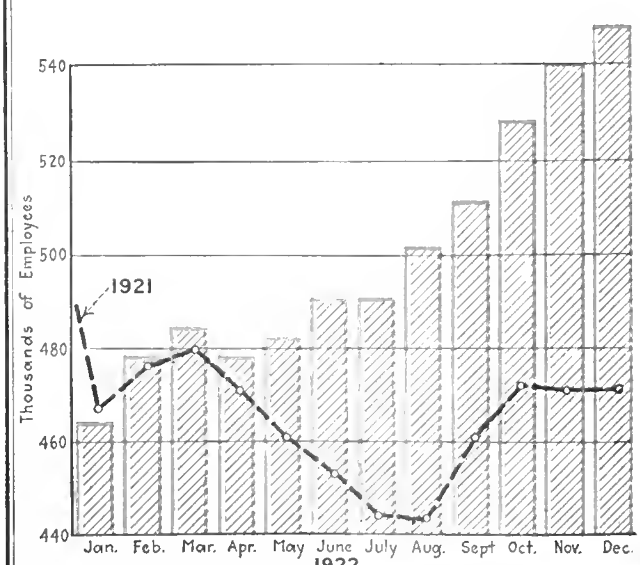
Activity of Spindles in Cotton Mills



Bituminous Coal Production



Employees in Factories of New York State

## The Coal Shortage Disappears

MOST gratifying are the data which have been issued by the Department of Commerce on the production of bituminous coal for the year 1922. These data indicate that, despite the five months' strike, bituminous-coal production was only 11,000,000 tons, or less than 3 per cent, below the tonnage mined during 1921. In December, notwithstanding the fact of the holiday season, the production was the greatest since March and was 50 per cent above the amount taken from the mines in December, 1921. Such favorable activities taken in conjunction with the recent agreement entered into by the operators and miners point to a year free from fuel shortage troubles, and it is to be hoped that this condition will be reflected in a material reduction in the price of coal to the consumer.

Copper production was maintained during December, being 458 per cent greater than the production reported for December, 1921.

# Why Do We Work?

MEN say that businesses are organized and run for profit. They say that those who labor in them work for pay. But beyond all that — specifically, what is the goal? What has inspired these business enterprises? What are the inner purposes—the ultimate toward which the effort is directed?

In every case analysis will show that the real fruit of such corporate activity is not profit — indeed, the profits are but the wages paid to the capital and brains which must be hired to do the work. The true aim is service. For every organized business has inevitably as its obligation either the saving of labor, the development of economy or the contribution of comforts that will better the conditions of living and bring to mankind more time and opportunity for self-culture, self-expression and the enjoyment of the better things of life. Test where you will and it is so. Any enduring business will be found to have as its far objective some such essential benefit.

Trade, after all, is but the instrument working toward this end, and not the end itself. Management and finance are secondary. The vital purpose is to render service to mankind, and in this there need never be a question as to compensation for all such work well done. America is ever lavish in the rewards she pays for service to the common weal.

What are these services which benefit mankind?

Agriculture is one. Mining is another. The agencies of distribution also render vital service in that they carry to man the urgent necessities of life. Each in turn contributes something fundamental to the well being of the people. The engineer finds his opportunity in his ability to aid in working out the scientific solution of the many problems which beset the way of these great life-giving services. And in this in his turn he himself contributes a further service to mankind that has a value past all estimation.

# H. Birchard Taylor

*An engineering executive who holds a leading place in the manufacture and development of hydraulic turbines.*

TO HAVE been in responsible charge of the manufacture of hydraulic machinery aggregating nearly two million horsepower and at the same time to have been a pioneer in the engineering development of this type of prime mover is an achievement of a kind that few men reach. Only courage, foresight, tenacity and knowledge enabled H. Birchard Taylor to accomplish these results in a very few years after leaving college. Today as vice-president of the William Cramp & Sons Ship & Engine Building Company this young executive continues to make notable contributions to this phase of the electrical industry.

Among the first installations for which Mr. Taylor became responsible were the developments on the New River in Virginia by the Appalachian Power Company and the Keokuk development of the Mississippi River Power Company. The Appalachian development was notable for the distinct forward step which it represented in hydro-electric practice. This comprised the abandonment of the many forms of multi-runner, horizontal-shaft installations then in vogue in favor of the vertical-shaft, single-runner unit of great simplicity and high efficiency. Mr. Taylor was a pioneer in advocating this form of unit, which represents the accepted practice of today in all large installations. The form of setting adopted by Mr. Taylor in the Appalachian development has since been generally adopted for all low-head and medium-head installations, namely, the use of a spiral casing molded in the concrete of the power-house substructure, and in combination with it a so-called "speed ring," or ring of stay vanes, embedded in the concrete and capable of supporting the weight of the superimposed structure. The Appalachian turbines under careful test established a world's record for efficiency. The Keokuk development was probably the largest hydraulic installation which had ever been carried out as a single project, and the turbines were of unprecedented dimensions. Many other installations of first rank have followed, and a high-water mark is represented by the two 70,000-hp. turbines now under construction by the Cramps for the Niagara Falls Power Company.

Mr. Taylor relinquished the office of hydraulic engineer in 1917, having been made vice-president of the Cramp company in that year, but has maintained his active supervision over the hydraulic business of his company, and a number of important inventions have been produced by him during this period. He is president of the Pelton Water Wheel Company and also a director of the Dominion Engineering Works.

# Editorial Comment

Electrical World, February 10, 1923

Volume 81 Number 6

## The People Want to Know

THE people want to know more about the electrical industry—how big it is in their own town, how it has grown, what it is going to do for them some day. This fact brings an opportunity which every central-station man should eagerly appropriate unto himself. For there is so much to tell, and there is a degree of romance in the tale that makes it fascinating.

But we must remember that the story must be phrased in human terms that paint a human picture. It must not be expressed in technicalities and statistics, for the jargon of our craft means little to outside ears. The mere statement that a utility has spent three or four million dollars in a year means nothing to the average householder and his wife. But a story of what the money bought, and how it will be used, and why it was required, and how much it will benefit in service to the people of the community, does mean something. What the expenditure has effected in terms of visible growth and the number and the kinds of people who have loaned their savings to the company to help finance this community improvement—people are interested in that too. For if it is interpreted to everybody, a better, bigger power station will become as much a matter for local pride as a better, bigger library.

## "Experts May Be Found to Justify Any Valuation"

THE editors of this and other technical journals, as well as several engineers of prominence, have at times almost gone out of their way to point out the opportunity and obligation of engineers as a class to undertake to help solve national and international social and economic problems by the application of engineering thinking. Nor is it intended to modify or do else than still more strongly impress that exhortation. But when the editorial page of one of the country's leading daily newspapers states, as a matter of course, that "Experts may be obtained to justify any valuation," it is apparent that the public must gain in some way a greater respect for the engineer as an arbiter or adviser before the engineer is going to be intrusted with the solution of the larger problems mentioned. It is not enough to answer this by saying that "experts" differ because some of them are not orthodox or are urged to become partisan for one reason or another. On the other hand, it is, of course, not practicable, much less within the bounds of probability, for two fair-minded and capable engineers to arrive at an identical result in a valuation. But it is possible and practicable, and it should be the invariable rule, that two engineers shall approach and deal with a valuation in such a way that they arrive at results of the same order of magnitude. Reason should be given to the public for confidence that the engineer approaches his problems in such a way as to find the one answer based on fact or expert judgment, and not as a special pleader or advocate.

Engineers have, by training and in general by practice, the ability and the attitude to reach conclusions based on fact or at least on clear analysis. Modern society, both nationally and internationally, needs that sort of assistance or leadership today. It is the opportunity—in fact, the duty—of the engineer to prove that he can contribute materially to the solution of larger problems. But he must build a sound confidence in the public mind that he is fully able to handle his humbler problems of an economic-engineering-social nature before he will be intrusted with others.

Such statements as the editorial utterance alluded to above are a direct challenge to the engineering profession.

## The Search for International Standards

IN THE determination of international standards allowances must often be made for temperamental and national prejudices. Such standards can be arrived at only by voluntary agreement; and we do not all think alike or act alike. To some, standards are commercial, to others technical. It is hard to avoid these differences of viewpoint. Yet there is, as has repeatedly been shown, an opportunity for an agreement which is ultimately to the advantage of all.

At the recent international conference at Geneva it was apparent that the delegates talked from two distinct standpoints on the question of motor ratings. Most of the European nations had proceeded on the belief that motor ratings would follow the I. E. C. recommendation of two years ago, which was that motors should be definitely rated at that continuous load which would produce a temperature rise not to exceed 50 degrees C., and they were still inclined to support that recommendation. The American delegation was somewhat divided in its own ranks, consisting as it did largely of individual representatives holding more or less divergent opinions on the subject, there being, unfortunately, no agreement on the subject in this country before the delegation left. Primarily, our delegates went over as observers, not ready to act on any program. But, as at least one observer has remarked, as the discussion went forward the Americans were naturally drawn into it until finally our differences had a public airing. The British delegation, on the other hand, came with a very definite viewpoint, and with a program built around it, that this old I. E. C. rating had not proved a practical proposition, at least in the case of motors for general distribution and use. Theirs was fundamentally a commercial viewpoint, gained through what they said was instructive experience. The British delegation of thirteen was a unit on the proposition, and eventually a recommendation to the commission was passed based on

the British proposals. (For details see ELECTRICAL WORLD, Dec. 2, 1922, page 1230, and Dec. 23, page 1404.)

Fundamentally, the situation now is that the Geneva conference has recommended that another motor rating standard be authorized in addition to the present I. E. C. standard. According to this recommendation motor ratings will be authorized on the basis of 40 degrees C. rise for continuous operation, with a 25 per cent overload guarantee for two hours without exceeding the I. E. C. maximum temperature limitation (approximately 90 degrees C.), but with the provision that on the same nameplate the rating according to the old I. E. C. continuous (50-degree C.) rating should also be indicated. Fortunately the only apparatus affected by this complicated arrangement is a limited range of motors.

Thus, in the effort to advance international standards, a somewhat awkward and confusing set-up (at least from the standpoint of the general purchaser and user) has been made. It was, perhaps and under the circumstances, the best that could be done, and it has at least brought forcibly to light the fact that international "commercial-engineering" standards cannot be decided solely from a highly technical standpoint, as can absolute engineering or scientific standards such as volts, amperes and similar quantities.

## A Present Opportunity for American Leadership in Standards

THE situation as left by the Geneva conference and by subsequent events now presents an opportunity, which is almost a challenge, for America to establish leadership in the question of motor ratings. It should surely serve as a spur to us to reach an agreement in this country on this question. The British, now that they have won their first proposal, hardly know exactly what to do with it, in detail. The principle they fought for was admitted—that there should be recognized a more "generous" motor rating than a rating based on the maximum the motor would do. On this point it is understood the American delegates, as well as those of other nations, all finally agreed with the British. But the actual method of application of the principle is indefinite, or at least undefined to the satisfaction of every one, and it is here that American commercial practicability and engineering ingenuity should step in and assume leadership.

As pointed out last spring by the editors of the ELECTRICAL WORLD and by several others who contributed to the discussion in these columns, it is illogical and uneconomic to continue the present double standard—that is, the two standards (the so-called 40-degree–55-degree and the 50-degree) of rating motors. One single standard, whatever it may be, should be found. As apparently agreed upon at Geneva, the 50-degree standard alone does not seem practicable. The solution would appear to be some standard at a lower temperature, with or without overload guarantee or even mention. Fortunately American manufacturers are fast coming to see that such a solution will be wise. The editors of this paper cannot and do not assume to state what any such actual basis should be, but, considering the 40-degree action at Geneva and considering the simplicity and commercial practicability of a single rating, it appears that an agreement to rate motors "at that horsepower which they will carry continuously without exceeding a temperature rise of 40 degrees" above the surrounding atmosphere would be both sound and practicable. And it seems safe to predict that if American manufacturers and engineers shall agree on some such single standard rating (whether on the exact definition and temperature above stated, or not), they will find themselves better off in their domestic business and also in a most advantageous position to assume world leadership in a final international agreement on motor ratings.

## Cost of Living and Electric Utilities

IN THE *Monthly Labor Review* issued by the United States Department of Labor and in the cost of living data issued by the National Industrial Conference Board a great wrong is done to the electric light and power companies of the country. This wrong is not done openly or possibly knowingly, but inferentially, and it is the inference which newspaper headline writers are quick to grasp and play up to our detriment. Why the cost of electric light should be combined with the cost of fuel in the curve "fuel and light," particularly since its effect is almost nil, is somewhat difficult to understand. The injustice is instantly apparent in the statement of the Labor Department that "fuel and light have increased 83.8 per cent in cost from 1913 to September, 1922," whereas its own reports on retail prices of electricity used for household purposes in thirty-two cities of the United States show that the rates for electricity were actually less in September, 1922, than they were in December, 1914. Since 1913 also the improved tungsten lamp has come into wider use, so that light for light the cost is now considerably less.

The National Electric Light Association has very properly taken this matter up with the Labor Department at Washington, and it is to be hoped that the injustice will be quickly righted. Water is more essential to life than artificial light, yet no note is taken of water by the Labor Department, nor of telephone or street-railway service. These have a greater effect on the cost of living than has the cost of electric light.

## Important Advances in Street-Lighting Equipment

DREARY standardization of street-lighting equipment has been threatened of late, and therefore it is refreshing to find that a step forward is actually being taken, one in a direction already familiar, the automatic operation of substations combined with outdoor apparatus. The progress referred to has been achieved in Kansas City and is described in this issue by A. E. Bettis.

Time was not many years ago when the suggestion of placing even switches and transformers out of doors was regarded as a dangerous heresy, stamping the engineer who proposed it as a harebrained innovator who should promptly be suppressed lest he break in on the beautiful symmetry of catalog equipment. But the world moves, and as time has gone on more and more apparatus has gone out of doors, sometimes indeed more than under the local conditions might always be desirable. The radical departure in Kansas City lies in placing the constant-current transformers and their immediate equipment on the line poles at convenient outlying points for the supply of the street-lighting circuits. To feed and control these a single 4,000-volt, three-phase, four-wire circuit is run out of each of

seven general substations. The several phases are distributed as 2,300-volt feeders in three symmetrical territories around each substation. In the automatic street-lighting units the line feeder is connected as usual, but is controlled by a time clock which operates the master controller, energizes the circuit and puts the equipment into operation. The same time clock takes the street-lighting circuits off by opening the control circuit and thus checking the activities of that particular feeder. The ordinary constant-current transformer used in this way is rated at 20 kva., smaller units being employed in some of the outlying districts. Each of these 20-kva. installations is good for about forty 600-cp. lamps or a proportionately greater number of 400-cp. or smaller sizes. As there are more than six thousand lamps in all, of which more than half are of 600 cp., the thorough subdivision of the transformer system is self-evident.

This automatic service does two very important things. It eliminates a serious amount of equipment in the substations, necessarily well filled with apparatus for other purposes and, what is even more important, it gets rid of the long and troublesome dead runs of wire on the street-lighting circuits. Any one who is familiar with the complication of laying out street-lighting circuits which have to be operated from one or a few substations will realize the value of pole equipment for handling comparatively short circuits automatically. In this way one can get the maximum number of lamps per actual mile of circuit and avoid contingencies which might put out of action a large portion of the circuit at once.

The other outstanding feature of the Kansas City installation is the underground cable work. The city was not provided with the conduits adequate for the new system even if it had been desired to use them, and it was desired to get rid of overhead wires in so far as this was humanly possible in a growing installation. The difficulty was met by a special lead-covered cable laid over with a triple jute covering impregnated with insulating compound. The chief purpose of the jute covering is to check danger from electrolysis. The cables are paper-insulated, carrying a single No. 8 conductor, and the experience of a year with this cable, of which 750,000 feet are now under ground, has been entirely satisfactory. It is laid directly in earth in a narrow trench 12 inches or 14 inches deep, and at street intersections an additional protection is installed in the form of a 2-inch fiber contact. Special lamp posts are used only where there are no trolley poles handy. Where these are available a special bracket carries the lamp. This arrangement of cable for the underground supply of street lamps has proved to be reasonably cheap. The cost of trenching, placing and filling is running less than 10 cents a foot in clear ground, while the typical total installation cost is reckoned at about 23 cents per foot exclusive of street crossings. Very little trouble has been had with the underground system, and experience indicates that no serious difficulty is to be anticipated.

Of course, the critical period for any such installation is after some years of service, and future results will be watched with interest. Enough has been done, however, to show not only that a thoroughly practical system of automatic pole transformers for street-lighting service can be used but that supply by underground cables laid simply in the earth is here, as it has been proved in various places abroad, an entirely satisfactory means of getting the wires out of the way.

### A Plant Investment That Paid

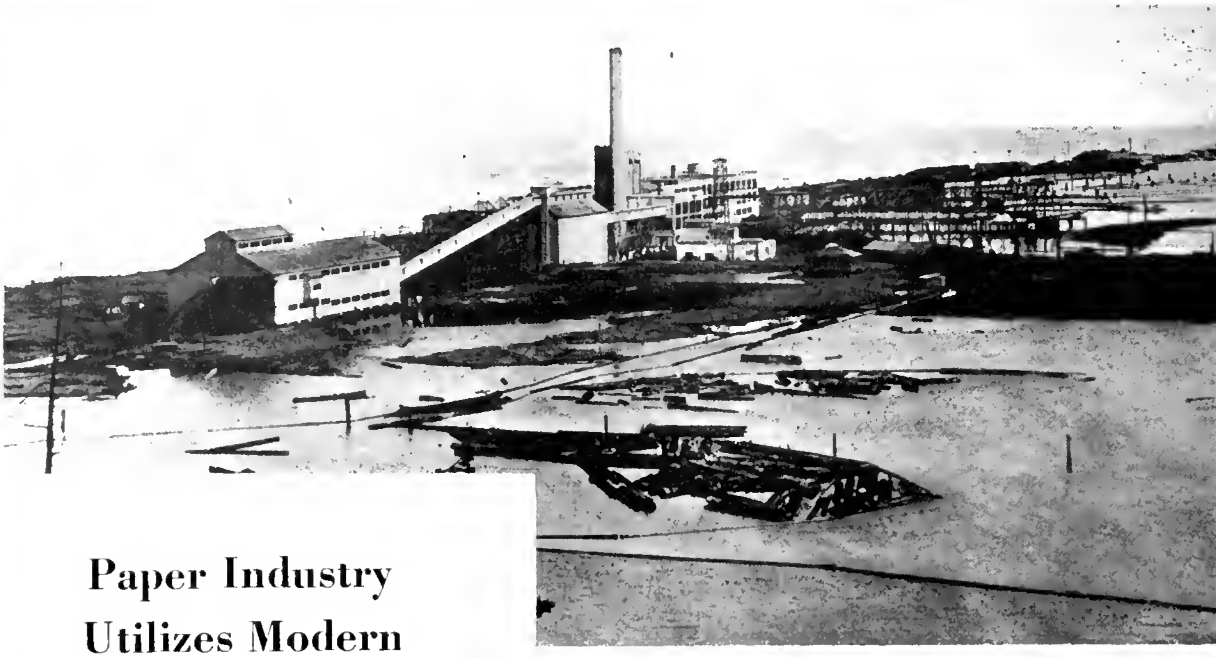
UNTHINKING criticism is sometimes launched at central-station companies on account of the large sums of money invested in plant construction, but when a plant situated within a hundred feet of an exploding gas tank goes through the experience without the injury of a single operating man or the loss of a single second of service over its outgoing lines little remains to be said in defense of substantial construction.

The manner in which the State Street station of the United Electric Light Company of Springfield, Mass., sustained the shock of an explosion in a gas-purifier tank on the opposite side of an intermediate railroad last week speaks volumes for the foresight of the engineers who designed the boiler plant and switch house and justifies the acceptance of their plans by the management of the company against a natural feeling that unnecessary quantities of reinforced concrete were put into these structures. Readers of the "News of the Industry" this week will join in congratulating the United company, its engineers and the Springfield public because the disaster to one great utility was not augmented by the interruption of the service of another, with all the interruption to local activities and the consequent loss and suffering which such a calamity would have entailed. Once more "safety first" has proved itself the most economical policy.

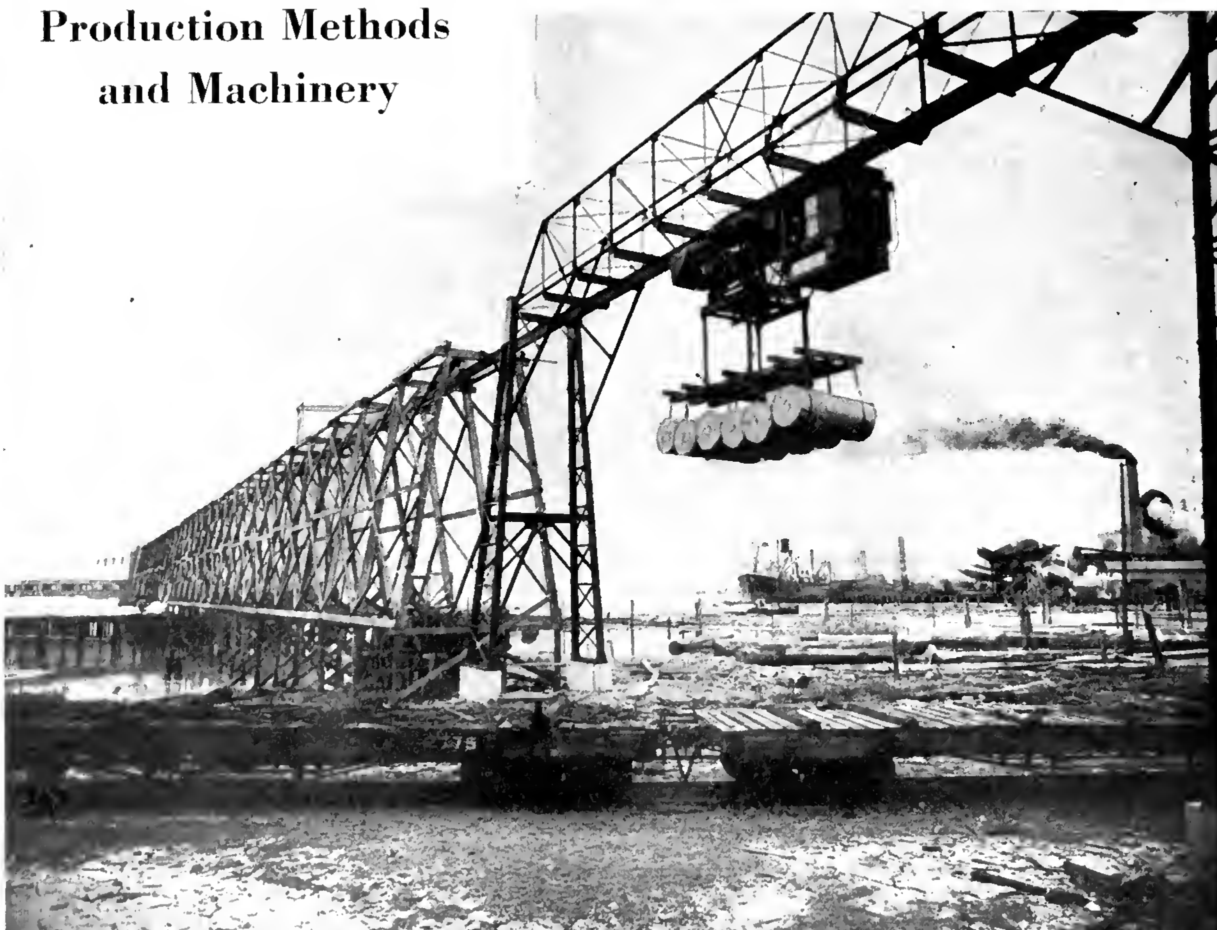
### Polyphase Circuit Measurements

THE proper method of making measurements on polyphase circuits has been the subject of considerable discussion within the last few years. With balanced circuits the methods are well known and commonly accepted, but this was not the case with unbalanced circuits. It was recognized that if the definition and methods of measurements were to have any assured standing they should cover unbalanced circuits. The present extensive use of the two-element wattmeter is incontrovertible evidence of the general recognition of the importance of unbalance in polyphase circuits; but the devices corresponding to the polyphase wattmeter were not developed for measuring power factor and reactive power on unbalanced circuits.

Recently a new system of measuring devices particularly applicable to unbalanced circuits has been proposed. These devices, which are described this week in an article by R. D. Evans, are relatively simply and employ standard types of instrument transformers and meter or relay elements, with an auxiliary network of resistors and reactors. Some of the advantages of the proposed system of measuring devices are discussed in the article by Mr. Evans and others in the paper on "Polyphase Power Measurements" to be presented by C. L. Fortescue at the midwinter convention of the American Institute of Electrical Engineers. The future of this new system cannot be predicted until the commercial instruments have been completely developed. It may be that measuring devices of this character will supplement and to an extent replace present systems. The principle, however, offers opportunity for immediate application to special polyphase motor installations in order to protect equipment from injury through single-phase operation.



# Paper Industry Utilizes Modern Production Methods and Machinery



The consumption of paper for all purposes requires immense mills and a great amount of power machinery. The accompanying views show the mill and log pond of the Washington Pulp & Paper Corporation at Port Angelus, Wash., on Puget Sound. A monorail system is used for carrying the finished paper rolls from the mill to the dock. In the mill itself are found sectionalized electric drives on the paper machines and numerous other applications of electrical equipment used to secure reliable and continuous production.

# New Practices in Street Lighting

## Pole-Type Transformers Used in Kansas City to Reduce Substation Equipment to a Minimum —Installation Conditions Required Underground Cable of Special Type—Features of Lamps—Standard Construction Used on Overhead Circuits

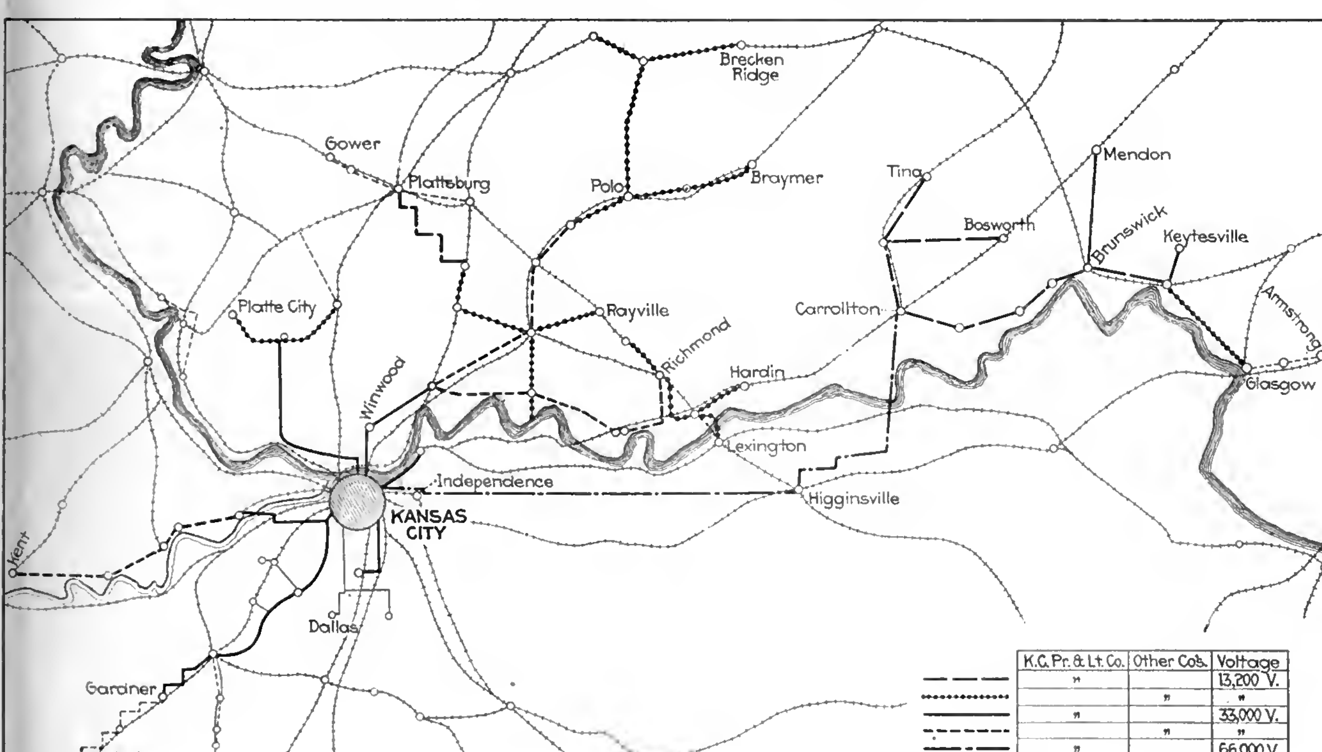
By A. E. BETTIS

*Superintendent of Distribution Kansas City Power & Light Company*

TWO radical departures have been made in the installation of a new street-lighting system in Kansas City, Mo. These are the removal of all street-lighting equipment from the substations, except one complete three-phase circuit switching equipment in each of seven substations, and the placing of a large part of the lamp circuits underground, a special cable buried in the earth without ducts save at street crossings being used. Ducts are used at street crossings to facilitate repairs in case of cable burnouts or other breakdowns. The removal of all of the usual series transformer and switching equipment from the substations means the saving of a great amount of valuable space and in some cases obviates the necessity of special substations for the street-lighting equipment. This in itself has meant a material saving in expense. The placing of the series circuits underground has enabled the use of a simple and attractive ornamental post on streets where there are no street-car lines. On the streets with street-car lines and steel trolley supports a simple type of ornamental bracket has been utilized for mounting on the trolley poles, the conductors being carried overhead. The plans which were followed made possible the removal from the streets of many of the unsightly wiring and lamp supports that overhead construction usually involves. These results have been attained because it was possible to start with a comparatively clean slate, much of the previous street lighting having been with gas.

Series-type constant-current transformers mounted on the line poles at points most convenient to the territory to be served are utilized throughout, thus removing all series equipment of any character from the substations. To control the series transformers one three-phase, 4,000-volt, four-wire, 60-cycle grounded-neutral circuit is run out of each of seven substations. The constant-current transformers are connected to these circuits in the same manner as the ordinary distribution transformers, care being taken to balance the phase loads. The usual oil-switch and relay equipment for a supply circuit is provided for the control panel of this circuit.

The A, B and C phases are distributed one in each of three territories around the substation serving a particular section. Each of the single-phase, 2,300-volt feeders is connected through knife disconnecting and oil switches to the station bus. The oil switches are single-element type, remote-controlled, with a separate inverse-time-element relay on each phase. In the automatic stations serving street-lighting circuits the street-lighting feeder is connected to the bus the same as in manually operated substations. The control, however,



LAYOUT OF TRANSMISSION CIRCUITS IN THE TERRITORY ADJACENT TO KANSAS CITY

is different. The circuits are put into and taken out of operation by a time clock which closes the control circuit and in turn operates the master controller, which then rotates to the position of the street-lighting feeder and energizes the control circuit closing the feeder oil switch. Relays are provided for tripping out the circuits in case of trouble. If any single-phase feeder is tripped out, a motor timer is put in operation. This two things. The first is the elimination of a mass of station equipment requiring valuable space, and the second is the elimination of dead runs of wire to reach lamps a long distance from a substation. The series transformers can be so placed as to obtain the shortest possible series circuit mileage, and the three-phase circuits pick up load at the point where they leave the substation.

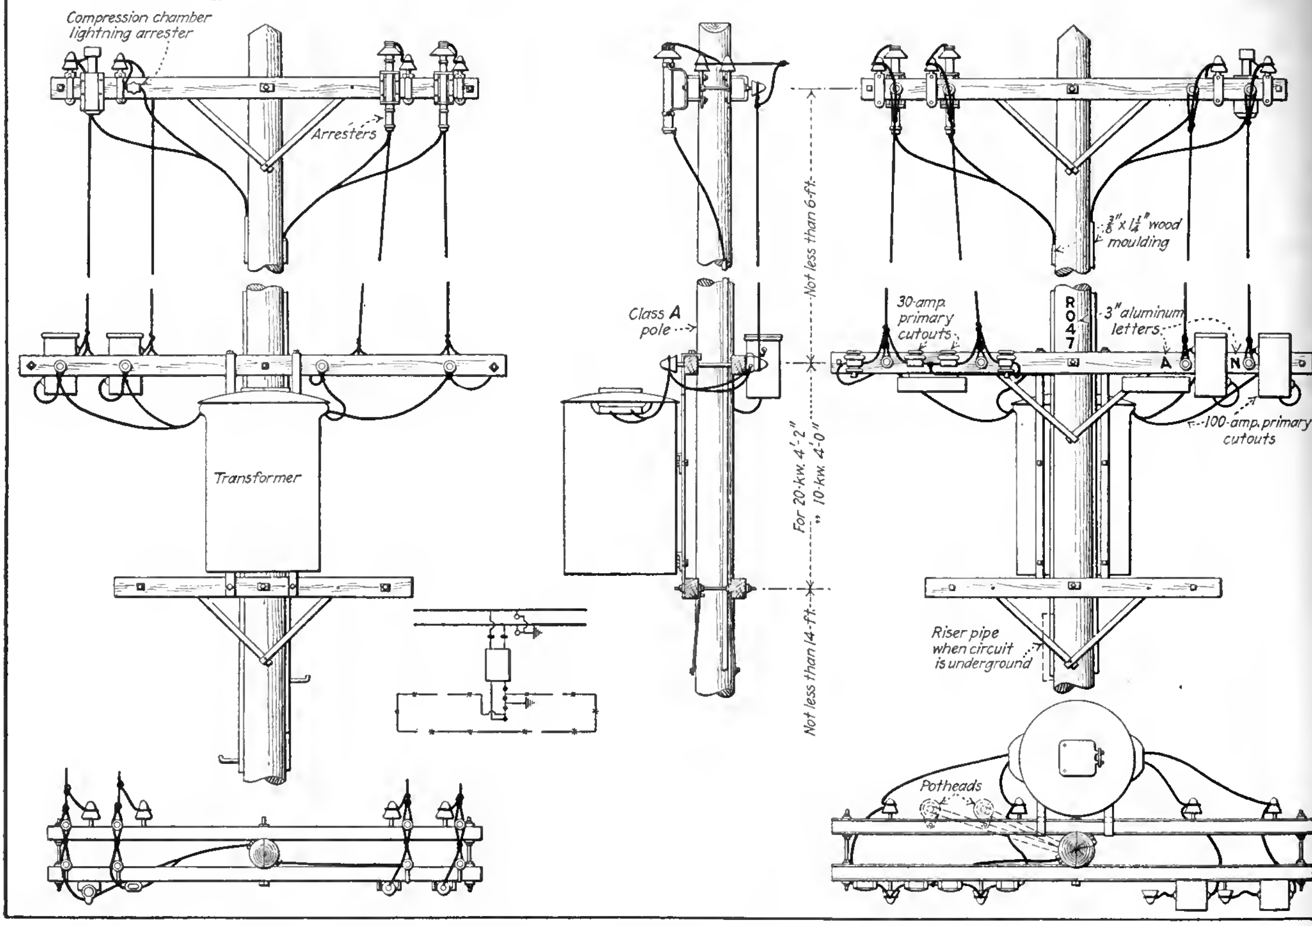
Lightning Arresters

Type and voltage of the lightning arrester depends on the capacity of the circuit. (Size of the R.O. transformer used)

| R.O. Transformer Size | Type of Arrester and G.E. Cat. No. | Operating Voltage of Arrester |
|---|---|---|
| 3 Kw. | Comp. Chamb. 178915 | 300 to 1,000 |
| 5 " | " " 79218 | 1,000 - 3,000 |
| 10 " | " " 79218 | 1,000 - 3,000 |
| 15 " | " " 1591185-G1 | 3,000 - 5,000 |
| 20 " | " " 1591185-G1 | 3,000 - 5,000 |

Fusing Transformers and Series Circuits

| Size of R.O. Kva. | Fuse Primary Boxes Amperes | Fuse Tungsten Circuit Plugs Amperes |
|---|---|---|
| 20 | 50 | 15 |
| 10 | 25 | |
| 5 | 15 | |
| 3 | 10 | |



STANDARD CONSTANT-CURRENT TRANSFORMER INSTALLATION AT KANSAS CITY

All substation equipment is eliminated except that required to control one 4,000-volt, four-wire, neutral-grounded, three-phase, 60-cycle circuit from each of seven substations. These installations are connected to the supply circuits in the same manner as ordinary customers' transformers, the supply circuits being switched at the proper time, either manually or automatically, depending on the type of substation from which they come. A standard size of 20 kva. has been adopted for use, the other sizes being used only under special conditions, such as in slow-growing outlying districts or small towns. In a few special situations where it is not practicable to run special supply circuits the installation is controlled by a time switch and connected to the regular service circuits. This type of series transformer installation eliminates a great deal of substation equipment.

motor timer will close the oil switch three times, hesitating approximately eight seconds, thirty seconds and one and one-half minutes before reclosing. This is accomplished by contact arms, rotating on a dial, which are spaced to give the desired time. Lock-out relays, one on each phase, open the control circuit for reclosing the oil switch and prevent any further operation on this feeder until the lock-out relays are set by hand. The street-lighting circuits are taken out of service by the time clock opening the control circuit and preventing any further operation of the feeder.

The foregoing arrangement obviously accomplishes

For city use constant-current transformers rated at 20 kva. are standard. Lower ratings, down to 3 kva., are used in small towns or outlying districts where development has not proceeded far. Where the smaller sizes are used there are a few cases in which the individual installations are controlled by a time switch on the pole as they are too far away or too scattered to justify the installation of a three-phase circuit for street lighting only. It is expected that these installations will be changed to the standard size and to substation control as the territory in which they are located develops.

BEFORE AND AFTER IMPROVING STREET LIGHTING ON HARRISON STREET SOUTH OF ARMOUR IN KANSAS CITY

Each transformer installation is protected by primary and series circuit fuses. Expulsion-type fuses are employed for the primary side, and the ordinary porcelain cut-out used on 2,300-volt service circuits is employed for the series circuit. In addition, two of the same type of cut-outs are placed on the circuits with the plug normally out, so that the circuit may be grounded on either side for test purposes. Compression-type arresters are used on each installation. Separate grounds through driven pipes are provided for lightning-arrester and test purposes. On the 20-kva. installations the normal number of 600-cp. lamps used is forty, while sixty to sixty-five 400-cp. lamps are used on the same size of transformer. The 600-cp. lamps are of the 20-amp. type. The 400-cp. are 15 amp. The 250-cp. lamps are 6.6 amp., no transformers between the lamps and the circuit being used for these.

Each installation is provided with the markings necessary to identify it, so that record checking and inspection is easy. The standard marker board indicates the substation (*P* is the symbol); *S* indicates that it is a street-lighting circuit, and the number is the number of the circuit. On the primary side the circuit number and the indication that it is a street-lighting service circuit is given. The *RO* number is that of the transformer installation.

Several knotty questions were involved in the selection of cable for the underground work. Duct work except at points like street crossings under pavements, where to save expense of installation tunneling was resorted to, was out of the question on account of expense. Armored cable was the first thought, but it involved expense that in Kansas City experience hardly seemed justified. The theory of the armor is that it will prevent street laborers from damaging the cable. Experience has shown that a laborer digging into a cable not only tears off the armor but often takes a considerable portion of the cable with it or damages it so that it must be replaced. The cable finally adopted is easily cut through and damage is thus limited to short pieces. The danger of electrolysis prohibited the use of a plain lead-covered cable, even though this danger is materially lessened by the facts that the cables between lamps are thoroughly insulated from each other and that the total length of any run is very short.

STREET-INTERSECTION LIGHTS OF THIS TYPE ARE PLACED ON THE STREET-LIGHTING CIRCUITS

The cable finally selected is lead-covered and has in addition a triple jute covering heavily impregnated. This is expected to provide sufficient insulation to pre-

vent damage from electrolysis to the short runs of cable used. The single No. 8 A. W. G. conductor is insulated with $\frac{3}{32}$ in. of saturated paper. An objection that will be raised is the immediate possibility of trouble on such a cable in case moisture enters it. It is felt, however, that this is an advantage rather than a drawback. With rubber-insulated cable it has been found that moisture entering the cable may not become apparent for some time, and by the time it is evident considerable sections of the cable may be damaged and have to be replaced. With the paper-insulated cable the entrance of moisture means an immediate blow-up which affects only a short length of cable. The defective section can be cut out, the cable dried out and a new section put in. The trouble is then over, which might not be the case with a rubber-insulated cable. Another criticism that has been made is that a single conductor inside a metal sheath is likely to give rise to serious inductive effects. Careful tests and the experience of a year have failed to show any. The cable, of which 750,000 ft. has so far been used, has withstood repeated tests at 15,000 volts.

The cable is buried directly in the earth. A narrow trench about 12 in. to 14 in. in depth is dug and the cable laid in. At street intersections where pavements are encountered trenching was first undertaken, but later tunneling and the installation of 2-in. fiber conduit was resorted to to reduce the expense. On high-class paving the cost of paving repair is a serious item.
